Seed plants of southern Africa: families and genera

Editor: O.A. Leistner

NATIONAL
BOTANICAL
INSTITUTE

Pretoria

2000

STRELITZIA

This series has replaced *Memoirs of the Botanical Survey of South Africa* and *Annals of Kirstenbosch Botanic Gardens* which the NBI inherited from its predecessor organisations.

The genus *Strelitzia* occurs naturally in the eastern parts of southern Africa. It comprises three arborescent species, known as wild bananas, and two acaulescent species, known as crane flowers or bird-of-paradise flowers. The logo of the National Botanical Institute is based on the striking inflorescence of *Strelitzia reginae*, a native of the Eastern Cape and KwaZulu-Natal that has become a garden favourite worldwide. It symbolises the commitment of the National Botanical Institute to promote the sustainable use, conservation, appreciation and enjoyment of the exceptionally rich plant life of South Africa, for the benefit of all its people.

TECHNICAL EDITOR	**N.L. Meyer**
EDITORIAL COMMITTEE	**G.F. Smith**, **G. Germishuizen**, **M. Koekemoer** and **E. du Plessis**
CHROMOSOME NUMBERS	**E.J.L. Liebenberg** and **H. du Plessis** (from various sources — see Introduction)
COVER DESIGN	**S. Turck** (incorporating various drawings from the *Flora of southern Africa* series)

How to cite this publication

The names of compilers appear directly below the family names. A reference to a family treatment from the book should therefore be cited as in the following example:

GLEN, H.F. 2000. Cupressaceae. In O.A. Leistner (ed.), Seed plants of southern Africa: families and genera. *Strelitzia* 10: 29–30. National Botanical Institute, Pretoria.

To cite the book as a single work, use the following format:

LEISTNER, O.A. (ed.) 2000. Seed plants of southern Africa: families and genera. *Strelitzia* 10. National Botanical Institute, Pretoria.

INDEX TO FAMILIES AND GENERA 761

INTRODUCTION

Preamble

'...I would exhort taxonomists to put right the errors and omissions of the present work and to publish a further revision to mark the turn of the century in the year 2000'. Thus wrote Dr R.A. Dyer in the Introduction to the predecessor and basis of the present work: *The genera of southern African flowering plants*, of which volume 1 appeared in 1975.

Since the publication of Dyer's work, plant systematics has entered a renaissance of unprecedented magnitude. New methods and techniques, especially DNA sequencing and cladistics, have provided a wealth of new data. Proposals for improvement of acknowledged systems of plant classification are published almost daily. A branch of Botany, considered by many to be near extinction, is flourishing. With ever-increasing certainty, we can trace the pathways of the evolution of the seed plants and depict them in cladograms (pp. 4–6). Incorporating these new findings and interpretations has proved to be a major challenge in the compilation of this work, which was originally projected to be merely a corrected, updated version of Dyer (1975, 1976).

Area covered

This work covers the same area as the *Flora of southern Africa* (*FSA*): the subcontinent south of the Kunene, Okavango, Zambezi and Limpopo Rivers. In the description of distributions, countries and South African provinces are listed in a more or less north-to-south sequence: Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Lesotho, Northern Cape, Western Cape and Eastern Cape. Botswana was formerly not included in the *FSA* and was also not dealt with in Dyer (1975, 1976).

Arrangement and circumscription of families and genera

In the interest of quick access, this work is basically alphabetically arranged. Bowing to school and textbook tradition, however, families are primarily grouped in three more or less natural assemblages: (1) **Gymnosperms** or non-angiosperm seed plants (pp. 29–33); (2) **Dicotyledons** or Magnoliopsida (pp. 34–565); and (3) **Monocotyledons** or Liliopsida (pp. 566–740). Certain families, such as Annonaceae and Nymphaeaceae, are in many respects intermediate between dicotyledons and monocotyledons. They are often grouped under the name **monosulcates** because most of them, like the majority of monocotyledons, have monosulcate (with a single groove) pollen grains. These families are treated within the alphabetical system of the dicotyledons.

As relationships between families are not indicated by their sequence in this work, their position in the following two classification systems is shown: (1) a modified version of the widely used system of Cronquist (1988) as given in Mabberley (1997); the subclass and order of each family is indicated in brackets before each family description; (2) a combined system by the Angiosperm Phylogeny Group (A.P.G.) (1998) and Judd *et al.* (1999); the relationships of southern African seed plant families are shown on simplified cladograms on pp. 4–6 and the order to which each family is assigned is indicated in the Index (p. 761).

The circumscription of families and genera generally reflects the opinion of the respective compiler. Where this differs from widely held views, it is usually commented on. The presumed phylogenetic position of genera in the larger families is indicated in outlines of the classification after the family descriptions. The number used in PRECIS (National Herbarium, Pretoria (**PRE**) **C**omputerised **I**nformation **S**ystem) (Arnold & De Wet 1993) is given for every genus.

Scope of descriptions and notes

The descriptions of families and genera, as well as the classification of genera within families, are based almost exclusively on southern African material. Only distribution and size of families and genera are also indicated on a worldwide basis. The main source for these figures was Mabberley (1997). Combined family-genus descriptions are given for all families represented locally by only a single genus.

Exotics

Full treatment is given to genera represented by one or more exotic species considered to be growing spontaneously in natural veld and therefore likely to be taken as indigenous. Garden escapes are sometimes mentioned in notes under their family description. Entirely exotic families, genera and species are marked with an asterisk.

Synonyms

Synonyms cited are mainly those found in commonly used literature. Generic synonyms given do not necessarily embrace the entire content of the current genus.

Chromosome numbers

Chromosome numbers given at the end of genus descriptions are primarily based on worldwide data for local genera obtained from the literature listed on p. 2. The following information is given:

1. Basic chromosome numbers (x) established from gametophytic (n) and sporophytic ($2n$) chromosome numbers of species. For example, the basic chromosome number for a genus in which most species are listed in the literature as having chromosome numbers of 7 or 13, whereas only a few of its species have 8 or 9, is given in the present work as $x = 7, 13 (8, 9)$.
2. 'Polyploidy' indicates that $2n = 3x$ to $7x$ and 'high polyploidy' that $2n = 8x$ or higher.
3. B-chromosomes.
4. Aneuploids.

Chromosome numbers in families, such as Scrophulariaceae, in which numerous taxonomic changes have been made recently, should be treated with particular caution.

Chromosome data were extracted by E.J.L. Liebenberg and H. du Plessis from the following sources:

FEDEROV, A. (ed.) 1969. *Chromosome numbers of flowering plants*. V.L. Komarov Botanical Institute, Academy of Sciences of the USSR.

Compilers

Most of the contributions to this work are by the staff of the three herbaria of the National Botanical Institute. The following researchers from outside the Institute contributed: Prof. Kevin Balkwill of the Botany Department, University of the Witwatersrand; Dr Peter Bruyns of the Bolus Herbarium, University of Cape Town; Dr Leanne Dreyer of the Botany Department, University of Stellenbosch; Dr Peter Goldblatt of the Missouri Botanical Garden, St Louis; Prof. A.V. (Tony) Hall of the Bolus Herbarium, University of Cape Town; Steven Hammer of the Sphaeroid Institute, Vista, U.S.A.; Dr H.E.K. (Heidi) Hartmann of the Institut für Allgemeine Botanik, University of Hamburg; Dr Cornelia Klak of the Bolus Herbarium, University of Cape Town; Dr Ashley Nicholas of the Botany Department, University of Durban-Westville; Prof. Ben-Erik van Wyk of the Botany Department, Rand Afrikaans University; and Prof. Johan Venter of the Department of Botany and Genetics, University of the Free State.

Directions on how to cite the individual contributions by different compilers are given on the back of the title page.

Editor's acknowledgements

My sincere thanks go to the Executive of the National Botanical Institute, specifically Prof. Brian Huntley and Prof. Gideon Smith, for the opportunity to edit a work of such a seminal nature. Nicole Meyer, technical editor, co-ordinator and typesetter, was the king-(or rather queen-)pin of the entire operation; she performed her painstaking work with great dedication, expertise and patience; she also contributed several monocot families. The Editorial Board, comprising Prof. Gideon Smith, Gerrit Germishuizen, Marinda Koekemoer and Emsie du Plessis, gave direction and encouragement. The Publications Section of the NBI played a crucial role in the production of the work and saw it through the press. All members of the section gave their whole-hearted support: Sarie Brink, Emsie du Plessis, Gerrit Germishuizen, Maretha Joubert, Daleen Maree, Beverley Momberg and Sandra Turck, with a special word of thanks to Emsie and Gerrit. All authors, especially those from outside the Institute, who had the option to decline the offer to contribute, are thanked sincerely for their inputs and the spirit of co-operation in which they were made. The names of non-NBI authors are listed under Compilers above. Robert Westfall of the Agricultural Research Council spent many hours computing family attributes (some preliminary results are apparent in *Identification of families*, p. 7); Peter Goldblatt and John Manning provided thoughts on classification of families, and glimpses into the manuscript of their forthcoming publication on Cape plants (in prep.); they also contributed the account of Iridaceae. Dee (Snijman) Paterson-Jones gave advice on monocots. Mabberley's *Plant-book* was a daily source of information and inspiration; he has accomplished the almost impossible—nay, the impossible: can you make our dear friend Franz Schubert live backwards? Mariette, my better half, spent many nights playing the plant family game on the computer, and unquestioningly accepted The Book as an excuse for any non-co-operation in the domestic realm.

Sponsors

The Trustees of the Mia Karsten Fund kindly approved a considerable contribution towards the printing cost of this work.

Literature

No formal cut-off date for the inclusion of new literature was fixed but the aim was to reflect the current state of knowledge. That aim was reached with varying degrees of success. The literature consulted in the compilation of families is given at the end of each family treatment. Dyer (1975, 1976) is not routinely cited. Literature referred to above, as well as much-used sources of a general nature consulted in the course of editing, include the following:

A.P.G. 1998. An ordinal classification for the families of flowering plants. *Annals of the Missouri Botanical Garden* 85: 531–553.

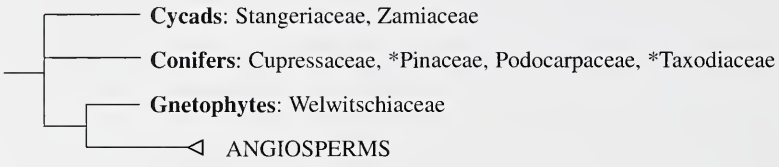
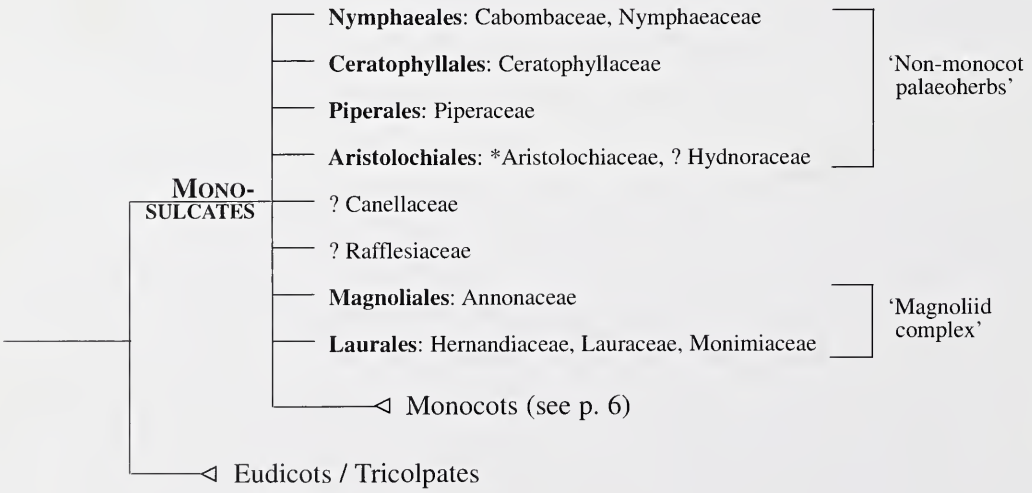
CLASSIFICATION OF FAMILIES

In this work families are arranged alphabetically under (1) gymnosperms, (2) dicotyledons, and (3) monocotyledons. The relationships between families are therefore scarcely reflected by their position. A knowledge of the phylogenetic situation of a family, however, is essential if it is to be seen in a wider context. From the numerous classification systems proposed for the families of seed plants, two are reflected here, with only occasional slight changes: (1) the system by Cronquist (1988, *The evolution and classification of flowering plants*) which is widely used, for example in the *Flora of Australia*. It is given here in the modified version as presented in Mabberley (1997, *The plant-book*). The subclass and the order into which each family is placed in this system is shown in brackets before the description of the family. Thanks to new techniques and procedures the insight into the phylogeny of plants is improving very rapidly. The latest available classification was chosen: (2) a system based on the recent publication of the Angiosperm Phylogeny Group (A.P.G. 1998, *Annals of the Missouri Botanical Garden* 85: 531–553) and on Judd *et al.* (1999, *Plant systematics: a phylogenetic approach*). It is displayed in the simplified cladograms below in which only families recorded from southern Africa are included. The order to which each family is assigned is also given in the Index (p. 761). A question mark indicates that the position of the family is uncertain. Unplaced families are listed after the asterids (p. 6).

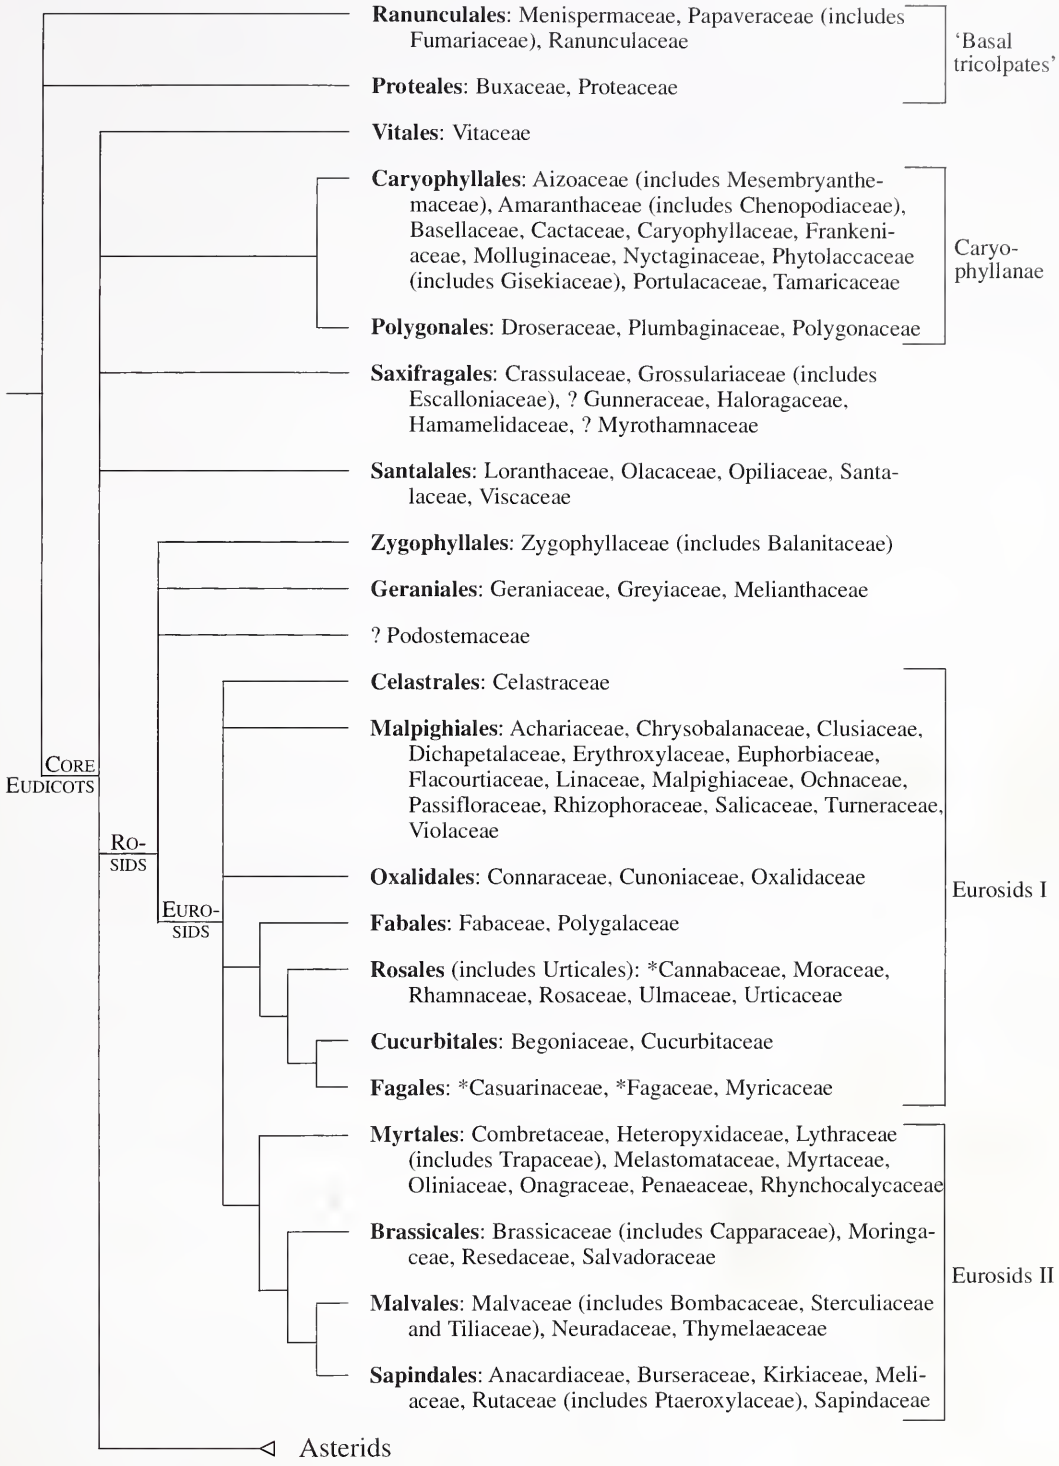
'GYMNOSPERMS'/'NON-ANGIOSPERM SEED PLANTS'



ANGIOSPERMS

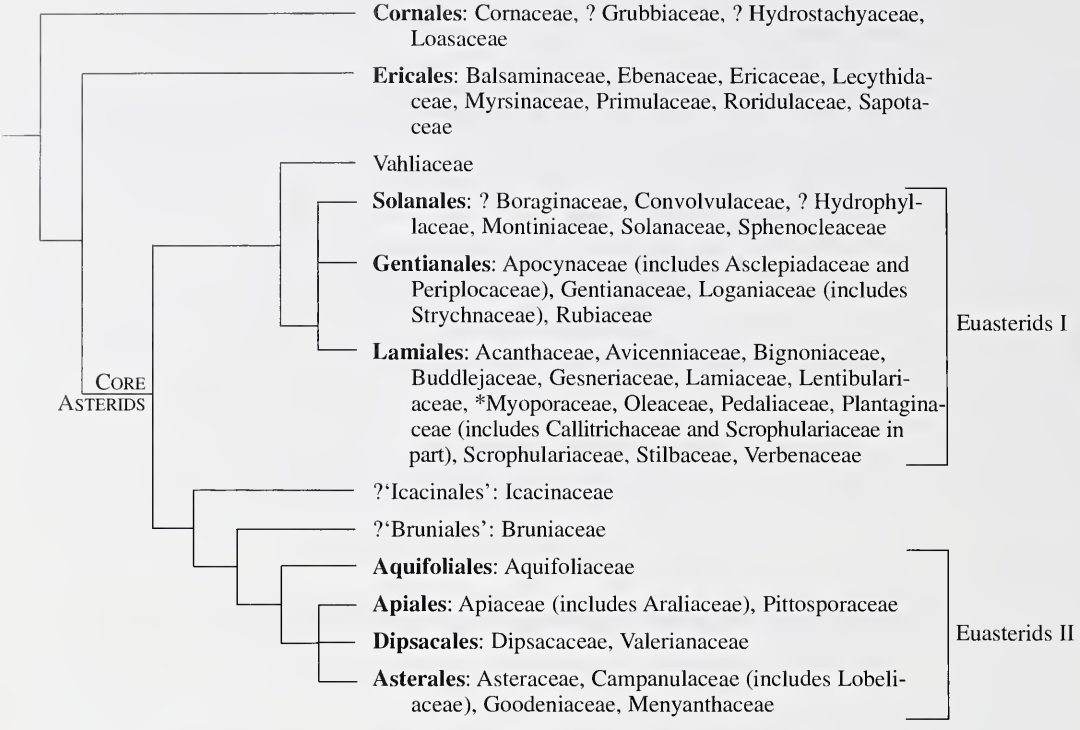


EUDICOTS / TRICOLPATES



Ranunculales: Menispermaceae, Papaveraceae (includes Fumariaceae), Ranunculaceae
Proteales: Buxaceae, Proteaceae
'Basal tricolpates'
Vitales: Vitaceae
Caryophyllales: Aizoaceae (includes Mesembryanthemaceae), Amaranthaceae (includes Chenopodiaceae), Basellaceae, Cactaceae, Caryophyllaceae, Frankeniaceae, Molluginaceae, Nyctaginaceae, Phytolaccaceae (includes Gisekiaceae), Portulacaceae, Tamaricaceae
Polygonales: Droseraceae, Plumbaginaceae, Polygonaceae
Caryophyllanae
Saxifragales: Crassulaceae, Grossulariaceae (includes Escalloniaceae), ? Gunneraceae, Haloragaceae, Hamamelidaceae, ? Myrothamnaceae
Santalales: Loranthaceae, Olacaceae, Opiliaceae, Santalaceae, Viscaceae
Zygophyllales: Zygophyllaceae (includes Balanitaceae)
Geraniales: Geraniaceae, Greyiaceae, Melianthaceae
? Podostemaceae
Celastrales: Celastraceae
Malpighiales: Achariaceae, Chrysobalanaceae, Clusiaceae, Dichapetalaceae, Erythroxylaceae, Euphorbiaceae, Flacourtiaceae, Linaceae, Malpighiaceae, Ochnaceae, Passifloraceae, Rhizophoraceae, Salicaceae, Turneraceae, Violaceae
CORE EUDICOTS
ROSIDS
EUROSIDS
Oxalidales: Connaraceae, Cunoniaceae, Oxalidaceae
Fabales: Fabaceae, Polygalaceae
Rosales (includes Urticales): *Cannabaceae, Moraceae, Rhamnaceae, Rosaceae, Ulmaceae, Urticaceae
Cucurbitales: Begoniaceae, Cucurbitaceae
Fagales: *Casuarinaceae, *Fagaceae, Myricaceae
Eurosids I
Myrtales: Combretaceae, Heteropyxidaceae, Lythraceae (includes Trapaceae), Melastomataceae, Myrtaceae, Oliniaceae, Onagraceae, Penaeaceae, Rhynchocalycaceae
Brassicales: Brassicaceae (includes Capparaceae), Moringaceae, Resedaceae, Salvadoraceae
Malvales: Malvaceae (includes Bombacaceae, Sterculiaceae and Tiliaceae), Neuradaceae, Thymelaeaceae
Sapindales: Anacardiaceae, Burseraceae, Kirkiaceae, Meliaceae, Rutaceae (includes Ptaeroxylaceae), Sapindaceae
Eurosids II
Asterids

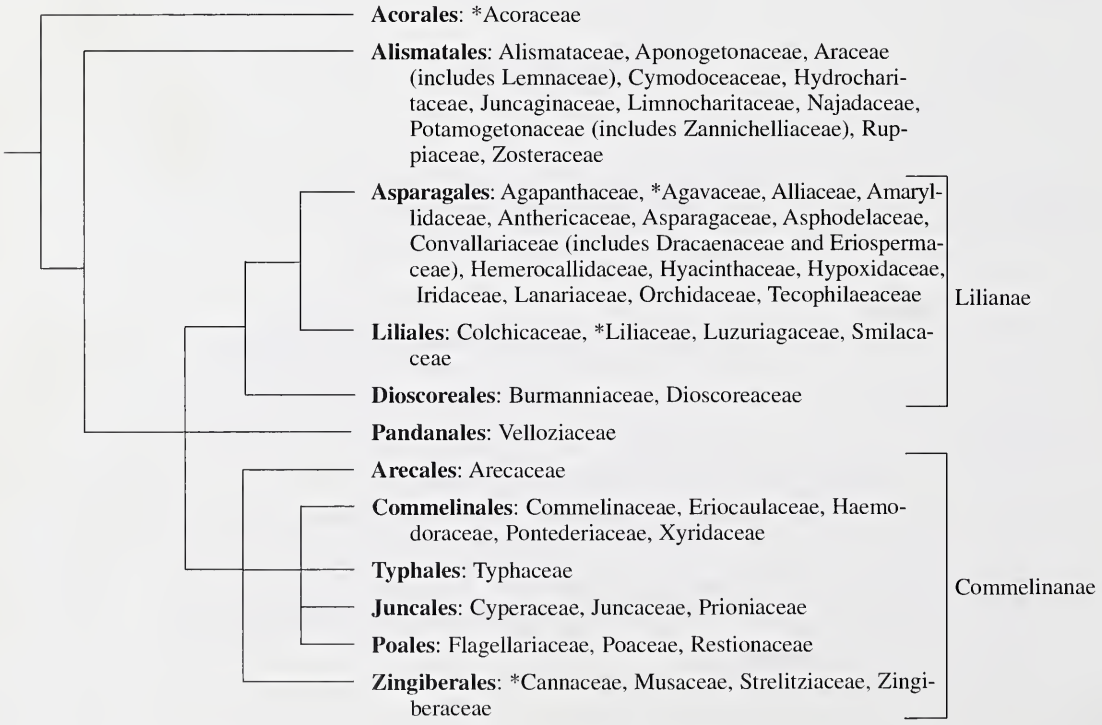
ASTERIDS



Cornales: Cornaceae, ? Grubbiaceae, ? Hydrostachyaceae, Loasaceae
Ericales: Balsaminaceae, Ebenaceae, Ericaceae, Lecythidaceae, Myrsinaceae, Primulaceae, Roridulaceae, Sapotaceae
Vahliaceae
Solanales: ? Boraginaceae, Convolvulaceae, ? Hydrophyllaceae, Montiniaceae, Solanaceae, Sphenocleaceae
Gentianales: Apocynaceae (includes Asclepiadaceae and Periplocaceae), Gentianaceae, Loganiaceae (includes Strychnaceae), Rubiaceae
Lamiales: Acanthaceae, Avicenniaceae, Bignoniaceae, Buddlejaceae, Gesneriaceae, Lamiaceae, Lentibulariaceae, *Myoporaceae, Oleaceae, Pedaliaceae, Plantaginaceae (includes Callitrichaceae and Scrophulariaceae in part), Scrophulariaceae, Stilbaceae, Verbenaceae
Euasterids I
CORE ASTERIDS
?'Icacinales': Icacinaceae
?'Bruniales': Bruniaceae
Aquifoliales: Aquifoliaceae
Apiales: Apiaceae (includes Araliaceae), Pittosporaceae
Dipsacales: Dipsacaceae, Valerianaceae
Asterales: Asteraceae, Campanulaceae (includes Lobeliaceae), Goodeniaceae, Menyanthaceae
Euasterids II

Families unplaced: Balanophoraceae, Elatinaceae, Geissolomataceae

MONOCOTS



Acorales: *Acoraceae
Alismatales: Alismataceae, Aponogetonaceae, Araceae (includes Lemnaceae), Cymodoceaceae, Hydrocharitaceae, Juncaginaceae, Limnocharitaceae, Najadaceae, Potamogetonaceae (includes Zannichelliaceae), Ruppiaceae, Zosteraceae
Asparagales: Agapanthaceae, *Agavaceae, Alliaceae, Amaryllidaceae, Anthericaceae, Asparagaceae, Asphodelaceae, Convallariaceae (includes Dracaenaceae and Eriospermaceae), Hemerocallidaceae, Hyacinthaceae, Hypoxidaceae, Iridaceae, Lanariaceae, Orchidaceae, Tecophilaeaceae
Liliales: Colchicaceae, *Liliaceae, Luzuriagaceae, Smilacaceae
Dioscoreales: Burmanniaceae, Dioscoreaceae
Lilianae
Pandanales: Velloziaceae
Arecales: Arecaceae
Commelinales: Commelinaceae, Eriocaulaceae, Haemodoraceae, Pontederiaceae, Xyridaceae
Typhales: Typhaceae
Juncales: Cyperaceae, Juncaceae, Prioniaceae
Poales: Flagellariaceae, Poaceae, Restionaceae
Commelinanae
Zingiberales: *Cannaceae, Musaceae, Strelitziaceae, Zingiberaceae

IDENTIFICATION OF FAMILIES

Introduction

The first step in identifying a plant is usually to ascertain the family to which it belongs. This can be a formidable task in a region such as southern Africa with some 230 families of seed plants, many with very diverse representatives. The readily available vegetative characteristics are usually not enough to distinguish families, and a knowledge of flower features is essential. In many families the flower structure has become modified to a lesser or greater extent, or flowers may be very small and hidden between bracts, such as in the grasses (Poaceae), or inside an almost completely closed flower receptacle, as in the figs (Moraceae). In the paragraphs below, a few ideas and data are given which may help to make the task of identifying families a little easier.

Aids to identification

General hints

The systematic examination of a plant in order to establish the characteristics required for its identification is described in detail in Cullen (1997). A few sentences from his work concerning ovary and ovule features are quoted here because these are often particularly difficult to determine: 'In order to see how many cells [locules] the ovary contains, it is usually necessary to section it horizontally across the middle [the widest part]. Such a section will also generally show how many ovules there are in the ovary or in each locule, and, very often, the way they are attached to the ovary—the placentation, which is a very important characteristic in the identification of families. With some groups it may also be necessary to cut another ovary longitudinally (along a diameter) to see precisely how the ovules are attached. The cutting of ovaries....is an art that has to be mastered with practice, as the ovaries can be very small indeed. In general terms it is relatively easy to cut a transverse section, using a single-edged razor blade. Longitudinal sections can be difficult and troublesome. The flower (or just the ovary, if it is large enough) should be held between finger and thumb, with the flower in the same position as it was on the plant, with the stem end pointing outwards. A cut should then be made carefully through this, moving the blade downwards as the cut goes through the tissues. In this way, clean surfaces will be left and the ovary will not be squeezed or squashed, which will happen if a sawing motion of the blade is used. It is sometimes helpful to rub over the ends of cut sections with the tip of a broad, black, felt-tip pen. The water-based ink is absorbed by the cut surfaces, which therefore stain black, but it is repelled by the waxy surface of the ovules, which are pale green and stand out from the rest of the stained cut.' A note by Goldblatt & Manning (in prep.: *Cape plants. A conspectus of the Cape flora of South Africa*) at the beginning of their key to angiosperms is also relevant in this context: 'In checking placentation it is often easier to examine ovaries after fertilisation when they have swollen slightly.'

Characteristics found only in a limited number of families

Certain distinctive attributes encountered in some or all members of a limited number of families may prove helpful when identifying plants (G—gymnosperms; M—monocotyledons; all others—dicotyledons):

Water plants, free-floating or with floating leaves:
Alismataceae (M), Aponogetonaceae (M), Araceae (M), Cabombaceae, Crassulaceae, Droseraceae, Hydrocharitaceae (M), Lemnaceae (M), Lentibulariaceae, Limnocharitaceae (M), Lythraceae, Menyanthaceae, Nymphaeaceae, Onagraceae, Podostemaceae, Pontederiaceae (M), Potamogetonaceae (M), Scrophulariaceae, Trapaceae.

Water plants, with submerged stems and leaves:
Alismataceae (M), Aponogetonaceae (M), Callitrichaceae, Ceratophyllaceae, Cymodoceaceae (M), Droseraceae, Elatinaceae, Haloragaceae, Hydrocharitaceae (M), Hydrostachyaceae, Lentibulariaceae, Limnocharitaceae (M), Lythraceae, Najadaceae (M), Onagraceae, Podostemaceae, Potamogetonaceae (M), Ranunculaceae, Ruppiaceae (M), Scrophulariaceae, Zannichelliaceae (M), Zosteraceae (M).

Parasitic plants:
(1) Without chlorophyll: Balanophoraceae, Convolvulaceae, Hydnoraceae, Lauraceae, Rafflesiaceae, Scrophulariaceae; (2) growing on aerial parts of trees and shrubs: Loranthaceae, Viscaceae.

Grasses and grass-like plants:
Cyperaceae (M), Juncaceae (M), Poaceae (M), Restionaceae (M), Typhaceae (M).

Succulent plants:
*Agavaceae (M), Aizoaceae, Amaranthaceae, Amaryllidaceae (M), Apocynaceae, Asphodelaceae (M), Asteraceae, Balsaminaceae, Begoniaceae, Boraginaceae (*Heliotropium curassavicum*), Cactaceae, Chenopodiaceae, Crassulaceae, Dracaenaceae (M), Euphorbiaceae, Geraniaceae, Goodeniaceae, Hyacinthaceae (M), Hydnoraceae, Lamiaceae, Lemnaceae (M), Loranthaceae, Menispermaceae, Mesembryanthemaceae, Molluginaceae, Orchidaceae (M), Passifloraceae, Pedaliaceae, Phytolaccaceae, Piperaceae, Polygonaceae, Portulacaceae, Rafflesiaceae, Rubiaceae (*Phylohydrax*), Scrophulariaceae, Viscaceae, Vitaceae, Zygophyllaceae.

Plants with true bulbs:
Alliaceae (M), Amaryllidaceae (M), Hyacinthaceae (M), *Liliaceae (M).

Plants with milky or coloured to conspicuous watery sap:
Alismataceae (M), Apocynaceae, Araceae (M), Asteraceae, Burseraceae, Cabombaceae, Campanulaceae, Convolvulaceae (some spp. of *Ipomoea*), Euphorbiaceae, Fumariaceae, Haemodoraceae (M), Limnocharitaceae (M), Lobeliaceae, Moraceae, Moringaceae, Nymphaeaceae, Papaveraceae, Sapotaceae.

Stem twining:
Achariaceae, Annonaceae, Apocynaceae, Aristolochiaceae, Basellaceae, Connaraceae, Convolvulaceae, Dioscoreaceae (M), Euphorbiaceae, Fabaceae, Flagellariaceae (M), Hyacinthaceae (M), Lauraceae, Linaceae, Luzuriagaceae (M), Malpighiaceae, Menispermaceae, Oleaceae, Polygonaceae, Solanaceae.

Tendrils present:
Achariaceae, Apocynaceae, Bignoniaceae, Colchicaceae (M), Cucurbitaceae, Fabaceae, Flagellariaceae (M), Fumariaceae, Linaceae, Menispermaceae, Passifloraceae, Rhamnaceae, Sapindaceae, Smilacaceae (M), Vitaceae.

Leaves absent or reduced to scales:
Amaranthaceae, Apocynaceae, Asparagaceae (M), Asteraceae, Bruniaceae, Burmanniaceae (M), Cactaceae, Campanulaceae, *Casuarinaceae, Chenopodiaceae, Convolvulaceae, Cucurbitaceae, Cupressaceae (G), Euphorbiaceae, Geraniaceae, Hyacinthaceae (M), Hydnoraceae, Juncaceae (M), Lauraceae, Lemnaceae (M), Mesembryanthemaceae, Orchidaceae (M), Podostemaceae, Rafflesiaceae, Restionaceae (M), Santalaceae, Scrophulariaceae, Viscaceae, Zannichelliaceae (M).

Leaves digitately compound (3 to many leaflets):
Anacardiaceae, Apiaceae, Araliaceae, Araceae (M), Arecaceae (M), Bignoniaceae, Bombacaceae, Burseraceae, *Cannabaceae, Capparaceae, Ceratophyllaceae, Cucurbitaceae, Cunoniaceae, Dioscoreaceae (M), Droseraceae, Euphorbiaceae, Fabaceae, Fumariaceae, Geraniaceae, Lamiaceae, Lentibulariaceae, Malvaceae, Oleaceae, Oxalidaceae, Passifloraceae, Pedaliaceae, Ranunculaceae, Rosaceae, Rutaceae, Sapindaceae, Sterculiaceae, Verbenaceae, Vitaceae, Zygophyllaceae.

Leaves paripinnate:
Araliaceae, Balanitaceae, Fabaceae (especially Caesalpinioideae), Hydrostachyaceae, Meliaceae, Oxalidaceae, Ptaeroxylaceae, Sapindaceae, Stangeriaceae (G), Zamiaceae (G) Zygophyllaceae.

Leaves imparipinnate:
Anacardiaceae, Apiaceae, Araceae (M), Arecaceae (M), Asteraceae, Bignoniaceae, Brassicaceae, Burseraceae, Connaraceae, Cunoniaceae, Fabaceae, Fumariaceae, Geraniaceae, Haloragaceae, Hydrophyllaceae, Hydrostachyaceae, Kirkiaceae, Meliaceae, Melianthaceae, Moringaceae, Oleaceae, Proteaceae, Ranunculaceae, Resedaceae, Rosaceae, Rutaceae, Sapindaceae, Stangeriaceae (G), Valerianaceae, Zamiaceae (G), Zygophyllaceae.

Leaves 2× or 3× pinnate:
Apiaceae, Araliaceae, Araceae (M), Asteraceae, Bignoniaceae, Fabaceae, Fumariaceae, Geraniaceae, Hydrostachyaceae, Lentibulariaceae, Meliaceae, Moringaceae, Proteaceae, Ranunculaceae.

Flowers densely crowded, sessile, usually small to minute; in heads, on a fleshy axis surrounded by a conspicuous bract, or enclosed as in a fig; inflorescence often resembling a single flower:
Amaranthaceae, Apiaceae, Araceae (M), Araliaceae, Asteraceae, Balanophoraceae, Bruniaceae, *Casuarinaceae, Colchicaceae (M), Convolvulaceae, Dipsacaceae, Eriocaulaceae (M), Euphorbiaceae (*Euphorbia*), Fabaceae (Mimosoideae), Gentianaceae, Hamamelidaceae, Hyacinthaceae (M), Juncaceae (M), Moraceae, Portulacaceae, Proteaceae, Rhamnaceae (*Phylica*), Rubiaceae, Thymelaeaceae, Urticaceae, Verbenaceae, Xyridaceae (M).

Flowers in an umbel or pseudo-umbel:
Agapanthaceae (M), Alismataceae (M), Alliaceae (M), Amaryllidaceae (M), Anthericaceae (M), Apiaceae, Apocynaceae, Araliaceae, Capparaceae, Cyperaceae (M), Euphorbiaceae, Fabaceae, Geraniaceae, Gisekiaceae, Hydrocharitaceae (M), Iridaceae (M), Limnocharitaceae (M), Loranthaceae, Malpighiaceae, Menyanthaceae, Molluginaceae, Myrsinaceae, Myrtaceae, Nyctaginaceae, Oxalidaceae, Ranunculaceae, Rhamnaceae, Ruppiaceae (M), Rutaceae, Smilacaceae (M), Solanaceae, Thymelaeaceae, Viscaceae.

Perianth absent:
Amaranthaceae, Araceae (M), Asteraceae, Balanophoraceae, Begoniaceae, Callitrichaceae, *Casuarinaceae, Chenopodiaceae, Cupressaceae (G), Cymodoceaceae (M), Cyperaceae (M), Euphorbiaceae, Fabaceae (*Brachystegia*), Gunneraceae, Haloragaceae, Hydrostachyaceae, Lemnaceae (M), Moraceae, Myricaceae, Myrothamnaceae, Najadaceae (M), Pinaceae (G), Piperaceae, Poaceae (M), Podostemaceae, Podocarpaceae (G), Potamogetonaceae (M), Restionaceae (M), Ruppiaceae (M), Salicaceae, Stangeriaceae (G), *Taxodiaceae (G), Typhaceae (M), Viscaceae, Zamiaceae (G), Zannichelliaceae (M), Zosteraceae (M).

Perianth dry, pergamentaceous:
Amaranthaceae, *Cannabaceae, *Casuarinaceae, Cyperaceae (M), Eriocaulaceae (M), Juncaceae (M), Moraceae, Plantaginaceae, Poaceae(M), Restionaceae (M), Typhaceae (M), Xyridaceae (M).

Perianth spurred:
Balsaminaceae, Brassicaceae, Lentibulariaceae, Orchidaceae (M), Pedaliaceae, Scrophulariaceae, Valerianaceae, Violaceae.

Sex organs, at least of one sex, in cones or catkins:
*Casuarinaceae, Cupressaceae (G), Euphorbiaceae, *Fagaceae, Gunneraceae, Moraceae, Myricaceae, Myrothamnaceae, *Pinaceae (G), Podocarpaceae (G), Salicaceae, Stangeriaceae (G), *Taxodiaceae (G), Welwitschiaceae (G), Zamiaceae (G).

Anthers connate:
Apocynaceae, Araceae (M), Asteraceae, Balsaminaceae, Cucurbitaceae, Fumariaceae, Gentianaceae, Hydnoraceae, Lobeliaceae, Rafflesiaceae, Scrophulariaceae, Violaceae.

Gynoecium of 2 or more free carpels with separate styles:
Alismataceae (M), Annonaceae, Aponogetonaceae (M), Arecaceae (M), Cabombaceae, Connaraceae, Crassulaceae, Cymodoceaceae (M), Gisekiaceae, Juncaginaceae (M), Limnocharitaceae (M), Menispermaceae, Nymphaeaceae, Phytolaccaceae, Potamogetonaceae (M), Ranunculaceae, Rosaceae, Ruppiaceae (M), Zannichelliaceae (M).

Fruit a circumscissile capsule: opening by a lid:
Aizoaceae, Hypoxidaceae (M), Lentibulariaceae, Lythraceae, Plantaginaceae, Plumbaginaceae, Portulacaceae, Primulaceae, Sphaenocleaceae.

Keys to families

KEY TO MAJOR GROUPS

1a Flowers absent; ovules/seeds borne on scales arranged in cones, or exposed, not in an ovary; pollen sacs borne on scales arranged in cones; trees to woody perennials; leaves mostly needle-, scale- or palm-like ..... **GYMNOSPERMS** (key below)

1b Flowers present; ovules/seeds enclosed in an ovary; pollen borne in anthers; annual herbs to trees (**ANGIOSPERMS**):

2a Leaves usually net-veined, simple to variously compound, often with a petiole, base rarely sheathing the stem (e.g. Apiaceae, Ranunculaceae); stipules present or absent; flower parts usually in 4s or 5s; vascular bundles in stem usually arranged in a cylinder; embryo usually with 2 cotyledons..... **DICOTYLEDONS** (key on p. 10)

2b Leaves usually with parallel-convergent veins, simple or rarely compound or lobed but then leaflets or lobes with parallel, not net-like venation, leaves rarely with a petiole but base usually sheathing the stem at least partly; stipules absent; flower parts usually in 3s; vascular bundles scattered in stem; embryo with 1 cotyledon..... **MONOCOTYLEDONS** (key on p. 25)

KEY TO GYMNOSPERMS (pp. 29–33)

1a Leaves 2, opposite, permanent, sprawling on the ground and often torn lengthwise by the wind ..... **WELWITSCHIACEAE**

1b Leaves indefinite in number, produced in succession from apex of stems:

2a Palm- or fern-like plants with fibrous stems or trunks, or stemless with a tuberous rootstock:

3a Stemless, somewhat fern-like plants with a tuberous rootstock; leaves deciduous from their base; leaflets with midrib and dichotomously branched lateral veins..... **STANGERIACEAE**

3b Stems above and below ground, covered with persistent leaf bases, sometimes up to 10 m tall, with a crown of palm-like leaves..... **ZAMIACEAE**

2b Trees or shrubs with hardwood stems and simple leaves along branches:

4a Leaves small and scale-like; ovules/seeds borne between scales of a rounded woody, rarely fleshy cone..... **CUPRESSACEAE**

4b Leaves well developed, linear to awl-shaped or needle-like:

5a Dioecious trees or shrubs; leaves linear to narrowly ovate; ovules/seeds 1 or 2 borne on a receptacle (often swollen and fleshy), not in cones ..... **PODOCARPACEAE**

5b Monoecious trees or shrubs; leaves needle-like, linear or awl-shaped; ovules/seeds borne in cones:

6a Leaves mostly needle-like, 1 or few united at base by a membranous sheath; female cones with many spirally arranged scales, leathery or fleshy at first, mostly becoming stiff and woody later, each bearing 2 ovules/seeds..... ***PINACEAE**

6b Leaves mostly linear to broadly awl-shaped, without a basal sheath, spirally arranged but sometimes appearing 2-ranked; female cones with 5–30 scales, free when young but closely fused later, each bearing 2–9 ovules... ***TAXODIACEAE**

KEY TO DICOTYLEDONS (pp. 34–565)

1a Gynoecium composed of 2 or more **free carpels** with separate styles and stigmas (in Nymphaeaceae the carpels are sunk in a fleshy disc):
2a Petals absent; perianth members all ± similar ..... **Group 1** (below)
2b Petals present ..... **Group 2** (below)
1b Gynoecium composed of **1 carpel** or of 2 or more **united carpels** with united or free styles, or if carpels free below then styles or stigmas united:
3a **Placentation parietal or marginal**: ovules 2 or more in the ovary, borne on its outer wall or sometimes on intrusions thereof:
4a Ovary superior:
5a Petals absent; perianth members, if present, all ± similar ..... **Group 3** (p. 11)
5b Petals free ..... **Group 4** (p. 11)
5c Petals ± united ..... **Group 5** (p. 12)
4b Ovary ± inferior ..... **Group 6** (p. 13)
3b **Placentation axile, basal or apical**: 1 or more ovules in the ovary, borne on the central axis, or the base or apex of the ovary, or placentation indistinct:
6a Ovary superior:
7a Petals absent; perianth members, if present, all ± similar ..... **Group 7** (p. 13)
7b Petals free ..... **Group 8** (p. 16)
7c Petals ± united ..... **Group 9** (p. 19)
6b Ovary inferior:
8a Petals absent; perianth members, if present, all ± similar ..... **Group 10** (p. 22)
8b Petals free ..... **Group 11** (p. 23)
8c Petals ± united ..... **Group 12** (p. 24)

GROUP 1 (*Carpels free; petals absent*)

1a Sepals united below; stamens perigynous, arising at mouth of calyx tube; leaves pinnate or digitate or palmately lobed; stipules present; trees, shrubs or herbs, sometimes scrambling with prickles ..... **ROSACEAE**
1b Sepals free; stamens hypogynous:
2a Leaves compound, sometimes decompound; sepals petaloid; herbs or soft-wooded climbing or trailing plants..... **RANUNCULACEAE**
2b Leaves simple:
3a Flowers unisexual; plants dioecious; woody climbers with alternate leaves:
4a Sepals 6–18 in 2 or more whorls; stamens 3–6, free or united into a synandrium; flowers in cymes or racemes; leaves entire or palmately lobed ..... **MENISPERMACEAE**
4b Sepals 4 or 5 in 1 whorl; stamens 10–15, free; flowers in elongated racemes; leaves entire..... **PHYTOLACCACEAE**
3b Flowers bisexual; herbs with opposite or subopposite leaves:
5a Leaves entire; calyx herbaceous; flowers small, in cymes or panicles ..... **GISEKIACEAE**
5b Leaves toothed or lobed; calyx petaloid; flowers large and conspicuous, solitary or few together..... **RANUNCULACEAE**

GROUP 2 (*Carpels free; petals present*)

1a Leaves opposite; stipules absent; carpels as many as petals; plants often succulent ..... **CRASSULACEAE**
1b Leaves alternate, sometimes all radical:
2a Aquatic herbs with floating leaves on long petioles; leaf blades ± peltate; flowers solitary, on long scapes, often large and conspicuous:
3a Carpels sunk in a fleshy disc; petals many; leaf blades cordate as well as peltate ..... **NYMPHAEACEAE**
3b Carpels not sunk in a fleshy disc; petals 3; leaf blades peltate, not cordate ..... **CABOMBACEAE**
2b Terrestrial plants; leaf blades not peltate:
4a Stamens perigynous, arising at mouth of calyx tube; leaves pinnate or digitate; stipules present; trees, shrubs or herbs, sometimes scrambling with prickles ..... **ROSACEAE**
4b Stamens hypogynous, not arising on calyx:
5a Sepals 6–24 in 2 or more whorls, free or inner ones united; dioecious shrublets or woody climbers with small flowers ..... **MENISPERMACEAE**
5b Sepals 2–5 in 1 whorl, free or united:
6a Leaves compound or deeply divided:
7a Herbs ..... **RANUNCULACEAE**
7b Trees or shrubs ..... **CONNARACEAE**
6b Leaves simple, entire:
8a Leaves succulent; stamens 8–12 ..... **CRASSULACEAE**
8b Leaves herbaceous; stamens mostly more than 12:
9a Herbs ..... **RANUNCULACEAE**
9b Trees or shrubs, sometimes trailing ..... **ANNONACEAE**

GROUP 3 (*Placentation parietal; ovary superior; petals absent*)

1a Submerged aquatic herbs, fern-like owing to pinnately much-divided leaves; plants dioecious; flowers in elongated, pedunculate spikes; calyx absent ..... **HYDROSTACHYACEAE**
1b Terrestrial plants, not fern-like in habit:
2a Leaves pinnate or 2-foliolate; trees ..... **FABACEAE**
2b Leaves simple or digitately 3-foliolate, sometimes reduced to scales:
3a Flowers unisexual; plants dioecious; leaves simple; trees or shrubs:
4a Calyx absent; flowers in catkins; fruit a 2-valved capsule; seeds with a basal tuft of long, fine hairs ..... **SALICACEAE**
4b Calyx present; flowers solitary or in fascicles or short racemes; fruit a berry; seeds glabrous or covered with a woolly indumentum ..... **FLACOURTIACEAE**
3b Flowers bisexual:
5a Flowers with a fimbriate corona outside stamens; herbs or shrubs, often climbing with tendrils ..... **PASSIFLORACEAE**
5b Flowers without corona; tendrils absent:
6a Herbs or low shrublets; fruit a small capsule, either 1-locular with many ovules or 2-locular with 1 or 2 ovules per locule:
7a Capsule (silicula) with 2 1- or 2-seeded locules divided by a persistent, often membranous partition ..... **BRASSICACEAE**
7b Capsule 1-locular, often open at the top, with many ovules on 2–5 placentas ..... **RESEDACEAE**
6b Shrubs or trees; fruit, if a capsule, with more than 2 seeds per locule:
8a Ovary borne on a distinct stalk (gynophore) ..... **CAPPARACEAE**
8b Ovary sessile or subsessile ..... **FLACOURTIACEAE**

GROUP 4 (*Placentation parietal; ovary superior; petals free*)

1a Stamens 6, tetradynamous (inner 4 long, outer 2 short); sepals 4; petals 4 or fewer; leaves without stipules; herbs ..... **BRASSICACEAE**
1b Stamens not tetradynamous:
2a Gynoecium composed of 1 carpel, thus with only 1 placenta in ovary:
3a Flowers regular; petals 5 or fewer, sometimes 1; leaves simple or compound; trees or shrubs or herbs, sometimes climbing ..... **FABACEAE**
3b Flowers irregular:
4a Leaves 2-pinnate; stipules present; trees, shrubs or herbs, sometimes climbing; flowers in spikes or heads ..... **FABACEAE**
4b Leaves simple, 1-pinnate or 1–3-foliolate:
5a Leaves pinnate or 3-foliolate, the leaflets dotted with pellucid glands, at least at margin; trees or shrubs ..... **RUTACEAE**
5b Leaves simple or 1-foliolate, without pellucid glands:
6a Leaves toothed; stipules present; stamens as many as and opposite petals, united at base; herbs or small shrubs ..... **STERCULIACEAE**
6b Leaves entire; stipules absent; stamens more numerous than petals; trees or shrubs, sometimes climbing:
7a Sepals 5; petals 5; flowers in few-flowered racemes ..... **CONNARACEAE**
7b Sepals 3; petals 6; flowers solitary, axillary ..... **ANNONACEAE**
2b Gynoecium composed of 2 or more united carpels, thus with 2 or more placentas:
8a Leaves scale-like, dense; shrubs or small trees ..... **TAMARICACEAE**
8b Leaves not scale-like:
9a Leaves opposite or whorled, simple, not all radical; herbs:
10a Leaves dotted with pellucid glands; stamens more than twice as many as petals, often ± grouped into bundles; terrestrial plants ..... **CLUSIACEAE**
10b Leaves not gland-dotted; herbs, often hydrophytes:
11a Leaves bladdery, whorled; stamens as many as petals; free-floating aquatics ..... **DROSERACEAE**
11b Leaves small, opposite or whorled, not bladdery; stamens (4 or 5)6 ..... **FRANKENIACEAE**
9b Leaves alternate or all radical:
12a Flowers unisexual:
13a Stamens as many as petals:
14a Petals smaller than sepals; herbaceous or woody climbers with tendrils; leaves sometimes digitate or palmately lobed ..... **PASSIFLORACEAE**
14b Petals larger than sepals; trees or shrubs without tendrils; leaves simple, not lobed ..... **PITTOSPORACEAE**
13b Stamens twice as many as petals or more numerous; trees or shrubs without tendrils; petals free in all flowers ..... **FLACOURTIACEAE**
12b Flowers bisexual or plants sometimes polygamous:
15a Ovary borne on a distinct gynophore:
16a Flowers with a fimbriate or hairy corona outside stamens; styles 3–6; leaves simple; trees or shrubs, sometimes climbing ..... **PASSIFLORACEAE**
16b Flowers without a corona; style 1 or stigma sessile; leaves simple or digitate; trees, shrubs or herbs, sometimes climbing ..... **CAPPARACEAE**
15b Ovary sessile or subsessile:

17a Flowers ± irregular:
18a Leaves 2- or 3-pinnate; trees; flowers in axillary panicles; stamens 5, alternating with 5 staminodes..... **MORINGACEAE**
18b Leaves simple or digitate; herbs or sometimes shrubs or small trees:
19a Connective of anthers prolonged above thecae into an appendage; flowers mostly solitary; fruit a 3-valved capsule; leaves simple ..... **VIOLACEAE**
19b Connective of anthers not prolonged above thecae; flowers in terminal racemes or spikes:
20a Fruit a capsule dehiscing throughout its length by 2 valves; leaves simple or digitate..... **CAPPARACEAE**
20b Fruit a capsule gaping at apex; leaves simple, sometimes pinnately lobed or divided..... **RESEDACEAE**
17b Flowers regular:
21a Stamens 10, with filaments connate into a tube ± as long as the 10 petals ..... **CANELLACEAE**
21b Combination of characters not as above:
22a Stamens more numerous than petals, or as many and opposite them:
23a Flowers with a disc or a corona:
24a Climbers with tendrils; corona fimbriate, outside stamens ..... **PASSIFLORACEAE**
24b Shrubs or small trees; disc cupular, crowned by 10 gland-like processes; stamens arising from within disc..... **GREYIACEAE**
23b Flowers without a disc or a corona:
25a Prickly herbs; leaves often pinnately lobed; sepals 2 or 3, caducous; fruit a capsule dehiscing by 4–6 short valves at the top ..... **PAPAVERACEAE**
25b Trees or shrubs; leaves not pinnately lobed; fruit capsular or baccate, or of separate drupelets:
26a Gynoecium of 5–15 ± free, 1-ovulate carpels united by their completely fused styles; fruit of separate 1-seeded drupelets..... **OCHNACEAE**
26b Gynoecium with a 1-locular ovary with 1–many ovules; fruit a capsule or berry..... **FLACOURTIACEAE**
22b Stamens as many as and alternating with petals:
27a Styles 2–5, free or shortly united at base:
28a Leaves bearing many sticky, stipitate glands; insectivorous herbs ..... **DROSERACEAE**
28b Leaves without sticky glands; plants not insectivorous:
29a Flowers with a conspicuous, fimbriate or hairy corona outside stamens; herbs or shrubs, often climbing with tendrils ..... **PASSIFLORACEAE**
29b Flowers without a corona, or corona very small and inconspicuous; herbs without tendrils..... **TURNERACEAE**
27b Style 1:
30a Stamens variously united, connective of anthers prolonged above thecae into an appendage; leaves with stipules ..... **VIOLACEAE**
30b Stamens ± free, anthers without an appendage; leaves without stipules ..... **PITTOSPORACEAE**

GROUP 5 (*Placentation parietal; ovary superior; petals± united*)

1a Gynoecium consisting of 1 carpel, therefore with only 1 placenta in ovary; leaves with or without stipules:
2a Leaves simple or compound, with stipules or stipular spines; fruit a legume..... **FABACEAE**
2b Leaves simple; stipules absent; fruit a drupe containing a solitary U-shaped seed..... **MENISPERMACEAE**
1b Gynoecium consisting of 2 or more united carpels, therefore with 2 or more placentas in ovary; leaves without stipules:
3a Flowers irregular:
4a Leaves pinnately or ternately compound:
5a Leaves alternate; annual herbs with watery sap, sometimes with tendrils; outer petals often spurred or saccate at base..... **FUMARIACEAE**
5b Leaves opposite; trees with large pendulous, sausage-like fruits ..... **BIGNONIACEAE**
4b Leaves simple, sometimes reduced to scales; herbs:
6a Plants parasitic on roots; leaves reduced to scales; stamens 4 ..... **SCROPHULARIACEAE**
6b Plants not parasitic; leaves (or solitary leaf) well developed; stamens 2 ..... **GESNERIACEAE**
3b Flowers regular; stamens as many as corolla lobes or more numerous:
7a Leaves opposite:
8a Petals many; succulent herbs or shrubs with succulent leaves..... **MESEMBRYANTHEMACEAE**
8b Petals 4–6:
9a Shrubs or woody climbers with latex; fruit a large berry..... **APOCYNACEAE**
9b Herbs without latex; fruit a capsule, rarely berry-like ..... **GENTIANACEAE**
7b Leaves alternate or basal, sometimes small and scale-like:
10a Flowers unisexual; plants monoecious, herbaceous, subherbaceous or acaulescent herbs ..... **ACHARIACEAE**
10b Flowers bisexual:
11a Leaves small, scale-like; trees or shrubs, often halophytic ..... **TAMARICACEAE**
11b Leaves well developed:
12a Stamens more numerous than petals; petals twice as many as sepals; trees or shrubs, sometimes climbing.... **ANNONACEAE**

12b Stamens, petals and sepals all 5(6):
13a Herbs, aquatic or wetland; stamens arising on corolla tube ..... MENYANTHACEAE
13b Small trees or shrubs; stamens free from corolla tube ..... PITTOSPORACEAE

GROUP 6 (*Placentation parietal; ovary± inferior*)

1a Plants parasitic on roots of shrubs or trees, low, ± fleshy:
2a Perianth tubular, 3- or 4(5)-lobed, resembling a fungus ..... HYDNORACEAE
2b Perianth cup-shaped, 4–9-lobed, fused towards base ..... RAFFLESIACEAE
1b Plants not parasitic:
3a Petals absent: perianth members all ± similar:
4a Flowers irregular, usually with an S-shaped tube, medium-sized to large ..... ARISTOLOCHIACEAE
4b Flowers regular; tepals fused only towards base; fruit winged, horned or spiny ..... AIZOACEAE
3b Petals present: perianth differentiated into calyx and corolla:
5a Flowers unisexual; plants usually climbing with tendrils; leaves often palmately lobed or deeply divided..... CUCURBITACEAE
5b Flowers bisexual; plants without tendrils; leaves mostly entire, rarely with palmate venation:
6a Leaves absent or reduced to scales; succulent shrubs or shrublets, sometimes epiphytic ..... CACTACEAE
6b Leaves mostly well developed:
7a Succulent herbs or shrubs with succulent leaves; leaves mostly opposite; petals many..... MESEMBRYANTHEMACEAE
7b Plants not succulent; leaves opposite, or alternate; petals fewer than 10:
8a Leaves opposite or whorled, with interpetiolar stipules ..... RUBIACEAE
8b Leaves alternate or spirally imbricate and ± ericoid, rarely opposite but then without stipules; stipules if present, not interpetiolar:
9a Leaves small, sessile, ± ericoid, densely spirally imbricate ..... BRUNIACEAE
9b Leaves flat, broader than ericoid, alternate, rarely opposite, floating or submerged, if aquatic herbs:
10a Aquatic herbs with usually floating peltate leaves ..... NYMPHAEACEAE
10b Trees or shrubs ..... FLACOURTIACEAE

GROUP 7 (*Placentation axile, basal or apical; ovary superior; petals absent*)

1a Ovary with 2 or more ovules in each locule:
2a Plants aquatic; moss-like or liverwort-like in habit, growing on rocks; flowers small and inconspicuous; stamens 1 or 2; ovary with many ovules; fruit a capsule ..... PODOSTEMACEAE
2b Plants terrestrial, not moss-like or liverwort-like in habit:
3a Leaves reduced to scales forming toothed sheaths surrounding nodes of pine needle-like jointed branchlets; trees with unisexual flowers; male flowers in spikes, female flowers in heads; stamen 1; ovary 1-locular with 2 collateral ovules; style with 2 elongated branches..... *CASUARINACEAE
3b Leaves well developed, not reduced to scales:
4a Leaves opposite or whorled or all radical:
5a Flowers unisexual; trees, shrubs or shrublets:
6a Calyx absent; leaves toothed at apex, fan-like; flowers in catkin-like spikes; ovules many in each locule..... MYROTHAMNACEAE
6b Calyx present; leaves entire, not fan-like; flowers solitary or fasciculate in axils of leaves; ovules 2 in each locule:
7a Leaves with stipules; plants dioecious; stamens very many, spirally arranged on prolonged floral axis..... EUPHORBIACEAE
7b Leaves without stipules; plants monoecious; stamens 4–6 ..... BUXACEAE
5b Flowers bisexual; herbs:
8a Calyx spurred, spur adnate to pedicel; ovary beaked; leaves toothed or lobed ..... GERANIACEAE
8b Calyx not spurred; ovary without stout central axis; leaves entire:
9a Sepals fused below; stamens perigynous, inserted on calyx tube:
10a Style 1; fruit a capsule:
11a Ovary 1–5-locular, with many ovules in each locule ..... LYTHRACEAE
11b Ovary 4-locular, with 2 or 4 basal, erect, or 2 erect and 2 pendulous ovules in each locule..... PENAEACEAE
10b Styles 2–5, or if 1 then ovary 1-locular with few ovules; fruit a circumscissile capsule..... AIZOACEAE
9b Sepals free or almost so; stamens hypogynous:
12a Ovary 2–5-locular, with axile placentas ..... MOLLUGINACEAE
12b Ovary 1- or 4-locular with basal, free-central or apical placentation:
13a Ovary 1-locular with basal or free-central placentation ..... CARYOPHYLLACEAE
13b Ovary 4-locular, with 2 pendulous ovules in each locule, rarely 1 ovule aborted..... GEISSOLOMATACEAE
4b Leaves alternate, not all radical:
14a Leaves pinnate; trees, polygamous or with flowers all unisexual; ovary 2-locular with 2 ovules in each locule; fruit indehiscent ..... SAPINDACEAE

14b Leaves simple or digitate:
15a Ovary 1-locular; flowers in racemes or spikes:
16a Flowers mostly bisexual but plants sometimes polygamous:
17a Calyx scarious; fruit a ± circumscissile capsule; herbs ..... **AMARANTHACEAE**
17b Calyx of 4 thickish lobes; fruit a follicle; gland-dotted shrubs ..... **RUTACEAE**
16b Flowers unisexual; plants dioecious; calyx not scarious; fruit a drupe; trees or shrubs, sometimes climbing:
18a Leaves with stipules; calyx imbricate; stamens opposite sepals; styles 3, usually 2-lobed..... **EUPHORBIACEAE**
18b Leaves without stipules; calyx valvate; stamens alternating with sepals; style absent, stigma sessile and multiradiate ..... **ICACINACEAE**
15b Ovary 2- or more-locular:
19a Gynoecium composed of 3 or more loosely united carpels, in fruit separating into as many follicles (or fewer by abortion); trees or shrubs with flowers both bi- and unisexual; leaves simple or digitate; sepals valvate, united below; stamens united into a column..... **STERCULIACEAE**
19b Gynoecium composed of completely united carpels, in fruit forming a capsule, or indehiscent or finally separating into winged cocci:
20a Ovary borne on a distinct gynophore; flowers bisexual; shrubs with solitary, pedunculate, axillary flowers ..... **CAPPARACEAE**
20b Ovary sessile or subsessile:
21a Flowers bisexual; perianth segments sepaloid externally and petaloid internally ..... **AIZOACEAE**
21b Flowers mostly unisexual; plants occasionally polygamous:
22a Leaves with stipules; fruit a capsule, or indehiscent, or separating into 2 winged cocci; trees or shrubs or herbs ..... **EUPHORBIACEAE**
22b Leaves without stipules; fruit a septicidal capsule with 2 or more longitudinal, membranous wings; shrubs or trees ..... **SAPINDACEAE**

1b Ovary with 1 ovule in each locule:
23a Ovary 2- or more-locular:
24a Leaves pinnate or 3-foliolate:
25a Leaves pinnate, alternate; trees or shrubs ..... **SAPINDACEAE**
25b Leaves 3-foliolate, opposite; subshrubs ..... **ZYGOPHYLLACEAE**
24b Leaves simple, sometimes lobed or much divided or reduced to scales or stipular spines:
26a Flowers unisexual or plants polygamous:
27a Ovary 5-locular, carpels loosely united and becoming separate in fruit; calyx present, valvate, sepals united below; stamens 5–10, united into a column; leaves alternate; trees or shrubs ..... **STERCULIACEAE**
27b Ovary 2–4-locular, carpels completely united and not becoming separate in fruit:
28a Small aquatic herbs, sometimes terrestrial in damp situations; leaves opposite; perianth absent; fruit indehiscent, leathery ..... **CALLITRICHACEAE**
28b Trees, shrubs or herbs; leaves alternate or opposite, sometimes reduced to scales or stipular spines; calyx present or absent; fruit mostly dehiscent..... **EUPHORBIACEAE**
26b Flowers bisexual:
29a Sepals fused into a very short to long tube; stamens perigynous or hypogynous:
30a Stamens arising from upper portion of calyx tube, in 2 whorls; fruit a drupe; shrubs ..... **THYMELAEACEAE**
30b Stamens not arising on sepals, sometimes in groups; fruit a capsule or flat samara with membranous wings:
31a Trees with dentate leaves; fruit a flattened samara ..... **ULMACEAE**
31b Herbs, shrublets or shrubs with entire, often somewhat succulent leaves; fruit a capsule ..... **AIZOACEAE**
29b Sepals free; stamens hypogynous or almost so:
32a Leaves ± toothed or pinnately lobed or divided; style 1; fruit a flattened silicule or separating into 2 cocci; herbs ..... **BRASSICACEAE**
32b Leaves entire; styles 2 or more, free or united at base:
33a Ovary 7–10-locular; fruit a berry; flowers in spike-like racemes; herbs or shrublets ..... **PHYTOLACCACEAE**
33b Ovary 2–5-locular; fruit a loculicidal capsule or separating into 2 cocci, cocci sometimes winged along back; flowers in lax or dense cymes; herbs..... **MOLLUGINACEAE**
23b Ovary 1-locular:
34a Leaves absent or reduced to scales; flowers spicate:
35a Slender, twining, parasitic plants; flowers not immersed in rachis of spike; stamens 6–9, accompanied by staminodes; anthers opening by valves ..... **LAURACEAE**
35b Succulent, maritime herbs with articulated branches, not parasitic; flowers immersed in rachis of spike; stamens 1 or 2; anthers opening by longitudinal slits ..... **CHENOPODIACEAE**
34b Leaves present, well developed, not reduced to scales:
36a Leaves with stipules, stipules sometimes forming a sheath (ocrea) surrounding the stem:
37a Leaves 3- or 4-pinnate; calyx petaloid; fruit a stipitate achene borne on a slender pedicel; herbs..... **RANUNCULACEAE**
37b Leaves simple or digitate:
38a Ovule pendulous from apex or near apex of ovary; flowers unisexual or plants polygamous:
39a Flowers densely spicate or capitate, or crowded in or on an open or flat receptacle or inside a hollow, almost closed receptacle (fig), female flowers sometimes immersed in tissue of receptacle; calyx sometimes absent; trees, shrubs or herbs..... **MORACEAE**

39b Flowers solitary or fasciculate or in cymes or racemes or panicles; calyx sometimes reduced or absent in female flowers:

40a Annual herbs; leaves opposite or alternate, all or lower ones palmately divided; male flowers in elongated panicles; female flowers spicate, enclosed by bracts; fruit dry, indehiscent..... *CANNABACEAE

40b Trees or shrubs; leaves alternate:

41a Stamens as many as calyx segments, 4 or 5; style 2-branched with simple or divided stigmas; fruit a drupe; trees or shrubs..... ULMACEAE

41b Stamens more numerous than calyx segments; style unbranched, sometimes very short:

42a Flowers solitary or paired in axils of leaves; leaves 1–3-foliolate with small, narrow leaflets; heath-like shrubs..... ROSACEAE

42b Flowers in axillary racemes or panicles; leaves simple; trees..... EUPHORBIACEAE

38b Ovule arising from base or near base of ovary:

43a Leaves opposite, marked with cystoliths; flowers unisexual; herbs or shrubs..... URTICACEAE

43b Leaves alternate:

44a Calyx absent; flowers minute, in dense spikes; shrubs, sometimes climbing..... PIPERACEAE

44b Calyx present:

45a Styles 2 or 3, free or united below; stamens 4–8; fruit a small nut; stipules often forming an ocrea surrounding the stem; herbs or shrubs, sometimes climbing..... POLYGONACEAE

45b Style 1 or absent; stamens 5 or fewer:

46a Flowers bisexual; sepals united below, free portions alternating with lobes of an epicalyx; style arising laterally from near base of ovary; herbs with palmately lobed leaves..... ROSACEAE

46b Flowers unisexual; sepals free or united, without an epicalyx; style or sessile stigma terminal:

47a Leaves palmate or palmately lobed, without cystoliths; plants dioecious; male flowers crowded in branched spikes; female flowers in heads; trees..... MORACEAE

47b Leaves simple, sometimes pinnately lobed, often marked with cystoliths; plants monoecious or dioecious; flowers cymose, cymes often dense or head-like; herbs or shrubs or trees, sometimes climbing or epiphytic..... URTICACEAE

36b Leaves without stipules:

48a Submerged, aquatic herbs; leaves whorled, deeply and bifurcately divided with linear or filiform segments; flowers unisexual, solitary and sessile in axils of leaves..... CERATOPHYLLACEAE

48b Plants not aquatic; leaves alternate or opposite, undivided or sometimes pinnately divided:

49a Calyx absent; flowers in spikes:

50a Flowers unisexual; stamens 3–12; styles 2, free or shortly united below; leaves alternate; trees or shrubs... ..... MYRICACEAE

50b Flowers bisexual; stamens 2; style absent, stigma sessile; leaves alternate or opposite or whorled; herbs, sometimes trailing or climbing or epiphytic..... PIPERACEAE

49b Calyx present, at least in male flowers:

51a Stamens twice as many as calyx segments or more numerous:

52a Ovule erect from base of ovary; fruit enclosed in persistent, longitudinally 4-winged calyx tube; spiny shrubs with small, linear, often fasciculate leaves; plants polygamo-dioecious..... NYCTAGINACEAE

52b Ovule pendulous from apex of ovary; fruit not enclosed in winged calyx tube; plants not spiny:

53a Flowers bisexual; sepals united into an elongated tube; stamens arising on calyx tube; style elongated, slender; shrubs, often heath-like, or sometimes trees, with alternate or opposite leaves.... ..... THYMELAEACEAE

53b Flowers unisexual; plants dioecious; sepals shortly united at base; stamens not arising on calyx tube; style absent, stigma sessile; shrubs or trees with opposite or subopposite leaves..... MONIMIACEAE

51b Stamens fewer than twice as many as calyx segments, sometimes accompanied by staminodes:

54a Anthers opening by valves; calyx 6-lobed; stamens 6–9, accompanied by staminodes; trees ... LAURACEAE

54b Anthers opening by longitudinal slits; calyx with 3–5 segments or lobes:

55a Leaves opposite or subopposite:

56a Sepals ± petaloid, united into a tube constricted above ovary, lower portion of tube persistent and enclosing fruit and often glandular on outside; stamens not accompanied by staminodes; herbs or climbing shrubs..... NYCTAGINACEAE

56b Sepals dry and ± scarious, free or shortly united at base, not forming a tube constricted above ovary; stamens as many as and opposite calyx segments, often alternating with staminodes; herbs or shrubs..... AMARANTHACEAE

55b Leaves alternate:

57a Twining herbs; sepals (petals?) united below into a tube with 2 adnate bracteoles outside; flowers in axillary, pedunculate spikes..... BASELLACEAE

57b Plants not twining; sepals free or united, without adnate bracteoles:

58a Calyx with 2–4 valvate segments; trees or shrubs; flowers bisexual, in large, bracteate heads or in elongated spikes or racemes; stamens 4, free, opposite to and inserted on calyx segments; fruit a nut..... PROTEACEAE

58b Calyx with 3–5 imbricate segments or sometimes almost completely tubular with indistinct segments; herbs, shrubs or woody climbers:

59a Stamens fewer than calyx segments and mostly alternating with them; leaves small, linear; flowers in elongated, simple spikes..... PHYTOLACCACEAE

59b Stamens as many as or fewer than calyx segments and opposite them:

60a Disc of 4 or 5 fleshy lobes alternating with petals (may be taken for sepals as calyx is reduced to a rim); woody climbers ..... **OPILIACEAE**
60b Disc absent:
61a Sepals dry and ± scarious, free or shortly united at base; leaves entire ..... **AMARANTHACEAE**
61b Sepals herbaceous, free or ± united into a tube; leaves entire or ± toothed or pinnately divided ..... **CHENOPODIACEAE**

GROUP 8 (*Placentation axile, basal or apical; ovary superior; petals free*)

1a Ovary 1-locular, sometimes septate towards base:
2a Sepals 1 or 2, free, sometimes caducous:
3a Flowers unisexual; plants dioecious; sepals 1 or 2; petals 1–4; stamens united into a synandrium; leaf blades peltate or subpeltate; woody climbers ..... **MENISPERMACEAE**
3b Flowers bisexual or, if unisexual, then stamens free; sepals 2; petals 4 or 5; leaf blades not peltate; herbs:
4a Flowers irregular; ovary with 1 ovule; fruit a nut; leaves much divided ..... **FUMARIACEAE**
4b Flowers regular; ovary with many ovules; fruit a capsule; leaves entire, fleshy ..... **PORTULACACEAE**
2b Sepals (or calyx lobes) 3 or more, sometimes ± obsolete (calyx annular):
5a Leaves opposite or whorled, not all radical:
6a Leaves with stipules; herbs or shrublets ..... **CARYOPHYLLACEAE**
6b Leaves without stipules:
7a Petals and stamens perigynous, inserted on calyx tube:
8a Ovary with 1 apical, pendulous ovule; fruit indehiscent, dry or fleshy; often heath-like ..... **THYMELAEACEAE**
8b Ovary with many ovules on a basal or free-central placenta; stamens twice as many as petals or fewer; herbs, shrubs or trees ..... **LYTHRACEAE**
7b Petals and stamens hypogynous or only slightly perigynous, not inserted on calyx:
9a Herbs; ovary with 1–many ovules on a basal or free-central placenta; fruit a capsule ..... **CARYOPHYLLACEAE**
9b Trees or shrubs; ovary with 1 or 2 ovules; fruit drupaceous; stamens as many as and alternating with petals:
10a Filaments united at base into a tube or cup ..... **SALVADORACEAE**
10b Filaments ± free:
11a Ovule 1; styles 3, free or united at base; flowers unisexual; plants dioecious or polygamous ..... **ANACARDIACEAE**
11b Ovules 2–8; style 1 or stigma sessile; flowers bisexual:
12a Ovules 2, pendulous from apex of ovary ..... **ICACINACEAE**
12b Ovules 2–8, erect from base of ovary ..... **CELASTRACEAE**
5b Leaves alternate, sometimes all radical:
13a Leaves compound with 3 or more leaflets; trees or shrubs, sometimes climbing:
14a Leaves 2-pinnate; flowers bisexual; fruit winged, indehiscent ..... **FABACEAE**
14b Leaves 1-pinnate or 3-foliolate; flowers unisexual; plants polygamous or dioecious; fruit drupaceous ..... **ANACARDIACEAE**
13b Leaves simple or 1-foliolate:
15a Ovary with 1 ovule:
16a Flowers irregular; the inner 2 sepals larger than the others, the lowest (median) petal forming a keel, the upper 2 petals vestigial or absent; fruit long-winged, indehiscent; trees or shrubs, sometimes climbing ..... **POLYGALACEAE**
16b Flowers regular; fruit unwinged, but sometimes surrounded by persistent wing-like sepals:
17a Leaves with stipules; stamens as many as petals; herbs ..... **CARYOPHYLLACEAE**
17b Leaves without stipules:
18a Sepals united into an elongated tube; stamens mostly twice as many as petals, inserted on calyx tube; shrubs, sometimes heath-like ..... **THYMELAEACEAE**
18b Sepals free or almost so; calyx sometimes reduced to a rim:
19a Stamens united into a synandrium; leaf blade peltate or subpeltate; woody, dioecious climbers ..... **MENISPERMACEAE**
19b Stamens free or almost so; leaf blade not peltate:
20a Plants polygamous or dioecious; stamens 1–10; trees or shrubs ..... **ANACARDIACEAE**
20b Plants with bisexual flowers; stamens as many as and opposite petals; woody climbers ..... **OPILIACEAE**
15b Ovary with 2 or more ovules:
21a Leaves with stipules:
22a Stamens as many as and opposite petals, united at base; petals and stamens hypogynous; herbs or shrublets with stellate hairs ..... **STERCULIACEAE**
22b Stamens more numerous than petals, free; petals and stamens perigynous, inserted at mouth of calyx tube; trees or shrubs ..... **ROSACEAE**
21b Leaves without stipules; trees or shrubs:
23a Petals imbricate; stamens as many as and opposite petals; ovules on a free-central or basal placenta ..... **MYRSINACEAE**
23b Petals valvate:

24a Ovules 2 per locule, pendulous from apex of ovary; stamens as many as and alternating with petals..... **ICACINACEAE**

24b Ovules 2–5 per locule, pendulous from apex of a central placenta; stamens as many as and opposite petals, or up to twice as many, or reduced to 3 and accompanied by staminodes..... **OLACACEAE**

1b Ovary 2- or more-locular:

25a Stamens opposite and usually as many as petals:

26a Filaments ± united into a tube or cup, sometimes alternating with staminodes; calyx lobes valvate; herbs or shrubs, often with stellate hairs..... **STERCULIACEAE**

26b Filaments free, not alternating with staminodes:

27a Ovary with many ovules in each locule; fruit a loculicidal capsule; flowers in mainly terminal panicles; trees or shrubs:

28a Flowers usually unisexual by abortion; sepals and petals (4)5; disc well developed; capsule rounded..... **HETEROPYXIDACEAE**

28b Flowers bisexual; sepals, petals and stamens 6; disc absent; capsule dorsiventrally compressed..... **RHYNCHOCALYCACEAE**

27b Ovary with 1 or 2 ovules in each locule; fruit drupaceous or baccate:

29a Inflorescences leaf-opposed; herbaceous or woody plants, often climbing with tendrils; leaves simple (often lobed or divided) or digitate; ovules 2 in each locule; fruit a berry..... **VITACEAE**

29b Inflorescences axillary; trees or shrubs, often spiny, without tendrils; leaves simple, undivided; ovules 1 in each locule; fruit drupaceous..... **RHAMNACEAE**

25b Stamens, at least those of inner whorl, alternating with petals, as many as or more numerous or fewer than petals:

30a Leaves compound, with 2 or more leaflets:

31a Inflorescences bearing tendrils; climbing shrubs or herbs; leaves pinnate or 2-ternate..... **SAPINDACEAE**

31b Inflorescences without tendrils:

32a Herbs; stamens mostly twice as many as petals, sometimes as many as petals:

33a Style simple or stigma sessile; leaves mostly opposite, rarely alternate, 2- or 3-foliolate or pinnate..... **ZYGOPHYLLACEAE**

33b Styles 5, rarely fewer; leaves alternate or radical, digitately or pinnately compound..... **OXALIDACEAE**

32b Trees or shrubs, sometimes climbing:

34a Anthers 1-thecous; leaves digitate, 3–9-foliolate; stamens 10 or more, filaments united below..... **BOMBACACEAE**

34b Anthers 2-thecous; leaves pinnate or 2-pinnate or 2- or 3-foliolate:

35a Leaves opposite or subopposite:

36a Leaves imparipinnate or 3-foliolate:

37a Leaves dotted with pellucid glands at least at margin; fruit baccate or separating into 2–4 mericarps..... **RUTACEAE**

37b Leaves not gland-dotted; fruit a capsule..... **CUNONIACEAE**

36b Leaves paripinnate, leaflets without pellucid glands; fruit a compressed capsule with winged seeds..... **PTAEROXYLACEAE**

35b Leaves alternate:

38a Leaves with lateral or intrapetiolar stipules, imparipinnate; flowers ± irregular, in racemes; stamens 4 or 5..... **MELIANTHACEAE**

38b Leaves without stipules:

39a Filaments united into a tube; leaves pinnate or 2-pinnate..... **MELIACEAE**

39b Filaments free or only shortly united at base:

40a Leaflets dotted with pellucid glands; leaves pinnate or 3-foliolate..... **RUTACEAE**

40b Leaflets without pellucid glands:

41a Ovary with 2 or more ovules in each locule:

42a Ovules many in each locule; styles 5; fruit baccate; leaves pinnate..... **OXALIDACEAE**

42b Ovules 2 in each locule:

43a Fruit drupaceous; plants resinous..... **BURSERACEAE**

43b Fruit a capsule; carpels separating from a persistent central column; plants not resinous..... **PTAEROXYLACEAE**

41b Ovary with 1 ovule in each locule:

44a Styles 3–5, free and separated at base; plants polygamous or dioecious..... **ANACARDIACEAE**

44b Style or styles central or terminal, not separated at base:

45a Fruit with carpels separating from persistent central column; ovules on axile placenta; seeds winged..... **PTAEROXYLACEAE**

45b Fruit not as above; ovules erect or ascending or pendulous:

46a Ovules erect or ascending; leaves paripinnate or 2-pinnate or 2- or 3-foliolate..... **SAPINDACEAE**

46b Ovules pendulous:

47a Leaves 2-foliolate; branches armed with straight spines..... **BALANITACEAE**

47b Leaves imparipinnate, tufted at ends of branchlets; branches unarmed..... **KIRKIACEAE**

30b Leaves simple or 1-foliolate, sometimes deeply divided:

48a Perianth strongly irregular; sepals 3 or sometimes 5, the median one spurred; petals 3; stamens 5, anthers united around ovary; fruit an explosively dehiscent capsule; herbs..... **BALSAMINACEAE**

48b Perianth regular or slightly irregular:
49a Plants viscid; subshrubs; leaves with gland-tipped tentacles which trap insects ..... **RORIDULACEAE**
49b Plants not viscid:
50a Leaves opposite or whorled, not all radical:
51a Stamens more than twice as many as petals:
52a Leaves with stipules:
53a Trees or shrubs; stipules interpetiolar; petals fringed at apex; stamens 15–45, filaments not united into bundles ..... **RHIZOPHORACEAE**
53b Herbs; stipules not interpetiolar; petals not fringed; stamens 15, filaments united below into 5 bundles ..... **GERANIACEAE**
52b Leaves without stipules; sepals free; stamens and petals hypogynous; filaments irregularly arranged or ± united into bundles; styles 1–5 or absent; leaves usually dotted or streaked with pellucid or opaque glands; trees, shrubs or herbs ..... **CLUSIACEAE**
51b Stamens up to twice as many as petals:
54a Sepals united below into a tube:
55a Petals perigynous, inserted at mouth of calyx tube; ovary with many ovules in each locule:
56a Anthers opening by apical pores; connective often appendaged below anther; leaves with 3 or more parallel longitudinal nerves; herbs or shrubs ..... **MELASTOMATACEAE**
56b Anthers opening by longitudinal slits; connective unappendaged; leaves without parallel longitudinal nerves; herbs, shrubs or trees ..... **LYTHRACEAE**
55b Petals hypogynous, not arising on calyx tube; ovary with 1–3 ovules per locule:
57a Succulent annuals ..... **ZYGOPHYLLACEAE**
57b Trees or shrubs:
58a Stamens twice as many as petals; leaves with interpetiolar stipules; petals fringed at apex; plants not spiny ..... **RHIZOPHORACEAE**
58b Stamens as many as petals; leaves without stipules; petals not fringed; plants spiny..... **SALVADORACEAE**
54b Sepals free or almost so:
59a Ovary with 1 ovule in each fertile locule (sometimes 1 or 2 of the locules empty); stamens twice as many as petals; fruit winged; shrubs, often climbing ..... **MALPIGHIACEAE**
59b Ovary with 2 or more ovules in each locule:
60a Leaves lobed or deeply divided; ovary beaked; herbs or shrublets ..... **GERANIACEAE**
60b Leaves not lobed or divided; ovary without a stout central axis:
61a Styles 3–5:
62a Ovary with many ovules in each locule; sepals entire; leaves with stipules ..... **ELATINACEAE**
62b Ovary with 2 ovules in each locule; sepals toothed or lobed at apex; leaves without stipules ..... **LINACEAE**
61b Style 1:
63a Herbs or subshrubs; leaves succulent or glaucous ..... **ZYGOPHYLLACEAE**
63b Trees or shrubs, sometimes climbing:
64a Stamens as many as petals, alternating with petaloid staminodes; leaves dotted with pellucid glands ..... **RUTACEAE**
64b Stamens as many as or fewer than petals, not alternating with staminodes; leaves without translucent glands ..... **CELASTRACEAE**
50b Leaves alternate or fascicled, sometimes all radical:
65a Ovary with 1 ovule in each fertile locule (sometimes 1 or 2 of the locules empty):
66a Flowers unisexual or plants polygamous:
67a Leaves without stipules; latex absent; flowers in racemes or narrow panicles; fruit a drupe or capsule, sometimes bladdery or winged ..... **SAPINDACEAE**
67b Leaves with or without stipules; stipules sometimes spiny, especially in succulent species; milky to reddish latex often present; inflorescences basically cymose, sometimes flowers in cyathia (*Euphorbia*); fruit often a 3-lobed capsule dehiscing septicidally into 3 bivalved cocci, often leaving a ± persistent axis ..... **EUPHORBIACEAE**
66b Flowers bisexual:
68a Anthers 1-thecous; stamens numerous, filaments ± united into a tube around the style; sepals valvate, with or without an epicalyx; plants often with stellate hairs ..... **MALVACEAE**
68b Anthers 2-thecous:
69a Styles 2 or more, sometimes fused towards base:
70a Herbs or low subshrubs; fruit of 2 hemispherical mericarps, often with a rough surface..... **MOLLUGINACEAE**
70b Trees, shrubs or perennial scramblers; fruit a drupe or separating into 2 or 3 broadly winged mericarps:
71a Perennial scramblers, rarely shrubs with medifixed unicellular hairs; fruit separating into 2(3) broadly winged mericarps ..... **MALPIGHIACEAE**
71b Trees or shrubs, not scrambling, glabrous; fruit a drupe ..... **ERYTHROXYLACEAE**
69a Style 1:
72a Herbs or subshrubs; sepals and petals 4; stamens 6, tetradynamous (inner 4 long, outer 2 short); fruit an indehiscent, dehiscent or splitting capsule (silicula) ..... **BRASSICACEAE**

72b Trees, shrubs or rhizomatous subshrubs; sepals and petals usually 5; stamens mostly more than 6:
73a Petals and stamens perigynous, arising at mouth of calyx tube; ovary entire, fused on one side to calyx tube ..... **CHRYSOBALANACEAE**
73b Petals and stamens hypogynous; ovary deeply lobed, free from calyx ..... **OCHNACEAE**
65b Ovary with 2 or more ovules in each locule:
74a Stamens as many as or fewer than petals:
75a Ovary 5-locular:
76a Trees, monoecious; leaves usually paripinnate; ovules 6–12 per locule ..... **MELIACEAE**
76b Herbs or shrublets; ovules 2 per locule:
77a Petals imbricate; leaves lobed or divided; ovary and fruit beaked; herbs or shrublets..... **GERANIACEAE**
77b Petals contorted; leaves simple, entire; ovary and fruit without a stout central axis; herbs..... **LINACEAE**
75b Ovary 2–4-locular:
78a Petals 2-lobed or 2-fid; fruit a drupe; leaves entire ..... **DICHAPETALACEAE**
78b Petals not 2-lobed:
79a Flowers unisexual; styles 2 or 3, free or united at base, often lobed or branched..... **EUPHORBIACEAE**
79b Flowers bisexual; style 1 ..... **CELASTRACEAE**
74b Stamens more numerous than petals:
80a Leaves without stipules:
81a Filaments ± united into a tube ..... **MELIACEAE**
81b Filaments free:
82a Leaves dotted with translucent glands ..... **RUTACEAE**
82b Leaves without translucent glands:
83a Trees or shrubs, secreting resin ..... **BURSERACEAE**
83b Herbs with tubers or a woody rootstock ..... **OXALIDACEAE**
80b Leaves with stipules:
84a Sepals imbricate; plants without stellate hairs; ovary 5-locular with 2 ovules in each locule:
85a Petals imbricate; ovary beaked, with a 5-branched style; herbs or shrublets ..... **GERANIACEAE**
85b Petals contorted; ovary without a stout central axis, with 5 free styles; trees or shrubs, sometimes climbing ..... **LINACEAE**
84b Sepals (or calyx lobes) valvate; plants often with stellate hairs:
86a Filaments free or almost so; trees, shrubs or herbs ..... **TILIACEAE**
86b Filaments ± united into a tube or into groups of 2 or 3:
87a Anthers 2-thecous; trees or shrubs ..... **STERCULIACEAE**
87b Anthers 1-thecous; herbs, shrubs or sometimes trees..... **MALVACEAE**

GROUP 9 (*Placentation axile, basal or apical; ovary superior; petals ± united*)

1a Ovary 1-locular, sometimes septate towards base:
2a Flowers unisexual; plants dioecious; male flowers with united petals, female flowers with 1–4 free petals; stamens united into a synandrium; leaf blades peltate or subpeltate; woody climbers ..... **MENISPERMACEAE**
2b Flowers bisexual; stamens free or with united filaments:
3a Ovary with 1 ovule:
4a Flowers irregular, papilionaceous, lowermost 2 petals united and forming a keel; stamens 10, diadelphous: uppermost 1 free, other 9 with united filaments; herbs..... **FABACEAE**
4b Flowers regular; stamens not diadelphous:
5a Sepals 2; petals united only near base; ± succulent twining herbs or stout shrubs:
6a Leaves alternate; perennials with twining stems..... **BASELLACEAE**
6b Leaves opposite; succulent shrubs with stout, sometimes waxy branches..... **PORTULACACEAE**
5b Sepals more than 2:
7a Stamens inserted on elongated calyx tube, usually twice as many as calyx lobes; corolla ring-like, inserted at mouth of calyx tube; ovule pendulous from apex of ovary; shrubs, sometimes climbing ... **THYMELAEACEAE**
7b Stamens not inserted on calyx, as many as calyx lobes; corolla 4- or 5-lobed, not ring-like; ovule arising from base of ovary:
8a Leaves alternate; stamens opposite petals; calyx covered with stalked glands; herbs or shrubs, sometimes climbing..... **PLUMBAGINACEAE**
8b Leaves opposite; stamens alternating with petals; calyx without stalked glands; shrubs or trees..... **SALVADORACEAE**
3b Ovary with 2 or more ovules:
9a Stamens fewer than petals; flowers ± irregular; herbs, often aquatic:
10a Stamens 2; corolla strongly irregular, tube spurred; leaves undivided or much divided and often bearing insectivorous bladders ..... **LENTIBULARIACEAE**

10b Stamens 4; corolla only slightly irregular, tube not spurred; leaves undivided, without bladders..... **SCROPHULARIACEAE**

9b Stamens as many as petals; flowers regular or almost so:

11a Stamens opposite petals:

12a Trees, shrubs or lianes; fruit indehiscent, usually 1-seeded; leaves alternate..... **MYRSINACEAE**

12b Herbs; fruit a many-seeded circumscissile or 5-valved capsule, or sometimes 1-seeded and indehiscent; leaves opposite or alternate..... **PRIMULACEAE**

11b Stamens alternating with petals; trees or shrubs:

13a Leaves densely crowded or in whorls or pseudowhorls, ± ericoid to coarsely so..... **STILBACEAE**

13b Leaves opposite or alternate, flat or succulent:

14a Leaves opposite:

15a Shrubs or woody climbers with milky sap..... **APOCYNACEAE**

15b Trees or shrubs, sometimes mangroves, sometimes leaves with 5(7) major veins from near the base:

16a Leaves with 1 major vein from the base; mangroves..... **AVICENNIACEAE**

16b Leaves with 5(7) major veins from near the base; savanna trees..... **STRYCHNACEAE**

14b Leaves alternate; stamens 5 or 10 or more; ovules 2 or 10 or more:

17a Trees, shrubs or lianas; sepals (3)4 or 5; stamens 5; fruit a drupe..... **ICACINACEAE**

17b Subshrubs or perennial herbs, often with fleshy leaves: sepals 2; stamens 10 or more; fruit a chartaceous capsule..... **PORTULACACEAE**

1b Ovary 2- or more-locular:

18a Petals 10 or more:

19a Styles/stigmas 5; fruit a 5-valved capsule; herbs with fleshy leaves..... **MESEMBRYANTHEMACEAE**

19b Style 1; fruit a berry; trees or shrubs, sometimes climbing:

20a Petals in 2 or 3 series, imbricate; stamens twice as many as inner petals, or as many as and opposite inner petals and alternating with staminodes; ovary with 1 ovule in each locule; leaves alternate..... **SAPOTACEAE**

20b Petals in 1 whorl, imbricate; stamens 2; ovary with 4 or 5 ovules in each locule..... **OLEACEAE**

18b Petals fewer than 10:

21a Stamens more numerous than petals:

22a Leaves with stipules, often digitate or palmately lobed; flowers unisexual; trees, shrubs or herbs..... **EUPHORBIACEAE**

22b Leaves without stipules:

23a Flowers irregular, lowest (median) petal forming a keel; filaments united into a sheath split on upper side; ovary 2-locular with 1 ovule in each locule; herbs or shrubs..... **POLYGALACEAE**

23b Flowers regular; filaments not united into a sheath; trees or shrubs:

24a Ovary with 1 or 2 ovules in each locule; fruit indehiscent, baccate; flowers bisexual or unisexual.. **EBENACEAE**

24b Ovary with several or many ovules in each locule; fruit a loculicidal capsule; flowers bisexual; anthers opening by apical pores or by longitudinal slits; style unbranched; plants often heath-like..... **ERICACEAE**

21b Stamens as many as or fewer than petals:

25a Stamens fewer than petals: 2–4:

26a Ovary with more than 4 ovules in each locule; flowers mostly irregular:

27a Leaves pinnate, opposite or ternate; stamens 4; fruit a loculicidal capsule with winged seeds; trees or shrubs, sometimes climbing..... **BIGNONIACEAE**

27b Leaves simple, sometimes deeply divided or reduced to scales:

28a Ovary completely or incompletely 4-chambered, each of 2 original locules becoming divided into 2 by a false septum; stamens 4; herbs or sometimes shrubs, with mucilaginous glands..... **PEDALIACEAE**

28b Ovary 2-locular, locules not becoming divided by false septa:

29a Ovules arranged in more than 2 series on each placenta; stamens 4 or 2; fruit a capsule or sometimes a berry, seeds not borne on hardened hook-like funicles; leaves alternate or opposite or whorled, sometimes reduced to scales; herbs or shrubs or sometimes trees..... **SCROPHULARIACEAE**

29b Ovules arranged in 1 or 2 series on each placenta:

30a Fruit a club-shaped to ellipsoidal, loculicidally, often explosively dehiscent capsule, with seeds mostly borne on hard, hygroscopic, hook-like funicles; leaves opposite, mostly entire; herbs, shrubs or small trees..... **ACANTHACEAE**

30b Fruit indehiscent to tardily dehiscent, sometimes a drupe; seeds not borne on hardened hook-like funicles; leaves ± sinuate or lobed to unlobed:

31a Fruit a drupe; flowers regular, small, white, bell-shaped, solitary or in axillary clusters; leaves gland-dotted, entire or toothed; evergreen shrubs or trees..... ***MYOPORACEAE**

31b Fruit indehiscent or tardily dehiscent, armed with horns bearing recurved spines; flowers irregular, medium-sized, variously coloured, adaxially often gibbous, usually solitary, axillary; herbs rarely shrubs or small trees..... **PEDALIACEAE**

26b Ovary with 1–4 ovules in each locule:

32a Stamens 3; peduncles adnate to petioles of subtending leaves; trees or shrubs with alternate leaves..... **DICHAPETALACEAE**

32b Stamens 4 or 2; peduncles not adnate to leaves:

33a Perianth regular:

34a Stamens 2; leaves opposite or sometimes ternate or alternate; trees or shrubs, sometimes climbing..... **OLEACEAE**

34b Stamens 4; leaves alternate, simple, gland-dotted; evergreen shrubs or trees ..... ***MYOPORACEAE**

33b Perianth irregular:

35a Ovary ± deeply 4-lobed, style gynobasic; fruit separating into 4 nutlets (or fewer by abortion); leaves simple, opposite or whorled or sometimes alternate; herbs or shrubs, often aromatic ..... **LAMIACEAE**

35b Ovary not deeply 4-lobed, style not gynobasic:

36a Fruit a capsule, loculicidally dehiscent or sometimes failing to dehisce; seeds often borne on hardened, hook-like funicles; ovary 2-locular with 2–4 ovules in each locule; herbs or shrubs with opposite, simple leaves ..... **ACANTHACEAE**

36b Fruit separating into 2 or more pyrenes or cocci, or a capsule, but then seeds not borne on hardened hook-like funicles:

37a Flowers solitary, axillary; fruit indehiscent, armed with 2 or 4 spines, or longitudinally 4-winged; stamens 4; leaves opposite or subopposite, often toothed or pinnately lobed; herbs with mucilaginous glands ..... **PEDALIACEAE**

37b Flowers grouped in inflorescences; fruit without spines or wings:

38a Anthers 1-thecous; leaves mostly alternate, simple, narrow; ovary 2-locular with 1 apical, pendulous ovule in each locule; herbs or shrubs ..... **SCROPHULARIACEAE**

38b Anthers 2-thecous; sometimes confluent; leaves opposite or whorled:

39a Herbs, shrubs or trees; leaves simple or digitate; ovary 2–8-locular with 1 basal or axile ovule in each locule ..... **VERBENACEAE**

39b Ericoid shrubs or shrublets; leaves simple, whorled on older branches; ovary 1- or 2-locular; sometimes septum incomplete, 2-ovuled; ovules erect, anatropous ..... **STILBACEAE**

25b Stamens as many as petals: 4 or more:

40a Leaves absent or reduced to scales:

41a Slender, twining, parasitic plants; ovary with 2 ovules in each locule; fruit a capsule; corolla with or without infrastaminal scales (*Cuscuta*) ..... **CONVOLVULACEAE**

41b Shrubs or succulent plants, not parasitic; ovary with many ovules in each locule; fruit formed of 2 separate follicular carpels (or 1 by abortion); flowers with corona ..... **APOCYNACEAE**

40b Leaves present, well developed:

42a Stamens opposite petals, sometimes with staminodes; trees or shrubs with alternate leaves ..... **SAPOTACEAE**

42b Stamens alternating with petals, sometimes partly connate:

43a Leaves opposite or whorled, sometimes in opposite or subopposite fascicles on small cushions, not all radical:

44a Stamens hypogynous, not arising on corolla; anthers opening by apical slits; heath-like shrubs..... **ERICACEAE**

44b Stamens arising on corolla tube or variously joined with gynoecium:

45a Petals imbricate:

46a Ovary with 1 or 2 ovules in each locule; fruit drupaceous or separating into pyrenes or nutlets:

47a Petals and stamens 5; herbs, often with bulbous-based hairs ..... **BORAGINACEAE**

47b Petals and stamens 4; herbs, shrubs or trees ..... **VERBENACEAE**

46b Ovary with several to many ovules in each locule; fruit a septicidal capsule, sometimes a berry:

48a Petals and stamens 5 or more; leaves pinnately compound, or simple and then rigid spiny shrubs with solitary or paired flowers ..... **BIGNONIACEAE**

48b Petals and stamens 4; herbs, subshrubs, shrubs or trees, not spiny, and if shrubs, flowers not solitary or paired:

49a Herbs; flowers solitary or paired in leaf axils ..... **SCROPHULARIACEAE**

49b Trees, shrubs or subshrubs; flowers in cymes, racemes or panicles ..... **BUDDLEJACEAE**

45b Petals contorted or valvate:

50a Petals valvate; leaves usually with 3 major veins from base; fruit a berry, often large, globose and with a woody rind ..... **STRYCHNACEAE**

50b Petals contorted:

51a Herbs with septicidal capsules or rarely trees with berries ..... **GENTIANACEAE**

51b Herbs, often succulent, shrubs or trees, often with milky latex; flowers often with corona; fruit mostly a pair of follicular mericarps ..... **APOCYNACEAE**

43b Leaves (at least lower ones) alternate, sometimes all radical:

52a Leaves all radical; flowers small, in pedunculate spikes or heads; fruit a circumscissile capsule; herbs... **PLANTAGINACEAE**

52b Leaves not all radical:

53a Ovary with more than 2 ovules in each locule:

54a Petals contorted; fruit formed of 2 follicular mericarps; shrubs or trees ..... **APOCYNACEAE**

54b Petals not contorted; fruit a capsule or berry:

55a Styles 2 or 3; petals imbricate; fruit a capsule; herbs ..... **HYDROPHYLLACEAE**

55b Style 1:

56a Petals plicate or valvate; herbs, shrubs or trees ..... **SOLANACEAE**

56b Petals imbricate:

57a Fruit a capsule with winged seeds; leaves simple or 3-foliolate; spiny shrubs..... **BIGNONIACEAE**

57b Fruit a berry or capsule, seeds unwinged; leaves simple; herbs or spiny shrubs..... **SOLANACEAE**

53b Ovary with 1 or 2 ovules in each locule:

58a Filaments united into a sheath split on upper side; flowers irregular, lowest (median) corolla lobe forming a keel; fruit drupaceous; shrubs or trees ..... **POLYGALACEAE**

58b Filaments not united into a sheath:

59a Corolla tube split down front, with 4 lobes; anthers 1-thecous; ovary 2-locular with 1 apical, pendulous ovule in each locule; herbs or shrublets with spicate flowers ...**SCROPHULARIACEAE**

59b Corolla tube not split; anthers 2-thecous:

60a Style absent; stigma sessile; flowers unisexual; fruit a globose berry ..... **AQUIFOLIACEAE**

60b Style(s) present, terminal or gynobasic; flowers bisexual; fruit a schizocarp or drupaceous or a capsule, rarely indehiscent:

61a Fruit a schizocarp of 4 nutlets or drupaceous with 4, 1-seeded stones, rarely a 2-locular capsule with 1 seed per locule (*Wellstedia*); petals imbricate or contorted in bud..... **BORAGINACEAE**

61b Fruit a capsule or indehiscent; petals convolute, folded and valvate in bud; plants often twining or trailing ..... **CONVOLVULACEAE**

GROUP 10 (*Placentation axile, basal or apical; ovary inferior; petals absent*)

1a Parasitic plants: either low, ± fleshy, ± leafless and growing on roots of woody plants or shrublets growing on trees or shrubs:

2a Shrublets growing on other trees or shrubs ..... **VISCACEAE**

2b Low, ± fleshy, ± leafless root parasites:

3a Flowers unisexual, in many-flowered inflorescences; leaves scale-like; ovule 1 ..... **BALANOPHORACEAE**

3b Flowers usually bisexual, solitary, with a tubular 3- or 4(5)-lobed perianth resembling a fungus ..... **HYDNORACEAE**

1b Plants not parasitic:

4a Ovary 2- or more-locular:

5a Flowers unisexual; leaves with stipules:

6a Male flowers in catkins; female flowers solitary ..... ***FAGACEAE**

6b Flowers in heads, cymes or panicles:

7a Flowers in heads; stamens as many as sepals; ovary with 1 ovule in each locule; trees or shrubs with entire leaves ..... **HAMAMELIDACEAE**

7b Flowers in cymes or panicles; stamens many; ovary with very many ovules in each locule; sepals petaloid; herbs, sometimes epiphytic, with alternate, often unequal-sided leaves ..... **BEGONIACEAE**

5b Flowers bisexual; leaves without stipules:

8a Leaves opposite; flowers solitary and subsessile in axils of leaves; herbs ..... **ONAGRACEAE**

8b Leaves alternate:

9a Trees (mangroves); stamens and staminodes very many, the outer series of staminodes fused and resembling a corolla ..... **LECYTHIDACEAE**

9b Herbs or shrubs; stamens, if many, without fused staminodes:

10a Perianth fused into an S-shaped to ± straight tube; usually twining or scrambling herbs or shrubs; fruit a capsule ..... ***ARISTOLOCHIACEAE**

10b Perianth members free or fused only in the lower half; fruit a nut, often winged or spiny ..... **AIZOACEAE**

4b Ovary 1-locular:

11a Ovules 2 or more in the ovary:

12a Stamens twice as many as calyx lobes:

13a Trees, shrubs or scramblers; flowers in racemes, spikes or heads; fruit indehiscent, often with 2–5 longitudinal wings ..... **COMBRETACEAE**

13b Shrubs or shrublets; flowers usually in threes surrounded by an involucre, or in miniature cone-like aggregations; fruit fused to perianth base and fused with adjacent fruits to form a syncarp ..... **GRUBBIACEAE**

12b Stamens as many as calyx lobes:

14a Ovules 2–4, pendulous from a free-central placenta; style 1 with an entire or divided stigma; flowers solitary or in cymes or racemes, bisexual or unisexual; herbs or shrubs, often parasitic on roots and sometimes with reduced leaves ..... **SANTALACEAE**

14b Ovules 4, pendulous from apex of ovary; styles 4; flowers clustered in axils of leaves, unisexual or plants polygamous; herbs, not parasitic ..... **HALORAGACEAE**

11b Ovule 1 in the ovary:

15a Herbs with basal, long-petiolate, toothed, kidney-shaped leaves; flowers small, paniculate-spicate...**GUNNERACEAE**

15b Trees, shrubs or subshrubs:

16a Leaves opposite; perianth tube deeply urn-shaped; anthers opening by 2 valves ..... **LAURACEAE**

16b Leaves mostly alternate:

17a Flowers unisexual, small, enclosed in a syconium or 'fig', or implanted on a flat to top-shaped receptacle, in globose heads or catkins; often with milky or watery latex ..... **MORACEAE**

17b Flowers bisexual or unisexual, cymose in axils of upper leaves; latex absent; fruit a bony nut with long wings ..... **HERNANDIACEAE**

GROUP 11 (*Placentation axile, basal or apical; ovary inferior; petals free*)

1a Parasitic shrubs growing on other shrubs or trees; ovules scarcely distinguishable from surrounding tissue of ovary; calyx truncate or obsolete; stamens as many as and opposite petals and arising on them; leaves simple, entire, opposite or alternate, sometimes reduced to scales ..... **LORANTHACEAE**

1b Plants not parasitic; ovule or ovules clearly distinguishable within ovary:

2a Ovary 1-locular:

3a Trees or shrubs, sometimes climbing; style 1, unbranched:

4a Leaves alternate or scattered, ± ericoid; stamens 4 or 5:

5a Sepals, petals and stamens 4; flowers solitary, axillary ..... **CELASTRACEAE**

5b Sepals, petals and stamens 5; flowers in dense heads, panicles or spikes, rarely solitary ..... **BRUNIACEAE**

4b Leaves opposite, rarely alternate but then stamens more than 5, flat, sometimes with 3(5) main veins from base:

6a Leaves with 3(5) main veins from base; young branches usually 4-angled; fruit a ± globose berry; ovules 2–12 on central placenta ..... **MELASTOMATACEAE**

6b Leaves with 1 main vein from base; fruit usually indehiscent, dry or sometimes fleshy, often variously winged or ridged; ovules usually 2, pendulous ..... **COMBRETACEAE**

3b Herbs or subshrubs; styles or style branches 2–6:

7a Ovules many on basal placenta; sepals 2, often deciduous; fruit a circumscissile capsule ..... **PORTULACACEAE**

7b Ovule or ovules pendulous from apex of ovary or on pendulous, apical placentas; sepals or calyx lobes 2–5; fruit not circumscissile:

8a Ovules many on pendulous placentas; fruit a capsule dehiscing at apex; leaves opposite; flowers bisexual, in axillary pairs; petals and stamens 5 ..... **VAHLIACEAE**

8b Ovules 1–4, pendulous from apex of ovary; fruit indehiscent; leaves alternate or opposite, sometimes all radical; flowers bisexual or unisexual, paniculate-spicate or in axillary clusters:

9a Leaves small, sessile; flowers in axillary fascicles ..... **HALORAGACEAE**

9b Leaves large, on long petioles; flowers in terminal heads or compound spikes ..... **GUNNERACEAE**

2b Ovary 2- or more-locular:

10a Ovule 1 in each locule, rarely 2 in Loasaceae:

11a Stamens many; scabrous shrubs or shrublets with barbed bristles; fruit woody, ribbed, crowned with persistent calyx ..... **LOASACEAE**

11b Stamens as many or twice as many as petals:

12a Stamens twice as many as petals:

13a Trees or shrubs, mostly mangroves ..... **RHIZOPHORACEAE**

13b Herbs or subshrubs:

14a Petals 5; stamens 10; ovary 5–10-locular; in dry habitats ..... **NEURADACEAE**

14b Petals 2–4; stamens 4–8; ovary 1–4-locular:

15a Flowers small to minute, usually unisexual; aquatics or marsh plants ..... **HALORAGACEAE**

15b Flowers conspicuous with 4 white, usually sharply clawed petals ..... **ONAGRACEAE**

12b Stamens as many as petals:

16a Stamens opposite petals; shrubs, often climbing with tendrils; fruit often separating into cocci, sometimes winged ..... **RHAMNACEAE**

16b Stamens alternating with petals; plants without tendrils:

17a Flowers solitary in axils of leaves; floating, aquatic herbs; leaves alternate, rosulate, with ± inflated petiole; fruit large, indehiscent, with hard endocarp and armed with 2 or 4 horns ..... **TRAPACEAE**

17b Flowers grouped in inflorescences; plants not aquatic:

18a Fruit separating into 2 cocci; herbs, sometimes arborescent; flowers in simple or compound umbels, sometimes capitate; leaves often much divided or compound ..... **APIACEAE**

18b Fruit drupaceous or capsular, not separating into cocci; trees or shrubs:

19a Leaves pinnate or digitate or palmately divided; flowers in umbels or racemes or spikes; fruit drupaceous ..... **ARALIACEAE**

19b Leaves simple, undivided:

20a Petals and stamens 4; fruit a drupe; leaves opposite, entire or toothed; flowers bisexual or unisexual, in panicles or umbel-like cymes ..... **CORNACEAE**

20b Petals and stamens 5; fruit a capsule:

21a Leaves small, often ericoid, rarely longer than 20 mm, sessile to shortly petiolate; shrubs or shrublets ..... **BRUNIACEAE**

21b Leaves mostly longer than 25 mm, petiolate; trees or shrubs ..... **HAMAMELIDACEAE**

10b Ovules 2 or more in each locule:

22a Leaves usually small, often ericoid, densely spirally imbricate ..... **BRUNIACEAE**

22b Leaves alternate or opposite:

23a Leaves alternate:

24a Leaves with stipules, often unequal-sided; flowers unisexual; plants monoecious; stamens many; ovules very many in each locule; herbs, sometimes epiphytic ..... **BEGONIACEAE**

24b Leaves without stipules:

25a Style absent; stigmas as many as locules, subulate to filiform; leaves ± succulent ..... **MESEMBRYANTHEMACEAE**

25b Styles 1 or 2:

26a Styles 2; flowers unisexual or both bisexual and unisexual on same plant, in axillary panicles; stamens as many as petals; ovary 2-locular; shrubs ..... **ESCALLONIACEAE**
26b Style 1, with an entire or lobed stigma; flowers bisexual or sometimes both bisexual and unisexual on same plant:
27a Fruit a drupe; petals 2-fid or 2-lobed; leaves entire ..... **DICHAPETALACEAE**
27b Fruit a capsule:
28a Stamens as many or twice as many as petals:
29a Herbs or shrubs, sometimes aquatic; flowers bisexual ..... **ONAGRACEAE**
29b Shrub or shrublets, dioecious; flowers small, male corymbose, female solitary ..... **MONTINIACEAE**
28b Stamens many, more than twice as many as petals; fruit a berry or drupe:
30a Flowers solitary or paired in axils of leaves; ovary 2-locular; leaves gland-dotted; shrublets..... **MYRTACEAE**
30b Flowers in terminal racemes; ovary 4-locular; leaves not gland-dotted; mangroves..... **LECYTHIDACEAE**
23b Leaves opposite:
31a Leaves fleshy and succulent ..... **MESEMBRYANTHEMACEAE**
31b Leaves not succulent:
32a Stamens as many as petals; petals alternating with incurved scales; trees or shrubs ..... **OLINIACEAE**
32b Stamens twice as many as petals or more numerous; petals not alternating with scales:
33a Stamens many, more than twice as many as petals; trees or shrubs with gland-dotted leaves; stipules absent or very small ..... **MYRTACEAE**
33b Stamens twice as many as petals, if more, then interpetiolar stipules present or a scar line if they have fallen:
34a Leaves with interpetiolar stipules; ovules 2 in each locule; viviparous, mangroves, or forest trees or shrubs ..... **RHIZOPHORACEAE**
34b Leaves without stipules or stipules much reduced; ovules many in each locule; plants not viviparous:
35a Anthers opening by an apical pore; connective often appendaged below anther; leaves with 3 or more parallel, longitudinal nerves; seeds without tuft of hairs; herbs or shrubs or small trees..... **MELASTOMATACEAE**
35b Anthers opening by longitudinal slits; connective unappendaged; leaves without parallel, longitudinal nerves; seeds often with an apical tuft of hairs; herbs ..... **ONAGRACEAE**

GROUP 12 (*Placentation axile, basal or apical; ovary inferior; petals ± united*)

1a Parasitic shrubs growing on other shrubs or trees; ovules scarcely distinguishable from surrounding tissue of ovary; calyx truncate or shortly lobed; stamens as many as and opposite corolla lobes and arising on them; leaves simple, entire, opposite or alternate, sometimes ternate ..... **LORANTHACEAE**
1b Plants not parasitic; ovule or ovules clearly distinguishable within ovary:
2a Ovary 1-locular:
3a Ovules pendulous; ericoid shrubs or shrublets ..... **BRUNIACEAE**
3b Ovules not pendulous:
4a Ovule 1; flowers regular or irregular, in involucrate heads; fruit indehiscent, often crowned by persistent calyx forming a pappus of bristles or scales:
5a Anthers united into tube surrounding style; ovule erect from base of ovary; herbs, shrubs or trees; corolla of outer (ray) flowers often differing from that of inner flowers ..... **ASTERACEAE**
5b Anthers free; ovule pendulous from apex of ovary; herbs with opposite leaves ..... **DIPSACACEAE**
4b Ovules many on basal placenta; flowers regular, not in involucrate heads:
6a Calyx composed of 2 often deciduous sepals; fruit a circumscissile capsule; stamens as many as and alternating with corolla lobes or more numerous; herbs ..... **PORTULACACEAE**
6b Calyx 4- or 5-lobed; fruit not circumscissile; stamens as many as and opposite corolla lobes:
7a Trees or shrubs; flowers in axillary panicles or racemes; fruit indehiscent, dry or fleshy ..... **MYRSINACEAE**
7b Herbs; flowers in terminal racemes; fruit a 5-valved capsule ..... **PRIMULACEAE**
2b Ovary 2- or more-locular (sometimes 3-locular with 1 fertile locule and 2 empty locules):
8a Petals united into a deciduous mass (calyptra); stamens very many; trees or shrubs with gland-dotted leaves..... **MYRTACEAE**
8b Petals more or less united into a tube, not into a deciduous mass; stamens not more than twice as many as corolla lobes:
9a Ovary 3-locular with 2 empty locules, fertile locule with 1 apical, pendulous ovule; stamens 3; fruit indehiscent, often crowned by persistent calyx forming feathery pappus; herbs with opposite leaves ..... **VALERIANACEAE**
9b Ovary 2- or more-locular, usually without empty locules:
10a Trailing or climbing herbs or shrubs often with tendrils; flowers unisexual; stamens 3–5, anthers sometimes curved or flexuous or folded; leaves often palmately or pedately lobed or deeply divided ..... **CUCURBITACEAE**
10b Plants without tendrils; flowers bisexual or sometimes unisexual:
11a Leaves opposite or whorled, with interpetiolar or intrapetiolar (sometimes leaf-like) stipules and entire margin; trees, shrubs or herbs, sometimes climbing ..... **RUBIACEAE**
11b Leaves alternate or opposite, or spirally imbricate, without stipules, sometimes reduced to scales:
12a Stamens indefinite; leaves fleshy ..... **MESEMBRYANTHEMACEAE**
12b Stamens definite; leaves rarely succulent:

13a Stamens twice as many as corolla lobes; anthers opening by apical pores; flowers in axillary racemes; trees or shrubs with alternate leaves ..... **ERICACEAE**
13b Stamens as many as corolla lobes; anthers opening by longitudinal slits:
14a Fruit a drupe:
15a Ovary with 1 ovule in each locule; flowers irregular, corolla tube split down back; maritime shrubs or undershrubs ..... **GOODENIACEAE**
15b Ovary with 2 or more ovules in each locule; flowers ± regular; petals bifid or bilobed..... **DICHAPETALACEAE**
14b Fruit a capsule:
16a Ovules (1)2(–10) in each locule, pendulous; ericoid shrublets or shrubs ..... **BRUNIACEAE**
16b Ovules many in each locule:
17a Corolla lobes imbricate; capsule circumscissile; flowers regular, in terminal spikes; anthers free; hydrophytes ..... **SPHENOCLEACEAE**
17b Corolla lobes valvate; capsule dehiscing by valves:
18a Flowers regular; anthers free ..... **CAMPANULACEAE**
18b Flowers irregular, 1- or 2-lipped; anthers cohering in a tube around the style, very rarely free ..... **LOBELIACEAE**

KEY TO MONOCOTYLEDONS (pp. 566–740)

1a Flowers white or otherwise brightly coloured; perianth wholly or partly petal-like:
2a Ovary superior ..... **Group 1** (below)
2b Ovary inferior or half-inferior ..... **Group 2** (p. 26)
1b Flowers with perianth absent or papery, glumaceous to hyaline or sometimes herbaceous, or reduced to hairs or scales:
3a Aquatic herbs, free-floating or submerged ..... **Group 3** (p. 27)
3b Land plants, sometimes rooting in water:
4a Flowers (florets) arranged in small spikes (spikelets) subtended or enclosed by bracts; grasses or grass-like plants..... **Group 4** (p. 27)
4b Flowers not arranged in spikelets ..... **Group 5** (p. 27)

GROUP 1 (*Flowers white or otherwise brightly coloured; perianth wholly or partly petal-like; ovary superior*)

1a Aquatic or marsh herbs:
2a Perianth of 6 petal-like tepals in 2 whorls, blue, white or yellow; gynoecium with an ovary of 3 fused carpels..... **PONTEDERIACEAE**
2b Perianth of 3 coloured sepals or tepals, often accompanied by 3 herbaceous sepals; gynoecium composed of 2–many ± free carpels:
3a Flowers in a simple or 2-branched spike; perianth in a single whorl of 1–3 white to pink tepals.. **APONOGETONACEAE**
3b Flowers whorled or in simple or compound umbels; plants often with white sap:
4a Carpels each with 1 basal ovule; fruit of 3–many achenes ..... **ALISMATACEAE**
4b Carpels each with many ovules on a parietal/marginal placenta; fruit a head of follicles ..... **LIMNOCHARITACEAE**
1b Land plants, sometimes rooting in water:
5a Perianth composed of separate calyx and corolla, the calyx usually herbaceous:
6a Style simple; ovary 2- or 3-locular; flowers in open to congested cymes, with conspicuous corolla often blue or yellow, often subtended by folded or boat-shaped bracts ..... **COMMELINACEAE**
6b Style branched; ovary 1–3-locular; flowers small, crowded in bracteate heads or spikes on long, leafless peduncles:
7a Flowers unisexual; corolla inconspicuous to minute; ovary 3- or 2-locular ..... **ERIOCAULACEAE**
7b Flowers bisexual; petals mostly yellow to white; ovary 1-locular ..... **XYRIDACEAE**
5b Perianth composed of similar or subsimilar tepals, all petal-like:
8a Stamens 3; rootstock often bright orange-red ..... **HAEMODORACEAE**
8b Stamens 6; sometimes outer whorl without anthers:
9a Anthers dehiscing by an apical pore, often unequal; filaments short, inserted at mouth of perianth tube; rootstock a corm..... **TECOPHILAEACEAE**
9b Anthers dehiscing by longitudinal slits (these rarely very short but then plants leafless); rootstock a rhizome, bulb or tuber:
10a Fruit a fleshy berry or drupe:
11a Leaves with 2 basal tendrils; flowers unisexual; plants dioecious ..... **SMILACACEAE**
11b Leaves without basal tendrils; flowers bisexual:
12a Leaf tips narrowing into a coiled tendril ..... **FLAGELLARIACEAE**
12b Leaf tips not as above:
13a Flowers crowded in dense racemes or panicles, longer than 20 mm, tubular below, with exserted stamens; leaves large, tough and crowded; plants rhizomatous or tree-like..... (Convallariaceae in part) **DRACAENACEAE**
13b Flowers few in axillary racemes or cymes, shorter than 10 mm; plants shrubby or scandent:
14a Leaves reduced to scales with a spiny or soft spur; cladodes needle-shaped or leaf-like and without distinct cross-connections between parallel veins ..... **ASPARAGACEAE**

14b Leaves with many prominent parallel veins with distinct cross-connections.....(Behniaceae) **LUZURIAGACEAE**

10b Fruit a capsule:

15a Flowers in umbels subtended by 2 spathaceous bracts and borne on naked peduncles:

16a Flowers perfectly regular with stamens spreading, or anthers sessile; capsule ovoid; plants usually smelling of onion or garlic; rootstock a bulb or rhizome..... **ALLIACEAE**

16b Flowers slightly irregular with stamens declinate and recurved at tips; capsule 3-angled or -winged; plants not smelling of onion or garlic; rootstock a rhizome..... **AGAPANTHACEAE**

15b Flowers in spikes or racemes:

17a Rootstock a bulb:

18a Flowers borne on leafy stems; bulb with loose scales..... ***LILIACEAE** (in narrow sense)

18b Flowers borne on naked peduncles; bulb rarely with loose scales..... **HYACINTHACEAE**

17b Rootstock a rhizome, corm or tuber:

19a Seeds woolly; flowering stems leafless except for a clasping basal leafy bract; leaves petiolate, often absent at flowering; rootstock a tuber.....(Convallariaceae in part) **ERIOSPERMACEAE**

19b Seeds glabrous; flowering stems leafy:

20a Rootstock a corm, rarely a tuber; seeds brown; flowers usually opposite the bracts ..... **COLCHICACEAE**

20b Rootstock a rhizome, sometimes short and with swollen roots; seeds black; flowers in axils of bracts:

21a Flowers borne singly in axils of bracts ..... **ASPHODELACEAE**

21b Flowers more than 1 in axils of bracts .....(including Hemerocallidaceae in part) **ANTHERICACEAE**

GROUP 2 (*Flowers white or otherwise brightly coloured; perianth wholly or partly petal-like; ovary inferior or half-inferior*)

1a Submerged aquatics rooting from a rhizome; flowers mostly unisexual, submerged or floating ..... **HYDROCHARITACEAE**

1b Terrestrial plants or emergent aquatics, but then rootstock cormous and stamens 6:

2a Fertile stamens 5(6) or 1, but then supported by and not fused to the style; leaves pseudopetiolate with a broad base, midrib prominent and secondary veins pinnate-parallel:

3a Fertile stamen 1:

4a Outer tepals united into a tube; anther 2-thecous; filament thread-like ..... **ZINGIBERACEAE**

4b Outer tepals free; anther 1-thecous; stamen partly petal-like..... ***CANNACEAE**

3b Fertile stamens 5(6):

5a Flowers unisexual, upper 5 tepals fused below; leaves spirally inserted; stems not woody, drying after fruiting, sometimes suckering; fruit a banana with seeds embedded in pith..... **MUSACEAE**

5b Flowers bisexual, lateral inner tepals fused and enclosing style and stamens; leaves distichous; stems and rootstock perennial; seeds pea-like with a tuft of hairs ..... **STRELITZIACEAE**

2b Fertile stamens 3(4)6 or 1, but then fused to the style into a complex columnar structure; leaf venation never pinnate-parallel:

6a Stamen 1, united with style into a column (gynostemium); pollen agglutinated into masses (pollinia); upper or lower median tepal often elaborated and spurred ..... **ORCHIDACEAE**

6b Stamens 3(4) or 6; pollen not agglutinated into masses:

7a Flowers unisexual, in spikes or racemes; climbers with ± heart-shaped leaves..... **DIOSCOREACEAE**

7b Flowers bisexual:

8a Stamens 3, opposite outer tepals; leaves mostly unifacial; rootstock a corm or rhizome ..... **IRIDACEAE**

8b Stamens 6 or 3, but then opposite inner tepals:

9a Inflorescence apparently an umbel (sometimes 1-flowered), subtended by 1 or more spathaceous bracts and borne on a naked scape; rootstock a bulb or rhizome ..... **AMARYLLIDACEAE**

9b Inflorescence a corymb, raceme, panicle, cyme or 1-flowered, not subtended by spathaceous bracts; rootstock a corm or rhizome (rarely reduced):

10a Small saprophytic herbs with a few narrow basal leaves or leaves scale-like..... **BURMANNIACEAE**

10b Photosynthetic plants with well-developed leaves:

11a Robust, rosulate plants with tree-like inflorescences and large, spine-tipped, leathery or succulent leaves persisting for several years..... ***AGAVACEAE**

11b Smaller plants, often coarsely hairy; leaves never spine-tipped:

12a Flowers many, in helicoid cymes borne on bracteate stalks; ovules 1 or 2 per locule:

13a Stamens 3; pubescence of simple hairs; rhizome often bright red ..... **HAEMODORACEAE**

13b Stamens 6; pubescence of plumose hairs..... **LANARIACEAE**

12a Flowers mostly solitary or few borne on leafless scapes or pedicels; ovules many per locule:

14a Shrublets or short-stemmed perennials; leaves fibrous, abscising below, persistent bases stiffly fibrous and closely imbricate; flowers solitary, purple to mauve or white, with septal nectaries; seeds white to yellowish ..... **VELLOZIACEAE**

14b Acaulescent perennials; leaves softer, decaying irregularly, bases loosely fibrous and not regularly imbricate; flowers 1 to many, yellow, white pink to red, without nectaries; seeds black..... **HYPOXIDACEAE**

GROUP 3 (*Aquatic herbs, free-floating or submerged (flowers sometimes emergent); perianth absent or cupular or scale-like to well developed*)

1a Plants floating freely on the surface, though sometimes attached to the substrate in very shallow water:
2a Small, ± disc-shaped to globular annuals not differentiated into stems and leaves; flowers borne in pouches or sheaths... (Araceae in part) **LEMNACEAE**
2b Rosette-forming, stoloniferous herbs with oblong, hairy leaves; flowers borne on a small spadix surrounded by a tubular spathe **ARACEAE**
1b Plants rooted or freely suspended with leaves submerged or floating:
3a Gynoecium composed of 2 or more free carpels with separate styles and stigmas:
4a Perianth absent or cupular; stamens 1 or 2:
5a Flowers bisexual, in spikes above water at anthesis, spikes consisting of 2 naked flowers facing in opposite directions and borne at different heights; carpels 4–8, becoming stipitate in fruit and appearing umbellate; stamens 2, free **RUPPIACEAE**
5b Flowers unisexual, submerged, axillary, cymose or solitary; carpels 1–9, stipitate; stamens 1 or 2, united:
6a Marine plants, dioecious; pollen filamentose **CYMODOCEACEAE**
6b Brackish or freshwater plants, monoecious; pollen globose **ZANNICHELLIACEAE**
4b Perianth present, composed of 1–4 free tepals; stamens 3–many:
7a Leaves borne on elongated stems; tepals usually 4; inflorescence a simple spike not enclosed in a spathe when young **POTAMOGETONACEAE**:
7b Leaves all basal; tepals 1–3; inflorescence a 2-branched or simple spike at first enclosed in a spathe:
8a Flowers in a 2-branched or simple spike on an elongated axillary peduncle at first enclosed in a spathe; flowers without bracts **APONOGETONACEAE**
8b Flowers whorled or in simple or compound umbels; plants often with white sap:
9a Carpels each with 1 basal ovule; fruit of 3–many achenes **ALISMATACEAE**
9b Carpels each with many ovules on a parietal placenta; fruit a head of follicles **LIMNOCHARITACEAE**
3b Gynoecium composed of 1 carpel or of 2 or more united carpels with free or united styles:
10a Perianth present; ovary inferior, 1-locular with many ovules on parietal placentas; flowers mostly unisexual, submerged in marine species, exserted during anthesis in others; male flowers sometimes becoming detached and free-floating **HYDROCHARITACEAE**
10b Perianth absent; ovary superior, with a solitary ovule:
11a Leaves opposite or verticillate, often toothed; flowers solitary or few together in leaf axils; freshwater plants **NAJADACEAE**
11b Leaves alternate; inflorescence a spike of alternating male and female flowers enclosed in a spathe; marine plants **ZOSTERACEAE**

GROUP 4 (*Flowers (florets) arranged in small spikes (spikelets) subtended or enclosed by bracts; grasses and grass-like plants*)

1a Leaves reduced to sheaths with free margins; plants dioecious; florets with a perianth of 6 tepals in 2 whorls **RESTIONACEAE**
1b Leaves usually with a well-developed blade and a sheathing base; plants very rarely dioecious; florets mostly with 2–6 scale-like bracts or bristles:
2a Leaves 2-ranked; leaf sheaths usually with free, overlapping margins; stems terete or compressed, usually with hollow internodes; style branches and stigmas usually 2, feathery; anthers deeply sagittate and therefore appearing dorsifixed **POACEAE**
2b Leaves often 3-ranked, mostly crowded in a basal tuft; leaf sheaths usually closed; stems often 3-angled, with solid internodes; style branches and stigmas 2 or 3, not feathery; anthers basifixed **CYPERACEAE**

GROUP 5 (*Land plants, sometimes rooting in water; perianth glumaceous to hyaline, or sometimes herbaceous, or reduced to bristles or scales*)

1a Leaves pinnately or palmately compound; palms **ARECACEAE**
1b Leaves simple:
2a Inflorescence a very dense cylindrical spike with female florets below and male ones above; perianth segments reduced to bristles **TYPHACEAE**
2b Inflorescence various, not as above:
3a Inflorescence a dense fleshy spike (spadix) subtended by a conspicuous or long, leaf-like spathe:
4a Leaves arranged in 2 vertical rows, not differentiated into petiole and blade; spathe leaf-like, much longer than spadix ***ACORACEAE**
4b Leaves alternate, differentiated into petiole and blade; spathe conspicuous, of various colours **ARACEAE**
3b Inflorescence various, not a spadix:
5a Perianth segments herbaceous; fruit separating into 3 cocci; leaves radical **JUNCAGINACEAE**
5b Perianth segments dry and glumaceous to hyaline; leaves basal, cauline or reduced to sheaths; plants often rush-like:
6a Tufted herbs with radical leaves and small to minute flowers crowded in terminal, compact, head-like inflorescences borne on naked peduncles:
7a Flowers unisexual; ovary 3- or 2-locular **ERIOCAULACEAE**

7b Flowers bisexual; ovary 1-locular ..... **XYRIDACEAE**

6b Combination of characters not as above:

8a Leaves reduced to sheaths; flowers unisexual, sexes on separate plants; ovary 1- or 3-locular with 1 ovule per locule ..... **RESTIONACEAE**

8b Leaves with blades; flowers bisexual; ovary 1–3-locular with 3 or more ovules per locule:

9a Plants caulescent, up to 2 m or higher, with apical leaf rosette; leaves serrate; ovules few; stigmas sessile or subsessile ..... (Juncaceae in part) **PRIONIACEAE**

9b Plants rhizomatous, with basal, entire leaves; ovules many; style short or long ..... **JUNCACEAE**

GYMNOSPERMS

Cupressaceae

(Pinopsida)

Compiled by H.F. Glen

Monoecious or occasionally dioecious, evergreen trees or shrubs; wood containing resin. **Leaves** usually of two types, in juvenile form often needle-like, spirally or subspirally arranged and spreading, in adult form usually small, scale-like, whorled or decussate, ± appressed and completely hiding the stem. **Male cones** catkin-like, small, mostly terminal and solitary; scales few to many, decussate or in whorls of 3, bearing at base on abaxial surface 2–10 pollen sacs; pollen grains without wings or air-bladders. **Female cones** with enlarged leathery or woody, valvate or imbricate and finally gaping scales, rarely fleshy and berry-like (**Juniperus*); scales few to many, all or most fertile, bearing 1–20 erect ovules at base on adaxial surface. **Seeds** free, rarely united in a stone, mostly winged; testa crustaceous to woody. **Cotyledons** 2, rarely 3–6.

Genera ± 16, species ± 115, cosmopolitan; sthn Afr.: 3 genera (2 exotic), 5 species (2 exotic).

Stapf: 14 (1933); Marsh: 43 (1966), the basis of this account; Page: 302 (1990); Von Breitenbach & Von Breitenbach: 179 (1992).

Key to genera

1a Female cones fleshy ..... ***Juniperus**

1b Female cones dry and woody:

2a Female cones ovoid to oblong, with 4 (rarely 6) ± oblong scales ..... **Widdringtonia**

2b Female cones subspherical to globose, usually with 8 peltate scales ..... ***Cupressus**

*Cupressus L. 0043000

Linnaeus: 1002 (1753); Linnaeus: 435 (1754); Eckenwalder: 405 (1993).

Trees or large shrubs; branchlets terete or quadrangular, in decussate arrays. **Leaves** opposite, in 4 ranks; adult leaves appressed to divergent, scale-like, rhomboid, free portion of long-shoot leaves up to 4 mm long; abaxial gland present or absent. **Male cones** with 4–10 pairs of sporophylls, each sporophyll with 3–10 pollen sacs. **Female cones** maturing in 1–2 years, generally persisting closed for many years, or until opened by fire, globose or oblong, 10–40 mm in diameter; scales in 3–6 pairs, valvate, peltate, thick and woody, persistent. **Seeds** 5–20 per scale, lenticular or faceted, narrowly 2-winged; cotyledons 2–5. $x = 11$.

Species ± 13, warm north temperate regions; 1 species: **Cupressus arizonica* Greene, naturalised in Free State and Eastern Cape.

*Juniperus L. 0045000

Linnaeus: 1003 (1753); Linnaeus: 461 (1754); Welch: 84 (1986); Adams: 412 (1993).

Sabina Mill. (1754).

Monoecious or dioecious shrubs or trees with thin, shredding bark; branchlets terete, 3–6-angled, variously oriented but not in flattened sprays. **Leaves**: juvenile leaves needle-like, usually in whorls of 3, spreading, acute to mucronate, with 1 or 2 pale bands on upper surface; adult leaves opposite, in 4 ranks, closely appressed to divergent, scale-like to subulate, free portion up to ± 10 mm long; abaxial gland visible or not, usually elongate, sometimes exuding white crystalline deposit. **Male cones** with 3–7 pairs or trios of sporophylls, each sporophyll with 2–8 pollen sacs. **Female cones** maturing in 1 or 2 years, globose to ovoid, fleshy, 3–20 mm in diameter, remaining closed, usually glaucous; scales persistent, in 1–3 pairs, peltate, tightly coalesced, usually thick and fleshy. **Seeds** 1–3 per scale, round to faceted, wingless; cotyledons 2–6. $x = 11$.

Species ± 60, temperate to subtropical northern hemisphere; 1 species: **Juniperus virginiana* L., recorded as naturalised in sthn Afr. (Free State).

Widdringtonia Endl. 0038010

Endlicher: 25 (1842); Stapf: 15 (1933); Marsh: 43 (1966); Page: 309 (1990); Von Breitenbach & Von Breitenbach: 181 (1992).

Monoecious trees or shrubs; wood fragrant, easily worked, containing oil and resin. **Leaves**: juvenile leaves needle-like and subspirally arranged; adult leaves scale-like and appressed, decussate or alternate but not in whorls of 3 or 4. **Male cones** small, ± 4 mm long, solitary, terminal, mostly on short lateral branchlets; scales in (5)6(7) pairs, decussate, coriaceous, peltate, normally with 4 pollen sacs at base of each scale. **Female cones** small, axillary, on elongated shoots, single or clustered; scales 4(5 or 6) of equal size and arranged in one whorl, corky-coriaceous, apiculate, divaricate at time of pollination, then closing; ovules several at base of each scale; mature cones woody, 13–25 mm in diameter, opening at apex, with 4 very thick, woody valves, often with a prominent dorsal cusp; exterior of valves smooth to warty. **Seeds** ovoid or trigonous, winged; testa crustaceous; cotyledons 2, rarely 3, green, needle-like.

Species 3, tropical and sthn Afr.; Northern Province, Mpumalanga, KwaZulu-Natal, Western and Eastern Cape, with 1 extending into tropical Africa.

*Pinaceae

(Pinopsida)

Compiled by H.F. Glen

Highly resinous, monoecious shrubs or trees. **Leaves** deciduous or evergreen, usually with resin canals, acicular, linear or oblong, solitary and spirally arranged on all shoots, and later densely grouped on short, lateral, spur shoots, soft, stiff, flexible, rigid or asperous in texture. **Shoots** glabrous, pubescent or hairy, usually with distinctive, rhythmic annual growth increments, and scaly, terminal, often resinous buds in resting season. **Cones**: male and female usually on same tree, female often appearing later, or borne mostly on higher branches. **Male cones** catkin-like, solitary or grouped, axillary, each cylindric with many, spirally arranged microsporophylls with two pollen sacs on lower surface of each; pollen grains with 2 air-bladders. **Female cones** solitary, in irregular groups or whorled, erect, suberect or pendent, sessile or shortly stalked, rounded or elongate, frequently large, each with many spirally arranged scales and ± conspicuous bracts; scales each with two ovules on upper (adaxial) surface, leathery or fleshy at first, becoming stiff, woody, flexible, papery or leathery with age, and sometimes highly resinous, maturing in 1–3 seasons and eventually dismembering on tree, or scales opening on tree to release seed. **Seeds** winged or unwinged, 2 to each scale; cotyledons of variable number, sometimes many. $x = 12$.

Genera ± 12, species ± 200, almost exclusively northern hemisphere; 1 genus naturalised in sthn Afr.

Jessop: 42 (1966); Page: 319 (1990); Farjon: 1(1990).

*Pinus L. 0022000

Linnaeus: 1000 (1753); Jessop: 42 (1966); Farjon: 13 (1984), no genus description as such, page reference is to reproductive morphology; Page: 329 (1990); Perry: 25 (1991).

Description as for family.

Species ± 80, northern hemisphere, many species cultivated, several occur as escapes in sthn Afr. and 8 have become naturalised, mainly in the moister parts of the region.

Podocarpaceae

(Pinopsida)

Compiled by H.F. Glen

Trees or shrubs, dioecious, evergreen. **Leaves** spirally arranged, subopposite or whorled, rarely opposite, linear to narrowly ovate or scale-like, long-persistent. **Male cones** usually consisting of many fertile scales, each bearing 2 pollen sacs, axillary, rarely terminal, sessile to shortly stalked, catkin-like, solitary or in groups of 2–5; pollen grains usually with 2 air-bladders or wings. **Female cones** axillary, on thin naked stalks or on short leafy or scaly branches, usually reduced to 1 or 2 fertile, terminal scales and a few sterile, lower scales fused with each other and with cone axis; fused cone axis and scales beneath seeds either remain woody or become swollen and often fleshy at maturity (receptacle). **Ovule** solitary, adnate to face of fertile scale, inverted and enclosed in a false aril (epimatium) arising from face of scale and adnate to single integument. **Seeds** ellipsoid to globose; testa and false aril form a coriaceous or externally fleshy and internally ± woody shell; embryo axile; cotyledons 2. $x = 13$.

Genera 17, species ± 125, in tropics at high altitudes, subtropics and temperate zones, mainly of southern hemisphere, including Africa, Asia, Australasia and South America; 1 genus in sthn Afr.

Stapf: 3 (1933); Phillips: 50 (1951) as Taxaceae; Leistner: 34 (1966); Page: 332 (1990); Von Breitenbach & Von Breitenbach: 131 (1992).

Podocarpus L'Hér. ex Pers. 0013000

Persoon: 580 (1807) name conserved; Stapf: 3 (1933); Leistner: 34 (1966); Page: 340 (1990); Von Breitenbach & Von Breitenbach: 133 (1992).

Description as for family.

Species nearly 100, mainly in montane forest of tropics and subtropics and at lower altitudes in temperate regions mainly in southern hemisphere; 4 in sthn Afr. (Northern Province, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Western and Eastern Cape).

De Laubenfels (1985) gives a description of infrageneric taxa, but no genus descriptions. Page (1990) places one sthn Afr. species: *Podocarpus falcatus* (Thunb.) R.Br. ex Mirb., in his genus *Afrocarpus*. See Leistner *et al.* (1995) for reasons why only one genus is recognised in this work.

Stangeriaceae

(Cycadopsida)

Compiled by H.F. Glen

Plants dioecious, with thick roots merging into simple or branched subterranean stems. **Stem** tuberous, with leaf or leaves from apex of each stem or branch, alternating with series of small scale-like bracts. **Leaves** pinnate, 1–4 from each stem, somewhat fern-like, petiolate, deciduous; leaflets in several to many opposite or subopposite pairs, with a conspicuous midrib and dichotomously forked lateral veins. **Cones** with scales (sporophylls) arranged spirally, tightly imbricate upwards. **Male scales** with pollen cells stipitate on lower surface towards base; pollen ellipsoidal, without wings or air-bladders. **Female scales** stalked, with 2 ovules, 1 on either side and above pedicel and with micropyle directed towards cone axis; scale head, or bulla shield-like, with incurved lateral lobes. **Seeds** with fleshy outer layer tightly adhering to hard inner shell encasing copious endosperm; cotyledons 2. $x = 6$.

A monotypic family confined to South Africa.

Hutchinson & Rattray: 25 (1933) pro parte; Dyer: 1 (1966); Johnson & Wilson: 370 (1990); Goode 24 (1989).

Stangeria T.Moore 0002000

Moore: 228 (1853); Hutchinson & Rattray: 25 (1933); Dyer: 1 (1966); Johnson & Wilson: 371 (1990); Jones: 265 (1993).

Description as for family.

Species 1: *Stangeria eriopus* (Kunze) Nash, N KwaZulu-Natal to Eastern Cape near East London, in coastal grassland and forest.

*Taxodiaceae

(Pinopsida)

Compiled by H.F. Glen

Medium-sized or large, monoecious, evergreen or deciduous trees, usually with shredding bark. **Leaves** usually linear or broadly awl-shaped, spirally arranged but sometimes appearing 2-ranked, or, more rarely, needle-like and in clusters. **Male cones** small, solitary or in clusters; pollen sacs 2–9 per scale, pollen without air-bladders. **Female cones** with bracts and cone scales free when young, but closely fused later; ovules 2–9 per scale; mature cones broadly ellipsoid, ovoid or almost spherical, scales persistent, spirally arranged, leathery or woody. **Seeds** 2–9 on each scale, usually winged.

Genera 10, species ± 14, mostly from E Asia but extending to Tasmania, and with 3 genera in North America; sthn Afr.: 2 exotic genera each with 1 naturalised species.

Dallimore & Jackson: 20 (1966); Lewis: 77 (1986); Page: 353 (1990).

Key to genera

Leaves 2-ranked, flattened; male cones in paniculate clusters ..... ***Taxodium**
Leaves spirally arranged, triangular in section; male cones in lateral, axillary, spicate clusters ..... ***Cryptomeria**

***Cryptomeria** D.Don 0034000

Don: 233 (1838); Dallimore & Jackson: 183 (1966), good account of numerous cultivars; Lewis: 79 (1986); Page: 357 (1990).

Evergreen, buttressed, monoecious trees up to 50 m tall in the wild, up to 30 m tall in cultivation; bark reddish brown, shredding. **Branchlets** hairless, deciduous. **Leaves** up to 20 mm long, spirally arranged in 5 ranks, persisting for 4 or 5 years, awl-shaped, blunt, margins incurved. **Male cones** ± 7.5 mm long, terminal, in clusters of 20 or more, orange or red when ripe. **Female cones** on short branchlets, surrounded by small rosettes of leaves; mature cones solitary, spherical, ± 15 mm long; scales 20–30, with 2 or 3 lobes and a recurved, triangular point on back; ovules erect. **Seeds** triangular, very narrowly winged. $x = 11$ (aneuploids, polyploidy).

Species 2 or more, China and Japan; sthn Afr.: **Cryptomeria japonica* (L.f.) D.Don, is recorded as naturalised in the KwaZulu-Natal midlands.

***Taxodium** Rich. 0035000

Richard: 298 (1810); Dallimore & Jackson: 583 (1966); Lewis: 77 (1986); Page: 361 (1990); Watson: 403 (1993).

Deciduous or evergreen trees. **Branchlets** terete. **Lateral roots** commonly producing erect, irregularly conic to rounded 'knees' in periodically flooded habitats. **Leaves** alternate, in 2 ranks; adult leaves

divergent to strongly appressed, linear or linear-lanceolate to deltate, generally flattened, free portion up to ± 17 mm long; abaxial glands absent. **Male cones** with 10–20 sporophylls, each sporophyll with 2–10 pollen sacs. **Female cones** maturing and shattering in one season, nearly globose; scales falling early, 5–10, valvate, ± peltate, thin and woody. **Seeds** (1)2 per scale, irregularly 3-angled, wingless; cotyledons 4–9. $x = 11$ (B-chromosomes).

Species 1(–3): North America, Mexico, Guatemala; 1 in sthn Afr.: **Taxodium distichum* (L.) Rich., naturalised in the KwaZulu-Natal midlands.

Welwitschiaceae

(Gnetopsida)

Compiled by H.F. Glen

Plant dioecious; stem woody, unbranched (closed system of growth), broadly obconic or turbinate, concave on top, outer covering corky; taproot elongated, branching near apex. **Leaves** produced from subcircular groove around rim of crater-like apex of plant, parallel-veined, persistent, growing from base. **Inflorescences** arising from floriferous cushions above and sometimes also below insertion of leaf. **Flowers** unisexual (male pseudo-bisexual but functionally unisexual), borne singly in axils of scales forming small cones. **Male flowers**: perianth segments 4, in 2 whorls; stamens 6, with filaments connate at base; anthers 3-thecate, dehiscing by 3 slits at summit, pollen grains ellipsoidal with ± 20 longitudinal ridges; ovule single, abortive, with integument produced into a style-like tubular structure and expanded at apex into a stigma-like, papillose disc. **Female flowers**: perianth segments 2, navicular, united along margins to enclose the ovule, flattened, with wings developing along keels; ovule with single integument produced into style-like tubular structure which eventually is exserted, widened and lobed at apex. **Seeds** winged; cotyledons 2, endospermous.

Monotypic family, Namibia and Angola.

Pearson: 1 (1933); Verdoorn: 48 (1966), the basis of this account; Friedrich-Holzhammer: 1 (1967); Kubitzki: 387 (1990); Von Breitenbach & Von Breitenbach: 209 (1992).

Welwitschia Hook.f. 0048000

Hooker: 71 (1862); Pearson: 1 (1933); Verdoorn: 49 (1966); Friedrich-Holzhammer: 1 (1967); Kubitzki: 390 (1990); Von Breitenbach & Von Breitenbach: 211 (1992).

Description as for family.

Species 1: *Welwitschia mirabilis* Hook.f., confined to the Namib desert in Namibia and Angola.

The Standing Committee on the Stabilization of Specific Names decided (Schubert 1975) that the specific name *Welwitschia mirabilis* Hook.f. takes priority over *W. bainesii* (Hook.f.) Carr. on the grounds that the latter was based on the provisional name *Tumboa bainesii* Hook.f.

Zamiaceae

(Cycadopsida)

Compiled by H.F. Glen

Plants dioecious, palm-like with main root or roots tuberous. **Stem** subterranean or aerial, occasionally up to 10 m tall, unbranched or branched from base, rarely branched above and then largely due to injury, covered by alternating series of woolly bracts and persistent swollen truncated leaf bases (pulvini). **Leaves** arising from apex of stems, spirally arranged, persisting 2–several years, petiolate, pinnate with a straight or curved rachis; leaflets pungent-pointed, entire, toothed or lobed on one or both margins, reduced in size towards base of rachis, sometimes to prickles, with longitudinal parallel venation and no midrib; leaflets of seedlings of all species with several teeth around apex. **Cones** 1–5, sometimes more, from near or around apex of stem, glabrous to densely woolly, pedunculate; peduncle of male cones somewhat longer than those of female cones in same species. **Male cones** subcylindric; scales densely packed in many spiral rows, terminating in a sterile truncate apex or beak; pollen cells in dense clusters on lower surface. **Female cones** cylindric to oval, broader than male; scales tightly packed, stalked, each bearing 2 collateral ovules, with micropyle directed towards axis of cone, on inner (adaxial) surface, one on either side of and along upper side of stalk, with an enlarged peltate head (bulla); bulla face flat or somewhat protruding and with lateral ridges extending into incurved lateral lobes, having mainly an upper, lower and terminal facet. **Seeds** red, yellow, amber or brownish with age, fleshy, oblong, angled by compression, with apical fleshy end

variable in length, with a thin, hard, subglobose or oblong-ovoid inner shell encasing copious endosperm, having a long maturing period on cone whether fertile or not; cotyledons 2. $x = 9$.

Genera 8, species over 100, tropical to warm-temperate regions mainly in southern hemisphere, in America, Africa, East Indies and Australia; sthn Afr.: genus 1, species ± 30.

Hutchinson & Rattray: 24 (1933), under Cycadaceae; Dyer & Verdoorn: 3 (1966); Johnson & Wilson: 371 (1990); Von Breitenbach & Von Breitenbach: 27 (1992).

DICOTYLEDONS

Acanthaceae

(Asteridae—Scrophulariales)

Compiled by K. Balkwill & W.G. Welman

Herbs, shrublets, shrubs, sometimes climbers or small trees, often with ± swollen nodes, sometimes spiny. **Leaves** opposite, rarely radical (*Elytraria*), mostly entire, simple, lamina often with cystoliths (mineral concretions) showing up as streaks or protuberances in dried material; stipules 0. **Inflorescence** based on dichasial and monochasial cymes; mostly bracteate, bracts often conspicuous, leaf-like or petaloid and subtending individual flowers. **Flowers** bisexual, mostly irregular. **Calyx** 4- or 5-partite (10–18-partite in *Thunbergia*), rarely 2-lipped, mostly shorter than corolla. **Corolla** gamopetalous, 1- or 2-lipped, or (3, 4)5-lobed, sometimes resupinate; tube cylindric, funnel-shaped or campanulate; when 2-lipped upper lip usually entire, emarginate or 2-toothed, sometimes with a rugula (central channel) accommodating the style, and sometimes with lateral staminal channels accommodating the stamens (in *Adhatoda*); lower lip 3-lobed or 3-toothed. **Stamens** arising on corolla, alternating with lobes, usually 4, sometimes didynamous, or 2, included or exserted; filaments normally linear; anthers 1- or 2-thecous, with thecae parallel to superposed, muticous or variously elaborated at base, sometimes ciliate; pollen prolate or, less often, sphaeroidal, 2- or 3- (col)porate; staminodes mostly 0, occasionally (1)2(3). **Disc** nectariferous, annular to deeply cupuliform. **Ovary** superior, 2-carpellate, 2-locular, with (1)2(3 or more) axile, usually anatropous ovules in each locule; style terete or long-filiform, included or exserted; stigma simple, or equally, or unequally 2-lobed. **Fruit** a 2-locular, loculicidally, often explosively, dehiscent capsule, ± club-shaped or ellipsoid; in a few genera placentas are elastic (i.e. remain attached to top of capsule and spring up from base). **Seeds** mostly borne on a retinaculum or jaculator (an elaboration of the funicle) except for a few genera of controversial inclusion (*Elytraria*, *Nelsonia*, *Thunbergia*), usually as many as ovules, usually ± lenticular, sometimes ± globose, smooth, rugose, tuberculate or muricate, sometimes covered with hygroscopic hairs or with hygroscopic hairs restricted to rim; endosperm 0 (except in Nelsonioideae); embryo large.

Genera ± 350; species ± 4350, abundant in tropics and subtropics; sthn Afr.: genera 42, species ± 350. **Acanthus pubescens* (Oliv.) Engl. is found as an occasional garden escape in the Northern Province.

Burkill & Clarke: 1 (1899); Burkill & Clarke: 193 (1900); Clarke: 1 (1901); Meyer: 1 (1968); Balkwill & Immelman: 1 (1995); Mabberley: 4 (1997).

Classification of sthn Afr. Acanthaceae

I. Subfamily NELSONIOIDEAE (ovules many; retinacula 0): *Elytraria, Nelsonia*
II. Subfamily THUNBERGIOIDEAE (ovules 4; retinacula 0): *Thunbergia*
III. Subfamily ACANTHOIDEAE (ovules 2–many; retinacula present):
1. Tribe **Acantheae**: *Acanthopsis, Blepharis, Crossandra, Sclerochiton*
2. Tribe **Ruellieae**:
   a. Subtribe Barleriinae: *Barleria*
   b. Subtribe Ruelliinae: *Crabbea, Ruellia, Ruelliopsis*
   c. Subtribe Petalidiinae: *Chaetacanthus, Duosperma, Dyschoriste, Hemigraphis, Hygrophylla, Lepidagathis, Petalidium, Phaulopsis*
3. Tribe **Justicieae**:
   a. Subtribe Diclipterinae: *Dicliptera, Hypoestes, Peristrophe*
   b. Subtribe Isoglossinae: *Isoglossa*
   c. Subtribe Justiciinae: *Adhatoda, Anisotes, Duvernoia, Justicia, Metarungia, Monechma, Rhinacanthus, Siphonoglossa*
   d. Subtribe Odontoneminae: *Asystasia, Chorisochora, Ecbolium, Glossochilus, Mackaya, Megalochlamys, Pseuderanthemum, Ruspolia, Ruttya, × Ruttyruspolia, Salpinctium*

Neuracanthus is currently of doubtful affinity. It is thought to be either a member of Acantheae, Ruellieae or in a tribe of its own.

Key to genera

1a Seeds not borne on retinacula:
  2a Plants with rosulate leaves and scapose inflorescences; scape covered with alternate bracts from base to tip ..... **Elytraria**
  2b Plants with internodes visible between leaves; bracts in inflorescence opposite:
    3a Plants prostrate, rooting at the nodes; corolla shorter than 12 mm ..... **Nelsonia**
    3b Plants upright herbs or creepers, not rooting at the nodes; corolla longer than 12 mm ..... **Thunbergia**
1b Seeds borne on retinacula:
  4a Corolla 1-lipped, with the adaxial suture slit; stamens 4, all monothecous:
    5a Stamens included in corolla tube, filaments epipetalous for most of their length, slender; corolla yellow, orange or red ..... **Crossandra**

5b Stamens exserted beyond corolla throat; filaments epipetalous for up to half of their length, stout; corolla white, blue or purple or various combinations of these:
6a Calyx with 5 lobes; seed surface convoluted and without hygroscopic structures ..... **Sclerochiton**
6b Calyx with 4 lobes; seed surface with feathery hygroscopic structures:
7a Anticous (outer) filaments branched at tip; ovary with 2 glands at tip; style with 2 unequal short branches .. **Blepharis**
7b Anticous (outer) filaments not branched at tip; ovary without 2 glands at tip; anticous style branch enlarged and flattened, posticous branch minute ..... **Acanthopsis**
4b Corolla 2-lipped, subregular or regular, adaxial suture not slit; if 4 stamens present, then at least 2 are 2-thecous:
8a Calyx 2-lipped with one lip of 3 lobes and one of 2; lobes fused for most of their length; corolla rotate above, with induplicate aestivation; filaments bifurcate at apex ..... **Neuracanthus**
8b Calyx not 2-lipped, or if obscurely so, then lobes free for most of their length; corolla not rotate and not with induplicate aestivation; filaments not bifurcate at apex:
9a Seeds with hygroscopic uniseriate hairs; corolla aestivation contorted or occasionally imbricate, but then not ascending; fertile stamens 4, or if 2 then pollen with many pseudocolpi (*Chaetacanthus*) or globose with deep reticulations and pores (*Barleria*):
10a Stamens not didynamous; calyx lobes 4, adaxial and abaxial lobes larger than lateral lobes ..... **Barleria**
10b Stamens didynamous; calyx usually of 5 lobes or if of 4 lobes, then these are equal in size:
11a Corolla distinctly 2-lipped and with rugula in upper lip; either with 2 bosses on lower corolla lip or with more than 2 seeds in each locule:
12a Seeds 2 in each locule; outer lobe of lower lip of corolla outermost in bud, lower lip without yellow bosses ..... **Lepidagathis**
12b Seeds 5 or more in each locule; corolla contorted in bud and with 2 bosses on lower lip ..... **Hygrophila**
11b Corolla regular or subregular or if 2-lipped then without a rugula in upper lip, without yellow bosses on lower corolla lip and with 1 or 2 seeds in each locule:
13a Corolla regular; fruits with inelastic placental bases:
14a Corolla contorted in bud; disc cupular; inflorescence a highly congested dichasial cyme surrounded by bracts ..... **Crabbea**
14b Corolla quincuncial in bud; disc annular; inflorescence not as above:
15a Anthers spurred; upper lobe of stigma absent; seeds 1 or 2 in each locule; pollen banded ..... **Ruelliopsis**
15b Anthers muticous; upper lobe of stigma present, although smaller than lower; seeds 3 or more in each locule; pollen with large reticulations ..... **Ruellia**
13b Corolla distinctly 2-lipped, or if corolla subregular then fruits with elastic placental bases:
16a Fruit with elastic placental bases; corolla obscurely 2-lipped:
17a Anticous calyx lobe much bigger than other 4 and bigger than bracts; corolla shorter than 15 mm, white, throat yellowish ..... **Phaulopsis**
17b All calyx lobes equal in size, usually enclosed by a pair of showy bracts; corolla usually longer than 15 mm and showy ..... **Petalidium**
16b Fruit with inelastic placental bases; corolla clearly 2-lipped:
18a Fertile stamens 2 ..... **Chaetacanthus**
18b Fertile stamens 4:
19a Capsule with 1 seed in each locule ..... **Duosperma**
19b Capsule with 2 or more seeds in each locule:
20a Capsule with 2 seeds in each locule ..... **Dyschoriste**
20b Capsule with 3 or more seeds in each locule ..... **Ruellia**
9b Seeds without hygroscopic, uniseriate hairs (although they may have tubercles or hygroscopic glochidiate hairs); corolla aestivation ascending; fertile stamens 2, or if 4 then pollen colporate with shallow reticulations (*Asystasia*, *Salpinctium* and *Glossochilus*):
21a Corolla with a distinct rugula in upper lip:
22a Pollen spheroidal, with a pusticulate ring of exine around the equator; anthers in species with cream flowers attached at right angles to filaments ..... **Isoglossa**
22b Pollen prolate; anthers attached parallel to filaments:
23a Corolla orange, red or yellowy brown, lower lip longer than 25 mm and narrower than 10 mm:
24a Capsules with elastic placental bases ..... **Metarungia**
24b Capsules with inelastic placental bases ..... **Anisotes**
23b Corolla white, cream, lilac, pink, purple or blue, lower lip shorter than 25 mm or if longer, then broader than 10 mm:
25a Corolla tube longer than lips:
26a Style with branches longer than broad; inflorescences terminal as well as axillary ..... **Rhinacanthus**
26b Style with very short (broader than long) branches; inflorescences axillary ..... **Siphonoglossa**
25b Corolla tube shorter than lips:
27a Seeds single in each locule, smooth and shiny ..... **Monechma**
27b Seeds paired in each locule, rough and often tuberculate (sometimes a single, smooth, shiny seed is borne in an indehiscent capsule):
28a Calyx lobes shorter than tube; staminal channels present in upper lip of corolla and at least half as long as lip ..... **Duvernoia**
28b Calyx lobes longer than tube; staminal channels absent or less than half as long as upper lip:
29a Inflorescence pedunculate and diffuse; anticous corolla lip deeply divided, palate of 2 smooth tumuli (small mounds) ..... **Justicia**

29b Inflorescence sessile, or if pedunculate then strobilate; palate rugose:
30a Lower anther thecae muticous or shortly tailed; lips of corolla nearly equally long; upper lip deeply hooded ..... **Adhatoda**
30b Lower anther thecae with short or long tails; upper lip of corolla shorter than lower; upper lip shallowly hooded ..... **Justicia**

21b Corolla without or with indistinct rugula in upper lip:
31a Corolla not resupinate; seeds usually more than 3 mm in diameter; anther thecae ± parallel; inflorescences terminal thyrses or monochasia or single axillary flowers:
32a Stamens 4:
33a Flowers single in axils ..... **Glossochilus**
33b Flowers in (usually terminal) monochasia or lax terminal thyrses:
34a Corolla 2-lipped; pollen with processes associated with pores ..... **Salpinctium**
34b Corolla campanulate above, ± 2-lipped; pollen without processes associated with pores ..... **Asystasia**
32b Stamens 2:
35a Anthers monothecous in chasmogamous flowers:
36a Corolla tube considerably longer than upper lip ..... **Ruspolia**
36b Corolla tube shorter than or ± as long as upper lip ..... **Ruttya** (see also × **Ruttyruspolia**)
35b Anthers 2-thecous in chasmogamous flowers:
37a Corolla with lips much longer than tube, throat narrow; disc shallowly cupular ..... **Chorisochora**
37b Corolla with lips ± as long as or shorter than tube, throat wide:
38a Inflorescence with small bracts; calyx easily visible:
39a Corolla subregular, campanulate; no cleistogamous flowers present ..... **Mackaya**
39b Corolla 2-lipped, tubular below; often with cleistogamous flowers ..... **Pseuderanthemum**
38b Inflorescence with large bracts obscuring calyx:
40a Corolla thin-textured, lobes ± as long as or longer than tube, bright or pale blue; staminodes 0; pollen prolate, without pseudocolpi, yellow when fresh ..... **Megalochlamys**
40b Corolla thick-textured, lobes much shorter than tube, green, lilac or white; staminodes 2; pollen almost spheroidal, with pseudocolpi, white or pink when fresh ..... **Ecbolium**
31b Corolla resupinate; seeds less than 3 mm in diameter; stamens only 2 and staminodes 0; anther thecae superposed (except where monothecous); inflorescences axillary, variously reduced 'umbels' of condensed monochasia:
41a Anthers monothecous ..... **Hypoestes**
41b Anthers 2-thecous:
42a Capsules with inelastic placental bases ..... **Peristrophe**
42b Capsules with elastic placental bases ..... **Dicliptera**

Acanthopsis Harv. 7982000

Harvey: 28 (1842); Clarke: 33 (1901).

Acanthodium Delile in part: t. 33 (1813).

Shrublets or acaulescent perennials, usually densely leafy. **Leaves** usually spinous-toothed. **Inflorescence** terminal, spicate; spikes cylindric or globose; bracts spinous-toothed, sometimes with spines on upper surface, rarely with gland-tipped hairs; bracteoles 2, usually linear. **Calyx** irregular; lobes 4, adaxial lobes outermost, broadly ovate or elliptic, ribbed; lateral lobes smaller, lanceolate or linear; tube shorter than lobes. **Corolla** 1-lipped; lobes 5, usually quadrate, with the 2 laterals smallest; tube shorter than lobes, ± cylindric. **Androecium**: fertile stamens 4, arising in mouth of corolla tube; filaments stout; anthers monothecous; theca oblong, ciliate, muticous; staminodes 0. **Pollen** prolate, 3-colpate; surface with shallow reticulations. **Disc** annular. **Gynoecium**: ovary somewhat ellipsoid, with 1 or 2 ovules in each locule, with 2 large sessile glands at tip; style filiform; style branch 1; ventral lobe flattened. **Capsule** compressed, ovoid, estipitate, with inelastic placental bases. **Seeds** elliptic, with long, feathery, hygroscopic hairs over whole surface.

Species 8, sthn Afr., Namibia and mainly arid winter-rainfall areas in South Africa.

Adhatoda Mill. 8094020

Miller: [39] (1754); Manning & Getliffe Norris: 62 (1995a).

Perennial herbs with annual branches from woody rootstock. **Leaves** sessile or subsessile, mainly elliptic, entire. **Inflorescence** terminal, a thyrse composed of 1- or 2-flowered cymes; bracts and bracteoles present. **Calyx** regular; lobes 5; tube shorter than lobes. **Corolla** 2-lipped, hairy; upper lip very shortly bilobed or nearly entire, rugula distinct; lower lip 3-lobed, with middle one ovate and lateral ones oblong, with 2 cavities at base without; aestivation ascending; staminal channels present; tube subcampanulate, shorter than lobes. **Androecium**: fertile stamens 2, arising deep in corolla throat, exserted; filaments linear; anthers 2-thecous; thecae parallel, tailed; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** cupular, with V-shaped slit, with 2 awns. **Gynoecium**: ovary with 1 or 2 ovules in each locule; style linear, running in rugula, exserted, hairy on lower portion; style branches 2, equal, very short, broader than long. **Capsule** stipitate, with inelastic placental bases. **Seed** surface rough and convolute or rugose. $x = 17$ (10) (aneuploids, polyploidy).

Species many, Old World tropics; 2 in sthn Afr., mainly KwaZulu-Natal and Eastern Cape.

Anisotes Nees 8096000

Nees von Esenbeck: 424 (1847); Baden: 65 (1995a).

Macrorungia C.B.Clarke: 254 (1900) in part.

Shrubs. **Leaves** opposite, entire. **Inflorescence** terminal, axillary or on short lateral shoots, spicate or thyrsoid; bracts small. **Calyx** regular, hairy; lobes 5; tube shorter than lobes. **Corolla** 2-lipped, red, hairy; lips long; upper lip entire or minutely lobed, rugula distinct; lower lip 3-lobed, with a distinct keel and 2 channels on lower surface; aestivation ascending; tube cylindric, shorter than lobes. **Androecium**: fertile stamens 2, arising near base

of corolla tube, exserted; filaments linear, sometimes adnate to corolla tube almost to mouth; anthers 2-thecous; thecae subparallel, muticous; staminodes 0. **Pollen** prolate, 2–4-colporate, with pseudocolpi; surface reticulate. **Disc** shallowly cupular. **Gynoecium**: ovary ovoid, with 2 ovules in each locule; style terete, running in rugula; style branches 2, equal, very short, broader than long. **Capsule** woody, oblong, stipitate, with inelastic placental bases. **Seeds** 4, planocompressed; surface rough and convolute or rugose.

Species 19, mostly Africa to Arabian Peninsula and Madagascar; 2 in sthn Afr., Northern Province.

Asystasia Blume 8007000

Blume: 796 (1826); Clarke: 41 (1901).

Herbs or shrubs. **Inflorescence** terminal or axillary, thyrses, monochasial cymes, spikes or solitary flowers in axils; bracts usually small; bracteoles minute or 0, rarely longer than calyx. **Calyx** regular, usually hairy; lobes 5; tube shorter than lobes. **Corolla** subregular or ± 2-lipped; lobes 5, ovate or oblong; aestivation ascending; rugula indistinct; tube longer than lobes, inflated upwards, curved, with oblique mouth. **Androecium**: fertile stamens 4, didynamous; filaments arising in pairs in corolla tube, usually included, linear; anthers 2-thecous; thecae parallel, muticous; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** cupular. **Gynoecium**: ovary ovate or oblong, with 2 ovules in each locule; style terete, included, running in rugula; style branches 2, equal (occasionally unequal) or ventral lobe more developed, cylindriform, expanded or sometimes very short, broader than long. **Capsule** stalked, laterally flattened, slightly beaked, stipitate, with inelastic placental bases. **Seeds** laterally compressed, irregularly obovate, rimmed; surface rough and convolute or rugose. x = 13 (14) (aneuploids, polyploidy).

Species ± 70, Africa to East Indies and Australia; 8 in sthn Afr., Namibia, Botswana, Swaziland and northern and eastern provinces of South Africa.

Barleria L. 7973000

Linnaeus: 636 (1753); Obermeyer: 123 (1933); Meyer: 8 (1968).

Shrublets or suffrutices of variable habit. **Leaves** usually with 2 serial buds in their axils, upper bud producing a normal branch, an inflorescence or an inflorescence reduced to a spine system and lower bud producing a branch or a vegetative spine system. **Inflorescence** terminal or axillary, dichasial or monochasial cymes, thyrses or single flowers, sometimes congested; bracts and bracteoles sometimes spinous. **Calyx** irregular; with 4 lobes; outer lobes 2, large, abaxial one sometimes bifid; inner lobes lateral, small; lobes sometimes foliaceous, sometimes pungent. **Corolla** subregular or irregular, sometimes 2-lipped; lobes 4 or 5, obovate, sometimes unequal, often with one lobe much shorter than others; when 2-lipped the upper lip 4-lobed; aestivation quincuncial; tube longer than lobes. **Androecium**: fertile stamens 2 or 4; filaments long, often twisted and crossing over each other; anthers 2-thecous; thecae parallel, muticous; staminodes 0–3. **Pollen** spheroidal, 3-porate; surface with large reticulations. **Disc** deeply cupular, sometimes with 2 awns or sometimes produced on one side. **Gynoecium**: ovary with 1 or 2 ovules in each locule; style terete, exserted; style branches 1 or 2, equal or ventral lobe more developed, flattened, disciform, funnel-shaped or very short and broader than long. **Capsule** with or without beak, estipitate, with inelastic placental bases; beak solid or hollow. **Seeds** flat, with hygroscopic hairs over whole surface. x = 10 (16, 19) (aneuploids, polyploidy).

Species 250, cosmopolitan, mainly tropics; ± 60 in sthn Afr., widespread, but rare in winter-rainfall area.

Blepharis Juss. 7980000

Jussieu: 103 (1789); Obermeyer: 105 (1937); Meyer: 18 (1968).

Acanthodium Delile: t. 33 (1813) in part. *Blepharacanthus* Nees: 385 (1836).

Procumbent annual or perennial herbs or suffrutices. **Leaves** often in unequal pairs, sometimes spinous-toothed. **Inflorescence** terminal, spicate, decussate, or scorpioid cymes, sometimes reduced; bracts 8, usually spinous-toothed, accrescent; bracteoles resembling bracts, sometimes 0. **Calyx** irregular; lobes 4; anticous one emarginate, bifid or bispinose and posticous one larger; lateral lobes 2, small; tube shorter than lobes. **Corolla** 1-lipped; lip usually with reflexed hairs on both sides; lobes usually 3–5, variable, with laterals smaller than others or obsolete; aestivation imbricate; tube shorter than lobes, subcylindric, with ring of hairs in mouth. **Androecium**: fertile stamens 4, equal, arising in mouth of corolla tube; filaments terete, with those of anticous stamens flattened above and produced into a protuberance as long as or shorter than anthers; anthers monothecous; theca ciliate, muticous; staminodes 0. **Pollen** prolate, 3-colpate; surface with shallow reticulations. **Disc** annular or saucer-shaped. **Gynoecium**: ovary ± ellipsoid, with 1 or 2 ovules in each locule, with 2 glandular bodies or cap at apex; style linear; style branches 2, equal, very short, broader than long. **Capsule** estipitate, with inelastic placental bases. **Seeds** laterally compressed, ovate, with long, feathery, hygroscopic hairs over whole surface. x = 8, 10, 13, 14, 15, 17, 18, 23.

Species ± 80, Africa to East Indies, also Mediterranean; ± 45 in sthn Afr., widespread, but mostly in arid parts.

Chaetacanthus Nees 7941000

Nees von Esenbeck: 444 (1836); Clarke: 18 (1901).

Shrublets or herbs, with woody rootstock or stolons. **Leaves** entire. **Inflorescence** axillary, dichasial cymes; bracteoles 2, usually shorter than calyx. **Calyx** regular; lobes 5; tube longer than lobes. **Corolla** 2-lipped; upper lip 2-lobed, rugula indistinct; lower lip 3-lobed; lobes oblong, truncate or obtuse; aestivation contorted; tube longer than lobes, pubescent, campanulate above. **Androecium**: fertile stamens 2; filaments of stamens and staminodes didynamous, arising in pairs in corolla throat; slightly exserted, linear; anthers 2-thecous; thecae parallel, oblong or linear-oblong, muticous; staminodes 2 or 0. **Pollen** prolate, 3-colporate, with many pseudocolpi; pore lipped; surface pusticulate. **Disc** annular. **Gynoecium**: ovary oblong, with 2 ovules in each locule; style terete, slightly exserted, pubescent; style branch 1; ventral lobe cylindriform. **Capsule** lanceolate, estipitate, with inelastic placental bases. **Seeds** biconvex, with hygroscopic hairs over whole surface.

Species ± 3, sthn Afr., widespread, mainly in eastern parts. Could probably be united with *Dyschoriste* Nees.

Chorisochora Vollesen 8048010

Vollesen: 469 (1994a).

Angkalanthus in sense of A.Meeuse: t. 1227 (1956).

Shrubs or shrubby herbs. **Leaves** long-petiolate, ± entire. **Inflorescence** terminal thyrses; bracts imbricate or not; bracteoles 2. **Calyx** regular, 5-lobed; lobes linear; tube shorter than lobes. **Corolla** 2-lipped, 5-lobed, pu-

berulous outside; 2 lobes in upper lip fused; lower lip deeply 3-lobed, aestivation ascending; tube shorter than lobes, cylindric, slightly widened upwards. **Androecium**: fertile stamens 2, arising just inside tube, with short downwardly directed hairs; anthers 2-thecous, thecae oblong, parallel, muticous; staminodes 0. **Pollen** spheroidal, 3-colporate; surface reticulate. **Disc** shallowly cupular. **Gynoecium**: ovary with 1 or sometimes 2 ovules per locule; style with scattered hairs towards base or glabrous; style branches 2, equal, cylindriform, longer than broad. **Capsule** stipitate, slightly beaked, club-shaped, 2- or 3-seeded, placental bases inelastic. **Seeds** discoid, broadly elliptic to circular in outline, rimmed, surface rough.

Species 3; 2 on Socotra, 1 in sthn Afr.: *Chorisochora transvaalensis* (A.Meeuse) Vollesen, Northern Province and Mpumalanga.

Crabbea Harv. 7972000

Harvey: 26 (1842) name conserved; Clarke: 118 (1899); Clarke: 38 (1901).

Perennial herbs, sometimes with decumbent stems or acaulescent. **Leaves** entire to faintly crenate or toothed. **Inflorescence** terminal or axillary, dichasial cymes, congested, sometimes peduncled heads; bracts foliaceous, ovate, weakly spinescent on margins; lower bract large, sterile; bracteoles slender or 0. **Calyx** subregular; lobes 5, with one slightly longer than others or two laterals shorter than others; tube shorter than lobes. **Corolla** ± 2-lipped; upper lip 2-lobed, lower 3-lobed; lobes semiorbicular or obovate; aestivation quincuncial; tube longer than lobes, usually with 2 large gibbosities at base. **Androecium**: fertile stamens 4, didynamous; filaments arising in pairs in lower portion of corolla tube, linear; anthers 2-thecous; thecae parallel or subparallel, sometimes ciliate, muticous; staminodes 0. **Pollen** spheroidal, 3-porate; surface with large reticulations. **Disc** cupular, with V-shaped slit. **Gynoecium**: ovary with 2–4 ovules in each locule; style terete, articulated on ovary, included; style branch 1, ventral lobe expanded. **Capsule** ± cylindric, estipitate, with inelastic placental bases. **Seeds** flattened, with hygroscopic hairs over whole surface. $x = 6$ or 7 (1 report, polyploidy).

Species ± 12, Africa; 7 in sthn Afr., Namibia (Caprivi), Botswana, Swaziland, Lesotho and mainly northern and eastern provinces of South Africa.

Crossandra Salisb. 7985000

Salisbury: t. 12 (1805); Vollesen: 503 (1990); Vos & Edwards: 94 (1992).

Shrublets or acaulescent perennials. **Leaves** sometimes large and elliptic. **Inflorescence** terminal, spicate, often on long peduncles; bracts large, ovate, usually pubescent, sometimes papery; bracteoles as long as calyx. **Calyx** subirregular, often with stalked, glandular hairs; lobes 5, elliptic or lanceolate, with uppermost lobe broadest and often 2-toothed; tube shorter than lobes. **Corolla** 1-lipped; lip 5-lobed, lobes rotund; aestivation imbricate; tube longer than lobes, cylindric. **Androecium**: fertile stamens 4, arising in upper part of corolla tube, included; filaments linear, shorter than anthers; anthers monothecous; theca sometimes ciliate, muticous; staminodes 0. **Pollen** prolate (with squared ends), 3-colpate; surface foveolate. **Disc** annular. **Gynoecium**: ovary ellipsoid, with 2 ovules in each locule; style filamentous, included; style branches 2, equal, cylindriform. **Capsule** oblong-elliptic, estipitate, with inelastic placental bases. **Seeds** ovate, compressed, with hygroscopic scales over whole surface. $x = 19$ (10) (polyploidy).

Species ± 50, Africa, Arabian Peninsula, India, Madagascar; 4 in sthn Afr., Swaziland and mainly northern and eastern provinces of South Africa.

Dicliptera Juss. 8031000

Jussieu: 267 (1807) name conserved; Balkwill *et al.*: 1 (1996).

Herbs or suffrutices. **Leaves** petiolate, entire. **Inflorescence** axillary, umbel-like group of monochasial cymes; primary bracts foliaceous, secondary bracts linear-lanceolate or occasionally elliptic, tertiary bracts broadly obovate, elliptic, ovate or linear-lanceolate, quaternary bracts linear-lanceolate. **Calyx** regular; tube shorter than lobes; lobes 5, linear-lanceolate. **Corolla** 2-lipped, resupinate, hairy; lip in upper position 3-toothed or shortly 3-lobed, rugula indistinct; lip in lower position entire or emarginate; aestivation ascending; tube shorter than lobes, cylindric below, somewhat campanulate above. **Androecium**: fertile stamens 2, arising in corolla throat, exserted; filaments linear, thinly hairy; anthers 2-thecous; thecae superposed, muticous; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** cupular, with V-shaped slit, with 2 awns. **Gynoecium**: ovary ellipsoid, with 2 ovules in each locule; style filiform, exserted; style branches 2, equal, cylindriform, longer than broad. **Capsule** ovoid, stipitate, with elastic placental bases. **Seeds** discoid; surface rough and tuberculate. $x = 13$ (10, 12) (high polyploidy).

Species ± 150, cosmopolitan in warm and tropical areas; 15 in sthn Afr., Namibia, Botswana, Swaziland, widespread in South Africa, mainly in northern and eastern provinces.

Duosperma Dayton 7940000

Dayton: 262 (1945); Meyer: 28 (1968).

Disperma C.B.Clarke: 79 (1899) not of J.F.Gmel.

Shrublets or shrubs, ± hairy. **Leaves** entire, crenate or toothed. **Inflorescence** axillary, dichasial cymes; bracts ± as long as calyx; bracteoles similar. **Calyx** regular, glandular, hairy; lobes 5, ovate, with posticous ones larger than others; tube shorter than lobes. **Corolla** ± 2-lipped; upper lip 3-lobed, transversely ribbed on palate and with stiff, reflexed hairs, rugula indistinct; lower lip 2-lobed; all lobes retuse; aestivation contorted; tube cylindric below, narrowly campanulate above, longer than lobes. **Androecium**: fertile stamens 4, didynamous; filaments arising in pairs in throat of corolla, slightly exserted, linear; anthers 2-thecous; thecae parallel, muticous; staminodes 0. **Pollen** prolate, 3-porate, with pseudocolpi; pore lipped; surface reticulate. **Disc** annular. **Gynoecium**: ovary with 1 or 2 ovules in each locule; style subterete, exserted, sparsely hairy; style branches 1 or 2; ventral lobe more developed, cylindriform. **Capsule** 2-seeded, obovoid-ellipsoid, much flattened, woody, shiny brown, estipitate, with inelastic placental bases. **Seeds** discoid, with hygroscopic hairs over whole surface.

Species 12, Africa; 2 in sthn Afr., Namibia, Botswana and Mpumalanga.

Duvernoia E.Mey. ex Nees 8055000

Nees von Esenbeck: 322 (1847); Manning & Getliffe Norris: 15 (1995b).

Shrubs or small trees. **Leaves** large, elliptic, entire or obscurely undulate-crenate. **Inflorescence** axillary, pedunculate thyrses; bracts and bracteoles small. **Calyx** regular, glabrous; lobes 5; tube longer than lobes, campanulate. **Corolla** 2-lipped, minutely pubescent; upper lip shortly 2-lobed, rugula distinct, staminal channels present; lower lip 3-lobed, with middle lobe oblong and others falcately oblong, with two gibbosities at base without; aestivation ascending; tube shorter than lobes, subcampanulate. **Androecium**: fertile stamens 2, arising

in mouth of corolla, exserted; filaments terete; anthers 2-thecous; thecae parallel, muticous; staminodes 0. **Pollen** prolate, 2-colporate, with pseudocolpi; surface reticulate. **Disc** deeply cupular, with V-shaped slit, with 2 awns. **Gynoecium**: ovary subglobose, with 2 ovules in each locule, densely hairy; style terete, running in rugula, exserted; style branches 2, equal, very short, broader than long. **Capsule** woody, club-shaped, tomentose, stipitate, with inelastic placental bases. **Seeds** semiorbicular, compressed; surface rough and convolute or rugose.

Species 2, Mozambique and sthn Afr.; both in Swaziland and eastern provinces of South Africa.

Dyschoriste Nees 7939000

Nees von Esenbeck: 75 (1832); Clarke: 71 (1899); Clarke: 15 (1901).

Calophanes D.Don in part: t. 181 (1833).

Suffrutices or shrublets. **Leaves** usually elliptic and entire. **Inflorescence** axillary, dichasial cymes or solitary flowers; bracteoles 2, shorter than calyx. **Calyx** regular, persistent; lobes 5; tube cylindric or narrowly campanulate, 5-ribbed, longer than lobes. **Corolla** 2-lipped, pubescent, upper lip 2-lobed, rugula indistinct; lower lip 3-lobed; lobes oblong; aestivation contorted; tube longer than lobes, ± cylindric below, campanulate above. **Androecium**: fertile stamens 4, didynamous, subsimilar, arising in pairs in throat of corolla tube or ± halfway down, exserted or included; filaments linear; anthers 2-thecous; thecae parallel, oblong, muticous; staminodes 0. **Pollen** prolate, 3-colporate, with many pseudocolpi; pore lipped; surface pusticulate. **Disc** annular, with projection perhaps representing a fifth stamen. **Gynoecium**: ovary elliptic, with 2 ovules in each locule; style terete, exserted, pubescent; style branch 1, ventral lobe flattened, or sometimes expanded, longer than broad. **Capsule** cylindric, estipitate, with inelastic placental bases. **Seeds** usually 4, compressed, orbicular, with hygroscopic hairs over whole surface or sometimes restricted to rim. $x = 10$ (polyploidy).

Species ± 65, cosmopolitan in tropical and warm areas; 11 in sthn Afr., Namibia, Botswana, Swaziland and mainly northern and eastern provinces of South Africa.

Ecbolium Kurz 8048000

Kurz: 75 (1871); Vollesen: 638 (1989).

Shrubs or undershrubs. **Leaves** entire. **Inflorescence** terminal, spicate; bracts ovate or obovate; bracteoles 2, linear. **Calyx** regular, hairy; lobes 5, somewhat unequal; tube shorter than lobes. **Corolla** 2-lipped; upper lip bifid or subentire; lower lip deeply 3-lobed, with lobes ovate or oblong; aestivation ascending; tube longer than lobes, cylindric or funnel-shaped. **Androecium**: fertile stamens 2, arising low down in corolla tube, exserted; filaments linear; anthers 2-thecous; thecae parallel, muticous; staminodes 2. **Pollen** spheroidal, 3-colporate, with pseudocolpi; surface reticulate. **Disc** shallowly cupular, sometimes with V-shaped slit, with 2 awns. **Gynoecium**: ovary with 1 or occasionally 2 ovules in each locule; style terete, somewhat exserted; style branches 2, equal, expanded and disciform. **Capsule** ovoid, stipitate, with inelastic placental bases. **Seeds** irregularly obovate, dorsiventral, rimmed, with hygroscopic glochidiate hairs sparse on central area. $x = 9$ (10) (polyploidy).

Species 22, Africa to India; 3 in sthn Afr., Namibia, Swaziland and eastern provinces of South Africa.

Elytraria Michx. 7908000

Michaux: 8 (1803) name conserved; Burkill & Clarke: 27 (1899).

Dwarf herbs. **Leaves** in basal rosette. **Inflorescence** terminal, simple or divided, narrow spikes, on slender bract-covered peduncles; bracts ovate, closely wrapped around peduncle, with membranous margin fringed with woolly hairs; bracteoles 2. **Calyx** subirregular; lobes 5; tube shorter than lobes. **Corolla** 2-lipped, with 1 lip shortly 2-lobed; lobes oblong or ovate, imbricate in bud; tube longer than lobes. **Androecium**: fertile stamens 2, arising in corolla throat; filaments short; anthers 2-thecous, with a terminal projection; thecae parallel, with minute tails or muticous; staminodes 0. **Pollen** spheroidal; 3-colpate; surface with shallow reticulations. **Disc** annular. **Gynoecium**: ovary ± ellipsoid, with several ovules in each locule; style linear; style branches 2, equal, cylindriform. **Capsule** slightly beaked, estipitate; with inelastic placental bases; retinacula 0. **Seeds** minute, ovoid, reticulate, minutely papillose. $x = 11$, 12 (10, 23) (polyploidy).

Species ± 7, Africa, Asia and America; 1 in sthn Afr.: *Elytraria acaulis* (L.f.) Lindau, Botswana and Northern Province.

Glossochilus Nees 7970000

Nees von Esenbeck: 83 (1847); Clarke: 40 (1901).

Shrublets with tap root. **Leaves** linear to spatulate-linear, glabrescent. **Inflorescence** of solitary, axillary flowers; bracteoles 0. **Calyx** regular; lobes 5, linear, ciliate; tube shorter than lobes. **Corolla** 2-lipped, subregular, pubescent; upper lip 2-lobed with lobes oblong, rugula distinct; lower lip 3-lobed, with middle lobe ovate and with deep channel and transverse ridges, and lateral lobes oblong; aestivation ascending; tube longer than lobes, funnel-shaped, pilose within near base. **Androecium**: fertile stamens 4; filaments didynamous, arising in pairs on lower part of corolla tube, included, linear; anthers 2-thecous; thecae subparallel, muticous; staminodes 0. **Pollen** spheroidal, 2-colporate, with pseudocolpi; surface reticulate. **Disc** cupular, with projection perhaps representing a fifth stamen. **Gynoecium**: ovary with 2 ovules in each locule; style terete, pubescent near base; style branches 2, equal, cylindriform, or sometimes expanded. **Capsule** cylindric, stipitate, with inelastic placental bases. **Seeds** compressed, elliptic, rimmed, produced into blunt projection on one side, deeply concave on other, grooved on margin, surface rough.

Species 2, sthn Afr., Botswana and northern arid areas of South Africa.

Hygrophila R.Br. emend. Heine 7926000

Brown: 479 (1810); Heine: 171 (1962); Heine: 656 (1971).

Asteracantha Nees: 75 (1832). *Hemigraphis* Nees in part: 722 (1847).

Herbs, often glandular. **Leaves** linear to lanceolate or ovate, entire. **Inflorescence** axillary; dichasial cymes or solitary flowers; pedicels present or very short; bracts resembling leaves; bracteoles 0. **Calyx** lobes 4; subregular; tube shorter than lobes. **Corolla** 2-lipped, subregular or irregular; upper lip 2-lobed, with lobes recurved, sometimes bifid, rugula distinct; lower lip 3-lobed, with lobes strongly reflexed; aestivation imbricate; tube longer than lobes, cylindric below, widening above, sometimes somewhat saccate on widened portion. **Androecium**: fertile stamens 4; filaments didynamous, arising in pairs, usually broadly linear, sometimes with coarse setae, arising ± in middle of corolla tube or in mouth or on base of upper lip; anthers 2-thecous; thecae parallel, muticous; staminodes 0. **Disc** deeply cupular. **Gynoecium**: ovary oblong or linear-oblong, with 10–13 ovules in each locule; style terete-filiform, ± exserted, running in rugula; style branch 1; ventral lobe flattened. **Capsule** linear or linear-oblong, estipitate, with inelastic placental bases. **Pollen** prolate, 3-colporate, with many pseudocolpi; surface reticulate.

Seeds compressed, with hygroscopic hairs over whole surface. $x = 16$ (11, 17) (polyploidy).

Species ± 100, tropics generally; 9 in sthn Afr., N Namibia and Botswana, Swaziland and eastern provinces of South Africa.

Hypoestes Sol. ex R.Br. 8032000

Brown: 474 (1810); Balkwill & Getliffe Norris: 133 (1985).

Herbs or undershrubs. **Leaves** entire. **Inflorescence** axillary, umbel-like group of monochasial cymes, sometimes reduced; primary bracts foliaceous, secondary bracts linear-lanceolate, tertiary bracts obovate, elliptic, or narrowly lanceolate, free or united into a tube, quaternary bracts linear-lanceolate when present. **Calyx** regular; lobes 4 or 5, linear-lanceolate; tube shorter than lobes. **Corolla** 2-lipped, resupinate, hairy; lip in upper position 3-toothed or shortly 3-lobed, rugula indistinct; lip in lower position entire or emarginate; aestivation ascending; tube shorter than lobes, cylindric below, somewhat campanulate above. **Androecium**: fertile stamens 2, arising in corolla throat, exserted; filaments linear, thinly hairy; anthers monothecous; theca muticous; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** cupular, with V-shaped slit, with 2 awns. **Gynoecium**: ovary ellipsoid, with 2 ovules in each locule; style filiform, exserted; style branches 2, equal, cylindriform, longer than broad. **Capsule** ovoid, stipitate. **Seeds** discoid; surface smooth or rough, with or without tubercles. $x = 10$ (aneuploids).

Species ± 40, Africa to Asia, East Indies and Australia; 3 in sthn Afr., Namibia, Botswana, Swaziland and mainly northern and eastern provinces of South Africa south to ± Still Bay (Western Cape).

Isoglossa Oerst. 8079000

Oersted: 155 (1854); Clarke: 79 (1901).

Robust herbs, undershrubs or shrubs with herbaceous branches, rarely woody. **Leaves** ovate or elliptic, usually petiolate. **Inflorescence** terminal or axillary, thyrsoid or spicate; bracts and bracteoles small, lanceolate or spatulate-obovate, sometimes enclosing calyx. **Calyx** regular, hairy or with stalked glands; lobes 5, lanceolate; tube shorter than lobes. **Corolla** 2-lipped, glabrous or hairy; upper lip shortly 2-lobed, rugula distinct; lower lip shortly 3-lobed, usually with a distinct keel on back and 2 raised ridges on palate; aestivation ascending; tube shorter than lobes, subcampanulate. **Androecium**: fertile stamens 2, arising near base of corolla tube or in upper cylindric portion, subexserted; filaments terete; anthers 2-thecous; thecae superposed and usually clearly separated with upper theca usually attached at right angles to filament, muticous; staminodes 0. **Pollen** spheroidal, 3-porate; surface reticulate. **Disc** annular, unusually large. **Gynoecium**: ovary with 1 or 2 ovules in each locule, ellipsoid; style terete, subexserted, or filiform and exserted, running in rugula; style branches 2, equal, very short, broader than long. **Capsule** ellipsoid, stipitate, with inelastic placental bases. **Seeds** ± quadrate, surface rough and convolute or rugose.

Species ± 50, Old World tropics; 15 in sthn Afr., Swaziland, Lesotho and mainly northern and eastern provinces of South Africa.

Justicia L. 8094000

Linnaeus: 15 (1753); Immelman: 18 (1995a).

Herbs or undershrubs. **Leaves** petiolate or sessile. **Inflorescence** terminal or axillary, thyrsoid, spicate, scorpioid cymes, dichasial cymes or raceme-like compound cymes; bracts and bracteoles variable. **Calyx** regular, with simple or stalked, glandular and/or eglandular hairs; tube shorter than lobes, with 4 or 5 lobes. **Corolla** 2-lipped, hairy or glandular; upper lip shortly 2-lobed or entire, rugula distinct; lower lip 3-lobed, with lobes ovate or oblong and usually pinnately ribbed on palate; aestivation ascending; tube shorter than lobes, subcampanulate or broadly cylindric. **Androecium**: fertile stamens 2, arising deep in corolla throat, slightly exserted; filaments linear, often hairy at base; anthers 2-thecous; thecae superposed, usually tailed, sometimes muticous; staminodes 0. **Pollen** prolate, 2- or 3-colporate, with pseudocolpi; surface reticulate. **Disc** deeply cupular; sometimes with V-shaped slit, with 2 awns (occasionally absent). **Gynoecium**: ovary ellipsoid or ovoid, with 2 ovules in each locule; style terete, running in rugula, subexserted; style branches 2, equal, very short, broader than long. **Capsule** ellipsoid or club-shaped, stipitate, with inelastic placental bases, occasionally hard, indehiscent capsule with single seed. **Seeds** usually orbicular; surface rough and convolute or rugose or rough and tuberculate or with long, barbed hairs. $x = 7, 9$ (8, 10, 11, 12, 13) (polyploidy, B-chromosomes).

Species ± 420, cosmopolitan in warm areas; 23 in sthn Afr., widespread, but not in Lesotho.

Lepidagathis Willd. 7971000

Willdenow: 400 (1800); Clarke: 120 (1899).

Perennial herbs or undershrubs. **Leaves** entire to faintly crenate. **Inflorescence** axillary, monochasial cymes, sometimes congested, sometimes somewhat spinescent; bracts present; bracteoles 0. **Calyx** subregular; lobes 5, unequal, usually with posticous one longer and broader than others and with lateral ones often pointed or spinescent; tube shorter than lobes. **Corolla** 2-lipped; upper lip ovate-oblong, emarginate, rugula distinct; lower lip 3-lobed, with 2 deep channels on outside; aestivation imbricate; tube longer than lobes, cylindric below, broadened above, often with stiff, deflexed hairs at top of cylindric part. **Androecium**: fertile stamens 4, didynamous; filaments arising in pairs ± in middle of corolla tube, slightly exserted, linear; anthers 2-thecous or rarely those of posticous stamens monothecous; thecae parallel, muticous; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface with shallow reticulations. **Disc** annular. **Gynoecium**: ovary with (1)2 ovules in each locule, usually hairy at tip; style terete, slightly exserted, running in rugula; style branch 1, ventral lobe flattened and expanded. **Capsule** ovoid or elliptic, estipitate, with inelastic placental bases. **Seeds** ovoid or suborbicular, with hygroscopic hairs over whole surface. $x = 10, 11$ (12) (polyploidy).

Species ± 100, fairly cosmopolitan in warm and tropical areas; 2 in sthn Afr., Namibia, Botswana, Swaziland and northern and eastern provinces of South Africa.

Mackaya Harv. 8039000

Harvey: 8, t. 13 (1859); Clarke: 44 (1901).

Shrub. **Leaves** petiolate, elliptic or elliptic-lanceolate, acuminate, undulate-crenate. **Inflorescence** terminal, monochasial cymes; bracts 2, subulate; bracteoles 2. **Calyx** regular, hairy; lobes 5, linear-lanceolate, acuminate; tube shorter than lobes. **Corolla** subregular, lobes 5, ovate or oblong; aestivation ascending; tube longer than lobes, cylindric below, campanulate above. **Androecium**: fertile stamens 2, arising at base of campanulate part of corolla tube, ± included; filaments linear; anthers 2-thecous; thecae parallel, muticous; staminodes 2. **Pollen** spheroidal, 3-colporate, with pseudocolpi; surface reticulate. **Disc** annular. **Gynoecium**: ovary with 1 or 2 ovules in each locule; style terete, hairy or nearly glabrous below; style branches 2, equal, cylindriform. **Cap-**

sule woody, ellipsoid, long-stipitate, with inelastic placental bases. **Seeds** ± ovate, asymmetrical at base; surface rough and convolute or rugose. $x = 7$ or 12 (1 report, polyploidy).

Species 1: *Mackaya bella* Harv., Swaziland and northern and eastern provinces of South Africa.

Megalochlamys Lindau 8061000

Lindau: 345 (1899); Vollesen: 605 (1989).

Suffrutices or shrubs. **Leaves** entire, often with conspicuous linear cystoliths. **Inflorescence** terminal, spicate; bracts elliptic to ovate, sometimes large with cordate base; bracteoles 2, subulate. **Calyx** regular, scabrous or pubescent; lobes 5, linear or linear-lanceolate; tube shorter than lobes. **Corolla** 2-lipped; upper lip ovate-oblong, subentire; lower lip 3-fid; aestivation ascending; tube longer than lobes, cylindric. **Androecium**: fertile stamens 2, long-exserted; anthers 2-thecous; thecae parallel, muticous; staminodes 0. **Pollen** prolate, 3-colporate; surface reticulate. **Disc** cupular. **Gynoecium**: ovary occasionally with 1 or with 2 ovules in each locule, glabrous; style branches 2, equal, expanded. **Capsule** subglobose, stipitate, with inelastic placental bases. **Seeds** compressed, orbicular; surface smooth.

Species 10, Africa and Arabian Peninsula; 4 in sthn Afr., Namibia, Botswana and Northern Province.

Metarungia Baden 8030000

Baden: 638 (1984); Baden: 3 (1995b).

Macrorungia C.B.Clarke in part: 254 (1900).

Shrubs or subshrubs. **Leaves** sessile, subsessile or petiolate. **Inflorescence** terminal or axillary, strobilaceous thyrses or spicate; bracts sessile, imbricate, with hyaline, pale membranous margin. **Calyx** regular; lobes 5; tube shorter than lobes. **Corolla** 2-lipped, yellowish brown; upper lip continuing the tube, arched, emarginate, rugula distinct; lower lip narrowly obovate, 3-lobed; aestivation ascending; tube shorter than lobes, with 2 lateral evaginations from outside. **Androecium**: fertile stamens 2, arising at top of tube; filaments broadly linear; anthers 2-thecous; thecae subparallel, oblong, muticous; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** cupular, with V-shaped slit and 2 awns. **Gynoecium**: ovary ovoid, with 2 ovules in each locule; style filiform, running in rugula; style branches 2, equal, expanded, very short, broader than long. **Capsule** woody, obovoid to oblongoid, stipitate, with elastic placental bases. **Seeds** compressed; surface rough and convolute or rugose.

Species 3, Africa; 2 in sthn Afr., Northern Province, Mpumalanga, Swaziland and Eastern Cape.

Monechma Hochst. 8094010

Hochstetter: 374 (1841); Munday: 47 (1995).

Herbs, undershrubs or shrubs. **Leaves** flat or rarely terete, entire, rarely with rudimentary teeth. **Inflorescence** axillary, reduced scorpioid cymes or flowers solitary; bracts and bracteoles usually small, rarely bracteoles 0. **Calyx** ± regular, usually with stalked, glandular hairs; lobes 4 or 5; tube shorter than lobes. **Corolla** 2-lipped, hairy; upper lip entire, truncate or emarginate, rugula distinct; lower lip 3-lobed with middle lobe pinnately ribbed; aestivation ascending; tube broadly cylindric, shorter than lobes; limb irregular. **Androecium**: fertile stamens 2, arising in mouth of corolla tube, ± included; filaments linear; anthers 2-thecous; thecae superposed, tailed or muticous; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** deeply cupular, with V-shaped slit, with 2 awns. **Gynoecium**: ovary ± ellipsoid, with 1(2) ovules in each locule; style terete, running in rugula, included; style branches 2, equal, very short, broader than long. **Capsule** subglobose, 2-seeded or 1-seeded by abortion, stipitate, with inelastic placental bases. **Seeds** compressed, orbicular; surface smooth, sometimes speckled. $x = 11$ (1 report).

Species ± 40, mainly Africa, also India; 19 in sthn Afr., widespread, but not in Lesotho.

Nelsonia R.Br. 7909000

Brown: 480 (1810); Vollesen: 315 (1994b).

Diffuse, softly villous herb. **Leaves** elliptic, entire. **Inflorescence** terminal, ovate or cylindric spikes; bracts ovate, glandular, villous, closely imbricate; bracteoles 0. **Calyx** irregular; lobes 4, free almost to base; adaxial and abaxial lobes large, adaxial one often bifid; lateral lobes small, lanceolate. **Corolla** 2-lipped, small, purplish, rose or white; lobes 5, obtuse, spreading; tube slender, ± equal to lips. **Androecium**: fertile stamens 2, arising above middle of tube; anthers 2-thecous; thecae parallel, broadly elliptic and somewhat divergent, sometimes ciliate, with minute tail or muticous; staminodes 0. **Disc** annular. **Pollen** prolate, 3-colporate; surface foveolate. **Gynoecium**: ovary with 8–10 ovules in each locule; style branches 2; ventral lobe more developed, expanded. **Capsule** oblong, slightly beaked, bearing seeds from base, empty above, estipitate; with inelastic placental bases; retinacula 0. **Seeds** small, ellipsoid; surface convolute or rugose, with hygroscopic glochidiate hairs over whole surface. $x = 17$ (B-chromosomes).

Species 5, Africa, India, Australia, South America; 1 in sthn Afr.: *Nelsonia canescens* (Lam.) Spreng., Namibia (Caprivi) and N Botswana.

Neuracanthus Nees 7977000

Nees von Esenbeck: 76 (1832); Clarke: 137 (1899); Bidgood & Brummitt: 1 (1998).

Shrublets, sometimes with prostrate branches, usually with woody rootstock. **Leaves** entire to faintly toothed. **Inflorescence** axillary, spicate, dense, unilateral; bracts sometimes spinescent; bracteoles 0. **Calyx** irregular, 2-lipped, pilose; upper lip 3-fid; lower lip 2-fid; tube shorter than lobes. **Corolla** subregular; lobes 5, triangular; aestivation induplicate; tube longer than lobes, ± funnel-shaped, with reflexed hairs inside and outside. **Androecium**: fertile stamens 4, didynamous; filaments arising in pairs in upper part of corolla tube, scarcely longer than anthers, included, bifurcate; upper pair of anthers 2-thecous; lower pair monothecous or with rudimentary second theca; thecae parallel, ciliate, muticous; staminodes 0. **Pollen** spheroidal, 3-colporate; surface foveolate. **Disc** annular. **Gynoecium**: ovary oblong in outline, with 2, or occasionally 1, ovules in each locule; style terete, included; stigma with a single flattened lobe, longer than broad. **Capsule** ovoid, compressed, with beak, estipitate, with inelastic placental bases. **Seeds** discoid, with hygroscopic hairs over whole surface.

Species ± 20, Africa, Arabian Peninsula to India; 1 in sthn Afr.: *Neuracanthus africanus* S.Moore, Northern Province.

Peristrophe Nees 8026000

Nees von Esenbeck: 112 (1832); Clarke: 84 (1901); Balkwill: 83 (1996).

Herbs or subshrubs, sometimes scrambling or procumbent, and rooting at nodes. **Leaves** entire. **Inflorescence**

axillary, umbel-like group of monochasial cymes; primary bracts foliaceous, secondary bracts usually linear-lanceolate, tertiary bracts ovate, elliptic, or linear-lanceolate, quaternary bracts linear-lanceolate. **Calyx** regular; lobes 5, linear-lanceolate; tube shorter than lobes. **Corolla** 2-lipped, resupinate, hairy; upper lip 3-toothed or shortly 3-lobed, rugula indistinct; lower lip entire or emarginate; aestivation ascending; tube shorter than lobes, cylindric below, somewhat campanulate above. **Androecium**: fertile stamens 2, arising in corolla throat, exserted; filaments linear, thinly hairy; anthers 2-thecous; thecae superposed, muticous; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** cupular, with V-shaped slit, with 2 awns. **Gynoecium**: ovary ellipsoid, with 2 ovules in each locule; style filiform, exserted; style branches 2, equal, cylindriform, longer than broad. **Capsule** stipitate, with inelastic placental bases. **Seeds** discoid; surface rough and tuberculate. $x = 10$ (polyploidy).

Species ± 15, Africa to East Indies; 11 in sthn Afr., Namibia, Botswana and northern and eastern provinces of South Africa.

Petalidium Nees 7934000

Nees von Esenbeck: 75 (1832); Obermeyer: 151 (1936); Meyer: 50 (1968).

Pseudobarleria T.Anderson: 26 (1864).

Shrublets or procumbent, perennial herbs. **Leaves** varying from ovate to linear. **Inflorescence** axillary, scorpioid or dichasial cymes, with few to many flowers; lower bracts present or 0, ultimate 2 bracts large, enclosing calyx. **Calyx** regular, glandular; lobes 4 or 5, when 4 then anticous one usually bifid or 2-toothed and lateral ones smaller; tube shorter than lobes. **Corolla** ± 2-lipped; upper lip 2-lobed; lower lip 3-lobed, with palate transversely ribbed and furnished with retrorse hairs; lobes obovate, obtuse or emarginate; aestivation contorted; rugula indistinct; tube longer than lobes, straight or curved, usually cylindric below and campanulate above. **Androecium**: fertile stamens 4, didynamous, arising at ± middle of corolla tube, included; filaments arising in pairs, broadly linear; anthers 2-thecous; thecae parallel, muticous or mucronate at base; staminodes 0. **Pollen** prolate, 3-porate, with pseudocolpi; pore lipped; surface reticulate. **Disc** annular. **Gynoecium**: ovary with 2 ovules in each locule; style terete, pubescent; style branches 2, equal, cylindriform. **Capsule** estipitate, compressed, narrowed at base and apex, with elastic placental bases. **Seeds** orbicular, with hygroscopic hairs over whole surface. $x = 8$ (polyploidy).

Species ± 35, Africa to India; 28 in sthn Afr., mainly Namibia, Botswana and arid northern and western parts of South Africa.

Phaulopsis Willd. 7932000

Willdenow: 342 (1800) name and orthography conserved; Manktelow: 1 (1996).

Scrambling or erect. **Leaves**: usually leaves of each pair unequal. **Inflorescence** axillary, partially reduced dichasial cymes subtended by a foliaceous bract. **Calyx** irregular, 2-lipped; upper lip of 4 lobes and lower of 1 much enlarged lobe, glandular-hairy, persistent; tube shorter than lobes. **Corolla** ± 2-lipped; upper lip 2-lobed; lower 3-lobed; lobes oblong or spatulate; aestivation contorted; rugula indistinct; tube longer than lobes, curved. **Androecium**: fertile stamens 4, didynamous, arising ± at middle of corolla tube, included; filaments arising in pairs, linear; anthers 2-thecous; thecae parallel, muticous and sometimes mucronate at base; staminodes 0. **Pollen** prolate, 3-(col)porate, with pseudocolpi; pore lipped; surface reticulate. **Disc** annular, with projection that might represent a fifth stamen. **Gynoecium**: ovary ellipsoid, with 2 ovules in each locule; style terete, finely pilose; style branch 1; ventral lobe sometimes expanded. **Capsule** estipitate, with elastic placental bases. **Seeds** compressed orbicular, with hygroscopic hairs over whole surface. $x = 17$ (1 report).

Species ± 20, Africa to India; 3 in sthn Afr., N Namibia, Swaziland and northern and eastern provinces of South Africa.

Pseuderanthemum Radlk. 8024000

Radlkofer: 282 (1883); Milne-Redhead: 255 (1936); Edwards & Harrison: 187 (1998).

Undershrubs. **Leaves** shortly petiolate. **Inflorescence** terminal thyrses; bracts and bracteoles present. **Calyx** regular; lobes 5; tube shorter than lobes. **Corolla** 2-lipped; lobes 5, subequal; aestivation ascending; rugula indistinct; tube longer than lobes, long-cylindric; small, cleistogamous flowers usually present. **Androecium**: fertile stamens 2, arising in throat of corolla; filaments linear; anthers 2-thecous; thecae parallel, muticous; staminodes 2. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** shallowly cupular. **Gynoecium**: ovary oblong, with 2 ovules in each locule; style branches 2, equal (occasionally unequal); ventral lobe more developed, expanded. **Capsule** long-stipitate, with inelastic placental bases. **Seed** surface rough and convolute or rugose. $x = 7$ (polyploidy).

Species ± 60, cosmopolitan in tropics; 2 in sthn Afr., KwaZulu-Natal.

Rhinacanthus Nees 8054000

Nees von Esenbeck: 76 (1832); Balkwill: 11 (1995).

Herbs or suffrutices, often with ribbed branches. **Leaves** petiolate, entire or obscurely undulate-crenate. **Inflorescence** terminal, panicles or scorpioid cymes of monochasial cymes or thyrses; bracts and bracteoles small, linear. **Calyx** regular, hairy or with stalked glands; tube shorter than lobes; lobes 5, linear-lanceolate. **Corolla** 2-lipped, pilose; upper lip entire or emarginate, rugula distinct; lower lip 3-lobed; aestivation ascending; tube much longer than lobes, cylindric. **Androecium**: fertile stamens 2, arising in mouth of corolla, exserted; filaments linear; anthers 2-thecous; thecae superposed, muticous; staminodes 0. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** shallowly cupular, with V-shaped slit, sometimes with 2 awns. **Gynoecium**: ovary with 2 ovules in each locule, ± ellipsoid, hairy; style filiform, running in rugula, exserted; style branches 2, equal, cylindriform, longer than broad. **Capsule** oblong, hairy, stipitate, with inelastic placental bases. **Seeds** suborbicular or transversely oblong; surface rough and tuberculate. $x = 10$ (polyploidy).

Species ± 22, Africa to Asia; 3 in sthn Afr., N Namibia, Swaziland, northern and eastern provinces of South Africa.

Ruellia L. 7965000

Linnaeus: 634 (1753); Clarke: 11 (1901); Meyer: 63 (1968).

Dinteracanthus C.B.Clarke ex Schinz: 416 (1915).

Shrubs, undershrubs or herbs, with taproot or woody rootstock. **Leaves** entire or slightly crenate. **Inflorescence** terminal or axillary, thyrses, dichasial cymes or solitary flowers; bracteoles 2, spatulate-elliptic or narrowly oblong, ± as long as calyx. **Calyx** ± 2-lipped; with 2 segments free nearly to base and 3 teeth connate nearly to middle; tube shorter than lobes. **Corolla** regular, subregular or 2-lipped; lobes 5, obovate; aestivation contorted; tube longer than lobes, cylindric below. **An-**

droecium: fertile stamens 4, didynamous; filaments arising in pairs, ± in middle of corolla tube, slightly exserted, linear; anthers 2-thecous; thecae parallel, muticous; staminodes 0. **Pollen** spheroidal, 3-porate; surface with large reticulations. **Disc** annular. **Gynoecium**: ovary with 3–8 ovules in each locule; style terete; style branch 1; ventral lobe expanded. **Capsule** subcylindric, elliptic or clavate, usually perfecting more than 4 seeds, estipitate, with inelastic placental bases. **Seeds** compressed, discoid, with hygroscopic hairs restricted to rim; rest of surface smooth. $x = 17$ (11, 16).

Species ± 150, America, Africa, Asia and Australia; ± 15 in sthn Afr., Namibia, Botswana, Swaziland and widespread mainly in northern and eastern provinces of South Africa.

Ruelliopsis C.B.Clarke 7946000

Clarke: 59 (1899); Meyer: 65 (1968).

Shrublets; stems sometimes procumbent from woody rootstock and rooting at nodes. **Leaves** linear, entire, usually setose. **Inflorescence** axillary, dichasial cymes or solitary flowers; bracts linear, longer than calyx; bracteoles ± as long as calyx. **Calyx** subregular; lobes 5, linear, setose; tube shorter than lobes. **Corolla** subregular; lobes 5, obovate; aestivation contorted; tube longer than lobes, narrow, widening above. **Androecium**: fertile stamens 4, didynamous; filaments arising in pairs, in upper part of corolla tube, included; anthers 2-thecous; thecae parallel, muticous or spurred; staminodes 0. **Pollen** spheroidal, 3-porate, with many pseudocolpi; pore lipped; surface reticulate. **Disc** annular. **Gynoecium**: ovary with 1–4 ovules in each locule; style terete, slightly exserted; style branch 1, ventral lobe flattened, longer than broad. **Capsule** cylindric, estipitate, with inelastic placental bases. **Seeds** compressed, orbicular, with hygroscopic hairs over whole surface. $x = 17$ (16, 18).

Species 2 or 3, Africa; 2 in sthn Afr., Namibia, Botswana and mainly northern and western parts of South Africa.

Ruspolia Lindau 8022000

Lindau: 79 (1896); Milne-Redhead: 255 (1936).

Subshrubs. **Leaves** shortly petiolate. **Inflorescence** terminal thyrses; bracts and bracteoles present. **Calyx** regular, hairy, sometimes glandular; lobes 5; tube shorter than lobes. **Corolla** 2-lipped; lobes 5, oblong; aestivation ascending; tube much longer than lobes, cylindric, glandular. **Androecium**: fertile stamens 2; arising in throat of corolla, exserted; filaments linear; anthers monothecous; thecae muticous; staminodes 2. **Pollen** prolate, 3-colporate, with pseudocolpi; surface reticulate. **Disc** shallowly cupular. **Gynoecium**: ovary with 2 ovules in each locule; style filiform, exserted; style branches 2, equal, very short, broader than long. **Capsule** club-shaped, stipitate, with inelastic placental bases. **Seeds** semi-orbicular, compressed, with somewhat horny margin, smooth on outer surface, rough and convoluted or rugose on inner surface.

Species 4, Africa, Madagascar; 3 in sthn Afr., N Botswana and Northern Province of South Africa.

Ruttya Harv. 8063000

Harvey: 27 (1842); Clarke: 55 (1901).

Suffrutices or shrubs. **Leaves** petiolate, entire. **Inflorescence** terminal, thyrses; bracts and bracteoles small, linear. **Calyx** regular, glabrous; lobes 5, linear; tube shorter than lobes. **Corolla** 2-lipped, glabrous or nearly so; upper lip emarginate or deeply 2-lobed, rugula indistinct; lower lip 3-lobed; lobes oblong, ± as long as tube; aestivation ascending; tube narrowly campanulate. **Androecium**: fertile stamens 2, arising in mouth of corolla, exserted; filaments broadly linear; anthers monothecous; theca muticous; staminodes 2. **Pollen** spheroidal, 3-colporate, with pseudocolpi; surface reticulate. **Disc** saucer-shaped, unusually large, with a projection perhaps representing a fifth stamen. **Gynoecium**: ovary with 2 ovules in each locule; style terete, exserted, thinly hairy on lower part; style branches 2, equal, very short, broader than long. **Capsule** club-shaped, stipitate, with inelastic placental bases; stalk long. **Seeds** compressed, elliptic, dorsiventral, rimmed; surface smooth.

Species 3, Africa; 1 in sthn Afr.: *Ruttya ovata* Harv., Swaziland and northern and eastern provinces of South Africa.

× **Ruttyruspolia** A.Meeuse & De Wet 8063010

Meeuse & De Wet: 439 (1961).

The essential difference between *Ruttya* and *Ruspolia*, is a 2-lipped corolla in *Ruttya* with a short broad tube widening gradually to the throat and in *Ruspolia* a subequally 5-lobed corolla with a narrowly cylindric tube. Both the wild and artificial hybrids have most of the morphological characters of the *Ruspolia* parent.

Only from Soutpansberg (Northern Province), × *Ruttyruspolia 'Phyllis van Heerden'* A.Meeuse & De Wet.

Salpinctium T.J.Edwards 8007010

Edwards & Getliffe Norris: 6 (1989).

Erect perennial herbs; stems branching from base, glabrous to densely pubescent. **Leaves** usually petiolate, elliptic to trullate, with cordate or widely rounded bases, entire. **Inflorescence** terminal, rarely branched, spikes with 5–20 flowers in decussate pairs; bracts linear to very narrowly lanceolate; bracteoles minute, linear. **Calyx** regular, persistent; lobes 5, linear, glabrous or glandular-pubescent; tube shorter than lobes. **Corolla** 2-lipped; upper lip 2-lobed, rugula indistinct; lower lip longer and unequally 3-lobed and with a poorly developed palate and faint nectar guides; aestivation ascending; tube longer than lobes, linear, pubescent without, glabrous within. **Androecium**: fertile stamens 4, didynamous; filaments arising in pairs, glabrous; anthers 2-thecous; thecae subparallel, muticous; staminodes 0. **Pollen** spheroidal, 2-porate with processes associated with pores; pseudocolpi present; surface reticulate. **Disc** cupular. **Gynoecium**: ovary with 2 ovules in each locule, oblong, glabrous or pubescent; style branches 2, equal, cylindriform, longer than broad. **Capsule** stipitate, with inelastic placental bases. **Seeds** reniform or pyriform, laterally compressed; surface rough and tuberculate.

Species 3, sthn Afr., Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Sclerochiton Harv. 7978000

Harvey: 27 (1842); Hilliard & Burtt: 109 (1970); Vollesen: 1 (1991).

Subshrubs, sometimes diffuse and scrambling. **Leaves** ± anisophyllous, entire or rarely dentate. **Inflorescence** terminal, spicate, sometimes reduced; bracts ovate or 0; bracteoles 2, ovate, shorter than calyx. **Calyx** regular; lobes 5, sometimes unequal, sometimes chartaceous and ribbed, with 2 outer segments sometimes bifid at apex; tube shorter than lobes. **Corolla** 1-lipped; lobes 5, oblong; aestivation imbricate; tube shorter than lobes. **Androecium**: fertile stamens 4, equal or subequal, arising in middle of corolla tube, exserted; filaments broadly linear; anthers monothecous; theca ciliate, muticous;

staminodes 0. **Pollen** prolate, 3-colpate; surface with shallow reticulations. **Disc** annular. **Gynoecium**: ovary ellipsoid, swollen at base, with 1 or 2 ovules in each locule, with large sessile glands near tip; style linear, exserted; style branches 2, equal, cylindriform. **Capsule** woody, ellipsoid, estipitate, with inelastic placental bases. **Seeds** oblong, flattened, oblique at base, without hygroscopic hairs; surface rough and convolute or rugose. $x = 6$ or 7 (1 report, polyploidy).

Species ± 12, Africa: 6 in sthn Afr., Swaziland and northern and eastern provinces of South Africa.

Siphonoglossa Oerst. 8049000

Oersted: 159 (1854); Immelman: 6 (1995b).

Aulojusticia Lindau: 324 (1897).

Undershrubs or herbs. **Leaves** opposite, petiolate, entire. **Inflorescence** axillary, solitary flowers or dichasial cyme; bracts and bracteoles linear. **Calyx** regular, sparsely hairy; tube shorter than lobes, lobes 4 or 5, linear-lanceolate. **Corolla** 2-lipped, glabrous or hairy; upper lip linear-oblong, entire or 2-fid, rugula distinct; lower lip 3-lobed, with middle lobe ovate, and lateral lobes oblong; aestivation ascending; tube long, narrowly cylindric. **Androecium**: fertile stamens 2, arising in mouth or throat of corolla tube, exserted; filaments linear; anthers 2-thecous; thecae superposed, tailed or muticous; staminodes 0. **Pollen** prolate, 2-colporate, with pseudocolpi; surface reticulate. **Disc** deeply cupular, with V-shaped slit, with 2 awns. **Gynoecium**: ovary ± ellipsoid, with 2 ovules in each locule; style terete, long-filiform, running in rugula, exserted; style branches 1 or 2, ventral lobe more developed, cylindriform. **Capsule** oblong, slightly beaked, stipitate, with inelastic placental bases. **Seeds** obovate; surface rough and convolute or rugose. $x = 11$ (14) (polyploidy).

Species ± 8, Africa and America; 3 in sthn Afr., Swaziland and eastern provinces of South Africa south to ± Knysna (Western Cape).

Thunbergia Retz. 7914000

Retzius: 163 (1780) name conserved; Retief & Reyneke: 107 (1984).

Suberect, rambling, twining or scandent herbs or suffrutices. **Leaves** ovate to lanceolate, sometimes cordate or hastate. **Inflorescence** terminal, compound monochasial cymes or thyrses or of solitary, axillary flowers with long pedicels; bracts 2, large, elliptic or ovate, surrounding each flower and hiding calyx. **Calyx** regular, usually with a shallow tube with 10–18 linear teeth or rarely shallowly cupular with 5 broad lobes. **Corolla** regular or subregular; lobes 5, obovate, spreading, contorted in bud; tube much longer than lobes, usually cylindric at base, funnel-shaped above. **Androecium**: fertile stamens 4, didynamous (arising in pairs) or subdidynamous; arising in lower part of corolla tube, included; filaments broadly linear; anthers 2-thecous; thecae parallel, each apiculate or with 1 apiculus and 2-spurred at base, with connective usually produced into an appendage, ciliate, or covered with multicellular hairs, which are sometimes club-shaped; staminodes 0. **Pollen** spheroidal; 3-colpate, surface foveolate, pusticulate or spinose. **Disc** deeply cupular. **Gynoecium**: ovary with 2 ovules in each locule; style terete, included; stigma funnel-shaped, with 2 infolding lobes and a tuft of hairs on each lobe and with stalked glands or stigma of 2 unequal lobes, one above the other. **Fruit** a globose capsule, abruptly rostrate, estipitate, with inelastic placental bases; retinacula 0. **Seeds** thick, broadly elliptic, with a cavity or groove on one face and convex on the other; surface rugose and sometimes tuberculate. $x = 8$, 9 (7, 10) (high polyploidy).

Species ± 100, Old World tropics; 11 in sthn Afr., Namibia, Botswana, Swaziland and northern and eastern provinces of South Africa.

Achariaceae

(Dilleniidae—Violales)

Compiled by R.H. Archer

Herbaceous climbers or shrubby or acaulescent herbs, monoecious, with or without tendrils. **Leaves** alternate or rosulate, simple, sometimes palmately lobed, crenate or serrate; with or without stipules. **Flowers** unisexual, regular, solitary or few, or shortly racemose, axillary; male flowers without rudiments of gynoecium, female flowers without rudimentary stamens or staminodes. **Calyx** 3–5-parted; sepals usually linear. **Corolla** sympetalous, 3- or 4-lobed; tube campanulate; petals as long as tube or shorter. **Stamens** 3–5; filaments arising at base or in throat of corolla tube; anthers 2-thecous, connective often broadly expanded; glands at base of corolla tube. **Ovary** superior, 1-locular, of 3–5 fused carpels, with 3–15 ovules on 3–5 parietal placentas; style 1, 3–5-lobed, with lobes sometimes 2-fid. **Fruit** a septicidal capsule, enclosed in persistent corolla. **Seeds** subglobose, pitted or tubercled, often arillate; embryo straight, cotyledons flat; endosperm present.

Genera 3, species 3, sthn Afr.; widespread but rarely common.

Harvey: 501 (1862) under Passifloreae; Killick: 128 (1976); Dahlgren & Van Wyk: 11 (1988).

Key to genera

1a Acaulescent perennial herbs with radical leaves ..... **Guthriea**
1b Herbaceous shrublets or climbers:
2a Male flowers in short racemes; corolla lobes ciliate, not winged; herbaceous climbers ..... **Ceratiosicyos**
2b Male flowers solitary or few together in axils; corolla lobes usually slightly winged or keeled; herbaceous shrublets..... **Acharia**

Acharia Thunb. 5375000

Thunberg: 14 (1794); Harvey: 501 (1862); Killick: 130 (1976).

Shrubby herbs. **Leaves** simple, petioled, deeply palmately lobed, toothed; stipules linear. **Flowers** solitary or few, cernuous. **Male flowers**: sepals 3 or 4, linear, recurved; corolla 3- or 4-lobed, pubescent, persistent, tube campanulate, lobes ± as long as tube, ovate, slightly winged or keeled; glands 3 or 4, ciliate, at base of corolla tube; stamens 3 or 4, free, anthers oblong, didymous; ovary absent. **Female flowers**: sepals 3 or 4, hairy, lanceolate, larger than in male flowers; corolla pubescent, larger than in male flowers; tube campanulate, winged; glands at base of corolla tube; ovary subsessile, somewhat compressed, with 3–5 ovules on 3–5 parietal placentas, pubescent; style about as long as ovary, 3–5-lobed. **Fruit** a capsule enclosed in persistent corolla, 3–5-valved, with persistent style. **Seeds** subglobose, pitted, narrowly winged (arillate) on one side, pubescent.

Monotypic: *Acharia tragodes* Thunb., endemic to sthn Afr., Northern Province, Mpumalanga, KwaZulu-Natal to Eastern Cape.

Ceratiosicyos Nees 5374000

Nees ab Esenbeck: 281 (1836); Harvey: 501 (1862); Marloth: 199 (1925); Killick: 128 (1976).

Slender, herbaceous climbers, with or without tendrils. **Leaves** usually palmately 5–7-lobed, with lobes acuminate and serrate, rarely simple, usually long-petioled. **Male flowers** in short racemes; sepals 4 or 5, linear, spreading; corolla 4- or 5-lobed, tube campanulate, lobes ± as long as tube, ovate-oblong, ciliate, cohering by cilia; stamens 5, arising at base of corolla tube, alternat-

ing with ellipsoid glands, adnate to corolla tube, filaments slightly dilated upwards, anthers oblong, cohering; ovary absent. **Female flowers** solitary; calyx rudimentary; corolla as for male; stamens absent; glands 5, linear, ± $^3/_4$ length of corolla tube; ovary shortly stalked, ± cylindric, with several ovules on 4 or 5 parietal placentas; styles 4, short, 2-lobed. **Fruit** a 4- or 5-valved, elongate, ribbed capsule. **Seeds** several, subglobose, narrowly winged above, tubercled.

Monotypic: *Ceratiosicyos laevis* (Thunb.) A.Meeuse, endemic to sthn Afr., Namibia, Northern Province, Mpumalanga, KwaZulu-Natal, Eastern and Western Cape.

Guthriea Bolus 5376000

Bolus: t. 1161 (1876); Killick: 132 (1976).

Acaulescent perennial herbs with a subhorizontal rhizome and fleshy roots. **Leaves** rosulate, simple, ovate or cordate, petiolate, discolorous, crenate. **Flowers** solitary, pedicelled. **Male flowers**: sepals 5, linear, almost as long as corolla and adnate to it for almost its whole length; corolla 5-lobed, profusely veined, tube deeply campanulate, lobes shorter than tube, reflexed; glands 5, fleshy, situated at base of corolla tube; stamens 5, filaments arising in throat of corolla, shorter than anthers, flattened, anthers didymous with broad connective, pectinate. **Female flowers**: sepals 4 or 5, linear, adnate to corolla for half their length; corolla 4- or 5-lobed, tube campanulate, lobes much shorter than tube, transversely oblong, erect; glands 4 or 5, fleshy, situated at base of corolla tube; ovary sessile, with 10–15 ovules on 4 or 5 parietal placentas; style broadly linear, 4- or 5-lobed. **Fruit** a 4- or 5-valved capsule, enclosed in persistent corolla. **Seeds** several, ellipsoid, arillate.

Monotypic: *Guthriea capensis* Bolus, endemic to sthn Afr., damp, mountainous situations, KwaZulu-Natal, Lesotho, NE Western and Eastern Cape.

Aizoaceae

(Caryophyllidae—Caryophyllales)

Compiled by L.L. Dreyer & M. Jordaan

Annual or perennial herbs, undershrubs or sometimes shrubs. **Leaves** alternate, opposite or crowded, sometimes very small, simple and entire, sometimes somewhat succulent, epidermis mostly with bladder idioblasts; stipules 0 or represented by membranes at base of petiole (*Sesuvium, Trianthema, Zaleya*). **Flowers** regular, mostly bisexual, perigynous, (semi)epigynous or rarely hypogynous, solitary, in cymes, fascicles or pedunculate clusters, rarely a spike (*Tetragonia*). **Perianth** elements (3–)5(–8), usually basally united, internally petaloid, externally sepaloid. **Stamens** 5–many; filaments free or variously united, anthers tetrasporangiate, opening by longitudinal slits. **Ovary** inferior to superior, 2–many-locular, with 1–many styles, free or fused at base; ovules 1–many per locule, sometimes pendulous; placentation axile, basal or parietal. **Fruit** mostly a loculicidal, sometimes septicidal or circumscissile, sometimes hygrochastic capsule, sometimes a horn-shaped or winged nut. **Seeds** with or without aril, with short funicle in *Tetragonia* and *Tribulocarpus*; perisperm copious, true endosperm ± 0.

Genera 12, species ± 174, cosmopolitan, prominent in the tropics and subtropics of the southern hemisphere, with a centre of diversity in Africa; sthn Afr.: genera 10, species ± 120, widespread.

Rudolphi: 53 (1830); Sonder: 387 (1862); Pax & Hoffmann: 179 (1934); Phillips: 285 (1951); Adamson: 109 (1955); Adamson: 87 (1956); Adamson: 23 (1959a); Adamson: 29 (1959b); Adamson: 147 (1961); Jeffrey: 1 (1961); Friedrich: 1 (1967); Gonçalves: 322 (1970); Gonçalves: 508 (1978); Friedrich: 1 (1970); Bittrich & Hartmann: 250 (1988); Hartmann: 44 (1993); Gilbert: 111 (1993).

Controversy prevails around the delimitation of the Aizoaceae in a broad sense, with different authors favouring different interpretations. This is reflected in the references cited here for the Aizoaceae in a strict sense: Rudolphi: 53 (1830) (Aizoaceae); Sonder: 386 (1862) (Mesembryaceae); Phillips: 285 (1951) (Aizoaceae including Molluginaceae and Tetragoniaceae); Adamson: 109 (1955) (Aizoaceae); 88 (1956) (Aizoaceae); 11 (1958a) (Aizoaceae); 67 (1958b) (Aizoaceae); 23 (1959) (Aizoaceae); 17 (1960) (Molluginaceae); 125 (1961) (Aizoaceae); Jeffrey: 1 (1961) (Aizoaceae including Molluginaceae and Tetragoniaceae); Friedrich: 1 (1967) (Tetragoniaceae); 1 (1970) (Aizoaceae); Dyer: 77 (1975) (Aizoaceae including Molluginaceae and Gisekiaceae, excluding Mesembryanthemaceae); Gonçalves: 508 (1978) (Aizoaceae in strict sense, excluding Molluginaceae, Mesembryanthemaceae and Tetragoniaceae); Bittrich & Hartmann: 239 (1988) (Aizoaceae including Mesembryanthemaceae and Tetragoniaceae, excluding Molluginaceae and the genus *Gisekia*); Hartmann: 44 (1993) (Aizoaceae including Mesembryanthemaceae and Tetragoniaceae, excluding Molluginaceae and the genus *Gisekia*); Gilbert: 111 (1993) (Aizoaceae including Mesembryanthemaceae and Tetragoniaceae, excluding Molluginaceae and Gisekiaceae).

The Aizoaceae in a strict sense, as accepted here, includes the subfamilies Aizooideae, Sesuvioideae and Tetragonioideae recognised by Bittrich & Hartmann: 239 (1988). The families Mesembryanthemaceae, Molluginaceae and Gisekiaceae are recognised as separate families and are treated as such in this publication.

Classification of Aizoaceae (excl. Mesembryanthemaceae) [after Bittrich & Hartmann (1988) in part]

I. Subfamily AIZOOIDEAE (Fruit a loculicidal or septicidal capsule; aril absent; inflorescences of bisexual flowers only): *Acrosanthes, Aizoanthemum, Aizoon, Galenia, Plinthus*

II. Subfamily SESUVIOIDEAE (Fruit a circumscissile capsule; seed completely covered by an aril): *Sesuvium, Trianthema, Zaleya*

III. Subfamily TETRAGONIOIDEAE (Fruit a nut, winged or horned; aril absent; inflorescences often andromonoecious): *Tetragonia, Tribulocarpus*

Key to genera

1a Fruit indehiscent, a winged or horned nut; plants often andromonoecious:
2a Fruit derived from a single ovary, winged, ridged or horned; perianth with free or only basally connate lobes ..... **Tetragonia**
2b Fruit compound, derived from a complete inflorescence including the bracts and bracteoles, spiny; perianth connate for ± half its length ..... **Tribulocarpus**
1b Fruit a capsule; inflorescence of bisexual flowers only:
3a Capsule circumscissile; aril present, covering the seeds completely:
4a Operculum of capsule breaking into 2 parts; 4 seeds per fruit ..... **Zaleya**
4b Operculum of capsule breaking off in 1 piece; many seeds per fruit ..... **Sesuvium**
3b Capsule loculicidal or septicidal, often hygrochastic; seeds never arillate:
5a Ovary locules 1; placentation parietal ..... **Trianthema**
5b Ovary locules 2 or more; placentation basal or ovules pendulous:
6a Fruit with septa incomplete, locules 2 with a single basal ovule each ..... **Acrosanthes**
6a Fruit with septa complete, locules mostly more than 2; ovules pendulous:
7a Capsules 5–10-locular; with 2–many ovules in each locule; distinct expanding keels present:
8a Capsules depressed at apex, if not then valves with prominent rims ..... **Aizoon**
8b Capsule convex at apex, ± rounded ..... **Aizoanthemum**
7b Capsules 2–5-locular; 1 pendulous ovule in each locule; expanding tissue rudimentary to absent:
9a Stamens as many as perianth lobes ..... **Plinthus**
9b Stamens twice the number of the perianth lobes, in pairs alternating with the perianth lobes ..... **Galenia**

Acrosanthes Eckl. & Zeyh. 2400000

Ecklon & Zeyher: 288 (1837); Sonder: 471 (1862); Pax & Hoffmann: 194 (1934); Friedrich: 58 (1955); Adamson: 23 (1959a); Bond & Goldblatt: 132 (1984); Hartmann: 45 (1993).

Aizoon L. subgen. *Acrosanthes* D.Dietr.: 180 (1847).

Prostrate to sprawling perennial undershrubs, branching dichasial with one branch dominant; stems woody at base. **Leaves** opposite, ± fleshy, glabrous; stipules 0. **Inflorescence** on suppressed dichasial branches, seemingly lateral, probably on well-developed vegetative base. **Flowers** perigynous, bisexual, small, pedunculate, solitary at nodes. **Perianth** 5-lobed with dorsal appendages; tube short, turbinate; lobes somewhat fleshy. **Stamens** 8–many, sometimes in groups. **Ovary** superior, incompletely divided by basal septum into 2 locules, each with 1 basal ovule; stigmas 2, short. **Fruit** a xerochastic capsule, persisting in perianth tube. **Seeds** reniform to orbicular; testa rugose to tuberculate, sometimes with an aril.

Species 5, Africa; 5 in sthn Afr., Western Cape.

Aizoanthemum Dinter ex Friedrich 2401010

Dinter: 27 (1935); Friedrich: 339 (1957); Friedrich: 11 (1970); Hartmann: 44 (1993).

Aizoon L. subgen. *Aizoanthemum* (Dinter ex Friedrich) Adamson: 44 (1959b).

Annual, variably papillose, prostrate or ascending, much-branched herbs. **Leaves** alternate, densely papillose, sessile or petiolate, ± fleshy; stipules 0. **Flowers** perigynous, bisexual, solitary, terminal, often sessile in fork of branches. **Stamens** many; filaments connate, flattened towards base. **Ovary** superior, 5–10-locular, with 2–many pendulous ovules per locule. **Fruit** a capsule with rounded top, opening completely hygrochastically by long expanding keels reaching from centre of fruit to tip of valve. **Seeds** reniform, with concentric ridges, light to dark brown. $x = 8$ (1 report).

Species 3, Africa; 3 in sthn Afr., Namibia.

Aizoon L. 2401000

Linnaeus: 488 (1753); Linnaeus: 216 (1754); Sonder: 469 (1862); Adamson: 29 (1959b); Friedrich: 613 (1960); Friedrich: 13 (1970); Gonçalves: 509 (1978); Hartmann: 44 (1993); Gilbert: 112 (1993).

Perennial or annual herbs or undershrubs, all parts variably pubescent. **Leaves** alternate, rarely opposite, often crowded, petiolate or sessile, flat to cylindrical; stipules 0. **Inflorescence** mostly frondose. **Flowers** bisexual, often seemingly solitary or in axillary groups. **Perianth** 4- or 5-lobed; tube ± campanulate, sometimes short, often strigose; lobes valvate or imbricate, white inside, yellow or pink outside. **Stamens** few to many, arising from calyx throat, in groups alternating with calyx lobes; filaments filiform. **Ovary** superior, 4- or 5-locular, sometimes discoid, included in calyx tube, with 2–many pendulous ovules per locule. **Fruit** a capsule with central impression, somewhat corky or woody, expanding keels long or short, lifting valves only slightly. **Seeds** small, pear-shaped or reniform, on long funicle, with concentric ridges. $x = 8$.

Species ± 25, Mediterranean; 11 in sthn Afr., often introduced as weed into suitable climates, Namibia, Botswana, Swaziland, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

Galenia L. 2399000

Linnaeus: 359 (1753); Linnaeus: 169 (1754); Schellenberg: 500 (1913); Adamson: 87 (1956); Friedrich: 47 (1970); Bogle: 449 (1970); Bittrich: 217 (1990); Hartmann: 45 (1993).

Perennial shrublets or shrubs, rarely herbs, mostly branch-shedders, erect; branches woody at base, often forming dense mats, lateral branches alternate, secund, spreading. **Leaves** opposite or alternate, small, mostly obovate; stipules 0. **Inflorescence** often clearly separated from well-developed vegetative base. **Flowers** perigynous, bisexual, axillary, sessile or stalked, sometimes in terminal cymes, distal ones often with adnate bracts and bracteoles. **Perianth** 4- or 5-lobed; tube ± campanulate. **Stamens** 8–10, in alternisepalous pairs; filaments flat, tapering upwards; anthers small, yellow. **Ovary** superior, 2–5-locular, usually glandular; ovule solitary in each locule, pendulous, campylotropous; styles 2(–5), free or united below; stigmatic along inner surface. **Fruit** a small, weakly hygrochastic or xerochastic capsule. **Seeds** compressed, reniform to orbicular.

Species ± 30, Africa; ± 30 in sthn Afr., Namibia, Botswana, Free State and Northern Cape.

Plinthus Fenzl 2398000

Fenzl: 288 (1841); Sonder: 479 (1862); Schellenberg: 499 (1913); Pax & Hoffmann: 225 (1934); Verdoorn: 177 (1941); Adamson: 147 (1961); Friedrich: 91 (1970); Gonçalves: 511 (1978); Hartmann: 44 (1993).

Procumbent perennial subshrubs, younger plants with scale hairs. **Leaves** opposite or alternate, small, imbricate, ovate or ± 3-angled; stipules 0. **Inflorescence** of 1–

3 sessile flowers. **Flowers** perigynous, bisexual. **Perianth** 4- or 5-lobed; tube ± campanulate. **Stamens** 4 or 5, alternisepalous; filaments exserted or included. **Ovary** 2–4-locular, papillose or pubescent, with 1 pendulous ovule per locule; styles 2 or 3(4). **Fruit** a capsule with reduced expanding tissue. **Seeds** flat, subreniform, often ribbed, with elongated funicle.

Species 5 or 6, Africa; 5 or 6 in sthn Afr., Namibia, Botswana, Northern Province, Free State and Northern Cape.

Sesuvium L. 2394000

Linnaeus: 1058 (1759); Jeffrey: 235 (1960); Jeffrey: 20 (1961); Adamson: 244 (1962); Friedrich: 124 (1970); Bogle: 450 (1970); Gonçalves: 514 (1978); Hartmann: 45 (1993).

Diplochonium Fenzl: 461 (1862); Sonder: 473(1862).

Annual or perennial herbs or undershrubs, creeping to erect, succulent, glabrous; stems several from a short tap root, often reddish; branches rarely rooting. **Leaves** opposite to alternate, sessile or petiolate, succulent; stipules 0, but with membranes at base of petiole. **Flowers** bisexual, solitary, sessile or pedunculate, axillary, with 2 basal bracteoles. **Perianth** 5-lobed; lobes triangular, with long unifacial dorsal appendages. **Stamens** 5–many, free or connate at base, arising from mouth of calyx tube; filaments filiform or subulate; anthers small, often reddish. **Ovary** superior, 2–5-locular; ovules many per locule, anacampylotropous; placentation axile; styles 2–5, linear, erect; stigma longitudinal, papillose. **Fruit** a circumscissile membranous capsule, enclosed within persistent perianth with ± conical top. **Seeds** many, small, round to reniform, smooth, black, arillate; embryo annular; cotyledons oblong, fleshy; endosperm soft, starchy. $x = 8, 9$ (aneuploids, polyploidy).

Species ± 12, tropics and subtropics of both hemispheres, but mainly African, inhabiting saline sandy dunes and beaches, riverbeds, marshes; ± 4 in sthn Afr., Namibia, Botswana, Northern Province and Northern Cape.

Tetragonia L. 2403000

Linnaeus: 480 (1753); Linnaeus: 215 (1754); Fenzl: 460 (1862); Schellenberg: 502 (1913); Adamson: 110 (1955); Jeffrey: 32 (1961); Friedrich: 1 (1967); Bogle: 459 (1970); Gonçalves: 333 (1970); Gonçalves: 553 (1978); Gilbert: 116 (1993); Hartmann: 46 (1993).

Erect to prostrate, annual or perennial herbs or shrublets, rarely with tuber and annual shoots, often minutely papillose. **Leaves** alternate, subsucculent, often rhomboid; stipules 0. **Inflorescences** of 1–many, mostly axillary, rarely terminal flowers. **Flowers** bisexual or sometimes with male flowers terminating inflorescences. **Perianth** free, 3–5(–7)-lobed; tube produced above ovary, rarely connate at base. **Stamens** few to many, separate or fascicled. **Ovary** inferior or semi-inferior, (1–)3–8(9)-locular, with 1 pendulous ovule per locule; styles as many as locules, papillose. **Fruit** a nut, terete, winged, ridged, horned or spiny. **Seeds** solitary, subreniform with membranous testa, light brown; embryo hook- or horseshoe-shaped; cotyledons linear-oblong, fleshy; endosperm starchy. $x = 8$ (high polyploidy).

Species 50–60, Asia, Africa, Australia, New Zealand, temperate South America; ± 40 in sthn Afr., Namibia, Free State, Northern, Western and Eastern Cape.

This genus, together with *Tribulocarpus*, is sometimes placed in their own family Tetragoniaceae (Friedrich 1969b; Takhtajan 1997) on the basis of floral structure, the presence of a floral tube, many stamens, half-inferior to inferior ovaries and indehiscent fruits.

Trianthema L. 2395000

Linnaeus: 223 (1753); Linnaeus: 105 (1754); Sonder: 598 (1862); Jeffrey: 22 (1961); Friedrich: 131 (1970); Bogle: 453 (1970); Gonçalves: 517 (1978); Hartmann: 45 (1993).

Mostly succulent, annual herbs, rarely undershrubs, usually diffuse or prostrate. **Leaves** opposite, glabrous, papillose or hairy, with membranes or stipule-like lobes at base of petioles. **Flowers** bisexual, axillary, solitary or in fascicles, cymes or clusters, with 2 bracteoles each. **Perianth** 5-lobed; tube short or subelongated and campanulate; lobes small or large, with membranous margins, coloured within, dorsally mucronate. **Stamens** 5–many, sometimes unequal, separate or grouped, arising from base of calyx lobes; filament filiform; anthers small, rotund to oblong. **Ovary** superior, with 1 carpel, 1-locular; ovules 2–many, campylotropous; placentation basal or parietal; style 1(2), short; stigma longitudinal, papillate. **Fruit** a membranous or coriaceous capsule, transversely dehiscent. **Seeds** 1 or 2, round-reniform, arillate, reddish brown to black; embryo annular to coiled; cotyledons oblong, fleshy; endosperm starchy. $x = 7, 8, 13$ (polyploidy).

Species ± 17, cosmopolitan in the tropics and subtropics; 6 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, Free State, KwaZulu-Natal and Northern Cape.

Tribulocarpus S.Moore 2403010

Moore: 228 (1921); Adamson: 148 (1955) as subgenus; Jeffrey: 34 (1961); Phillips: 294 (1951); Friedrich: 6 (1967); Gilbert: 116 (1993); Hartmann: 46 (1993).

Low shrublets. **Leaves** alternate; stipules 0. **Inflorescence** bracteolate, in terminal dense groups. **Flowers** bisexual or sometimes lateral ones male. **Perianth** 5-parted, connate for ± half its length; tube very short in male flowers. **Stamens** many, arising from mouth of perianth. **Ovary** inferior, of 2 fused carpels, 2-locular, with solitary, pendulous ovule per locule; style 1; stigmas 2. **Fruit** compound, fused to spinous bracts, spiny, stalked.

Species 1: *Tribulocarpus dimorphanthus* (Pax) S.Moore, Africa; Namibia.

The genus is separated from *Tetragonia* by the compound fruit which includes the sclerotinised bracts. The horns of some species of *Tetragonia* may, however, be of similar origin.

Zaleya Burm.f. 2395010

Burman: 110 (1768); Jeffrey: 235 (1960); Jeffrey: 236 (1961); Friedrich: 134 (1970); Gonçalves: 520 (1978); Hartmann: 45 (1993); Gilbert: 115 (1993).

Annual or perennial, prostrate to ascending herbs. **Leaves** opposite, petiolate, slightly succulent, with a membranous sheath at base of petiole; stipules 0. **Flowers** bisexual, sessile, in axillary clusters of 5–20. **Perianth** 5-lobed, connate in lower half; lobes with membranous margins, coloured within, dorsally mucronate. **Stamens** 5–15, free, arising from upper part of calyx tube. **Ovary** superior, 2-carpellate, syncarpous, 2-locular, with 2 ovules per locule, arising from interlocular septum; stigmas 2, free. **Fruit** a 4-seeded capsule; operculum splitting septicidally into 2 valves. **Seeds** reniform.

Species 6, NE and E Africa, Asia and Australia; 1 in sthn Afr.: *Zaleya pentandra* (L.) Jeffrey, Namibia, Botswana, Northern Province, North-West, Mpumalanga, Swaziland, N KwaZulu-Natal and Northern Cape.

Amaranthaceae

(Caryophyllidae—Caryophyllales)

Compiled by M. Jordaan

Annual or perennial herbs or subshrubs, with Kranz anatomy. **Leaves** alternate or opposite, simple, entire or almost so; stipules 0. **Inflorescence** a dense head, a loose or dense spike-like thyrse, a spike, a raceme or a panicle, basically cymose, usually bracteate; bracts hyaline to membranous, stramineous to white, or coloured, subtending 1 or more flowers. **Flowers** bisexual or unisexual, sometimes sterile, mostly regular, small or minute, with 2–5 bracteoles, frequently in ultimate 3-flowered cymules; lateral flowers of such cymules sometimes sterile and modified into scales, straight or hooked spines, bristles, wings or hairs which serve as dispersal mechanism. **Perianth** uniseriate, membranous to firm and finally ± indurate, usually falling with ripe fruit included, with or without bracteoles at base. **Tepals** (0)1–3(–5), free or connate below, glabrous to ± pilose or lanate, equal or unequal, imbricate, green to white or variously coloured. **Stamens** 1–5, isomerous, opposite tepals, hypogynous, rarely perigynous; filaments frequently connate at base into a cup or tube, rarely free to base, some occasionally anantherous, sometimes alternating with variously shaped pseudostaminodes; anthers 1- or 2-thecous, dehiscing by 1 or 2 slits. **Ovary** superior, 2- or 3(4)-carpellate, free or adnate to perianth, 1-locular; ovules 1–many, erect to pendulous, placentation basal; style obsolete to long and slender; stigmas capitate to long and filiform, 1(2–5)-fid. **Fruit** an irregularly rupturing or circumscissile capsule, rarely a berry, usually with rather thin, membranous walls. **Seeds** globular to lenticular or ovoid, rarely arillate; testa shiny; embryo curved or circular; perisperm ± copious, true endosperm scanty.

Genera ± 69; species over 1 000, predominantly tropical, occurring mainly in Africa and America; sthn Afr.: genera 24, species 71. Family includes several cosmopolitan weeds and a large number of xerophytic plants; some are important vegetable or grain crops, and some are grown as decoratives.

Jussieu: 87 (1789); Brown: 417 (1810), as Amarantaceae; Martius: 207 (1826); Endlicher: 300 (1837); Moquin-Tandon: 231 (1849); Hooker: 20 (1880); Gilg: 152 (1897); Schinz: 91 (1893); Cooke & Wright: 402 (1910); Schinz: 7 (1934), as Amaranthaceae; Cronquist: (1981); Townsend: 1 (1985); Townsend: 28 (1988); Townsend: 70 (1993a); Townsend: 140 (1993b).

Classification of Amaranthaceae

I. Subfamily AMARANTHOIDEAE (Anthers 2-thecous):
  1. Tribe **Celosieae** (Ovary pluriovulate; leaves alternate): *Celosia, Hermbstaedtia*
  2. Tribe **Amarantheae** (Ovary uniovulate; leaves alternate or opposite):
    a. Subtribe **Amaranthinae** (Leaves alternate; seeds erect, radicle directed downwards): *Amaranthus*

b. Subtribe **Aervinae** (Leaves mostly opposite; seeds pendulous, radicle directed upwards): *Achyranthes, Achyropsis, Aerva, Arthraerua, Calicorema, Centema, Centrostachys, Cyathula, Kyphocarpa, Leucosphaera, Marcelliopsis, Nelsia, Nothosaerva, Pandiaka, Psilotrichum, Pupalia, Sericocoma, Sericorema*

II. Subfamily GOMPHRENOIDEAE (Anthers 1-thecous):

1. Tribe **Gomphreneae** (Ovary uniovulate; leaves opposite):
   a. Subtribe **Froelichinae** (Stigma capitate or shortly bilobed): **Alternanthera, *Guilleminea*
   b. Subtribe **Gomphreninae** (Stigmas 2(3)): **Gomphrena*

Key to genera

1a Leaves reduced to scales, or if developed, then fleshy or semisucculent; Namibia and Northern Cape:
2a Leaves alternate or occasionally opposite, often reduced to scales, or if developed then fleshy; branchlets twiggy, very shortly woolly ..... **Calicorema**
2b Leaves opposite, scale-like; opposite branches articulate; branchlets glabrous ..... **Arthraerua**
1b Leaves well developed, not fleshy; all regions of southern Africa:
3a Leaves alternate or fasciculate or sometimes opposite:
4a Modified sterile flowers present alongside fertile flowers, formed of wings, scales, spines, hairs or bristles; tepals pilose or floccose; stigma with a tuft of hairs:
5a Sterile flowers of strap-shaped processes furnished with long unicellular hairs, forming a silky-haired ball in fruit; tuft of hairs of stigma not purplish ..... **Sericorema**
5b Sterile flowers formed of long hairs and pilose spines; tuft of hairs of stigma purplish ..... **Marcelliopsis**
4b No modified sterile flowers present alongside fertile flowers; tepals pilose or glabrous; stigma without a tuft of hairs:
6a Ovaries with more than one ovule:
7a Stamens fused for at least half their length in a tube, either with large bifid intermediate pseudostaminodes, or with a sterile tooth on each side of antheriferous tooth or each filament widely expanded ..... **Hermbstaedtia**
7b Stamens not fused, pseudostaminodes 0 or small, filaments never widely expanded nor with a sterile tooth on each side of anther:
8a Inflorescences white-woolly; tepals dorsally densely lanate ..... **Aerva**
8b Inflorescences not white-woolly; tepals glabrous or pilose about the base only ..... **Celosia**
6b Ovaries uniovulate:
9a Flowers unisexual, male flowers situated towards apex of inflorescences or scattered among females, or plants dioecious; tepals glabrous; pseudostaminodes 0 ..... **Amaranthus**
9b Flowers bisexual, or if unisexual tepals ± hairy and pseudostaminodes present:
10a Leaves narrowly to broadly elliptic, elliptic-oblong or ovate; flowers minute, ± 1.25 mm long; stamens 1 or 2 ..... **Nothosaerva**
10b Leaves narrow, linear; flowers larger; stamens 5 ..... **Sericocoma**
3b Leaves opposite:
11a Bracteoles with a projecting dorsal keel along at least upper part of midrib ..... ***Gomphrena**
11b Bracteoles without dorsal keel along midrib:
12a Modified sterile flowers present, consisting of hairs, spines, bristles or scales, frequently on one side of sterile flower, sometimes concealed within bracteoles in flowering stage:
13a Stamens without intermediate pseudostaminodes:
14a Modified sterile flowers consisting of numerous uncinately hooked spines ..... **Pupalia**
14b Modified sterile flowers without hooked spines:
15a Inflorescence capitate; leaves narrowly or widely elliptic to lanceolate or ovate; densely canescent ..... **Leucosphaera**
15b Inflorescence spicate; leaves linear-acicular to narrowly oblong, glabrous ..... **Centema**
13b Stamens with intermediate pseudostaminodes:
16a Leaves narrowly linear; ovary asymmetrically horned at apex ..... **Kyphocarpa**
16b Leaves broadly linear or narrowly oblong, opposite sterile flowers of single rigid spines; ovary without an apical horn:
17a Sterile flowers of long plumose-pilose processes ..... **Nelsia**
17b Sterile flowers of spines or bracteoliform processes, never plumose-pilose ..... **Cyathula**
12b Modified sterile flowers 0, all flowers fertile:
18a Anthers 1-thecous; plants mainly prostrate or decumbent and diffusely branched:
19a Stamens perigynous; tepals densely woolly-lanuginose, 1-nerved, fused to ± halfway ..... ***Guilleminea**
19b Stamens hypogynous; tepals glabrous and 1-nerved or barbellate-pilose and 3-nerved, free:
20a Stigma capitate; flower clusters sessile in axils of leaves ..... ***Alternanthera**
20b Stigmas 2 or 3; flowers in dense spikes or terminal, sessile heads ..... ***Gomphrena**
18b Anthers 2-thecous; plants mainly erect:
21a Stamens 1 or 2; flowers minute, ± 1.25 mm long; leaves, branches and flower clusters varying from alternate to opposite ..... **Nothosaerva**
21b Stamens 4 or 5; flowers minute to larger; leaves and branches constantly alternate or opposite, or else flowers 4.5–6.0 mm long:
22a Pseudostaminodes absent between filaments ..... **Psilotrichum**
22b Pseudostaminodes present between filaments:

23a Robust aquatic or marsh perennial; upper tepal slightly longer than remainder with a sharper and often slightly recurved apex ..... **Centrostachys**

23b Plant not truly aquatic or paludal; upper tepal not thus differentiated:

24a Tepals glabrous, or floccose below the middle only:

25a Fruiting perianth strongly deflexed, closely appressed to inflorescence axis; bracteoles spinous aristate, arista longer than basal wings, or inflorescences fasciculate and formed of several spikes of diverse lengths ..... **Achyranthes**

25b Fruiting perianth not or less deflexed, not closely appressed to inflorescence axis; bracteoles frequently with midrib excurrent, but not long and spinose; inflorescence a solitary spike ..... **Achyropsis**

24b Tepals pilose throughout ..... **Pandiaka**

Achyranthes L. 2328000

Linnaeus: 204 (1753); Linnaeus: 96 (1754); Brown: 417 (1810); Hooker: 35 (1880); Schinz: 112 (1893); Baker & Clarke: 62 (1909); Cooke & Wright: 427 (1910); Adamson: 361 (1950); Bullock: 73 (1957); Cavaco: 302 (1958); Cavaco: 114 (1962); Podlech: 4 (1966); Henderson & Anderson: 102 (1966); Townsend: 145 (1973); Townsend: 473 (1974); Townsend: 100 (1985); Townsend: 105 (1988); Townsend: 163 (1993a); Townsend: 87 (1993b).

Erect perennial herbs, sometimes bushy or scandent, sometimes flowering in first year. **Leaves** opposite, entire, petiolate. **Inflorescence** a ± slender, simple or branched, elongated solitary or fasciculate spike up to 0.3 m long, terminal on stem and branches, flowers at first congested and ± patent, finally usually laxer and deflexed; bracts deltoid, ovate or acuminate, midrib excurrent in a spine, deflexed in fruit, persistent. **Flowers** bisexual, solitary in axils of bracts; bracteoles 2, spinous-aristate with excurrent midrib, lamina forming short and free to longer and adnate membranous wings; entire flower with bracteoles falling with ripening of seed. **Tepals** 4 or 5, 1–3(–5)-nerved, narrowly lanceolate, acuminate, mucronate with excurrent midrib, indurated in fruit especially at base. **Stamens** 2–5; filaments filiform, monadelphous at base, alternating with usually fringed pseudostaminodes; anthers 2-thecous. **Ovary** turbinate or obovoid; ovule solitary from apex of an elongated basal funicle; style cylindrical, variable in length; stigma capitellate. **Capsule** thin-walled, indehiscent. **Seed** cylindrical; perisperm/endosperm copious. $x = 7$ (aneuploids, high polyploidy).

Species 6–8, warm temperate and tropical regions of the Old World; 1 in sthn Afr.: *Achyranthes aspera* L. with 3 varieties, widespread and very variable in robustness.

Achyropsis (Moq.) Hook.f. 2328020

Hooker: 36 (1880); Baker & Clarke: 66 (1909); Cooke & Wright: 429 (1910); Cavaco: 100 (1960); Townsend: 430 (1979a); Townsend: 108 (1985); Townsend: 110 (1988); Townsend: 87 (1993b).

Achyranthes L. sect. *Achyropsis* Moq.: 310 (1849).

Annual or perennial herbs or subshrubs, trichotomously branched. **Leaves** opposite or fascicled, entire, sessile or shortly petiolate. **Inflorescences** subcapitate to spicate, terminal on stem and branches, bracteate; bracts persistent, finally weakly deflexed or deflexed-ascending. **Flowers** bisexual, small, solitary in axils of bracts, modified sterile flowers 0; bracteoles 2, closely appressed to tepals; bracteoles and perianth falling together with fruit. **Tepals** 4 or 5, glabrous or pubescent, shiny, firm, deeply concave and often cucullate above, 1–3-nerved, with midrib not or scarcely excurrent in a minute mucro. **Stamens** 4 or 5; filaments delicate, shortly monadelphous at base, alternating with small simple or fringed pseudostaminodes; anthers 2-thecous. **Ovary** ovoid, glabrous; ovule solitary, suspended from a long, basal funicle; style cylindrical, very short to slender; stigma capitellate. **Capsule** thin-walled, indehiscent, enclosed in base of perianth. **Seed** ovoid or lenticular; perisperm/endosperm copious.

Species 6, tropical and sthn Afr.; 2 in sthn Afr., Botswana, the northern provinces, Swaziland to KwaZulu-Natal and Eastern Cape.

Aerva Forssk. 2317000

Forsskål: 170 (1775) name conserved; Schinz: 108 (1893); Baker & Clarke: 37 (1909); Cooke & Wright: 425 (1910); Schinz: 52 (1934); Cavaco: 103 (1962); Townsend: 461 (1974); Townsend: 83 (1985); Townsend: 93 (1988); Townsend: 161 (1993a); Townsend: 85 (1993b).

Ouret Adans.: 268, 586 (1763).

Perennial herbs (sometimes flowering in first year), prostrate to erect or scandent. **Leaves** opposite or alternate, entire, flat. **Inflorescences** axillary and terminal, sessile or pedunculate, woolly spikes, or spikes arranged in a loose panicle, bracteate. **Flowers** unisexual or bisexual, plants probably sometimes polygamous, solitary in axils of bracts; bracteoles 2; bracteoles and perianth falling together with fruit but bracts and bracteoles persistent. **Tepals** 5, free, oval, or lanceolate-oblong, sometimes unequal, some or all softly woolly, with membranous margin and a thin to wider green centre. **Stamens** (and subulate staminodes of female flowers) 5; filaments connate at base into a basin or cup, alternating with subulate to oblong pseudostaminodes; anthers 2-thecous. **Ovary** small; ovule solitary, suspended from an elongated basal funicle; style shorter or longer than ovary; stigmas 2 or capitellate. **Capsule** thin-wall, delicate, bursting irregularly, membranous, enclosed in perianth. **Seed** compressed-reniform, firm, black. $x = 7, 8, 9, 10, 11$ (polyploidy).

Species ± 10, warmer parts of Africa and Asia; 3 in sthn Afr., widespread, but absent from KwaZulu-Natal and southern Cape region.

***Alternanthera** Forssk. 2335000

Forsskål: 28 (1775); Brown: 416 (1810); Hooker: 38 (1880); Schinz: 115 (1893); Baker & Clarke: 72 (1909); Cooke & Wright: 431 (1910); Schinz: 71 (1934); Adamson: 362 (1950); Podlech: 5 (1966); Townsend: 121 (1985); Townsend: 124 (1988); Townsend: 166 (1993a); Townsend: 89 (1993b).

Telanthera Moq.: 362 (1849); Hooker: 38 (1880); Henderson & Anderson: 104 (1966).

Annual or perennial herbs, sometimes becoming woody at base, prostrate or erect to floating or scrambling. **Leaves** opposite, entire. **Inflorescences** heads or short spikes, axillary, sessile or pedunculate, solitary or fasciculate, bracteate; bracts persistent. **Flowers** bisexual, solitary in axils of bracts; bracteoles 2, usually shorter than perianth, persistent or not; perianth falling with fruit. **Tepals** 4 or 5, free or concrescent at base, similar to very dissimilar, glabrous or furnished with smooth or denticulate hairs. **Stamens** 2–5, some occasionally anantherous, hypogynous; filaments monadelphous at base into a cup or tube, alternating with large and laciniate to small pseudostaminodes or these rarely obsolete; anthers 1-thecous. **Ovary** suborbicular or obovate in outline, usually compressed; ovule solitary, pendulous, basal; style short or absent; stigma capitellate. **Capsule** thin-

walled or sometimes corky, indehiscent. **Seeds** ± lenticular. $x = 17$ (7, 8, 9, 10) (high polyploidy).

Species ± 100, best represented in the New World tropics and subtropics; 4 introduced into sthn Afr., naturalised, widespread.

Amaranthus L. 2299000

Linnaeus: 989 (1753); Linnaeus: 427 (1754); Brown: 414 (1810); Hooker: 28 (1880); Schinz: 102 (1893); Baker & Clarke: 30 (1909); Cooke & Wright: 408 (1910); Adamson: 191 (1936); Adamson: 360 (1950); Aellen: 465 (1959); Aellen: 109 (1964); Podlech: 8 (1966); Townsend: 471 (1974); Townsend: 63 (1977); Brenan: 451 (1981); Townsend: 20 (1985); Townsend: 45 (1988); Townsend: 143 (1993a); Townsend: 81 (1993b).

Annual or rarely perennial herbs, erect or decumbent, glabrous or furnished with short and gland-like or multicellular hairs; plants monoecious or dioecious. **Leaves** alternate, simple, entire or sinuate, long-petiolate. **Inflorescences** basically cymose, of dense to lax axillary thyrses or upper clusters dense, leafless, aggregated and spike-like, bracteate. **Flowers** unisexual or bisexual; bracteoles 2–5, small and herbaceous or membranous and spinescent. **Tepals** (1–3)5, glabrous, membranous, equal or subequal, free or connate below and somewhat indurate, occasionally absent in flowers of dioecious spp. **Stamens** as many as tepals; filaments free at base; pseudostaminodes absent; anthers 2-thecous. **Ovary** ellipsoid, compressed; ovule solitary, subsessile, erect; style short or absent; stigmas 2 or 3, subulate or filiform. **Fruit** a dry capsule, usually enclosed in perianth, indehiscent or circumscissile, sometimes 2- or 3-toothed at apex. **Seed** globose or compressed, black, smooth and shiny; testa thin; embryo annular; endosperm present. $x = 17, 8$ (7, 9, 10, 12) (high polyploidy).

Species ± 60, tropical and warm temperate regions of both Old and New World, sporadic as weeds in cooler temperate areas; 15 native and introduced in sthn Afr., mostly widespread weeds of cultivation. A difficult genus, complicated by the cultivation of some species (e.g. *A. lividus* L. and *A. tricolor* L.) as green vegetables and others (especially *A. caudatus* L. and *A. hybridus* L. agg.) as grain crops. It is also a genus prone to hybridisation, though probably the frequency of natural hybrids has been overestimated.

Arthraerua (Kuntze) Schinz 2320000

Schinz: 109 (1893); Baker & Clarke: 71 (1909); Schinz: 50 (1934); Podlech: 10 (1966); Townsend: 85 (1993b).

Aerua Juss. sect. *Arthraerua* Kuntze: 272 (1886).

Low rounded semisucculent subshrubs, repeatedly branched; branches articulate, becoming striate. **Leaves** opposite, scale-like. **Inflorescences** small, dense, terminal, woolly spikes, bracteate. **Flowers** bisexual, solitary in axils of bracts. **Tepals** 5, free, 1-nerved, acuminate, scarious, silky. **Stamens** 5, free; quadrate pseudostaminodes fused to filaments; anthers 2-thecous, divergent at base. **Ovary** glabrous; ovules solitary on a basal funicle; style slender; stigma capitate. **Capsule** indehiscent, falling early with perianth.

Monotypic: *Arthraerua leubnitziae* (Kuntze) Schinz, confined to the west coast of Namibia.

Calicorema Hook.f. 2325000

Hooker: 34 (1880); Schinz: 545 (1912); Podlech: 10 (1966); Cooke & Wright: 427 (1910); Townsend: 86 (1993b).

Small, much-branched subshrubs, rigid and twiggy; young branches very shortly woolly. **Leaves** alternate or occasionally opposite, sometimes much reduced, fleshy. **Inflorescences** short to subcapitate spikes, bracteate. **Flowers** bisexual, solitary in axils of bracts; bracteoles 2. **Tepals** 5, free, stiffly membranous, subequal, with straight, silky hairs on back. **Stamens** 5; filaments fused to the quadrate to deltoid, fringed or entire pseudostaminodes; anthers 2-thecous. **Ovary** ovoid or turbinate, glabrous or downy; ovule solitary, suspended from an elongated basal funicle; style slender; stigma capitate. **Capsule** thin-walled, indehiscent.

Species 2, confined to sthn Afr., both in Namibia and Northern Cape.

Celosia L. 2292000

Linnaeus: 205 (1753); Linnaeus: 96 (1754); Hooker: 24 (1880); Schinz: 99 (1893); Schinz: 178 (1895); Schinz: 4 (1903); Baker & Clarke: 16 (1909); Cooke & Wright: 404 (1910); Schinz: 7 (1934); Meeuse: 145 (1961); Townsend: 1 (1975); Townsend: 30 (1988); Townsend: 141 (1993a); Townsend: 80 (1993b).

Annual or perennial herbs, sometimes rather woody at base, occasionally scandent. **Leaves** alternate, simple, entire or lobed. **Inflorescences** dense, terminal and axillary spikes, or in fascicles along floriferous branchlets, or more generally lax or compact terminal and axillary thyrses, bracteate. **Flowers** bisexual, small, white, silvery or rosy, sessile or shortly pedicellate; bracteoles 2. **Tepals** 5, free, all ± equal, glabrous or rarely somewhat pilose. **Stamens** 5; filaments expanded and fused into a cup below, free portions deltoid below and narrow above or ± swollen below; pseudostaminodes 0, rarely with minute, blunt intermediate teeth; anthers 2-thecous. **Ovary** ovoid to subglobose; ovules few to many, rarely solitary; style distinct and elongate to almost obsolete; stigmas 2 or 3, circular to filiform. **Capsule** membranous, circumscissile, sometimes thickened at apex. **Seeds** black, usually strongly compressed and shining, subcircular, reticulate, grooved, punctate or tuberculate, not arillate; endosperm present. $x = 9$ (7, 11) (high polyploidy).

Species ± 45, warmer regions of both Old and New World; 2 in sthn Afr., mainly in Namibia, Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Centema Hook.f. 2311000

Hooker: 31 (1880); Schinz: 107 (1893); Baker & Clarke: 55 (1909); Cooke & Wright: 418 (1910) in part; Schinz: 547 (1912); Schinz: 45 (1934); Townsend: 70 (1988); Townsend: 83 (1993b).

Erect perennial herbs or subshrubs; stems sometimes tuberculate. **Leaves** opposite, entire. **Inflorescences** pedunculate or sessile spike-like bracteate thyrses, each bract with a partial inflorescence of 1 or 2 bisexual flowers and 2 or 3 modified sterile flowers consisting of single very rapidly developing spines, partial inflorescence falling as a 2- or 3-spined burr. **Tepals** 5, inner becoming narrower, outer several-nerved, hardened at base, woolly on back. **Stamens** 5, unequal; filaments filiform, flattened, connate at extreme base; pseudostaminodes 0; anthers narrow, 2-thecous. **Ovary** ± compressed, glabrous; ovule solitary, basal; style slender, with 2 short or elongated stigma branches. **Capsule** scarcely compressed, delicate except for a small firm area about base of style, irregularly ruptured by developing seed, thin-walled, indehiscent. **Seed** ± horseshoe-shaped; perisperm/endosperm copious.

Species 2, southern tropical Africa; 1 in sthn Afr.: *Centema subfusca* (Moq.) Lopr., Northern Province, Swaziland and KwaZulu-Natal.

Centrostachys Wall. 2328030

Wallich: 497 (1824); Moquin-Tandon: 321 (1849); Baker & Clarke: 64 (1909); Schinz: 62 (1934); Cavaco: 124 (1962); Townsend: 472 (1974); Townsend: 105 (1985); Townsend: 109 (1988); Townsend: 87 (1993b).

Aquatic or subaquatic perennial herbs, prostrate to straggling or erect, usually much-branched, rooting particularly at lower nodes. **Leaves** opposite, entire, petiolate. **Inflorescence** a shortly pedunculate, elongate, bracteate spike, terminal on stem and branches; bracts

persistent, hyaline. **Flowers** bisexual, solitary in axils of bracts; bracteoles 2, ± circular, hyaline, falling with flower. **Tepals** 5, ± spreading at anthesis, later closing together and considerably indurate at base; upper tepal narrowest and longest, 1–3-nerved. **Stamens** 5, shorter than perianth, shortly monadelphous at base, alternating with spathulate pseudostaminodes furnished with fimbriate dorsal scales; anthers 2-thecous. **Ovary** oblong in outline; ovule solitary, pendulous on curved funicle, radicle ascending; style filiform; stigma capitate. **Capsule** thin-walled, tightly enclosing seed, falling together with persistent perianth and bracteoles. **Seed** smooth, chestnut-brown; perisperm/endosperm copious.

Monotypic: *Centrostachys aquatica* (R.Br.) Wall. ex Moq.; in tropical Asia from India and Sri Lanka to Indonesia and tropical Africa from Nigeria to Sudan and Ethiopia south to DRC, Tanzania, Zambia, Zimbabwe, Mozambique and sthn Afr. (Botswana).

Cyathula Blume 231200

Blume: 548 (1825) name conserved, not of Loureiro; Moquin-Tandon: 329 (1849); Baker & Clarke: 42 (1909); Cooke & Wright: 419 (1910); Schinz: 221 (1921); Schinz: 47 (1934); Cavaco: 87 (1962); Podlech: 15 (1966); Townsend: 74 (1977); Townsend: 55 (1985); Townsend: 79 (1988); Townsend: 152 (1993a); Townsend: 84 (1993b).

Annual or perennial herbs, sometimes woody at base, sometimes decumbent. **Leaves** opposite, entire, petiolate, sessile or subsessile, usually pubescent. **Inflorescences** terminal on stem and branches, spiciform or capitate, bracteate, ultimate division basically a triad of 1 central bisexual fertile and 2 modified sterile flowers formed of uncinate, straight or glochidiate spines or bracteoliform processes; bracts ovate, usually aristate, accompanied by 2 bracteoles, persistent, finally ± deflexed; bracteoles and perianth, all or part, falling as a burr in fruit. **Tepals** 5, free, subequal, very shortly mucronate or some hooked-aristate, often pilose. **Stamens** 5, shortly monadelphous at base; filaments linear, alternating with fringed pseudostaminodes; anthers 2-thecous. **Ovary** obovoid; ovule solitary, suspended from an elongated, basal funicle; style slender; stigma capitate. **Capsule** thin-walled, indehiscent, closely held in perianth. **Seed** ovoid, slightly compressed; perisperm/endosperm copious. $x = 17$ (7, 8) (polyploidy).

Species ± 25, tropics of both Old and New World; mostly Africa; 6 in sthn Afr., widespread, but less so in the Cape region.

*Gomphrena L. 2338000

Linnaeus: 224 (1753); Linnaeus: 105 (1754); Brown: 415 (1810); Hooker: 40 (1880); Schinz: 116 (1893); Baker & Clarke: 75 (1909); Cooke & Wright: 433 (1910); Adamson: 362 (1950); Cavaco: 165 (1962); Henderson & Anderson: 118 (1966); Podlech: 16 (1966); Townsend: 127 (1985); Townsend: 130 (1988); Townsend: 167 (1993a); Townsend: 89 (1993b).

Annual or occasionally perennial herbs, erect or prostrate, usually thickened at nodes, pubescent. **Leaves** opposite, sessile or subsessile, entire. **Inflorescences** terminal or axillary, capitate to spicate, sessile or pedunculate, solitary or glomerate, often subtended by a pair of sessile leaves, bracteate with bract persistent in fruit, axis frequently thickened. **Flowers** bisexual, solitary in axils of bracts; bracteoles 2, concave, or laterally compressed with a dorsal longitudinal keel or wing, or crested, falling with fruit. **Tepals** 5, erect, similar or dissimilar, free or almost so, ± lanate dorsally, at least inner 2 usually ± indurate at base in fruit. **Stamens** 5, hypogynous; filaments monadelphous, tube shortly 5-dentate with entire to very deeply bilobed teeth; with or without free pseudostaminodes; anthers 1-thecous. **Ovary** turbinate or subglobose; ovule solitary, pendulous; style short or long; stigmas 2 or 3, linear or short and thicker. **Capsule** a compressed, thin-walled, irregularly rupturing utricle. **Seed** compressed-ovoid, brown, smooth or faintly reticulate, shining. $x = 13$ (8, 9, 10, 11) (polyploidy).

Species ± 120, tropics and subtropics of the New World and in Australia, some introduced and naturalised in the Old World; 2 in sthn Afr., widespread weeds.

*Guilleminea Kunth 2330010

Kunth: 40, pl. 518 (1823) name emended; Mears: 137 (1967); Moquin-Tandon: 338 (1849); Schinz: 113 (1893); Townsend: 119 (1985); Townsend: 122 (1988); Townsend: 88 (1993b).

Gossypianthus Hook.: t. 251 (1840). *Brayulinea* Small: 394 (1903); Schinz: 64 (1934); Cavaco: 156 (1962); Henderson & Anderson: 14 (1966); Podlech: 9 (1966).

Prostrate or decumbent, mat-forming perennial herb with a thickened rootstock, pubescent. **Leaves** opposite, entire, ± elliptic, petiolate. **Inflorescences** sessile, axillary, dense, often fasciculate spikes, bracteate; bracts persistent, subequal, silvery, ± ovate. **Flowers** bisexual, minute, solitary in axils of bracts; bracteoles 2; perianth and bracteoles falling with fruit. **Tepals** 5, elliptic, oblong or ovate, acute, woolly at base, hyaline, or firm with 3 green nerves, free or connate to ± halfway; perianth and bracteoles falling with fruit. **Stamens** 5, perigynous; filaments fused into a tube, tube adnate to perianth; anthers 1-thecous. **Ovary** compressed; ovule solitary, pendulous; style usually short; stigma shortly bilobed. **Capsule** membranous, thin-walled, indehiscent. **Seed** compressed, firm.

Species 5, all natives of the Americas from southern USA to Argentina; 1 species: **Guilleminea densa* (Willd.) Moq., an increasingly widespread tropical weed, naturalised and widespread in sthn Afr.

Hermbstaedtia Rchb. 2293000

Reichenbach: 164 (1828); Moquin-Tandon: 246 (1849); Hooker: 25 (1880); Schinz: 100 (1893); Schinz: 8 (1903); Baker & Clarke: 24 (1909); Cooke & Wright: 405 (1910); Schinz: 229 (1911); Burtt Davy: 43 (1926); Schinz: 134 (1931); Schinz: 30 (1934); Meeuse: 145 (1961); Podlech: 12 (1966); Townsend: 82 (1982); Townsend: 39(1988); Townsend: 80 (1993b).

Berzelia Mart.: 292 (1826) not of Brongn.

Annual or perennial herbs, sometimes ± woody at base, never scandent. **Leaves** alternate, scattered, linear or spatulate-oblong, entire. **Inflorescences** dense to elongating, bracteate, terminal spikes or rarely in heads. **Flowers** bisexual, white, rosy or carmine to vermilion; bracteoles 2, persistent on fruit-fall. **Tepals** 5, equal or slightly dissimilar. **Stamens** 5, glabrous; filaments fused for at least half their length, alternating pseudostaminodes either free and bifid or adnate to adjoining filaments, which are then expanded almost to the tip and rounded or toothed on each side of anther; anthers 2-thecous. **Ovary** ovoid, narrowed into a style; ovules 2–20, erect; style long to very short; stigmas 2 or 3(–5). **Capsule** included in perianth, circumscissile. **Seeds** black, strongly compressed-lenticular and shiny, reticulate; endosperm present.

Species ± 15, confined to tropical and sthn Afr.; 11 in sthn Afr., widespread except in Cape region.

Kyphocarpa (Fenzl) Lopr. 2309000

Lopriore: 42 (1899); Baker & Clarke: 52 (1909) as *Cyphocarpa*; Cooke & Wright: 414 (1910); Podlech: 17 (1966); Townsend: 62 (1988); Townsend: 83 (1993b).

Sericocoma Fenzl sect. *Kyphocarpa* Fenzl: 323 (1843).

Erect annual herbs. **Leaves** opposite, entire, linear to oblong. **Inflorescences** elongate or subglobose, densely pilose spike-like thyrses terminal on stem and branches,

shortly or long-pedunculate or subtended by 1 or 2 reduced leaves; each bract subtending a bibracteolate partial inflorescence consisting mostly of a triad of a central bisexual flower and 2 lateral modified sterile flowers consisting of slender, finally spinous, processes; partial inflorescences falling as a unit complete with bracteoles; bracts persistent on inflorescence axis. **Tepals** 5, narrow, 3- or 5-nerved, free, oblong or oblong-lanceolate, mucronate, with broad, membranous margins, only a narrow central section coloured. **Stamens** 5; filaments fused into a cup at base, usually alternating with very short, blunt pseudostaminodes; anthers 2-thecous. **Ovary** scarcely compressed, considerably pilose above and with a distinct horn on one side below its apex; ovule solitary, suspended from a basal funicle; style simple; stigma capitate. **Capsule** ± compressed, irregularly ruptured below by developing seed, rounded apex densely pilose, gibbous to one side of style with a short horn-like process. **Seed** suborbicular; perisperm/endosperm copious.

Species probably 4, in south tropical and sthn Afr., widespread in warm, dry areas, Namibia, Botswana, the northern provinces, Free State, Swaziland, KwaZulu-Natal and Northern Cape.

Leucosphaera Gilg 2313000

Gilg: 152 (1897); Lopriore: 41 (1899); Schinz: 250 (1911); Schinz: 45 (1934); Townsend: 84 (1993b).

Marcellia Baill.: 625 (1886) in part; Baker & Clarke: 51 (1909) in part; Cooke & Wright: 413 (1910).

Small silvery shrublet. **Leaves** mostly opposite, entire. **Inflorescences** capitate, the ultimate divisions of 1 or 2 bisexual fertile flowers and 1 or 2 sterile flowers formed of 2–4 narrow, white, plumose-hairy bracteoliform processes. **Tepals** 5, obscurely 3-nerved, lanceolate-linear, with broad, membranous margins on lower half, long-acuminate, with minutely scabrid hairs; perianth of sterile flowers not spiny. **Stamens** 5; filaments abruptly expanded and connate into a cup below; pseudostaminodes 0; anthers 2-thecous. **Ovary** pyriform, densely pilose above; ovule solitary; style slender; stigma capitate. **Capsule** not compressed, thin-walled, apex firm, pilose, flat, hyaline wall glabrous and ruptured by developing seed, or indehiscent. **Seed** brown, shining, ± reticulate.

Monotypic: *Leucosphaera bainesii* (Hook.f.) Gilg, Angola, Namibia, Botswana and NW Northern Cape.

Marcelliopsis Schinz 2308000

Schinz: 48 (1934); Podlech: 18 (1966); Townsend: 84 (1993b).

Marcellia Baill.: 625 (1886) not of Choisy; Baker & Clarke: 49 (1909) in part. *Sericocoma* Fenzl subgen. *Newtonia* Schinz: 183 (1895).

Annual or perennial herbs or subshrubs. **Leaves** opposite or sometimes alternate, linear to oblong, entire. **Inflorescences** terminal, elongated, dense spiciform thyrses, bracteate; bracts subtending 2 bisexual flowers flattened at their point of contact and 2 modified lateral sterile flowers formed of long hairs and pilose spines. **Tepals** 5, oblong to linear, pilose. **Stamens** 5, free; filaments narrow, monadelphous at base; pseudostaminodes 0; anthers 2-thecous. **Ovary** woolly; ovule solitary, pendulous, basal; style columnar; stigma small, capitate with a tuft of purplish hairs. **Capsule** thin-walled, indehiscent. **Seed** orbicular, flattened.

Species 3, confined to Namibia.

Nelsia Schinz 2309020

Schinz: 247 (1911); Schinz: 44 (1934); Cavaco: 73 (1962); Podlech: 20 (1966); Townsend: 65 (1988); Townsend: 83 (1993b).

Sericocoma Fenzl subgen. *Eusericocoma* Schinz: 183 (1895).

Erect annual or perennial herbs. **Leaves** opposite on simple or branched stems, entire, subsessile. **Inflorescences** sessile or pedunculate, spike-like, densely silky-hairy, terminal or axillary bracteate thyrses; each bract subtending a bibracteolate partial inflorescence of usually 2 bisexual flowers accompanied by 1 or 2 lateral bracteolate triads of a central fertile flower subtended by 2 modified sterile flowers consisting of long, narrowly bracteoliform, plumose-pilose processes, some short and scale-like; the whole falling as a burr-like unit in fruit; bracts persistent on inflorescence axis. **Tepals** 5, narrow, linear-lanceolate, 3-nerved, pilose, mucronate, margin hyaline. **Stamens** 5; filaments filiform, delicate, connate below and with intermediate flabellate pseudostaminodes; anthers narrow, 2-thecous. **Ovary** ± compressed, glabrous; ovule solitary, from apex of a long basal funicle; style slender, stigma 1, minutely capitate. **Capsule** scarcely compressed, apex concave with a distinct raised rim, thin-walled, indehiscent. **Seed** brown, smooth and shining, finely reticulate; perisperm/endosperm copious.

Species 2; 1 in Angola and 1 in sthn Afr.: *Nelsia quadrangula* (Engl.) Schinz, Namibia and Botswana.

Nothosaerva Wight 2318000

Wight: 1 (1853); Hooker: 34 (1880); Schinz: 109 (1893); Schinz: 52 (1934); Cavaco: 104 (1962); Townsend: 88 (1985); Townsend: 97 (1988); Townsend: 161 (1993a); Townsend: 85 (1993b).

Annual herbs. **Leaves** opposite or alternate, entire. **Inflorescences** in dense, sessile, solitary or clustered spikes, or flowers solitary in axils of scarious bracts. **Flowers** bisexual, very small; bracteoles 2, very small. **Tepals** 3 or 4(5), free, hyaline, villous, with a green band, subtended by 2 very small bracteoles. **Stamens** 1 or 2; filaments filiform; intermediate pseudostaminodes 0; anthers 2-thecous. **Ovary** globose-ovoid; ovule solitary, pendulous, radicle ascending; style short; stigma capitate. **Capsule** delicate, irregularly rupturing. **Seed** rounded, compressed; perisperm/endosperm copious.

Monotypic: *Nothosaerva brachiata* (L.) Wight in Pakistan, India, Sri Lanka, Burma, Mauritius and tropical Africa from Senegal eastwards to Ethiopia and N Somalia southwards to sthn Afr., Northern Province and N KwaZulu-Natal.

Pandiaka (Moq.) Hook.f. 2328010

Hooker: 35 (1880); Baker & Clarke: 67 (1909); Schinz: 64 (1934); Cavaco: 138 (1962); Podlech: 20 (1966); Cavaco: 81 (1960); Townsend: 425 (1979a); Townsend: 112 (1985); Townsend: 115 (1988); Townsend: 87 (1993b).

Achyranthes L. sect. *Pandiaka* Moq.: 310 (1849). *Argyrostachys* Lopr.: 108 (1901).

Annual or perennial herbs with slender to tuberous rootstocks. **Leaves** opposite, entire, sessile or petiolate. **Inflorescence** spicate to capitate, lateral and terminal, elongating later or not; bracts 2, usually more than half as long as flowers, acute or ± spinescent, persistent, spreading or rarely deflexed. **Flowers** bisexual, solitary in axils of bracts; bracteoles 2, ± half as long as perianth or more, midrib excurrent in a short, glabrous and pungent, flexuose and pilose arista, lamina firm, chartaceous or horny. **Tepals** 5, lanceolate to oblong-lanceolate, feebly to strongly 1–3(5)-nerved, with straight white hairs or glabrescent, concrescent at base, ± mucronate to aristate with excurrent nerve, falling with ripe seed, accompanied by bracteoles or not. **Stamens** 5; filaments filiform, monadelphous below, alternating with mostly quadrate dentate or fimbriate pseudostaminodes; anthers 2-thecous. **Ovary** ovoid, glabrous; ovule solitary, on basal funicle; style linear; stigma small, capitate. **Capsule** oblong-obovoid, with a narrower firm apex, thin-walled, indehiscent. **Seed** oblong-ovoid, brown, shining, faintly reticulate.

Species ± 12, tropical and sthn Afr.; 1 in sthn Afr.: *Pandiaka carsonii* (Baker) C.B.Clarke var. *carsonii*, N Namibia.

Psilotrichum Blume 2324000

Blume: 544 (1825); Hooker: 32 (1880); Schinz: 110 (1893); Baker & Clarke: 57 (1909); Cooke & Wright: 424 (1910); Schinz: 60 (1934); Verdcourt: 489 (1964); Townsend: 90 (1985); Townsend: 101 (1988); Townsend: 87 (1993b).

Psilostachys Hochst.: 6, t. 4 (1844).

Perennial herbs or subshrubs, prostrate to erect or scandent, trichotomously branched. **Leaves** opposite or partly alternate, ovate or elliptic-lanceolate, entire. **Inflorescences** axillary and terminal, sessile to long-pedunculate, bracteate heads or spikes or broad, lax, panicles; bracts persistent, finally spreading or deflexed. **Flowers** bisexual, solitary in axils of bracts; bracteoles 2, falling with fruit. **Tepals** 5, free, inner 2 with broader hyaline margin than outer 2, with central intermediate, sometimes gibbous at base, usually pubescent on outer surface. **Stamens** 5, shortly monadelphous at base, without or rarely with small alternating pseudostaminodes; anthers 2-thecous. **Ovary** subglobose or oblong in outline; ovule solitary, suspended from a long, basal funicle; style slender but rather short; stigma bifid or capitate. **Capsule** thin-walled, indehiscent, enclosed in hardened base of perianth. **Seed** smooth, lenticular, brownish.

Species ± 18, mostly in tropical Africa, also in tropical Asia; 1 in sthn Afr.: *Psilotrichum sclerantlium* Thwaites (= *P. africanum* Oliv.), Northern Province and KwaZulu-Natal.

Pupalia Juss. 2314000

Jussieu: 132 (1803) name conserved; Hooker: 31 (1880); Schinz: 108 (1893); Baker & Clarke: 47 (1909); Cooke & Wright: 422 (1910); Schinz: 48 (1934); Townsend: 131 (1979b); Townsend: 73 (1985); Townsend: 88 (1988); Townsend: 84 (1993b).

Pupal Adans.: 268, 596 (1763).

Annual or perennial herbs or subshrubs, often trichotomously branched, sometimes scandent. **Leaves** opposite, broad, entire, petiolate. **Inflorescence** a spiciform bracteate thyrse, terminal on stem and branches, each bract subtending a partial inflorescence of 1–more fertile bisexual flowers which are subtended on each side by modified sterile flowers formed of 3–more stalked clusters of hooked spines; bracts persistent, finally ± deflexed, entire; partial inflorescence falling as a burr in fruit. **Tepals** 5, free, lanceolate, shortly mucronate, loosely woolly. **Stamens** 5; filaments linear, connate at base around ovary; pseudostaminodes 0; anthers 2-thecous. **Ovary** subglobose; ovule solitary, pendulous, basal; style slender; stigma capitate. **Capsule** thin-walled, irregularly ruptured below firm apex by developing seed. **Seed** oblong-ovoid or ovoid, black, slightly compressed; perisperm/endosperm copious. $x = 10$ (13) (high polyploidy).

Species 4, tropics of Old World from Africa to Malaysia and the Philippines; 2 in sthn Afr., Namibia, Botswana, the northern provinces, Swaziland, Free State, KwaZulu-Natal, Northern and Eastern Cape.

Sericocoma Fenzl 2305000

Fenzl: 33 (1842); Fenzl: 323 (1843); Hooker: 30 (1880); Schinz: 106 (1893); Schinz: 236 (1911) excluding *S. pungens*; Baker & Clarke: 41 (1909); Cooke & Wright: 416 (1910); Schinz: 43 (1934); Podlech: 21 (1966); Townsend: 82 (1993b).

Sericocoma Fenzl subgen. *Eurotia* Schinz: 183 (1895) in key, and subgen. *Eusericocoma* Schinz: 183 (1895), in part.

Glabrous or hairy herbs or subshrubs. **Leaves** opposite or partly alternate, linear, oblong or occasionally obovate, sessile, entire. **Inflorescences** terminal heads or spiciform, 1 or 2 flowers together with 1–more flowers reduced to spines, bracteate. **Flowers** all bisexual, solitary in axils of bracts; bracteoles 2, falling with fruit. **Tepals** 5, connate at base, coriaceous or chartaceous, ovate or oblong-lanceolate, long-pilose, subequal, outer not long-aristate. **Stamens** 5, shortly connate below; pseudostaminodes minute 0; anthers 2-thecous. **Ovary** ± ovoid, woolly or tomentose; ovule solitary, suspended from apex of elongated funicle; style slender; stigma capitate. **Capsule** thin-walled, included in perianth, membranous, indehiscent. **Seed** compressed; embryo annular.

Species 3, confined to sthn Afr., dry parts of Namibia, Northern, Western and Eastern Cape.

Sericorema (Hook.f.) Lopr. 2307000

Lopriore: 39 (1899); Cooke & Wright: 412 (1910); Schinz: 244 (1911); Schinz: 44 (1934); Townsend: 6770 (1988); Townsend: 83 (1993b).

Sericocoma Fenzl sect. *Sericorema* Hook.f.: 30 (1880). *Sericocoma* Fenzl subgen. *Sericorema* (Hook.f.) Schinz: 183 (1895).

Much-branched, erect, annual or perennial herbs. **Leaves** alternate or occasionally opposite, linear to oblong, sessile, entire. **Inflorescences** elongated, bracteate, spike-like thyrses; each bract with 1–more central bisexual flowers and 2–more lateral sterile modified flowers, each formed of an accrescent, finally spinous-margined process, fused with indurate base of partial inflorescence so that the whole falls as a unit (a burr) complete with bracteoles; bracts persistent on inflorescence axis. **Tepals** 5, narrow, 3-nerved, ± pilose or floccose, connate at base, acuminate or pungent. **Stamens** 5; filaments slender, connate below; pseudostaminodes 0; anthers narrow, 2-thecous, each theca with an awn-like tail at each end. **Ovary** ± compressed, villous or glabrous; ovule solitary, erect; style very short; stigma with a tuft of whitish penicillate hairs. **Capsule** scarcely compressed, with a firm apex, delicate below, thin-walled, indehiscent. **Seed** ± horseshoe-shaped, compressed, brown, smooth and shining; perisperm/endosperm copious.

Species 2, both in sthn Afr., widespread in warm arid regions, Namibia, Botswana, Northern Province, North-West, Free State and Northern Cape.

Anacardiaceae

(Rosidae—Sapindales)

Compiled by R.H. Archer

Trees, shrubs or suffrutices; dioecious or monoecious, but with occasional bisexual flowers; often with resinous bark; sometimes with watery latex; crushed foliage often with turpentine-like odour. **Leaves** usually alternate, rarely opposite or subopposite (*Protorhus*), simple, 3-foliolate, or imparipinnate, entire to coarsely toothed; stipules 0. **Flowers** small, usually regular and male and female similar, mostly in terminal or axillary panicles. **Calyx** 4–7-fid or -partite, rarely spathaceous or irregularly ruptured. **Petals** 4–7, usually free, rarely connate and adnate to torus. **Disc** ± annular, rarely stalked or of separate glands. **Stamens** as many as or twice as many as petals, or many; filaments free; anthers 2-thecous,with longitudinal dehiscence. **Ovary** superior, (1–)3–5-carpous, 1(2–4)-locular; ovule solitary, adnate to ovary wall, or pendulous from a basal funicle; styles 1–5, free or connate, sometimes lateral; stigmas often capitate. **Fruit** usually drupaceous or dry with resinous or oleaginous mesocarp and coriaceous endocarp, sometimes winged. **Seeds** erect, horizontal or pendulous with membranous or coriaceous testa; endosperm 0 or rarely present.

Genera ± 60; species ± 600; chiefly tropical but also Mediterranean, E Asia and America; sthn Afr.: 13 genera (3 exotic), ± 110 species.

Sonder: 502 (1860) under Terebintaceae; Fernandes & Fernandes: 550 (1966); Merxmüller & Schreiber: 1 (1968); Kokwaro: 1 (1986).

Key to genera

1a Leaves compound, trifoliolate, or variably imparipinnate:
  2a Leaves variably imparipinnate:
    3a Ovary 2–4-locular; fruit large, fleshy, with prominent stone, brown.....**Sclerocarya**
    3b Ovary 1(2)-locular:

4a Fruit fleshy:
5a Stamens 8; leaflets straight, sessile or petiolulate ..... **Lannea**
5b Stamens 7–10; leaflets falcately narrowly ovate, subsessile ..... **Harpephyllum**
4b Fruit dry:
6a Fruit somewhat flattened, with parchment-like covering and surrounded by enlarged, coloured calyx; leaflets opposite; rachis winged ..... **Loxostylis**
6b Fruit small, dry, with reddish chartaceous exocarp ..... ***Schinus**
2b Leaves nearly always trifoliolate:
7a Fruit a small, fleshy or dryish drupe ..... **Rhus**
7b Fruit with membranous, winged pericarp ..... **Smodingium**
1b Leaves simple:
8a Leaves opposite or nearly so, margin entire; stamens 5, arising below disc; styles 3, connate at base ..... **Protorhus**
8b Leaves alternate:
9a Leaves with serrate margin; ovary 1-locular; style lateral with minutely 2-lobed stigma; fruit compressed, narrowly winged ..... **Laurophyllus**
9b Leaves with entire margin:
10a Style and stigma 1; male flowers with 1(2) fertile stamens:
11a Pedicel and receptacle swollen and fleshy in fruit, finally larger than compressed fruit; fruit not fleshy..... ***Anacardium**
11b Pedicel and receptacle not fleshy; drupe large, ovoid or subglobose, pulpy ..... ***Mangifera**
10b Styles and stigmas 3; male flowers with all stamens normal:
12a Ovary asymmetrical, narrowed into a neck below styles; styles united towards base ..... **Heeria**
12b Ovary symmetrical; styles free or nearly so, without columnar base ..... **Ozoroa**

*Anacardium L. 4546000

Linnaeus: 383 (1753); Fernandes & Fernandes: 551 (1966); Kokwaro: 2 (1986).

Trees or shrubs, polygamo-dioecious. **Leaves** alternate, simple, entire, coriaceous. **Flowers** in corymbose terminal panicles. **Sepals** 5, imbricate, slightly connate at base. **Petals** 5, imbricate, reflexed, caducous. **Stamens** 7–10, 1 or 2 fertile, rest sterile, unequal; filaments connate at base. **Disc** 0. **Ovary** 1-carpous, 1-locular; ovule single, ascendent; style 1 with capitate stigma. **Fruit** obliquely reniform on swollen pedicel. **Seeds** reniform with 2 large, white, thick cotyledons. x = 10, 12 or 6 (polyploidy).

Species 8 in tropical America; **Anacardium occidentale* L., Cashew Nut, a strong-growing, spreading tree, is becoming naturalised in parts of subtropical KwaZulu-Natal.

Harpephyllum Bernh. 4562000

Bernhardi: 349 (1844); Sonder: 525 (1860); Fernandes & Fernandes: 555 (1966).

Trees, dioecious, glabrous. **Leaves** alternate, imparipinnate; leaflets entire, falcately narrowly ovate. **Flowers** in axillary panicles. **Male flowers**: calyx 4- or 5-lobed; petals 4 or 5; stamens 7–10; ovary vestigeal. **Female flowers**: disc saucer-shaped, with somewhat crenate rim; staminodes conspicuous; ovary 1(2)-locular, 1 locule often reduced, ± ellipsoid, with thick walls, with a solitary, pendulous ovule; styles 4 or 5, separate, with truncate stigmas. **Fruit** a fleshy drupe with bony endocarp; stone 1(2)-locular with 1 operculum per locule, concealed by ridges. **Seeds** reniform, flattened.

Species 1: *Harpephyllum caffrum* Bernh., sthn Afr.: Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape; in riverine forests.

Heeria Meisn. 4589000

Meisner: 75 (1837); Fernandes & Fernandes: 150 (1965).

Rhus L.: 265 (1753) in part; Sonder: 504 (1860) in part; Phillips: 474 (1951) in part.

Shrubs or small trees, monoecious. **Leaves** alternate, simple, entire, petiolate, coriaceous, discolorous. **Flowers** in terminal panicles or racemes. **Male flowers**: calyx 5- or 6-segmented; petals 5 or 6, oblong, longer than stamens; disc lobed; stamens 5–10. **Female flowers**: calyx and corolla as in male; disc annular; staminodes 5–10; ovary 1(3)-locular with a single, basal ovule, asymmetrical, extending into a small column supporting styles; styles 3, united towards base, spreading above; stigmas somewhat capitate. **Fruit** a subfleshy, depressed, globose drupe, yellowish green, longitudinally rugose-striate.

Species 1, sthn Afr.: *Heeria argentea* (Thunb.) Meisn., common in Western Cape.

Lannea A.Rich. 4563000

Richard: 153, t. 42 (1831) name conserved; Fernandes & Fernandes: 557 (1966); Kokwaro & Gillett: 748 (1980).

Odina Roxb.: 293 (1832); Sonder: 503 (1860).

Trees or suffrutices. **Leaves** alternate, imparipinnate or trifoliolate with opposite, often discolorous leaflets; rachis sometimes shortly winged. **Flowers** bisexual or some unisexual, often arising before leaves, in panicled, terminal racemes and with peduncle sometimes stellately hairy. **Calyx** shortly 4-lobed, persistent. **Petals** 4(–6), spreading, imbricate. **Disc** annular, fleshy, entire or crenate. **Stamens** 8, arising on disc; filaments flattened; anthers ovate or sometimes sagittate. **Ovary** 1-locular with 1 pendulous ovule; in male flowers 4(–6)-partite; styles 4, short or sometimes longer than petals; stigmas simple or subcapitate. **Fruit** a fleshy drupe, with remains of styles. **Seeds** half-moon-shaped. x = 10 (7) (polyploidy).

Species ± 40, Africa to India; 6 in sthn Afr., Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Laurophyllus Thunb. 4587000

Thunberg: 104 (1792).

Botryceras Willd.: 396 (1811); Sonder: 524 (1860).

Trees or shrubs, dioecious, resinous. **Leaves** alternate, simple, petiolate, elliptic, serrate. **Inflorescence** paniculate, often galled. **Male flowers**: in terminal panicles; calyx 4- or 5-cleft nearly to base, with imbricate lobes; petals 4 or 5, similar to sepals; disc fleshy, somewhat convex; stamens 4 or 5, slightly exserted, alternat-

ing with sepals; filaments ± as long as anthers; pistil 0. **Female flowers**: densely clustered; calyx similar to male; petals lanceolate, coloured; ovary 1-locular, subcompressed, suborbicular, with a single, pendulous ovule; style 1, lateral, with minutely 2-lobed stigma. **Fruit** a small achene, compressed, narrowly winged; pericarp with raised veins. **Seeds** with chartaceous testa.

Species 1: *Laurophyllus capensis* Thunb.; Swellendam in Western Cape to Uitenhage in Eastern Cape.

Loxostylis A.Spreng. ex Rchb. 4586000

Reichenbach: t. 205 (1830); Sonder: 524 (1860); Killick: t. 1536 (1968).

Trees, dioecious. **Leaves** alternate, imparipinnate, 2–6-jugate; leaflets opposite, lanceolate; rachis winged. **Flowers** in terminal panicles. **Male flowers**: calyx 5-lobed, with campanulate tube; petals 5, reflexed; disc of five 2-lobed scales; stamens 5, free, unequal, arising between disc scales; pistil 0. **Female flowers**: calyx 5-parted; segments narrowly ovate-linear, becoming enlarged and pinkish in fruit; petals similar to sepals; disc of 5 broad, 2-notched glands; stamens rudimentary; ovary 1-locular, obliquely obovoid, papillate, with a single, basal ovule; styles 1–4, unequal, arising laterally; stigmas capitate. **Fruit** a dry drupe, oblique, somewhat flattened, with persistent calyx and remains of styles, rugose. **Seeds** compressed.

Species 1: *Loxostylis alata* A.Spreng. ex Rchb., KwaZulu-Natal, Eastern Cape to Western Cape in the Humansdorp and Willowmore Districts.

*__Mangifera__ L. 4545000

Linnaeus: 200 (1753); Fernandes & Fernandes: 552 (1966); Kokwaro: 3 (1986).

Erect, evergreen trees, polygamous. **Leaves** alternate, simple, entire. **Flowers**: male and bisexual flowers in same terminal or subterminal panicles. **Sepals** (4)5(–7), free, imbricate. **Petals** (4)5(–7), imbricate, dark yellow nerves conspicuous. **Stamens** 5–10, 1(2–5) fertile, others sterile; filaments filiform. **Disc** 4- or 5-lobulate or vestigeal. **Ovary** subglobose, 1-locular with a single ovule; style 1. **Fruit** a fleshy drupe, subreniform or ovoid with fleshy mesocarp and fibrous woody endocarp. **Seeds** oblong-ovoid, compressed, with chartaceous testa; embryo with cotyledons plano-convex; radicle ascendent. $x = 10$ (polyploidy).

Species ± 62 in SE Asia; many cultivars of **Mangifera indica* L. (Mango) in sthn Afr., widely cultivated and sometimes escapes in subtropical forests in KwaZulu-Natal.

Ozoroa Delile 4589010

Delile: 91, t. 1, fig. 3 (1843); Fernandes & Fernandes: 150 (1965); Fernandes: 19 (1966); Fernandes & Fernandes: 574 (1966); Kokwaro: 4 (1986); Von Teichman & Van Wyk: 175 (1994).

Rhus L.: 265 (1753) in part; Sonder: 504 (1860) in part. *Heeria* of authors, in part, not of Meisn. 1837; Phillips: 474 (1951) in part.

Shrubs or small trees, dioecious. **Leaves** alternate, simple, entire to undulate, petiolate or subsessile, usually discolorous, hairy. **Flowers** in axillary or terminal panicles. **Male flowers**: calyx 5-segmented; petals 5, elliptic; disc lobed; stamens 5. **Female flowers**: calyx and corolla as in male; disc annular; staminodes 5, rudimentary; ovary 1-locular, symmetrical, with a single basal ovule; styles 3, free or nearly so; stigmas somewhat capitate. **Fruit** a dry or subfleshy, reniform or subglobose drupe, often black, irregularly rugulose. **Seeds** pendulous from basal funicle.

Species ± 40, Africa and Arabian Peninsula, possibly Madagascar; ± 20 in sthn Afr.; widespread.

Protorhus Engl. 4576000

Engler: 377, 420 (1881); Fernandes: 37 (1966); Von Teichman & Van Wyk: 175 (1994).

Trees, dioecious, sometimes with bisexual flowers. **Leaves** opposite or subopposite, simple, entire to undulate. **Flowers** in small, axillary or large, terminal panicles. **Calyx** 1-partite. **Petals** 5, imbricate. **Disc** urceolate in male, and saucer-shaped in female flowers. **Stamens** 5, arising below rim of disc. **Ovary** 1-locular, ovoid or subglobose, with a solitary, pendulous ovule; funicle attached laterally to wall which has oil ducts; styles 3, connate at base; stigmas capitate. **Fruit** a black, 1-seeded drupe. **Seeds** oblong, with membranous testa.

Species ± 20, Madagascar; 1 in sthn Afr.: *Protorhus longifolia* (Bernh.) Engl., Namibia, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Northern and Eastern Cape.

Rhus L. 4594000

Linnaeus: 265 (1753); Sonder: 504 (1860) in part; Schonland: 3 (1930); Fernandes & Fernandes: 590 (1966); Fernandes:123 (1967); Moffett: 1 (1993).

Searsia Barkley: 472 (1942).

Shrubs or trees, usually dioecious, rarely with bisexual flowers; sometimes armed; prominently lenticellate. **Leaves** alternate, usually 3-foliolate, entire, crenate to coarsely dentate, usually petiolate, with petiole sometimes winged. **Flowers** unisexual, very rarely bisexual, in axillary or terminal panicles, bracteate. **Calyx** (4)5(6)-partite, sometimes with segments unequal. **Petals** (4)5(6), usually inconspicuous. **Disc** usually 5(–10)-crenate. **Male flowers**: stamens 5; pistil rudimentary. **Female flowers**: staminodes usually 5; ovary 3-carpous, 1(2, 3)-locular with 1(2, 3) ovules, subglobose or compressed; styles 3, free; stigmas usually ± capitate. **Fruit** a small globoid or compressed drupe. **Seeds** reniform, exalbuminous. $x = 15$ (aneuploids, polyploidy, B-chromosomes).

Species ± 200, mostly tropical and subtropical countries; ± 75 in sthn Afr., widespread in forest and scrub.

*__Schinus__ L. 4582000

Linnaeus: 388 (1753); Barkley: 160 (1944).

Trees to shrubs. **Leaves** imparipinnate; leaflets subsessile, entire or dentate. **Flowers** in axillary panicles. **Sepals** 4 or 5, deltoid, ovoid or rotund, glabrous to densely pilose. **Petals** 4 or 5, ovate, truncate, usually glabrous. **Stamens** 8–10, unequal, stamens in pistillate flowers smaller. **Disc** thick, lobed. **Ovary** 1-locular with a single suspended ovule; style 1. **Fruit** a small, slightly fleshy to dry drupe with thin, chartaceous, shining red exocarp. **Seeds** 1. $x = 7, 15$ (polyploidy).

Species ± 25, South and Central America; 2 introduced in sthn Afr.: **Schinus molle* L., Pepper Tree, widely cultivated because of its hardy nature, sometimes found as an escape, **S. terebinthifolius* Raddi, has similar fruit, but broader leaflets, less frequently found as an escape.

Sclerocarya Hochst. 4558000

Hochstetter: 1 (1844); Sonder: 524 (1860); Fernandes & Fernandes: 552 (1966); Kokwaro & Gillett: 756 (1980); Kokwaro: 42 (1986).

Trees or shrubs, usually dioecious. **Leaves** crowded at tips of branches, alternate, imparipinnate; leaflets petiolate, entire, usually acuminate. **Flowers** sometimes bisexual, mostly unisexual, in spikes in male and solitary in female plants. **Sepals** 4 or 5, oblong or orbicular, imbricate. **Petals** 4 or 5, oblong or obovate, imbricate. **Disc** depressed, entire, or somewhat raised in male flowers. **Stamens** 10–16(–26), fewer in female flowers and apparently sterile. **Ovary** 2- or 3(4)-locular, with a solitary,

pendulous ovule in each locule; styles 2–4, distant, short, with peltate stigma. **Fruit** a fleshy, pale green to yellow drupe; endocarp bony, with 1–4 ovate opercules at apex. **Seeds** 2 or 3, obclavate with thin brown testa. $x = 13$ (1 report).

Species 2, Africa and Madagascar, 1 in sthn Afr.: *Sclerocarya birrea* (A.Rich.) Hochst. subsp. *caffra* (Sond.) Kokwaro, Namibia, Botswana, Northern Province, North-Wcst, Gauteng, Mpumalanga, Swaziland and KwaZulu-Natal. Fruit favourcd by man and animals; seeds tasty and highly nutritious.

Smodingium E.Mey. ex Sond. 4588000

Sonder: 523 (1860); Ellis: 259 (1974).

Shrubs, dioecious, glabrous. **Leaves** alternate, digitately 3-foliolate, petiolate; leaflets lanceolate, coarsely toothed. **Flowers** small, in dense, terminal clusters. **Male flowers**: calyx 5-cleft, persistent; petals 5, reflexed; disc with subcrenate margin; stamens 5, opposite sepals. **Female flowers**: calyx and corollas as in male; disc annular; staminodes 5, rudimentary; ovary 1-locular, suborbicular, somewhat flattened, with a solitary, pendulous ovule; styles 3, free, lateral, persistent; stigmas capitate. **Fruit** an achene, with a membranous, winged pericarp, containing black, resinous ducts. **Seeds** kidney-shaped, with chartaceous testa.

Species 1: *Smodingium argutum* E.Mey. ex Sond., Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal, Lesotho and Eastern Cape; may cause severe dermatitis.

Annonaceae

(Magnoliidae—Magnoliales)

Compiled by M. Jordaan

Trees, shrubs, rarely subshrubs, or climbers, often aromatic; stems with resin canals and septate pith. **Leaves** alternate, distichous, simple, entire, penninerved; stipules 0. **Inflorescences** terminal, leaf-opposed, axillary or supra-axillary, or cauliflorous, solitary, paired or in few- to many-flowered fascicles, or occasionally cymosely racemose. **Flowers** usually bisexual, occasionally unisexual, regular, very often fleshy or brittle, often drooping, fragrant; bracts often present. **Sepals** (2)3(4), valvate or imbricate in bud, free or connate, at least at base, persistent or deciduous. **Petals** hypogynous, 3–6(–12), usually 6, free, in two whorls of 3, imbricate or valvate in each whorl. **Stamens** many, rarely few, hypogynous; filaments short, thick and free or rarely longer and united into a tube; anthers linear, opening by longitudinal slits, with extrorse or lateral, rarely introrse, dehiscence; connective often produced into an appendage. **Gynoecium** consisting of many or few carpels, rarely 1, free or rarely united into a 1-locular ovary with parietal placentas; ovules 1 or 2, inserted at base of carpel or 1–several on ventral suture in 1 or 2 whorls, anatropous; styles free or connate, mostly shortly terete, thick; stigma capitate or oblong, sometimes sulcate or bilobed. **Fruit** either consisting of 1 to several fleshy or ± woody indehiscent or rarely dehiscent, sessile or stipitate monocarps, or syncarpous with numerous 1-seeded fruiting carpels, or 1-locular and many-seeded, cylindrical and often moniliform, rounded or irregular. **Seeds** rather large, sometimes arillate with a groove encircling seed; endosperm abundant, ruminate, hard, oily; embryo straight, minute.

Genera ± 130; species ± 2 300, pantropical; particularly in lowland evergreen forest; sthn Afr.: genera 8, species 14.

Jussieu: 283 (1789), as Anoneae; Dunal: 1 (1817); Candolle: 177 (1832); Endlicher: 830 (1839); Sonder: 7 (1860) as Anonaceae; Bentham: 20 (1862a); Prantl: 23 (1891); Fries: 1 (1959); Robson: 104 (1960); Van Setten & Maas: 675 (1990); Kessler: 93 (1993).

Key to genera

1a Carpels united in fruit, forming a fleshy or hard-shelled syncarp:

2a Fruits fleshy, orange when mature; petals in 2 equal whorls; hairs, if present, stellate and simple ..... **Annona**

2b Fruits dry and hard-shelled, blackish when mature; petals very unequal, united in lower parts; hairs absent or simple.... ..... **Monodora**

1b Carpels free or solitary in fruit, if more than 1 then forming a cluster of apparently separate fruits:
3a Hairs stellate and simple ..... **Uvaria**
3b Hairs simple or absent:
4a Climbers, rarely small trees, with leaf-opposed, laterally compressed hooks ..... **Artabotrys**
4b Habit various but leaf-opposed hooks absent:
5a Climbing or scrambling plants:
6a Branches with prominent lenticels, red or blackish; bracteoles small, ovate-oblong ..... **Monanthotaxis**
6b Branches without lenticels; bracteoles large, foliaceous and orbicular to broadly ovate with amplexicaul base.... ..... **Friesodielsia**
5b Erect trees or shrubs:
7a Fruits splitting open when ripe, stipitate; flowers greenish; flower bud extended into a straight or curved beak; petals long-acuminate from an ovate base ..... **Xylopia**
7b Fruits never splitting open, sessile; flowers cream, white or yellow; flower bud obtuse to subacute; petals transversely folded in bud... ..... **Hexalobus**

Annona L. 2729000

Linnaeus: 536 (1753); Linnaeus: 241 (1754); Endlicher: 834 (1839); Harvey: 583 (1862); Bentham: 476 (1862b); Oliver: 14 (1868); Prantl: 37 (1891); Engler & Diels: 76 (1901); Fries: 129 (1931); Fries: 1 (1959), accepted 17 sections; Robson: 141 (1960); Paiva: 107 (1966); Roessler & Schreiber: 1 (1968); Verdcourt: 112 (1971a); Van Setten & Maas: 678 (1990); Kessler: 126 (1993).

Trees, shrubs or shrublets, with simple or stellate hairs or glabrous. **Leaves** usually large, petiolate, often ± elliptic. **Inflorescences** fascicled, or occasionally cymosely racemose, terminal, leaf-opposed, supra-axillary or cauliflorous, or flowers solitary. **Flowers** usually bisexual, pedicellate, bracteolate; bracteoles 0–2, persistent. **Sepals** 3, valvate, free, much shorter than petals. **Petals** 6, valvate, or imbricate, in 1 or 2 whorls, subequal or inner whorl rudimentary or absent, free or connate at base. **Stamens** many; filaments linear or linear-valvate; anther thecae extrorse and often unequal at base; connective usually terminating in a swollen head or hood-like process above anther thecae. **Carpels** many, free at first or united from beginning, ± cylindrical, often hairy; ovule solitary, basal, erect; style clavate; stigma muricate. **Fruit** syncarpous, formed by united monocarps, indehiscent, fleshy, usually ovoid, spherical or cordiform, many-seeded. **Seeds** irregularly arranged in syncarp; with endosperm of firm, waxy plates, interspersed with membranous outgrowths from endocarp; aril carunculoid. $x = 7$ (aneuploids, polyploidy).

Species ± 110, mostly in tropical America, 4 in tropical Africa; 2 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal. Few species cultivated as fruit trees throughout the tropics.

Artabotrys R.Br. 2724000

Brown: t. 423 (1820); Endlicher: 833 (1839); Bentham: 466 (1862b); Oliver: 27 (1868); Hooker & Thomson: 53 (1872); Prantl: 36 (1891); Engler & Diels: 70 (1901); Robson: 129 (1960); Paiva: 88 (1966); Le Thomas: 128 (1969); Verdcourt: 56 (1971a); Van Setten & Maas: 678 (1990); Kessler: 117 (1993).

Shrubs or rarely small trees, usually climbing or scrambling, with simple hairs. **Leaves** petiolate, often ± elliptic, coriaceous. **Inflorescences** condensed cymes or flowers solitary, supra-axillary. **Flowers** bisexual, pedicellate, on flattened, hooked peduncles by which plants are supported; bracts and bracteoles small, often caducous. **Sepals** 3, valvate, equal to petals or shorter, free or ± connate at base, tomentose. **Petals** 6, free, valvate, in 2 whorls, subequal, spoon-shaped, concave and connivent at base. **Stamens** many; filaments oblong or cuneate, with or without appendages; connective with a truncate dilated apex; anther thecae dorsal or lateral. **Carpels** few or many, free, ovoid or ellipsoid; ovules 2, basal; style oblong or columnar; stigma fleshy. **Monocarps** indehiscent, succulent, cylindrical or ellipsoid, sessile, sometimes large and pear-shaped, 1- or 2-seeded. **Seeds** vertical, collateral; aril 0. $x = 8$ (aneuploids).

Species ± 100, tropics and subtropics of Old World; 2 in sthn Afr., Botswana, Northern Province and KwaZulu-Natal.

Friesodielsia Steenis 2691010

Van Steenis: 458 (1948); Van Steenis: 357 (1964); Verdcourt: 17 (1971b); Verdcourt: 86 (1971a); Van Setten & Maas: 681 (1990); Kessler: 120 (1993); Van Wyk: 42 (1994).

Polyalthia sect. *Oxymitra* Blume: 71, t. 35–37 (1830). *Oxymitra* (Blume) Hook.f. & Thomson: 145 (1855). *Guatteria* Blume: 60, t. 29, 31C (1830). *Unona* Hook.f. & Thomson in part Benth.: 469 (1862b); Oliver: 35 (1868). *Popowia* Engl. & Diels: 44, t. 17B (1901); Baker: 18 (1911); Robson: 123, t. 12A (1960); Paiva: 34 (1966); Roessler & Schreiber: 3 (1968).

Evergreen shrubs or rarely small trees, often multistemmed and scrambling or subscandent, with simple hairs. **Leaves** petiolate. **Flowers** bisexual, solitary, leaf-opposed or supra-axillary. **Sepals** 3, free, valvate, ± connate at base. **Petals** 6, valvate, in 2 whorls, inner much shorter than outer, cohering towards base. **Stamens** numerous, connective with a truncate dilated apex. **Carpels** numerous, ± cylindrical; ovules 1–5, lateral. **Monocarps** pendulous, moniliform with 1–many seed-containing segments, stipitate. **Seeds** ellipsoid; seed coat with numerous thin lamellae penetrating endosperm. $x = 8$ (1 report).

Species ± 50–60; tropical Asia and Africa; 1 in sthn Afr.: *Friesodielsia obovata* (Benth.) Verdc., Namibia and Botswana.

Hexalobus A.DC. 2716000

Candolle: 212 (1832); Oliver: 26 (1868); Prantl: 36 (1891); Engler & Diels: 55 (1901); Robson: 1 (1960); Paiva: 61 (1966); Roessler & Schreiber: 2 (1968); Le Thomas: 81 (1969); Van Setten & Maas: 682 (1990); Kessler: 113 (1993).

Trees or shrubs, with simple hairs. **Leaves** petiolate, often ± elliptic-oblong. **Inflorescences** 2- or 3-flowered fascicles, axillary or supra-axillary or flowers solitary. **Flowers** bisexual, sessile or shortly pedicellate, bracteolate; bracteoles 2–several, biseriate, caducous. **Sepals** 3, free, coriaceous, ovate, valvate, enclosing petals in bud, with margins not or scarcely bent outwards, densely brown- or fawn-pubescent. **Petals** 6, slightly imbricate, in 2 whorls, equal or subequal, connate at base into a small tube, valvate, transversely folded in bud, expanding and spreading at anthesis. **Stamens** many; anthers linear or linear-cuneate; connective thickened and truncate above thecae. **Carpels** 2 or 3, villous; ovules many, in 1 row; style very short; stigma 2-lobed, with lobes oblong or dilated. **Monocarps** indehiscent, succulent, cylindrical or ellipsoid, usually not or scarcely constricted, subsessile. **Seeds** horizontal; aril absent.

Species 5, tropical Africa from Senegal to Sudan and southwards to sthn Afr., 1 dubiously placed species (climber) recorded from Madagascar; 1 in sthn Afr.: *Hexalobus monopetalus* (A.Rich.) Engl. & Diels, Namibia, Botswana and Northern Province.

Monanthotaxis Baill. 2696000

Baillon: 878 (1890), in broad sense; Verdcourt: 20 (1971b); Verdcourt: 88 (1971a); Van Setten & Maas: 683 (1990); Kessler: 123 (1993).

Popowia in sense of various authors, all Afr. species, not of Endl.: 831 (1839); Engler & Diels: 53 (1901); Robson: 122 (1960); Paiva: 34 (1966); Le Thomas: 255 (1969). *Unona* Benth: 469 (1862); Oliver: 35 (1868).

Small trees, shrubs or woody climbers with simple hairs. **Inflorescences** few-flowered fascicles, or flowers solitary, supra-axillary, rarely axillary. **Flowers** bisexual or unisexual, small, mostly pedicellate, bracteolate; bracteoles often persistent, quite conspicuously leafy and usually situated on lower half of pedicel, frequently minute. **Sepals** (2)3, valvate, free or ± connate at base, much shorter than petals. **Petals** (4–)6, valvate, in 1 or 2 whorls, free or slightly connate at base, inner shorter than outer, ± clawed. **Stamens** 6–many, in 1 to several whorls, or rarely 6 alternating with 6 staminodes; connective without a prolonged apex, sometimes with lateral appendages. **Carpels** few to many, free, cylindrical, ellipsoid or obconic; ovules 1–8, lateral, in 1 whorl; style as long as or shorter than ovary; stigma bifurcate or grooved. **Monocarps** indehiscent, ± cylindrical, mostly stipitate, 1–8-seeded, often fleshy, mostly constricted between seeds, articles easily breaking off. **Seeds** oblong-ellipsoid, ovoid or subglobose, vertical; testa intrusions into endosperm lamelliform.

Species ± 60; tropical Africa and Madagascar; 1 in sthn Afr.: *Monanthotaxis caffra* (Sond.) Verdc., Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Monodora Dunal 2733000

Dunal: 34, 79 (1817); Endlicher: 834 (1839); Bentham: 473 (1862); Oliver: 37 (1868); Prantl: 38 (1891); Engler & Diels: 84 (1901); Robson: 145 (1960); Le Thomas: 338 (1969); Verdcourt: 124 (1971a); Codd: t. 1870 (1982); Van Setten & Maas: 683 (1990); Kessler: 128 (1993); Thulin: 19 (1993).

Trees or shrubs, sometimes climbing or scrambling, with simple hairs or glabrous; young shoots frequently blackening and becoming brittle on drying. **Leaves** petiolate, often ± elliptic, thin. **Inflorescences** paired or few-flowered cymes, terminal or extra-axillary or in axils of fallen leaves, or flowers solitary. **Flowers** bisexual, pedicellate, bracteolate; bracteole single, often large and leafy, usually amplexicaul, persistent. **Sepals** 3, valvate, free, much shorter than petals. **Petals** 6, valvate, in 2 whorls, all connate at base, inner smaller than outer, clawed, usually with crisped or undulate margins, connivent at apex until anthesis. **Stamens** many, without filaments; anthers oblong or cuneiform to orbicular, with extrorse dehiscence; connective prolongation thickened. **Carpels** several, united, 1-locular, globose or conical, with parietal placentation; ovules numerous; stigmas sessile, radiating. **Fruit** syncarpous, a coriaceous or ligneous berry, globose to ellipsoid or obovoid, stipitate, many-seeded; pericarp leathery or woody. **Seeds** irregularly arranged, shining; aril 0. $x = 8$.

Species ± 15, confined to tropical Africa; 1 in sthn Afr.: *Monodora junodii* Engl. & Diels, Northern Province and KwaZulu-Natal.

Uvaria L. 2673000

Linnaeus: 536 (1753); Linnaeus: 240 (1754); Endlicher: 832 (1839); Sonder: 8 (1860); Bentham: 464 (1862b); Oliver: 19 (1868); Hooker & Thomson: 47 (1872); Prantl: 30 (1891); Engler & Diels: 7 (1901); Robson: 106 (1960); Le Thomas: 37 (1969); Verdcourt: 2 (1971b); Verdcourt: 10 (1971a); Van Setten & Maas: 687 (1990); Kessler: 111 (1993).

Climbing, straggling or erect shrubs or small trees, usually with stellate and sometimes also simple hairs. **Leaves** ± leathery, mostly elliptic-oblong. **Inflorescences** short terminal cymes, opposite leaves, only rarely axillary or flowers solitary. **Flowers** usually bisexual, dull to yellowish green. **Sepals** 3, valvate, often connate at base, or calyx cupular in bud and later splitting into often irregular lobes. **Petals** 6, imbricate, in 2 whorls, subequal, sometimes connate at base; inner somewhat smaller than outer and without glands at base. **Stamens** many, inserted on torus surrounding carpels; filaments very short or absent, outer sometimes sterile and leaf-like; anther thecae lateral or extrorse; connective expanded into a truncate appendage. **Carpels** many, free, linear-oblong in outline, sometimes angular and furrowed; ovules few–many in 1 or 2 rows; style absent or short and thick; stigma 5, horseshoe-shaped or funnel-shaped with a slit down inner side, with involute margins. **Monocarps** indehiscent, ± oblique, oblong to ovoid to subglobose, stipitate or subsessile, 1–many-seeded, dry or sometimes fleshy when ripe. **Seeds** horizontal or oblique, ovate, brown and shiny; aril small or 0. $x = 8$ (aneuploids).

Species ± 110, mostly tropical Asia, Australia and Africa; 3 in sthn Afr., Northern Province, Swaziland, KwaZulu-Natal and Eastern Cape.

Xylopia L. 2717000

Linnaeus: 1250 (1759) name conserved; Endlicher: 832 (1839); Bentham: 478 (1862b); Oliver: 29 (1868); Prantl: 36 (1891); Engler & Diels: 57 (1901); Fries: 86 (1930); Robson: 133 (1960); Paiva: 66 (1966); Roessler & Schreiber: 3 (1968); Verdcourt: 72 (1971a); Kessler: 117 (1993).

Trees, shrubs or shrublets, not climbing, with simple hairs. **Leaves** often ± elliptic, usually membranous or coriaceous. **Inflorescences** axillary cymes or fascicles or flowers solitary. **Flowers** bisexual, pedicellate or sessile, often fragrant, bracteolate; bracteoles (1)2–5, caducous or persistent. **Sepals** 3, ± connate, valvate, much shorter than petals. **Petals** 6, free, valvate, in 2 whorls, subequal or outer larger than inner, spoon-shaped, erect or spreading. **Stamens** many, linear, outer and inner often flattened and staminodal; filaments articulated, sometimes connate at base, enclosing gynoecium; anther thecae extrorse, transversely septate; connective prolongation capitate. **Carpels** many to few, free, rarely solitary, ovoid-cylindrical or ± flattened; ovules many; styles cylindrical or narrowly clavate, aggregated. **Monocarps** obovoid to cylindrical, mostly stipitate, dehiscent or indehiscent, ± fleshy, 1–8-seeded. **Seeds** vertical to horizontal, collateral or biseriate; aril sometimes small. $x = 8$.

Species ± 100–160, pantropical, Africa, Madagascar, Asia, Malaya and America; 3 in sthn Afr., Namibia and Northern Province.

Apiaceae (Umbelliferae)

(Asteridae—Asterales)

Compiled by B-E. van Wyk

Herbs, annual or perennial, often with a tuberous rootstock, occasionally shrubs or trees, often aromatic. **Leaves** usually alternate, rarely opposite, often radical, usually with a sheathing petiole, variously divided or sometimes simple; stipules 0. **Flowers** usually small, regular and bisexual, rarely unisexual, in simple or compound umbels, rarely heads subtended by involucres, rarely without. **Calyx** with tube adnate to ovary, with (usually 5) or without lobes. **Petals** 5, free, inserted on margin of disc, usually with inflexed apices and keeled on inner face, soon falling. **Disc** expanded, depressed or conical, with entire or crenate margin. **Stamens** 5, alternating with petals; filaments inflexed in bud; anthers 2-thecous, opening laterally. **Ovary** inferior, (1)2(3)-locular, with a single, pendulous ovule in each locule; styles 2, short or long, free, sometimes with a thickened base (stylopodium). **Fruit** a dry schizocarp, usually crowned with calyx, disc and styles; fruit splitting down a septum (commissure) into 2 single-seeded, indehiscent mericarps, at first joined by their (commissural, inner) faces, and mostly suspended from a common, slender, divided or unbranched stalk (carpophore) derived from main vascular strand of fruit; mericarps typically with 5 primary ribs: 1 dorsal, 2 lateral, 2 commissural, and between them 4 secondary ridges, all running longitudinally from base to stylar end of fruit; mericarps either similar (homomorphic) or different (heteromorphic) in shape, sometimes winged, glabrous, villous, or spiny, usually with intervallecular vittae (oil ducts in furrows between ribs), or vittae sometimes intrajugal (within ribs). **Seeds** various.

Genera ± 453; species over 3750, cosmopolitan, mainly in temperate regions; sthn Afr.: genera 36 (8 naturalised), species 152 (15 naturalised). The following genera and species are encountered as rare escapes and are not included in the key and descriptions: **Cancalis* L. (5950000) – the only species: **C. platycarpos* L., is a cosmopolitan weed of Europe; **Pastinaca* L. (6120000) – a genus of 14 species from Europe and Asia; 1 species: **P. sativa* L., the cultivated Parsnip, occurs as an occasional escape in moist situations; **Petroselinum* Hill (6006000) – **P. crispum* (Mill.) A.W. Hill, the cultivated herb Parsley, is an occasional escape.

Sonder: 524 (1862); Drude: 63 (1898); Schreiber: 1 (1967); Cannon: 555 (1978); Burtt: 133 (1991); Pimenov & Leonov: 1 (1993); Plunkett, Soltis & Soltis: 565 (1997).

Drude's (1898) classification system is likely to be modified as a result of evidence from DNA sequence data, e.g. Plunkett, Soltis & Soltis (1997). Some genera of the Hydrocotyloideae (*Centella*, *Hydrocotyle*) for example, have already been transferred to the Araliaceae but a formal new classification system for the two families (Apiaceae and Araliaceae) has not yet been published. Drude's system is not followed here, but the three subfamilies represented in sthn Afr. are as follows:

I. Subfamily HYDROCOTYLOIDEAE: *Hermas*

II. Subfamily SANICULOIDEAE: *Alepidea*, *Arctopus*, *Sanicula*

III. Subfamily APIOIDEAE: all remaining genera

The following key is that of Burtt (1991), with slight modifications to accommodate recent taxonomic changes.

Key to genera

1a Leaves simple or palmately lobed or palmately compound:
  2a Plants woody, not dying down to ground level after flowering:
    3a Fruit hairy ..... **Deverra**
    3b Fruit glabrous:
      4a Mericarps heteromorphic, winged:
        5a Margins of leaflets toothed; seed loose within endocarp ..... **Polemanniopsis**
        5b Margins of leaf or leaflets entire; seed adherent to endocarp ..... **Heteromorpha**

4b Mericarps homomorphic, not winged:
6a Leaves flat, palmately lobed, with distinct intramarginal nerve ..... **Polemannia**
6b Leaves ± terete ..... **Anginon**
2b Plants herbaceous (i.e. stems dying down to ground level after flowering, occasionally radical leaves persistent, or stems creeping and only the inflorescences dying):
7a Leaves palmately compound:
8a Fruit dorsally flattened ..... **Peucedanum**
8b Fruit not flattened ..... **Pimpinella**
7b Leaves simple or palmately lobed to partite (*Sanicula*):
9a Leaf blade many times longer than broad:
10a Umbels (heads) simple with conspicuous involucre of bracts united at base, pale green, greenish yellow or silvery white, sometimes becoming pinkish inside ..... **Alepidea**
10b Umbels compound; involucral bracts free:
11a Leaves grass-like, tapered to an acute tip; flowers yellow ..... **Bupleurum**
11b Leaves linear or spathulate, blunt; flowers white ..... **Itasina**
9b Leaf blade not more than 3 times as long as broad:
12a Plants acaulescent; leaves prickly, in dense rosette; flowers unisexual; fruit 1-seeded ..... **Arctopus**
12b Plants caulescent; leaves not prickly (at most with strong marginal cilia); flowers bisexual or andromonoecious; fruit 2-seeded:
13a Umbels simple, or seemingly so by forming compact heads:
14a Leaves palmately lobed or divided:
15a Involucral bracts united; fruit glabrous except for some blunt scales at the top ..... **Alepidea**
15b Involucral bracts free; fruit with hooked bristles ..... **Sanicula**
14b Leaves entire or toothed:
16a Leaves tomentose below; involucral bracts free ..... **Hermas**
16b Leaves never tomentose below; involucral bracts united ..... **Alepidea**
13b Umbels manifestly compound, umbellules with conspicuous peduncles:
17a Leaves palmately lobed, cordate or peltate; fruit with vittae in the furrows ..... **Dracosciadium**
17b Leaves palmately trifid; fruit with vittae below veins in the ribs ..... **Lichtensteinia**
1b Leaves pinnate, pinnately lobed or decompound, or basal leaves simple and cauline leaves pinnately dissected:
18a Plants woody, not dying to ground level after fruiting:
19a Fruit (and ovaries) hairy or bristly:
20a Leaves thick, fleshy ..... **Marlothiella**
20b Leaves not fleshy:
21a Plant leafless at flowering; leaves, if present, with linear segments ..... **Deverra**
21b Plant with well developed leaves at flowering; leaf segments broadly elliptic ..... **Diplolophium**
19b Fruit (and ovaries) glabrous:
22a Mericarps unequal, ribs winged ..... **Heteromorpha**
22b Mericarps equal, ribs not winged or with wing-like ridges only:
23a Fruit not flattened, or slightly compressed laterally:
24a Fruit ribs without wing-like extensions; surface between the ribs tuberculate or wrinkled ..... **Anginon**
24b Fruit ribs without wing-like extensions; surface smooth between the ribs:
25a Lower leaves with broad segments, upper ones with linear segments; sparsely hairy at least along lower midrib; stem not conspicuously ribbed ..... **Glia**
25b Lower and upper leaf segments linear to subterete segments; glabrous; stems ribbed ..... **Stenosemis**
23b Fruit strongly flattened dorsoventrally:
26a Shrub or small tree; leaves deciduous, simply pinnate with fine-tipped teeth; vittae inconspicuous or absent in ripe fruit ..... **Steganotaenia**
26b Subshrub; leaves evergreen, pinnatisect; vittae conspicous, one in each furrow between the ribs and 2 on the commissure ..... **Peucedanum**
18b Plants herbaceous, either dying down to ground level after fruiting or low creeping herbs:
27a Foliage leaves all radical, those on the stem reduced to a sheath with or without a vestigial lamina:
28a Fruit with vittae below the veins in the ribs ..... **Lichtensteinia**
28b Fruit with vittae in the furrows between ribs:
29a Fruit strongly dorsoventrally flattened; basal leaves sometimes present at flowering ..... **Peucedanum**
29b Fruit not flattened; leaves usually withered or not yet produced at flowering:
30a Mericarps heteromorphic ..... **Annesorhiza**
30b Mericarps homomorphic:
31a Fruit oblong with strong, yellow, almost contiguous ridges, 5 mm or longer ..... **Annesorhiza**
31b Fruit ovoid or flask-shaped with ribs well spaced, shorter than 4 mm ..... **Chamarea**
27b Foliage leaves both radical and cauline:
32a Fruit hairy or bristly:
33a Perennials or biennials:
34a Involucre absent ..... **Pimpinella**
34b Involucre present:

35a Involucral bracts pinnatisect ..... *Daucus
35b Involucral bracts entire:
36a Low spreading herb; umbels simple or apparently so because of very short rays ..... Agrocharis
36b Erect herbs; umbels obviously compound:
37a Leaves pinnate with broad leaflets ..... Diplolophium
37b Leaves usually absent at flowering, if present segments linear ..... Deverra
33b Annuals or biennials:
38a Fruit processes large, multicellular, cells multiseriate, sometimes flattened at the base and usually with recurved barbs (glochids) at the apex:
39a Processes arranged on ribs (especially the secondary ribs) of the fruit, the larger much flattened at base; involucral bracts pinnate ..... Daucus
39b Processes spread over surface of fruit, scarcely flattened at base; involucral bracts entire ..... Torilis
38b Fruit processes unicellular, or at least of uniseriate cells, neither flattened nor barbed:
40a Fruit oblong ..... Ezosciadium
40b Fruit ± as broad as long:
41a Fruit much flattened, discoid, margins thickened, mericarps not separating ..... Choritaenia
41b Fruit not flattened, mericarps separating when ripe:
42a Erect; basal leaves usually cordate, upper dissected; involucre absent ..... Pimpinella
42b Dwarf, branched from base; all leaves dissected; involucre present:
43a Fruit ovoid; lateral ribs marginal ..... Sonderina
43b Fruit distinctly didymous; lateral ribs not marginal ..... Stoibrax
32b Fruit glabrous:
44a Perennials or biennials:
45a Fruit dorsoventrally flattened ..... Peucedanum
45b Fruit ± round in cross section:
46a Fruit at least twice as long as broad:
47a Leaf segments filiform; plant strongly aromatic; flowers yellow ..... *Foeniculum
47b Leaf segments flat; plant weakly aromatic; flowers white ..... *Anthriscus
46b Fruit distinctly less than twice as long as broad:
48a Involucre absent:
49a At least some of the umbels shortly pedunculate, apparently leaf-opposed ..... Apium
49b All umbels on well developed peduncles ..... Pimpinella
48b Involucre present:
50a Leaves once-pinnate:
51a Teeth on leaflet margin spreading ..... Berula
51b Teeth on leaflet margin incurved and often slightly overlapping ..... Sium
50b Leaves decompound:
52a Low growing, somewhat fleshy maritime herb; fruit with rather thick but narrow wings; vittae persistent; endosperm not sulcate ..... Dasispermum
52b Erect biennial, 0.5–3.0 m high; leaves not fleshy; fruit only ridged; vittae not usually visible in mature fruit; endosperm sulcate ..... Conium
44b Annuals or biennials:
53a Involucral bracts pinnatisect ..... *Ammi
53b Involucral bracts undivided or absent:
54a Fruit strongly flattened dorsoventrally ..... Capnophyllum
54b Fruit not strongly flattened dorsoventrally, sometimes laterally compressed:
55a Involucre absent:
56a Outer flowers with outer petals enlarged ..... *Coriandrum
56b Outer flowers with all petals equal:
57a Calyx teeth obsolete:
58a Biennial; umbels strongly pedunculate ..... Conium
58b Annual; umbels sessile or subsessile ..... *Cyclospermum
57b Calyx teeth distinct:
59a Vallecular vittae 2 or more; stem erect, not branched in lower part; basal leaves often simply cordate ..... Pimpinella
59b Vallecular vittae solitary; stem branched in lower part; basal leaves pinnatisect ..... Sonderina
55b Involucre present:
60a Surface of fruit covered with close-set clavate vesicles ..... Phlyctidocarpa
60b Surface of fruit without vesicles:
61a Endosperm sulcate on commissural face; erect biennial branched only in upper part; radical leaves usually ± 300 mm long ..... Conium
61b Endosperm not sulcate; low-growing plants, radical leaves usually only 150 mm long:
62a Leaves fleshy; fruit with narrow but thickish wings ..... Dasispermum
62b Leaves not fleshy; fruit with slender ribs ..... Sonderina

Agrocharis Hochst. 5950010

(Apioideae)

Hochstetter: 19 (1844); Heywood & Jury: 572 (1978); Burtt: 162 (1991); Pimenov & Leonov: 17 (1993).

Annual or biennial herbs. **Leaves** pinnately decompound. **Flowers** in umbels of few short rays or subcapitate, terminal or opposite the leaves; involucre 0 or of up to several bracts and many bracteoles. **Calyx** teeth obsolete to lanceolate. **Petals** usually unequal, oval, with inflected, acuminate apex. **Fruit** ± ovoid, with several prominent ridges and armed with rows of coarse, spreading bristles; mericarps with oil ducts in furrows (under secondary ribs) and in commissural face.

Species 4, Africa; 1 in sthn Afr.: *Agrocharis melanantha* Hochst., widespread in the high-lying eastern parts.

Alepidea F.Delaroche 5922000

(Saniculoideae)

Delaroche: 19 (1808); Sonder: 533 (1862); Dümmer: 7 (1913); Wolff: 94 (1913); Weimarck: 217 (1949); Cannon & Constance: 567 (1978); Burtt: 293 (1982); Townsend: 19 (1989); Burtt: 163, 253 (1991); De Castro & Van Wyk: 345 (1994).

Perennial herbs, rosulate at base with erect flowering stems; usually with strong rootstock. **Leaves** simple, rarely multisect, usually coarsely ciliate or setose on margin; radical ones petiolate; cauline ones sessile. **Flowers** in few-flowered heads usually arranged in panicles; involucral bracts usually coloured and in two rows. **Calyx** with variable lobes. **Petals** erect with long, inflexed apices, keeled on face. **Disc** usually tumid. **Fruit** globose, ovoid or obovoid, scarcely laterally compressed; carpophore reduced, undivided; mericarps convex on back, usually prominently 3-keeled, with keels obtuse, flat on face, with 5 oil ducts, sometimes pustulate. **Seeds** often planoconvex and ribbed on convex side, sometimes without ribs.

Species ± 28, mainly sthn Afr., from the Eastern Cape to the summer-rainfall region; a few extending northwards to Zimbabwe, Kenya and Ethiopia.

*__Ammi__ L. 6016000

(Apioideae)

Linnaeus: 243 (1753); Townsend: 48 (1989); Burtt: 171 (1991); Pimenov & Leonov: 18 (1993).

Robust, erect, annual or perennial herbs; stem sparingly branched and wiry, glabrous; taproot slender. **Leaves** pinnate or bipinnate, with ultimate segments elliptic to broadly obovate, toothed along margins; segments of upper leaves narrower. **Flowers** in large, compound, showy, many-rayed, terminal umbels; involucres conspicuous, of several pinnate bracts. **Calyx** with obsolete teeth. **Petals** ovate, white. **Fruit** narrowly oblong, glabrous, with pale, narrow ribs; oil ducts 6, 4 in furrows, 2 on inner face. **Seeds** dorsally compressed. $x = 10, 11$.

Species 3 or 4, Europe, Asia and Africa; 1 in sthn Afr.: **Ammi majus* L. var. *glaucifolium* (L.) Godron, Lace-plant; cultivated for decorative purposes and has become naturalised in several places in sthn Afr.

Anginon Raf. 5994010

(Apioideae)

Rafinesque: 56 (1840); Sonder: 540 (1862) under *Rhyticarpus*; Schreiber: 8 (1967) as *Sonderina streyi*; Burtt: 90 (1988); Burtt: 172 (1991); Van Wyk *et al.*: 511 (1997); Allison & Van Wyk: 561 (1997).

Woody shrubs or undershrubs, sometimes glaucous. **Leaves** tripinnatisect, often reduced to rachises and/or petioles which are sometimes long, simple and pine needle-like, with or without longitudinal grooves along upper sides. **Flowers** in compound, bracteate umbels. **Calyx** with short, triangular teeth or linear, acute lobes. **Petals** broadly ovate, inflexed at apex, keeled on inner face. **Disc** conical. **Styles** shorter or longer than petals. **Stamens** ± as long as petals. **Fruit** somewhat elliptic, crowned with persistent disc and styles, smooth, rugose or tuberculate but not ribbed or winged; mericarps flat on face, convex on back, a single oil duct in each of 4 furrows and 2 on face, rarely 8–12 around each seed; carpophore bipartite. **Seeds** semiterete.

Species 12, sthn Afr., S Namibia, Northern and Western to Eastern Cape.

Annesorhiza Cham. & Schltdl. 6078000

(Apioideae)

Chamisso & Schlechtendal: 398 (1826); Sonder: 544 (1862); Marloth: 241 (1925); Adamson: 61 (1938); Burtt: 177 (1991); Pimenov & Leonov: 21 (1993).

Biennial or perennial herbs; scapes almost leafless; roots tuberous, usually fleshy, often pencil-like, single or in clusters. **Leaves** radical, usually developing after flowering; sometimes large, petiolate, pinnatipartite or multisect, or pinnate with pinnae lobed; cauline leaves scale-like. **Flowers** in umbels of many rays; involucres of small bracts. **Calyx** with small or obsolete teeth. **Petals** elliptic, with inflexed apex, keeled on face. **Disc** broadly conical or cushion-like. **Fruit** oblong, more than 5 mm long, crowned with calyx teeth and disc, slightly or distinctly winged; mericarps homomorphic or heteromorphic, flat on inner face, prominently veined, when heteromorphic then one 3-ribbed and the other 4-ribbed; ribs sclerified; oil ducts 6, 4 in furrows, 2 on inner face; carpophore bipartite. **Seeds** dorsally compressed, terete or concave-convex in cross section, flat or grooved on face.

Species 12, sthn Afr., widely distributed in South Africa, Lesotho and Swaziland.

*__Anthriscus__ Pers. 5938000

(Apioideae)

Persoon: 320 (1805), name conserved; Townsend: 24 (1989); Burtt: 182 (1991); Pimenov & Leonov: 22 (1993).

Annual, biennial or perennial herbs. **Leaves** bipinnate, tripinnate or sometimes 4-pinnate, fern-like; segments lanceolate to acuminate, toothed, glabrous or somewhat hairy. **Flowers** in sparse, terminal, compound umbels; involucres small or usually absent. **Calyx** 0. **Petals** notched, white. **Fruit** narrowly oblong, slightly 3-angled dorsally, glabrous and shiny at maturity. **Seeds** semiterete and grooved on face. $x = 8$ (7, 9).

Species 10–12, Europe, Asia and Africa; 1 supposedly naturalised in sthn Afr.: **Anthriscus sylvestris* (L.) Hoffm. var. *sylvestris*, KwaZulu-Natal, Lesotho and Eastern Cape.

Apium L. 6004000

(Apioideae)

Linnaeus: 264 (1753); Wollf: 26 (1927); Tutin: 351 (1968); Cannon: 582 (1978); Burtt: 182 (1991); Pimenov & Leonov: 22 (1993).

Annual, biennial, or weak perennial herbs. **Leaves** pinnate to ternately decompound, upper ones becoming sessile. **Flowers** in compound umbels, usually opposite leaves, sessile or shortly pedunculate; involucral bracts 0 or many and foliaceous. **Calyx** teeth obsolete. **Petals** ovate, concave, entire or slightly emarginate, inflexed at apex. **Styles** short, divergent; bases depressed, with entire margins. **Fruit** ovate, laterally flattened, glabrous; mericarps each with 5 longitudinal ribs; oil ducts 4 in furrows and 2 on face. $x = 11$ (7, 8) (polyploidy).

Species 25, cosmopolitan; 4 in sthn Afr., widespread; 1 indigenous: *Apium prostratum* Vent (Sea Celery), along the coast, from the Cape Peninsula (Western Cape) to the Eastern Cape; the naturalised species include **A. graveolens* L., Celery.

Arctopus L. 5926000

(Saniculoideae)

Linnaeus: 1058 (1753); Sonder: 564 (1862); Burtt: 184 (1991); Pimenov & Leonov: 23 (1993).

Acaulescent, perennial herbs with thick rootstock, dioecious. **Leaves** simple, spreading rosette-wise on ground, petiolate, ovate, lobed, with setose margins, mostly spiny on upper surface. **Male flowers** in a compound, stalked umbel, with an involucre of 5–7 spine-tipped bracts; sepals 5, linear-oblong; petals oblong or oblanceolate, with long, inflexed tips; disc flattened; stamens longer than petals; filaments linear; anthers oblong; style 0. **Female flowers** in sessile umbels surrounded by 4(5) connate, spine-tipped bracts; sepals usually 5, spinose-acute, becoming rigid; petals sepallike; styles linear, longer than sepals. **Fruit** ± oblong, usually beaked; carpophore undivided; mericarps flat on inner face, with primary veins spiny, without oil ducts. **Seeds** ± elliptic, flat on one face, slightly convex on other. $x = 9$ (1 report).

Species 3, from Calvinia District (Northern Cape) to Cape Peninsula (Western Cape) and eastwards along the coast to Grahamstown (Eastern Cape).

Berula W.D.J.Koch 6038010

(Apioideae)

Koch: 433 (1826); Sonder: 539 (1862), under *Sium*, in part; Cannon: 598 (1978); Burtt: 185 (1991); Pimenov & Leonov: 27 (1993).

Perennial herbs, robust, glabrous, sometimes aquatic. **Leaves** elongate, once-pinnate; pinnae fairly regular in size, serrate or toothed on margin. **Flowers** in compound umbels; involucres of many persistent bracts. **Calyx** with 5 small teeth. **Petals** obcordate, with an inflexed apex and keeled down inner face. **Stamens** exceeding petals; filaments filiform; anthers oblong. **Styles** terete, subcapitate. **Fruit** ovate or oblong, laterally flattened, indistinctly ribbed; mericarps convex on back, keeled on face, oil ducts 6, set deep in mesocarp, 4 in furrows, 2 on face; carpophore bipartite. **Seeds** subterete. $x = 9$ (6, 10, 11).

Species 1, ± cosmopolitan; 1 subspecies in sthn Afr.: *Berula erecta* (Huds.) Coville subsp. *thunbergii* (DC.) B.L.Burtt, spread almost throughout the region.

Bupleurum L. 5994000

(Apioideae)

Linnaeus: 236 (1753); Sonder: 541 (1862); Burtt Davy: 519 (1932); Burtt: 187 (1991); Pimenov & Leonov: 29 (1993)

Annual or perennial herbs, sometimes undershrubs. **Leaves** ± crowded at base of stem, lax above, entire and grass-like, attentuate to base and sometimes stem-clasping. **Flowers** in compound umbels, with or without bracts. **Calyx** with small or obsolete teeth. **Petals** subcircular, obovate or oblong, ± deeply concave, inflexed at apex, keeled on inner face. **Disc** flat, depressed, rarely subconical. **Stamens** longer than petals. **Styles** very short. **Fruit** ± laterally flattened, sometimes subdidynamous, oblong, crowned with disc; mericarps with 5 acute wings or prominent veins, rarely veins obsolete; oil ducts present or 0; carpophore 2-fid or 2-partite. **Seeds** subterete. $x = 7, 8$ (6, 11) (polyploidy, B-chromosomes).

Species ± 180, mainly Europe, Asia and Africa; 1 in sthn Afr.: *Bupleurum mundii* Cham. & Schltdl.; widespread in the southern, eastern and northeastern parts of sthn Afr.; **B. rotundifolium* L. occurs rarely as an escape in the northern parts of South Africa.

Capnophyllum Gaertn. 6103000

(Apioideae)

Gaertner: 32, t. 85 (1790); Sonder: 562 (1862); Burtt: 188 (1991); Pimenov & Leonov: 31 (1993).

Annual, monoecious herbs. **Leaves** 2- or 3-pinnate, with ultimate segments linear. **Flowers** unisexual, in terminal and lateral umbels; involucres of a few bracts. **Calyx** with 0 or only small teeth. **Petals** elliptic, with inflexed apex. **Disc** cushion-shaped. **Stamens** longer than petals; filaments linear; anthers elliptic, subdidynamous. **Fruit** elliptic in outline, ribbed; mericarps strongly dorsiventrally flattened, convex on back, concave on face and with winged margins, with or without warty ridges; oil ducts 6, 4 in furrows, 2 on face; carpophore 2-partite. **Seeds** ± oblong in cross section. $x = 10$.

Species 2, South Africa; coastal sands of the Northern and Western Cape, from Port Nolloth to Gansbaai.

Chamarea Eckl. & Zeyh. 6020000

(Apioideae)

Ecklon & Zeyher: 346 (1837); Sonder: 538 (1862), under *Carum*; Burtt: 200, 261 (1991); Pimenov & Leonov: 35 (1993).

Perennial herbs with fleshy, tuberous root and slender, leafless scapes. **Leaves** basal, arising after flowering, the first formed ones finely dissected or sometimes pinnate with broad, dentate lobes, the later ones variously dissected, usually finely bi- or triternate, segments dentate. **Flowers** in compound umbels; involucre often absent. **Calyx** with or without minute teeth. **Petals** obovate or elliptic, with long, inflexed apex and keeled inner face. **Disc** shortly conical. **Stamens** slightly shorter than petals; filaments terete; anthers elliptic. **Styles** short. **Fruit** small, ovoid, shorter than 4 mm, usually narrowing towards apex, ribbed; mericarps flat on face, convex on back, with 5 prominent ribs; oil ducts 6, 1 in each furrow, 2 on face; carpophore bipartite. **Seeds** semiterete.

Species 5 or more, widespread in the western, central and southern parts of South Africa and eastwards as far as the Eastern Cape.

Choritaenia Benth. 6129000

(Apioideae)

Bentham: 907 (1867); Burtt: 201 (1991); Pimenov & Leonov: 36 (1993).

Annual, compact, prostrate herbs, very free-flowering. **Leaves** irregularly subternately dissected. **Flowers** in umbels from base and apex of branches; involucres foliaceous. **Calyx** with short, ovate teeth. **Petals** ovate with short, inflexed apex, keeled on face, channelled on back. **Disc** slightly raised, with somewhat undulate margin. **Stamens** as long as petals; filaments filiform; anthers oblong. **Ovary** villous; styles distinct, somewhat linear. **Fruit** circular, somewhat biconvex, crowned with persistent disc and styles, covered with long, stiff, club-shaped hairs mixed with thin hairs; mericarps not separating, convex on back, flat on face, with median rib; oil ducts 9–13, forming separate pockets in wing; carpophore bipartite. **Seeds** linear in cross section.

Species 1, sthn Afr.: *Choritaenia capensis* Benth., widespread in the central and northeastern parts.

Conium L. 5970000

(Apioideae)

Linnaeus: 243 (1753); Sonder: 567 (1862); Hilliard & Burtt: 465 (1985); Burtt: 202 (1991); Pimenov & Leonov: 38 (1993).

Biennial herbs, erect, fairly vigorous; stem maculate or immaculate, with taproot. **Leaves** pinnately decompound, resembling carrot leaves. **Flowers** in dense, compound umbels, with many bracts, rarely unisexual. **Calyx** with obsolete teeth. **Petals** obovate or cuneate, with apex shortly inflexed, keeled on inner face. **Disc** cushion-shaped, divided. **Stamens** longer than petals. **Fruit** broadly ovate or elliptic, slightly laterally flat-

tened; mericarps smooth or with 5 primary, prominent veins, channelled on inner face; oil ducts many, small; carpophore undivided. **Seeds** subterete or flat on one face and slightly convex on the other, channelled on inner face. $x = 11$ (8—1 report)

Species 6, Europe, Africa, Asia; 3 indigenous and widespread in sthn Afr.; one cosmopolitan weed: **Conium maculatum* L., highly poisonous, has been recorded from the Western Cape.

**Coriandrum* L. 5953000

(Apioideae)

Linnaeus: 256 (1753); Cannon: 575 (1978); Burtt: 203 (1991); Pimenov & Leonov: 38 (1993).

Annual herbs, strongly aromatic; stem erect, with slender taproot. **Leaves** pinnate or bipinnate, dimorphic; lower ones with broad, cuneate segments, upper ones with slender, linear segments. **Flowers** in terminal and lateral umbels; involucre inconspicuous or absent. **Calyx** with conspicuous, triangular teeth. **Petals** white to pink, outer ones of outer flowers much enlarged. **Fruit** globose, glabrous, with inconspicuous blunt ribs; oil ducts 0; carpophore bipartite. **Seeds** concave on inner face. $x = 11$ (aneuploids).

Species 2, Europe and Asia; 1 in sthn Afr.: **Coriandrum sativum* L., Coriander; occurs sporadically as an escape in all parts.

**Cyclospermum* Lag. 6004010

(Apioideae)

Lagasca y Segura: 101 (1821), name conserved; Cannon: 582 (1978), as *Apium*; Burtt: 507 (1989c) as *Ciclospermum*; Burtt: 202 (1991) as *Ciclospermum*; Brummitt: 692 (1993).

Annual herbs. **Leaves** 3- or 4-pinnate, with many filiform, glabrous segments; base sheathing. **Flowers** in compound umbels, sessile to pedunculate; involucels 0. **Calyx** teeth obsolete. **Petals** ovate, concave, entire or slightly emarginate, inflexed at apex, white or pale pink. **Styles** very short. **Fruit** broadly elliptic to rounded; mericarps each with 5 longitudinal ribs; oil ducts minute, in furrows and 2 on face.

Species 1: **Cyclospermum leptophyllum* (Pers.) Sprague, a cosmopolitan weed introduced from the Caribbean and central America, widespread in sthn Afr.

Dasispermum Raf. 6069020

(Apioideae)

Rafinesque: 56 (1840); Sonder: 552 (1862), under *Cnidium*; Phillips: 555 (1951), under *Cnidium*; Dyer: 425 (1975), under *Heteroptilis*; Burtt: 93 (1988); Burtt: 204 (1991); Pimenov & Leonov: 43 (1993); Tilney & Van Wyk: 245 (1995).

Flowering as annuals, becoming perennials and somewhat woody at base, decumbent or suberect. **Leaves** mostly pinnatifid or multifid, somewhat fleshy. **Flowers** in compound, terminal or lateral umbels; involucres 0 or of few bracts. **Calyx** with or without short teeth. **Petals** ovate, obovate, or elliptic, with inflexed apex, keeled on face. **Disc** short, conical. **Stamens** longer than petals; filaments subterete; anthers elliptic. **Styles** very short. **Fruit** elliptic, variously winged; mericarps sometimes heteromorphic; usually with 3–5 prominent wings, with a single oil duct under each furrow and 2 on inner face; carpophore bipartite. **Seeds** terete.

Species 1, South Africa: *Dasispermum suffruticosum* (P.J.Bergius) B.L.Burtt; widespread along the South African coastline.

**Daucus* L. 6142000

(Apioideae)

Linnaeus: 242 (1753); Burmann: 8 (1768); Sonder: 563 (1862); Pimenov & Leonov: 43 (1993).

Annual or biennial herbs; stems erect, with stiff, bristle-like hairs; taproot fleshy. **Leaves** bipinnate, lower ones with acute, lanceolate segments, upper ones much smaller and less divided. **Flowers** in terminal umbels; involucre conspicuous, with numerous, narrow, 3-forked bracts. **Calyx** minute. **Petals** broadly obovate, notched, white. **Fruit** elliptic, with sharp bristles. $x = 9, 11$ (6, 8, 10) (polyploidy).

Species 22, Europe, Asia, N Africa, Australia; 1 in sthn Afr.: **Daucus carota* L., the cultivated Carrot; occurs sporadically as an escape and roadside weed.

Deverra DC. 6013000

(Apioideae)

Candolle: 45 (1829); Sonder: 548 (1862); Schreiber: 4 (1967); Cannon: 582 (1978); Pfisterer & Podlech: 571 (1986); Burtt: 205 (1991); Pimenov & Leonov: 44 (1993).

Rigid perennial herbs or broom-like undershrubs. **Leaves** aborted or radical and tripinnately decompound; cauline leaves few or scale-like. **Flowers** in compound umbels; involucres of few bracts or 0. **Calyx** obsolete. **Petals** ovate, inflexed at apex; keeled on face. **Disc** conical, dilated at base with undulate margin. **Stamens** longer than petals; filaments linear; anthers oblong. **Ovary** pilose or scabrid; styles short, thick. **Fruit** elliptic, slightly laterally compressed, pilose, scabrid or scaly; mericarps subterete, with primary veins distinct, flat on face; oil ducts 6, 4 in furrows, 2 on face; carpophore 2-partite. **Seeds** flat on face, convex on back.

Species 7, North Africa to Arabian Peninsula and sthn Afr.; 2 in sthn Afr., widespread except in KwaZulu-Natal.

Diplolophium Turcz. 6054000

(Apioideae)

Turczaninow: 173 (1847); Cannon: 600 (1978); Burtt: 206 (1991); Pimenov & Leonov: 46 (1993).

Robust, erect perennial herbs with solid, finely grooved stems. **Leaves** with large sheathing bases, usually tripinnate or multifid, with ultimate lobes filiform or elliptic. **Flowers** usually in many-rayed umbels; involucres conspicuous, of few to many large, entire bracts. **Calyx** with 5 small or rudimentary teeth. **Petals** inflexed at apex, hairy on outer surface. **Fruit** semiterete, with longitudinal ridges, covered with bristly hairs; mericarps convex on back, usually slightly winged on margins; oil ducts conspicuous, usually 6, 1 in each furrow, 2 or 4 in commissural face; carpophore divided. **Seeds** oblong.

Species 5, tropical Africa; 1 in sthn Afr.: *Diplolophium swynnertonii* (Baker f.) Norman, Northern Province (Venda).

Dracosciadium Hilliard & B.L.Burtt 6016010

(Apioideae)

Hilliard & Burtt: 220 (1986); Burtt: 206 (1991); Pimenov & Leonov: 47 (1993).

Perennial, rhizomatous herbs, subglabrous. **Leaves** palmate or peltate-palmate, margins dentate, radical ones slender-petiolate, upper ones much reduced. **Flowers** in compound umbels. **Calyx** lobes small, triangular. **Petals** broadly elliptic, inflexed at apex. **Disc** hemispherical or conical. **Fruit** on erect or drooping peduncles, ovoid to shortly oblong, laterally flattened, glabrous; oil ducts 6, 1 in each furrow, 2 on face.

Species 2, sthn Afr.; highlying areas of KwaZulu-Natal.

Ezosciadium B.L.Burtt 6020030

(Apioideae)

Burtt: 207, 268 (1991); Pimenov & Leonov: 51 (1993).

Small, erect, annual herbs, sparsely to densely hairy. **Leaves** slender, long-petiolate, ternately dissected, lobes 2- or 3-fid, linear-oblong, acute, margins entire. **Flowers**

in umbels, 1–3(–5) at each node, rays unequal; involucre cauline, umbellules 2–4-flowered. **Petals** very small, white. **Fruit** narrowly oblong, with prominent ridges, sparsely to densely pilose; mericarps with blunt ridges; oil ducts 6, 1 in each furrow and 2 on face.

Species 1, South Africa: *Ezosciadium capense* (Eckl. & Zeyh.) B.L.Burtt, Eastern Cape.

*Foeniculum Mill. 6062000

(Apioideae)

Miller: [513] (1754); Sonder: 548 (1862); Cannon: 605 (1978); Burtt: 207 (1991); Pimenov & Leonov: 53 (1993).

Robust, glabrous, slightly glaucous perennial herbs; stem erect, ribbed. **Leaves** 3- or 4-pinnate, with narrowly linear to narrowly acicular segments; base sheathing. **Flowers** in many-rayed, terminal or lateral umbels; involucre absent. **Calyx** obsolete. **Petals** inflexed at apex, bright yellow. **Disc** short, broadly conical. **Fruit** narrowly ovoid, with prominent ridges at maturity; glabrous; oil ducts 6, large. **Seeds** subterete, grooved. $x = 11$ (8, 10, 13).

Species 5, Europe, Asia, N Africa; 1 in sthn Afr.: **Foeniculum vulgare* Mill., Fennel; cultivated and a widespread roadside weed.

Glia Sond. 6078010

(Apioideae)

Sonder: 547 (1862); Adamson: 618 (1950); Wijnands: 199 (1983); Burtt: 198 (1989a); Burtt: 208 (1991); Pimenov & Leonov: 21 (1993).

Perennial herbs, strongly erect, glabrous. **Leaves** pinnate, variable; basal ones dense, with broad segments; upper ones smaller, with linear segments. **Flowers** in compound, bracteate umbels. **Calyx** 5-toothed, persistent. **Petals** obovate, subemarginate, with inflexed tips, yellow. **Disc** 2-lobed, conical. **Fruit** ovate-oblong, subterete, crowned with stylopodium and spreading styles; mericarps with 5 equal, wing-like ridges, lateral ones marginal; carpophore bipartite. $x = 11$ (1 report).

Species 3, Africa; 1 in sthn Afr.: *Glia prolifera* (Burm.f.) B.L.Burtt; Western Cape: Cape Peninsula and adjacent districts to Caledon.

Hermas L. 5917000

(Hydrocotyloideae)

Linnaeus: 163 (1771); Sonder: 565 (1862); Burtt: 211 (1991); Pimenov & Leonov: 60 (1993).

Robust herbs or undershrubs with tufted habit, monoecious or flowers bisexual. **Leaves** radical or mainly on basal growth, sessile or petiolate, simple, often large and leathery, tomentose or woolly, at least on lower surface. **Flowers** in pedunculate, bracteate, compound, capitate umbels; each umbel with a single, female or bisexual flower surrounded by a number of male flowers, rarely all flowers bisexual. **Calyx** with ovate or lanceolate, persistent lobes. **Petals** somewhat filiform, inflexed at apex. **Disc** flattened. **Styles** terete, longer than calyx lobes. **Fruit** ovate, dorsally flattened or oblong; mericarps orbicular or oblong, flat or convex on back and face, usually deeply channelled on each margin, with 5 or 6 veins and many oil ducts in furrows; dorsal vein often forming a narrow keel. **Seeds** flattened, usually broadly elliptic. $x = 7$ (1 report).

Species 7, Western and Eastern Cape, from Caledon to Uitenhage District.

Heteromorpha Cham. & Schltdl. 5992000

(Apioideae)

Chamisso & Schlechtendal: 385, t. 5 (1826), name conserved; Sonder: 542 (1862); Burtt: 213 (1991); Winter & Van Wyk: 225 (1996).

Shrubs, sometimes small to medium-sized trees or woody climbers, with bark becoming waxy with age, layers peeling in horizontal bands, rarely undershrubs. **Leaves** petiolate, variable; simple or trisect to pinnately and/or palmately compound. **Flowers** in dense, compound, bracteate umbels. **Calyx** with 5 triangular teeth. **Petals** ± elliptic, inflexed, keeled on inner face. **Disc** conical. **Stamens** often longer than petals, inflexed. **Styles** very short. **Fruit** elliptic or somewhat pear-shaped, winged; mericarps of 2 forms, the one 2-winged, the other 3-winged, mostly flattened, with prominent ribs; oil ducts 6 to several, with 2 on face and up to 16 around each seed; carpophore bipartite. **Seeds** subterete.

Species 7, sub-Saharan Africa and Yemen; 5 in sthn Afr., widespread.

Itasina Raf. 6046020

(Apioideae)

Rafinesque: 51 (1840); Sonder: 547 (1862), under *Oenanthe*; Wolff: 139, 369 (1927), under *Thunbergiella*; Burtt: 92 (1988); Burtt: 243 (1991); Pimenov & Leonov: 63 (1993).

Delicate perennial herbs, sometimes appearing annual, glabrous, with fleshy, cylindric roots. **Leaves** basal, filiform or grass-like; cauline, absent or few, narrowly linear. **Flowers** in compound umbels; involucres of few bracts. **Calyx** with ovate-acuminate teeth. **Petals** obovate, with a long, inflexed apex, keeled on face. **Disc** conical. **Stamens** longer than petals; filaments linear; anthers elliptic, subdidynamous. **Styles** spreading, subterete. **Fruit** oblong, ribbed, crowned with persistent styles; mericarps oblong, semiterete, flat on face, with 5 prominent ribs; oil ducts 6, 2 on inner face; carpophore 0. **Seeds** semiterete.

Species 1: *Itasina filifolia* (Thunb.) Raf., Western Cape eastwards to about Humansdorp (SW Eastern Cape).

Lichtensteinia Cham. & Schltdl. 5990000

(Apioideae)

Chamisso & Schlechtendal: 394, t. 5 (1826), name conserved; Sonder: 542 (1862); Burtt: 221 (1991); Pimenov & Leonov: 69 (1993).

Perennial herbs, aromatic, with large rootstock. **Leaves** all in persistent, radical rosette, shortly petiolate, entire, pinnatifid or bipinnatisect, toothed. **Flowers** in compound, bracteate umbels. **Calyx** with 5 thick, ovate, acute lobes. **Petals** elliptic, quadrate or spatulate, with long, inflexed apices, keeled on inner face. **Disc** conical, often mostly connate. **Stamens** ± as long as petals; filaments somewhat fleshy; anthers subdidynamous. **Ovary** smooth or strongly ribbed; styles sometimes minute. **Fruit** ovoid or oblong, nearly terete, crowned with persistent calyx; mericarps semiterete or flattened, flat on one face, convex on other, with 5 primary veins and oil ducts under each; oil ducts absent from furrows and face of mericarps. **Seeds** somewhat flattened, obovate or elliptic, often grooved on back.

Species ± 7, South Africa and 1 on St Helena; widespread along the coastal regions of KwaZulu-Natal, Western and Eastern Cape.

Marlothiella H.Wolff 5996010

(Apioideae)

Wolff: 263 (1912); Schreiber: 7 (1967); Burtt: 225 (1991); Pimenov & Leonov: 73 (1993).

Shrublets up to ± 1 m high, cushion-shaped, gnarled, densely leafy, subsucculent, resiniferous. **Leaves** mostly clustered on short, lateral shoots, pinnate to bipinnate, with sheathing base, thick, fleshy, bright green, with sunken glands. **Flowers** in dense, compound, bracteate umbels; secondary umbels capitate; some central flowers sterile. **Calyx** with ovate-triangular teeth 1.0–1.5 mm long. **Corolla** lobes green, with brownish apex. **Fruit** broadly ovoid, 4–5 mm long, up to ± 2 mm thick; meri-

carps halfmoon-shaped, with minute, mealy indumentum; oil ducts 5, intrajugal, absent on face; carpophore unbranched.

Species 1: *Marlothiella gummifera* H.Wolff; Namibia, along the coast.

Peucedanum L. 6116000

(Apioideae)

Linnaeus: 245 (1753); Linnaeus: 116 (1754); Sonder: 553 (1862); Burtt: 227 (1991); Pimenov & Leonov: 87 (1993).

Perennial herbs or undershrubs, often acaulescent, with taproot. **Leaves** usually 3-pinnate or multifid, with ultimate lobes filiform to ovate, rarely simple and grass-like. **Flowers** usually in many-rayed umbels; involucres of few to many bracts. **Calyx** with 5 small or rudimentary teeth. **Petals** obovate, oblanceolate or cuneate, ± emarginate, inflexed at apex, keeled on face. **Disc** mostly conical, sometimes crenate. **Stamens** slightly longer than petals; filaments subterete; anthers ovate. **Styles** short, thick. **Fruit** dorsally flattened, sometimes biconvex, capped with persistent disc and styles, ribbed, with a narrow, flattened margin, or winged, glabrous; mericarps slightly convex on the back, flat, concave or channelled on face, 3-veined on back, usually winged on margins; oil ducts conspicuous, usually 6, 2 on inner face, rarely 10, and 4 on face; carpophore divided. **Seeds** oblong, linear or planoconvex in cross section. $x = 11$ (6, 9, 10, 13) (polyploidy).

Species ± 120, Eurasia and Africa: 31 or more in sthn Afr., widespread.

Phlyctidocarpa Cannon & W.L.Theob. 5970010

(Apioideae)

Cannon & Theobald: 479 (1967); Schreiber: 7 (1967); Burtt: 240 (1991); Pimenov & Leonov: 88 (1993).

Annual, erect herbs, 0.5–0.6 m tall, glabrous. **Leaves** 3-pinnate, up to 80 mm long, with broad, sheathing base; pinnae linear-lanceolate, remotely toothed. **Flowers** in compound, bracteate umbels, rays 10–30 mm long; peduncles 5–10 mm long; flowers of the terminal umbels bisexual, some of the laterals male. **Calyx** with rudimentary teeth. **Corolla** yellow. **Disc** obsolete. **Fruit** elongate, up to 3 mm long; mericarps semicircular in section, densely covered with rows of cone-shaped papillae; oil ducts large, 1 in each furrow, 2 on face.

Species 1: *Phlyctidocarpa flava* Cannon & W.L.Theob.; endemic to Namibia: Outjo and Kaokoveld.

Pimpinella L. 6033000

(Apioideae)

Linnaeus: 263 (1753); Sonder: 538 (1862); Wolff: 219 (1927); Townsend: 759 (1985); Burtt: 240 (1991); Pimenov & Leonov: 90 (1993).

Perennial herbs, rarely annual. **Leaves** slender-petiolate, radical ones often simple, ovate, cordate, entire or toothed and in succession upwards becoming divided and pinnate. **Flowers** in compound umbels; involucral bracts few or absent, rarely many. **Calyx** with or without teeth. **Petals** obovate or elliptic, inflexed at apex, glabrous, hirsute or villous. **Disc** cushion-shaped or conical. **Stamens** longer than petals; filaments terete; anthers oblong, slightly divided above. **Styles** longer than disc, terete; stigmas subcapitate. **Fruit** ovate in outline or broader than long, slightly laterally flattened, glabrous or hairy, crowned with disc and styles; mericarps flat on face, convex on back, 5-ribbed; oil ducts ± 9, 2 or more in each furrow, 2 on inner face; carpophore 2-fid or 2-partite. **Seeds** semiterete. $x = 9$, 10 (8, 11) (polyploidy).

Species ± 150, ± cosmopolitan; 7 in sthn Afr., northern and eastern parts and southwards to Uniondale and Humansdorp in the Eastern Cape.

Polemannia Eckl. & Zeyh. 6045000

(Apioideae)

Ecklon & Zeyher: 347 (1837), name conserved; Sonder: 550 (1862); Hilliard & Burtt: 225 (1986); Burtt: 242 (1991); Pimenov & Leonov: 92 (1993).

Shrubs or small trees, glabrous. **Leaves** palmately 3-foliolate; leaflets obovate, cuneate, 3-lobed and sometimes serrate, with distinct intramarginal nerve. **Flowers** in compound umbels or umbels in panicles on leafless branches; involucres of few bracts. **Calyx** with persistent, ovate lobes. **Petals** elliptic, entire, inflexed at apex, keeled on inner face. **Disc** conical. **Stamens** slightly longer than petals; filaments terete, anthers elliptic. **Styles** very small. **Fruit** oblong or ovate, flattened; mericarps dorsally flattened, oblong, flat on face, convex on 3-nerved back, winged on margins; oil ducts 6, 2 on inner face; carpophore bipartite. **Seeds** planoconvex in cross section.

Species 3, sthn Afr.: E Free State, high-lying areas of KwaZulu-Natal, Lesotho, and Eastern Cape.

Polemanniopsis B.L.Burtt 6045010

(Apioideae)

Burtt: 498 (1989b); Burtt: 243 (1991); Pimenov & Leonov: 92 (1993).

Robust, multistemmed, summer-deciduous shrubs, glabrous. **Leaves** palmately 3- to 5-foliolate; leaflets obovate, serrate. **Flowers** bisexual or some male (plant andromonoecious), in compound umbels, usually terminal; involucres of few bracts, falling before flowering. **Calyx** with persistent, triangular lobes. **Petals** ovate-acuminate, inflexed at apex. **Disc** fleshy, dark coloured. **Fruit** large, oblong, 5-winged, wings hollow; mericarps markedly heteromorphic, one 2-winged, the other 3-winged; oil ducts indistinct, within wings when present; carpophore bipartite. **Seeds** narrowly ellipsoid, grooved on face, lying loose within the pericarp.

Species 1: *Polemanniopsis marlothii* (H.Wolff) B.L.Burtt, Richtersveld (Northern Cape) and also Clanwilliam District (Western Cape).

Sanicula L. 5918000

(Saniculoideae)

Linnaeus: 235 (1753); Sonder: 533 (1862); Cannon: 565 (1978); Burtt: 245 (1991); Pimenov & Leonov: 99 (1993).

Perennial herbs, sometimes monoecious. **Leaves** mainly radical and few cauline, often long-petiolate, mainly tripartite or palmately partite, rarely pinnate. **Flowers** unisexual or bisexual, sometimes both kinds in same inflorescence, in simple or compound, bracteate umbels, rarely umbels in racemes. **Calyx** with lanceolate lobes; lobes free in bisexual flowers and somewhat connate in unisexual flowers. **Petals** ± emarginate and strongly inflexed. **Disc** flat or saucer-shaped. **Filaments** strongly inflexed, longer than petals. **Fruit** covered with hooked spines; styles terete, rarely thickened; carpophore 0; mericarps broad or narrow on inner face, smooth or sometimes setose or granulate, oil ducts 5, below veins or with 2 oil ducts on inner face. **Seeds** flat or swollen and halfmoon-shaped, often deeply concave or grooved on face. $x = 8$ or 4 (high polyploidy).

Species ± 39, more or less cosmopolitan, 1 in sthn Afr.: *Sanicula elata* D.Don, widespread along the eastern parts and along the Cape coastal region to Cape Peninsula.

Sium L. 6038000

(Apioideae)

Linnaeus: 251 (1753); Sonder: 539 (1862) in part, *S. thunbergii* transferred to *Berula*; Cannon: 598 (1978); Burtt: 247 (1991); Pimenov & Leonov: 105 (1993).

Robust herbs in wet places, glabrous. **Leaves** elongate, once-pinnate, with pinnae appearing finely and regularly

serrate on margins, teeth curved inwards and often slightly overlapping. **Flowers** in compound, bracteate umbels; involucres and involucels conspicuous. **Calyx** with 5 small or obsolete teeth. **Petals** obcordate, with inflexed apex, white. **Styles** with depressed or slightly conical base, spreading or recurved above. **Fruit** laterally flattened or contracted, subdidymous; mericarps with 5 ridges; oil ducts 6, 4 in furrows, 2 on face; carpophore bipartite. **Seeds** subterete. $x = 6$ (8, 9, 10, 11, 13) (polyploidy).

Species 14, ± cosmopolitan; 1 in sthn Afr.: *Sium repandum* Welw. ex Hiern, widespread in the northern and eastern parts and southwards to the Eastern Cape; readily confused with *Berula*.

Sonderina H.Wolff 6017010

(Apioideae)

Wolff: 92 (1927); Adamson: 620 (1950); Burtt: 248 (1991); Pimenov & Leonov: 106 (1993).

Annual herbs. **Leaves** 1- or 2-pinnatisect or subtripinnate, with narrow segments. **Flowers** in compound umbels; involucres of a few, narrow bracts. **Calyx** of small or obsolete teeth. **Petals** obovate or subquadrate, with bifid or emarginate, inflexed tip, keeled on inner face. **Disc** cushion-like. **Stamens** longer than petals; filaments filiform; anthers ovate-oblong. **Styles** slender, ± as long as ovary; stigmas subcapitate. **Fruit** slightly flattened, ovate or oblong, minutely scabrid, or hispid; mericarps with 5 ribs, flat on face, or channelled, convex on back; oil ducts 6, 1 in each furrow and 2 on face; carpophore bipartite. **Seeds** terete. $x = 9$ (1 report).

Species 4, South Africa: KwaZulu-Natal, Northern, Western and Eastern Cape, but mainly western area.

Steganotaenia Hochst. 6116010

(Apioideae)

Hochstetter: 4 (1844); Norman: 514 (1934); Schreiber: 8 (1967); Cannon: 617 (1978); Burtt: 249 (1991); Pimenov & Leonov: 108 (1993).

Trees up to ± 6 m tall, with somewhat waxy bark. **Leaves** crowded at ends of branches, petiolate, pinnate; leaflets ovate, acuminate, setose on margins. **Flowers** bisexual or male, in compound umbels; involucres of a few bracts. **Calyx** with small teeth. **Petals** obovate, with long, inflexed apex, keeled on face. **Stamens** longer than petals; filaments terete; anthers oblong. **Male flowers** with disc cushion-shaped and rudimentary styles. **Bisexual flowers** with disc slightly concave; ovary obovate; styles terete, ± half as long as stamens. **Fruit** flattened, obovate in outline, ribbed, winged; mericarps convex on back, with 3 prominent, acute veins, winged on margin, flat on face, with narrow, apical channel; oil ducts inconspicuous; carpophore bipartite. **Seeds** planoconvex.

Species 2, Africa; 1 in sthn Afr.: *Steganotaenia araliacea* Hochst., northern parts of Namibia and Botswana, Northern Province and Mpumalanga.

Stenosemis E.Mey. ex Sond. 6078020

(Apioideae)

Sonder: 551 (1862); Burtt: 324 (1979); Burtt: 207 (1989a); Burtt: 250 (1991); Pimenov & Leonov: 108 (1993).

Perennial herbs with woody base; stems procumbent, glabrous, distinctly ribbed. **Leaves** slender, much dissected, 3-pinnate to multifid, ultimate lobes nearly terete, oblong to filiform. **Flowers** in terminal, bracteate, multi-rayed umbels on long peduncles. **Calyx** small, with narrowly triangular teeth. **Petals** obovate, subemarginate, with inflexed tips, yellow. **Disc** shortly conical. **Styles** slender, much longer than petals. **Fruit** roundish ovate, subterete, crowned with stylopodium and spreading styles; mericarps with 5 wing-like ridges, wings thick, corky, undulate; oil ducts 6, 4 in the furrows and 2 on face.

Species 2, South Africa; S KwaZulu-Natal to Eastern Cape.

Stoibrax Raf. 6014010

(Apioideae)

Rafinesque: 52 (1840); Sonder: 538 (1862), under *Ptychotis*; Burtt: 145 (1989d); Burtt: 250 (1991); Pimenov & Leonov: 108 (1993).

Annual decumbent herbs, glabrous. **Leaves** 2- or 3-pinnate, with many filiform, glabrous segments. **Flowers** in compound umbels, pedunculate, with 10 to 16 rays; involucral bracts pinnatifid. **Flowers** very small. **Petals** white. **Styles** very short. **Fruit** broader than long, distinctly 2-lobed (didymous), minutely tuberculate; mericarps ovate, with 5 longitudinal ribs on each. $x = 10$ (1 report).

Species 5, Europe and Africa; 1 in sthn Afr.: *Stoibrax capense* (Lam.) B.L.Burtt (= *Sonderina didyma* (Sond.) Adamson), Namaqualand (Northern Cape) to Cape Agulhas (Western Cape).

Torilis Adans. 5945000

(Apioideae)

Adanson: 99 (1763); Sonder: 564 (1862); Burtt: 251 (1991); Pimenov & Leonov: 113 (1993).

Annual herbs. **Leaves** pinnately compound, resembling carrot leaves. **Flowers** in umbels opposite leaves; umbels compound with few rays; involucre absent; corolla larger on outside flowers than on inner ones. **Calyx** of 5 small, acute teeth, persistent. **Petals** obovate, emarginate, with inflexed point, white. **Fruit** grooved at sides, covered with stiff, straight bristles; mericarps circular in section, without ridges. $x = 6$ (8, 11) (polyploidy).

Species ± 15, Africa and adjacent areas; 1 doubtfully indigenous to South Africa: *Torilis arvensis* (Huds.) Links (= *T. africana* (Thunb.) Spreng.), mostly in the Cape coastal districts; another species, **T. nodosa* (L.) Gaertn., occurs sporadically as an escape.

Apocynaceae (in broad sense)

(Asteridae—Gentianales)

Compiled by J.E. Victor, C.L. Bredenkamp, H.J.T. Venter, P.V. Bruyns & A. Nicholas

Trees, erect or scandent shrubs, shrublets, subshrubs, lianas, perennial, rarely annual herbs, often succulents, glabrous or pubescent, with milky or clear sap. **Leaves** opposite, sometimes whorled or decussate, rarely alternate or fascicled, simple, entire, pinnately veined, in some succulents reduced to small rudiments or spines; stipules, if present, usually intrapetiolar, rarely on each side of petiole, minute to short, rarely spinose; colleters (mucilaginous hairs) often present at junction of petiole and lamina. **Inflorescence** mostly a cyme, sometimes racemose or umbelliform, terminal to axillary, sometimes flowers solitary. **Flowers** regular, bisexual, small to large and showy, usually bracteolate, sometimes fragrant, occasionally with an obnoxious smell. **Calyx** of 5(4) sepals, free or slightly united at base, rarely forming a tube; mostly with paired, ± alternisepalous, basal, adaxial colleters. **Corolla** gamopetalous, 5(4)-lobed to 5(4)-fid, rotate to tubular; lobe aestivation dextrorse (overlapping to the right) or sinistrorse (to the left) or valvate; a corolline corona sometimes present. **Corona** of 5 or more, free or fused lobes in 1 or 2(3) series often present, either on corolla or arising from or near base of staminal column. **Disc** annular or cupular or of 2–5 scales usually present in Apocynoideae. **Stamens** 5(4), either arising on corolla tube and alternating with petals, or conniving in a cone around style head, or fused into a tubular staminal column (gynostegium) with anthers fused to style head; anthers 2-thecous, either 2- or 4-locular, sometimes with apical appendix, tailed at base or winged; pollen grains in monads, tetrads or united into waxy pollen masses (pollinia), dispersed singly, in translators or in pollinaria comprising 2 or 4 pollinia attached by caudicles (translator arms) to a corpuscle (corpusculum, clip, gland, pollen carrier). **Nectary**, if present, in a ring around base of ovary or in 5 alternisepalous troughs at base of filaments or staminal column. **Ovary** superior to half-inferior, of 2 carpels, either entire and 1- or 2-locular with (1–4) or many ovules on an axile placenta, or carpels ± free to partly connate, each carpel with (1)–many ovules on a single, ventral, marginal placenta; style 1 or carpels ± free except towards base and towards apex and dilated at apex into style head comprising anthers. **Fruit** a berry, drupe, samara, or a pair (often 1 by abortion) of ventrally dehiscent follicular or baccate mericarps. **Seeds** often compressed, often with a tuft of silky hair (coma) at micropylar end, sometimes with marginal wing; embryo straight; endosperm present.

Genera 480, species 4800, mostly tropical and warm (especially Africa), few in temperate regions; sthn Afr.: genera 90, species ± 696. **Vinca minor* L., Periwinkle and **Plumeria rubra* L., Frangipani, both widely cultivated ornamentals, have not been recorded as garden escapes.

Leeuwenberg: 1213 (1994); Liede & Albers: 201 (1994); Struwe *et al.*: 175 (1994); Takhtajan: 434 (1997); Venter & Verhoeven: 705 (1997).

Apocynaceae, as circumscribed here, includes Asclepiadaceae and Periplocaceae.

Key to subfamilies

1a Anthers free from style head; corolla lobe aestivation in bud typically sinistrorse (overlapping to the left), rarely dextrorse (overlapping to the right); fruit dehiscent or indehiscent, syncarpous or apocarpous, a berry, drupe, follicle or capsule; seeds naked, with wings, or arils, but almost never with a tuft of hairs ..... **Plumerioideae** (p. 72)

1b Anthers adnate or ± adherent to style head; corolla lobe aestivation in bud typically dextrorse or valvate, rarely sinistrorse; fruit dehiscent, almost always apocarpous, a pair of follicles, sometimes reduced to one by abortion or postgenitally fused; seeds small, compressed, almost always with a coma (tuft of hairs) at one end:

2a Anthers 4-locular, adherent to style head by hairs or secretions, lower part often sterile; filaments free; pollen shed as monads; nectaries, if present, in a ring around base of ovary ..... **Apocynoideae** (p. 73)

2b Anthers 2- or 4-locular, adnate to style head (if adherent by hairs or secretions then pollen gathered in 4 small pollinia — Secamonoideae), fertile throughout; filaments free or fused; pollen shed in tetrads into translators or gathered in 2(4) pollinia attached to the corpuscle; nectaries located in alternistaminal troughs at base of filaments or staminal column:

3a Pollen shed in tetrads into spoon-shaped translators with a sticky end which can adhere to a pollinator for removal; anthers 4-locular ..... **Periplocoideae** (p. 73)

3b Pollen gathered in pollinia attached in pairs (or 4s) to a ± spherical corpuscle which can become attached to a pollinator for removal; anthers 2- or 4-locular:

4a Anthers 4-locular; pollen gathered in 4 small pollinia attached to a soft, pale corpuscle ..... **Secamonoideae** (p. 74)

4b Anthers 2-locular; pollen gathered in 2 pollinia attached to a dark, hard corpuscle ..... **Asclepiadoideae** (p. 74)

Subfamily **Plumerioideae**

Herbs, subshrubs, tendrilous lianes or trees, mostly with milky sap; indole alkaloids often present. **Flowers** often fragrant. **Corolla**: lobe aestivation almost always sinistrorse; rarely corona present in mouth. **Disc** annular, cup-shaped, of 2 glands or absent. **Stamens**: filaments ± free, usually short, arising on corolla tube; anthers 4-locular, mostly entirely fertile, free from style head; pollen in monads, 3- or 4-colporate. **Nectary** in ring around base of ovary. **Ovary** superior to slightly inferior, entire and 1- or 2-locular, with 1–4(more) ovules per locule, or consisting of 2 distinct, partly fused, usually many-seeded carpels; style 1, ending in a ± enlarged style head (pistil head) with a nonreceptive stigmoid apex and a true stigma on the cylindrical part underneath. **Fruit** syncarpous or apocarpous, a berry, drupe or a pair (or 1 by abortion) of follicular mericarps. **Seeds** ± ovoid to flattened, sometimes winged, often ruminate, glabrous, without a coma (tuft of hairs).

Schumann: 122 (1895); Leeuwenberg: 1219 (1994); Takhtajan: 434 (1997).

Classification of Plumerioideae

1. Tribe **Carisseae**: *Acokanthera*, *Ancylobothrys*, *Carissa, Landolphia*
2. Tribe **Tabernaemontaneae**: *Callichilia*, *Tabernaemontana*, *Voacanga*
3. Tribe **Plumerieae**: **Catharanthus*, *Diplorhynchus*, *Gonioma*
4. Tribe **Alyxieae**: *Rauvolfia*

Key to genera of Plumerioideae

1a Ovary entire:

2a Ovary 2-locular, with 1–4, rarely many, ovules in each; shrubs or trees, rarely scandent:

3a Unarmed shrubs or trees; inflorescence axillary ..... **Acokanthera**

3b Armed shrubs, sometimes scandent; inflorescence terminal or pseudo-axillary ..... **Carissa**

2b Ovary 1(2)-locular, with many ovules; woody climbers or rarely shrubs:

4a Inflorescence of elongate, branched, terminal panicles ..... **Ancylobothrys**

4b Inflorescence contracted, short and often clustered, terminal or axillary ..... **Landolphia**

1b Ovary of 2 separate or almost separate carpels:

5a Stems subherbaceous, not taller than 1.5 m ..... ***Catharanthus**

5b Stems woody; shrubs, trees or climbers:

6a Fruit baccate or drupaceous:

7a Fruit a drupe; ovules 2 in each carpel ..... **Rauvolfia**

7b Fruit baccate; ovules many in each carpel:

8a Calyx divided almost to base:

9a Fruit of 2 large, subglobose mericarps; corolla tube shorter than 10 mm ..... **Tabernaemontana**

9b Fruit syncarpous, bilobed; corolla tube longer than 10 mm ..... **Callichilia**

8b Calyx with distinct tube which is circumscissile at base ..... **Voacanga**

6b Fruit follicular:

10a Ovules many in each carpel; leaves oblong to oblanceolate; fruit longitudinally striate ..... **Gonioma**

10b Ovules 2–4 in each carpel; leaves usually broadly ovate-elliptic; fruit lenticellate ..... **Diplorhynchus**

Subfamily **Apocynoideae**

Trees, erect or scandent, sometimes succulent shrubs or woody climbers, mostly with milky sap; glycosides often present. **Stipules** occasionally spinose. **Flowers** usually fragrant. **Corolla**: lobe aestivation almost always dextrorse; sometimes with scales, protuberances, ridges or corona in mouth. **Disc** annular or cupular or of 2–5 scales, sometimes ± adnate to ovary, rarely 0. **Stamens** usually included; filaments ± free, arising on corolla tube, often very short; anthers conniving in a cone around style and ± adherent to style head, 4-locular, mostly fertile only near apex, often with an apical appendage, sometimes united at tip; pollen shed in monads, 3- or 4-porate. **Nectary** in a ring around base of ovary. **Ovary** superior to slightly inferior; carpels 2, partly fused, with many ovules; style 1, entire or divided at base, ending in a ± enlarged style head (pistil head) with a nonreceptive stigmoid apex and a true stigma on cylindrical part underneath. **Fruit** of 2 follicular mericarps. **Seeds** many, generally with a coma (tuft of hairs), not ruminate.

Jussieu: 143 (1789); Stapf: 490 (1907); Codd: 244 (1963); Huber: 1 (1967a); Leeuwenberg & Kupicha *et al.*: 395 (1985); Leeuwenberg: 1213 (1994); Struwe *et al.*: 175 (1994).

Classification of Apocynoideae

1. Tribe **Echiteae**: *Pachypodium*
2. Tribe **Wrightieae**: *Adenium, Holarrhena, *Nerium, Strophanthus, Wrightia*
3. Tribe **Apocyneae**: *Baissea, Oncinotis*

Key to genera of Apocynoideae

1a Leaves opposite or ternate; stems woody or subherbaceous:
  2a Corolla ± salver-shaped:
    3a Corolla without appendages in throat; leaves broadly elliptic ..... **Holarrhena**
    3b Corolla with scales or appendages in throat; leaves lanceolate, oblong or oblanceolate:
      4a Woody climbers; leaves oblong to oblanceolate; scales in corolla throat free ..... **Oncinotis**
      4b Trees or shrubs; leaves lanceolate; scales in corolla throat forming a short corona ..... **Wrightia**
  2b Corolla tube campanulate to broadly funnel-shaped:
    5a Corona absent ..... **Baissea**
    5b Corona present:
      6a Corona reduced to paired appendages alternating with corolla lobes ..... **Strophanthus**
      6b Corona of 5 truncate epipetalous parts, each 3–8-lobed ..... ***Nerium**
1b Leaves alternate or fascicled; stems succulent:
  7a Stipules minute or absent; anthers produced into long, hairy appendages ..... **Adenium**
  7b Stipules transformed into rigid spines; anthers with only a short, terminal appendage ..... **Pachypodium**

Subfamily **Periplocoideae**

Climbers, erect to scrambling shrubs or shrublets, or geophytic herbs with watery or milky sap; roots often tuberous. **Leaves** with interpetiolar lines, ridges or clustered colleters adaxially at juncture of petiole and blade. **Flowers** often fragrant. **Calyx** persistent. **Corolla**: lobe aestivation usually dextrorse. **Corona** double; outer corona of 5 free or fused, epipetalous lobes; inner corona of free or fused interstaminal discs. **Stamens**: filaments free or fused to outer or inner corona; anthers 4-locular, fused to style head, nearly horizontal to ascending, connectives apically pronounced, apiculate or variously shaped, connivent over style head; pollen shed in T-shaped to rhomboidal, decussate or linear tetrads. **Nectaries** in 5 alternisepalous troughs at base of filaments. **Ovary** half-inferior; carpels 2, free except towards base and at apex where they are fused and dilated into style head with 5 embedded, semi-erect to erect translators consisting of spoon- to cornet-shaped receptacle (into which pollen is shed), with small sticky viscidium at lower end (which may become attached to pollinator); style head enclosed in corolla tube or exposed from it. **Fruit** a pair of cylindrical-ovoid follicles or a solitary follicle by abortion. **Seeds** many, compressed, obliquely ovate to oblong, with micropylar coma (tuft of hairs), seldom with a ring of hairs or a membranous wing.

Schlechter: 23 (1924); Brown: 518 (1907) under Asclepiadaceae; Bullock: 503 (1957); Huber: 1 (1967b); Liede: 233 (1997); Venter & Verhoeven: 705 (1997); Verhoeven & Venter: 1 (1998).

Classification of Periplocoideae

1. Tribe **Periploceae**: *Mondia, Petopentia, Tacazzea*
2. Tribe **Gymnanthereae**: *Raphionacme*
3. Tribe **Cryptolepideae**: *Cryptolepis, Ectadium, Stomatostemma*

Key to tribes of Periplocoideae

1a Corolla open, rotate, lobed almost to its base; stamens and outer corona inserted at corolla base; gynostegium completely exposed ..... **Periploceae**
1b Corolla tube well defined and broadly campanulate to cylindrical; stamens and outer corona inserted within tube, from base to mouth; gynostegium enclosed within corolla tube or exserted:
  2a Stamens and outer corona arising at mouth of corolla tube ..... **Gymnanthereae**
  2b Stamens inserted from base to middle of corolla tube; outer corona arising anywhere from base to mouth of tube ..... **Cryptolepideae**

Key to genera of Periplocoideae

1a Gynostegium exserted from the corolla mouth:
2a Corolla campanulate with distinct tube; erect, prostrate or climbing herbaceous geophytes with suffrutescent stems…..... **Raphionacme**
2a Corolla rotate with tube indistinct; woody lianes with perennial stems:
3a Corona lobes broadly ovate; stems with interpetiolar, frill-like stipules..... **Mondia**
3b Corona lobes filiform; stems with interpetiolar lines or dentate ridges:
4a Corolla lobes narrowly triangular to triangular-ovate with acuminate apex; leaves glabrous, glossy..... **Petopentia**
4b Corolla lobes broadly ovate to oblong-ovate with obtuse apex; leaves adaxially glabrous to puberulous, abaxially tomentose..... **Tacazzea**
1b Gynostegium enclosed in the corolla tube:
5a Corona lobes arising at the middle or lower down on the corolla tube..... **Cryptolepis**
5b Corona lobes arising at corolla mouth:
6a Corolla trumpet-shaped, pale green to yellow; corona lobes subulate; anthers hairy..... **Ectadium**
6b Corolla broadly campanulate, creamy white with centre maroon to violet; corona lobes clavate; anthers glabrous…..... **Stomatostemma**

Subfamily **Secamonoideae**

Shrubby climbers with milky sap. **Leaves** with few colleters at juncture of petiole and blade. **Corolla**: lobe aestivation dextrorsely contorted or valvate; corolline corona of 5 fleshy ridges usually present near mouth of tube. **Stamens** with filaments fused into a tubular staminal column (gynostegium) enclosing gynoecium; anthers 4-locular, erect to ± horizontal, adaxially fused to sides of style head; lateral margins of adjacent anthers forming distinct gynostegial grooves (guide rails or anther slits); pollen in 4 minute pollinia (2 per theca); pollinia ± erect, attached by ± obsolete caudicles to soft, white corpuscle usually larger than pollinia. **Corona (gynostegial)**: outer corona rarely present as small ridge beneath gynostegial grooves, inner arising at or slightly below base of anthers. **Nectary** in 5 alternisepalous troughs. **Ovary** half-inferior; style head broad, with 5 presumed stigmatic areas on sides of lower cylindric part. **Fruit** a pair of fusiform, ventrally dehiscent follicles. **Seeds** many, flattened, with micropylar coma (tuft of hairs).

Takhtajan: 434 (1997).

Only genus in sthn Afr..... **Secamone**

Subfamily **Asclepiadoideae**

Perennial herbs, subshrubs, shrublets or shrubs, often twining or scrambling, often succulent, with clear or milky sap. **Leaves** sometimes reduced to small rudiments or spines. **Corolla** rotate to tubular; aestivation in bud typically dextrorse or valvate. **Stamens** with filaments fused into a tubular staminal column (gynostegium) enclosing gynoecium; anthers adaxially fused to style head; anthers 2-locular, spreading, erect or ± horizontal, with lateral margins of adjacent anthers forming distinct gynostegial grooves (guide rails or anther slits); pollen gathered in pollinia, 1 per theca, with waxy outer wall; pollinia attached in pairs (one each from adjacent anthers) by a flexible, translucent caudicle (translator arm) to a small, spherical, hard, brown to black corpuscle (corpusculum, carrier, translator, retinaculum, gland, pollen carrier or clip), to form a pollinarium. **Corona**: outer corona of 5 lobes, frequently present at or near base; inner corona usually at or just below base of anthers, usually of 5 lobes. **Nectary** in 5 alternisepalous troughs. **Ovary** superior (half-inferior), of 2 apocarpous carpels; style head broad, often with flat or convex apex with 5 presumed stigmatic zones located on sides of lower cylindrical part behind gynostegial grooves. **Fruit** a pair (often only 1 by abortion) of ventrally dehiscent follicles with dry pericarp; in Ceropegieae generally with delayed development. **Seeds** many, flattened, often with wing-like margins, mostly with micropylar coma (tuft of hairs).

Brown: 295 (1902); Brown 385 (1903); Brown: 518 (1907); Brown: 673 (1908); Brown: 685 (1909); Huber: 1 (1967c).

The hybrid genus × *Hoodiapelia* is not included.

Classification of Asclepiadoideae

1. Tribe **Asclepiadeae**: **Araujia, Asclepias, Aspidoglossum, Aspidonepsis, Astephanus, *Calotropis, Cordylogyne, Cynanchum, Eustegia, Fanninia, Gomphocarpus, Kanahia, Microloma, Miraglossum, Oncinema, Pachycarpus, Parapodium, Pentarrhinum, Pergularia, Periglossum, Sarcostemma, Schizoglossum, Stathmostelma, Stenostelma, Woodia, Xysmalobium*
2. Tribe **Marsdenieae**: *Fockea, Marsdenia, Rhyssolobium, Sphaerocodon, Stigmatorhynchus, Telosma, Tylophora*
3. Tribe **Ceropegieae** (= Stapelieae): *Anisotoma, Brachystelma, Caralluma, Ceropegia, Duvalia, Emplectanthus, Hoodia, × Hoodiopsis, Huernia, Lavrania, Macropetalum, Notechidnopsis, Ophionella, Orbea, Orbeanthus, Orbeopsis, Orthanthera, Pachycymbium, Pectinaria, Piaranthus, Quaqua, Riocreuxia, Sisyranthus, Stapelia, Stapeliopsis, Tavaresia, Tenaris, Tridentea, Tromotriche*

Key to tribes of Asclepiadoideae

1a Pollinia developing in part of anther below position of corpuscle..... **Asclepiadeae** (key on p. 75)
1b Pollinia developing in part of anther above position of corpuscle:

2a Pollinia with insertion crest (ridge along edge of pollinium that becomes lodged in guide rail and through which pollen tubes arise) ..... **Ceropegieae** (key on p. 76)

2b Pollinia without insertion crest:

3a Carpels narrowing gradually into slender neck below style head; anther appendages with basal horizontal slit..... ..... **Asclepiadeae** (key below)

3b Style head sessile on carpels that lack slender neck; anther appendages without basal horizontal slit..... ..... **Marsdenieae** (key on p. 76)

Note: In this key and in the descriptions below, the parts of the pollinium (e.g. inner side, outer side) are labelled relative to the anther in which the pollinium has arisen.

Key to genera of Asclepiadeae

1a Corona absent on staminal tube; plant with clear sap:

2a Corolla lobes closing tube at bases or remaining closed over mouth of tube; anther appendages covering whole of style head, mostly with apical tuft of hairs..... **Microloma**

2b Corolla lobes not closing corolla tube; anther appendages only covering base of style head, without apical tuft of hairs.. ..... **Astephanus**

1b Corona present on staminal tube; plant with clear or milky sap:

3a Style head produced beyond anthers into elongated cone bifid near apex; corona lobes behind anthers with margins folded backwards:

4a Corolla less than 10 mm in diameter, tube not swollen towards base; plant with clear sap..... **Oncinema**

4b Corolla more than 15 mm in diameter, tube swollen towards base; plant with milky sap..... ***Araujia**

3b Style head and corona not as above:

5a Corona consisting of 20 free lobules of ± equal length and 5 slightly shorter lobules adpressed to backs of anthers; pollinarium with caudicles rising up alongside corpuscle and then spreading and descending to pollinia; small erect herbs with clear sap ..... **Eustegia**

5b Corona not as above; caudicles spreading and descending to pollinia; if small erect herb then with milky sap:

6a Corona consisting of ± uniformly tall outer series of fused lobes encircling gynostegium, often with inner series of 5 lobes adpressed to backs of anthers:

7a Outer coronal series ± cupular near base of gynostegium, much shorter than and separated from inflated vesicular inner lobes adpressed to backs of anthers..... **Sarcostemma**

7b Outer coronal series cupular to tubular, sometimes divided nearly right to base but equalling or exceeding gynostegium, fused to inner lobes if these present ..... **Cynanchum**

6b Corona consisting of very small lobes beneath guide rails (sometimes absent) and very much larger (usually heavily vascularised) lobes behind anthers, these often with adaxial outgrowths or keels spreading towards style head:

8a Stems twining:

9a Corolla with microscopic hairs inside, ± entirely without tube; corona ± absent beneath guide rails, lobes behind anthers with incurved margins; pollinia attached by slender caudicles, without insertion crest..... ..... **Pentarrhinum**

9b Corolla with conspicuous hairs towards edges of lobes, with cupular tube below insertion of corona; corona with 5 discrete lobes beneath guide rails, lobes behind anthers without incurved margins; pollinia attached by caudicles much shorter than broad, with insertion crest along inner edge ..... **Pergularia**

8b Stems erect, decumbent or prostrate, mainly herbaceous; rootstock often tuberous:

10a Anther appendages ascending and covering style head; style head conical above..... **Stenostelma**

10b Anther appendages adpressed to sides of style head but not covering it; style head concave above with slight central depression:

11a Pollinaria with very ornate caudicles considerably longer and broader than pollinia ..... **Stathmostelma**

11b Pollinaria with caudicles much shorter and narrower than pollinia:

12a Corona (behind anthers) arising from staminal tube but fused to corolla tube for considerable distance towards sinuses of corolla lobes ..... **Parapodium**

12b Corona (behind anthers) arising from staminal tube and not fused to corolla tube:

13a Corona lobes (behind anthers) fleshy and solid, without keel or process on ventral surface .. **Xysmalobium**

13b Corona lobes (behind anthers) dorsiventrally flattened or with margins folded inwards:

14a Corona lobes (behind anthers) dorsiventrally flattened, lateral margins not folded inwards to form cavity, sometimes keeled adaxially:

15a Corona lobes (behind anthers) spreading horizontally or curving outwards from base, with keels on inner face; usually fairly robust perennials ..... **Pachycarpus**

15b Corona lobes (behind anthers) erect from base:

16a Petals white, flowers rather showy, in few-flowered, terminal umbels; corona lobes linear-oblong, purple; somewhat delicate perennial herbs ..... **Fanninia**

16b Petals rarely white; corona lobes not as above:

17a Corona lobes (behind anthers) deeply trifid or quadrate with square shoulders, with an incurved midlobe and incurved margins at base ascending the column as narrow wings; usually single-stemmed perennial herbs..... **Woodia**

17b Corona lobes ± spathulate or lanceolate, sometimes produced into a point, usually keeled or with processes on inner surface:

18a Flowers in dense, globose, pedunculate heads; corolla lobes suberect, corona lobes spathulate or hastately subspathulate, usually with 2 keels capped by a transverse ridge or tubercle on inner face:

19a Corona lobes hastately subspatulate; marsh-loving ..... **Cordylogyne**

19b Corona lobes spatulate; slender grassland herbs ..... **Periglossum**

18b Flowers in sessile or pedunculate umbels; corona lobes often produced into a subulate or filiform apex, usually with 2 keels and frequently with 1 or 2 appendages on inner face:

20a Inflorescence pedunculate (except in *S. bidens* subsp. *pachyglossum*); pollinia medially attached to caudicle with pellucid zone on outer side ..... **Schizoglossum**

20b Inflorescence sessile; pollinia subapically attached, usually without germination zone (if this present then located at point of attachment of pollinia to caudicle):

21a Corona lobes fleshy; pollinia without pellucid zone ..... **Miraglossum**

21b Corona lobes thin; pollinia often with pellucid zone ..... **Aspidoglossum**

14b Corona lobes (behind anthers) flat, with lateral margins folded forwards at least in part (usually strongly) to form cavity (i.e. cucullate or complicate), with or without processes within cavity:

22a Axils of leaves with minute bristles; flowers developing in gradual succession, spirally arranged around elongating top of peduncle ..... **Kanahia**

22b Axils of leaves without bristles; inflorescences umbellate (flowers radiating from single point) with flowers all opening ± simultaneously:

23a Plants forming shrub or tree 2–8 m tall with cork-like bark and woody trunk, bearing inflated, ± smooth fruit 70–100 × 60–70 mm ..... ***Calotropis**

23b Plants smaller, without woody trunk; fruit < 60 mm long and often covered with soft bristles:

24a Robust shrubs with many erect perennial branches; rootstock consisting of fibrous roots only, spreading just below surface ..... **Gomphocarpus**

24b Few- to single-stemmed herbs with branches dying back to ground level in dry season; rootstock thickened below surface (often well below) and often forming tuber:

25a Plants consisting of a single slender, erect stem with linear to narrowly elliptic leaves:

26a Inflorescences 1–3 per plant at apex of stem ..... **Aspidonepsis**

26b Inflorescences more than 3 per stem, spread over upper half of stem ..... **Aspidoglossum**

25b Plants with several stems, stout and erect or decumbent and then erect:

27a Stems strictly erect; leaves glabrous and glaucous; inflorescence nodding.. **Gomphocarpus**

27b Stems initially horizontally spreading, then ascending; leaves scabrid and not glaucous; inflorescences erect ..... **Asclepias**

Key to genera of Marsdenieae

1a Pollinia attached directly to corpuscle (without caudicles); corona forming cylindrical tube around gynostegium; anthers with conspicuous erect and much inflated appendages filling up inside of tubular corona ..... **Fockea**

1b Pollinia with slender to stout caudicles attaching them to corpuscle; corona consisting only of small lobes behind anthers; anthers with appendages adpressed to style head:

2a Corona on staminal column absent:

3a Corona on corolla tube present as pubescent ridges with inward-directed tips ..... **Marsdenia**

3b Corona on corolla tube absent ..... **Rhyssolobium**

2b Corona on staminal tube present:

4a Erect stiff shrubs; carpels with 2 ovules ..... **Stigmatorhynchus**

4b Subshrubs or climbers, sometimes woody; carpels with few to many ovules:

5a Anther appendages small or obsolete:

6a Corolla saucer-shaped, with broadly campanulate tube, crimson or black ..... **Sphaerocodon**

6b Corolla almost flat, with obsolete tube and usually slender lobes, not crimson or black ..... **Tylophora**

5b Anther appendages elongate, membranous, incumbent on style apex or applied to side of conical tip or beak:

7a Corolla tube constricted at mouth; corona lobes broad and ± rectangular with subulate process adpressed to backs of anthers ..... **Telosma**

7b Corolla tube not constricted at mouth; corona lobes narrowing from base into process adpressed to backs of anthers ..... **Marsdenia**

Key to genera of Ceropegieae

In most recent accounts (e.g. Bruyns & Forster 1991, Liede & Albers 1994) this tribe is referred to as the Stapelieae Decne. in Candolle: 606 (1844). However, Ceropegieae Orb. (*Dictionnaire universel d'histoire naturelle* 3: 339) of 1843 predates this and is therefore the correct name for this tribe.

1a Stems herbaceous to fleshy, erect, prostrate or twining, with well-developed leaves to ± leafless and tuberculate but tubercles not arranged into angles; flowers not fleshy:

2a Corona present only as spreading, somewhat arched ridge behind anthers; style head with slender apex covered by anthers; follicles single by abortion (corolla with slender tube inflated at base) ..... **Orthanthera**

2b Corona present as two series with outer series sometimes much reduced to low ridge between anthers, then usually much taller behind inner lobes (behind anthers); style head obtuse above; follicles single or paired:

3a Roots hard, somewhat woody and fusiform (not arising from fleshy tuber); follicles single by abortion:

4a Corolla shortly campanulate to globose-campanulate (with globose to cupular tube), usually densely shaggy-pubescent on inside of lobes; inner corona lobes adpressed to anthers and rarely slightly exceeding them; pollinaria with short thick corpuscle and pollinia longer than broad; plant erect and slender with filiform leaves..... **Sisyranthus**

4b Corolla deeply lobed and ± rotate (with short bowl-shaped tube), microscopically pubescent on lobes; inner corona lobes rising up in centre and connate above style head; pollinaria with slender corpuscle (longer than broad) and pollinia broader than long; plant ± creeping with ovate- or orbicular-cordate leaves..... **Anisotoma**

3b Roots soft, often fleshy and fusiform or arising from swollen tuber; follicles paired:

5a Anthers ascending to erect, pressed into sides of style head:

6a Corolla lobes long, slender and reflexed against pedicel, guide rails minute and ± horizontal beneath edge of style head; plant erect and slender with filiform leaves..... **Macropetalum**

6b Corolla lobes and guide rails not as above; plant erect to climbing, mostly with cordate leaves:

7a Corolla tube often with inflated base, 1–3 times as long as lobes..... **Riocreuxia**

7b Corolla shallowly bowl-shaped, deeply lobed (tube < 0.5 times length of lobes) ..... **Emplectanthus**

5b Anthers horizontal and pressed into top of style head:

8a Corolla rotate to campanulate, tube broader than long, if longer, then inner corona lobes not exceeding anthers:

9a Flowering stems slender, unbranched, glabrous; leaves ± glabrous and ± reduced to midrib only, filiform and 1–2 mm broad, glabrous; exterior of corolla glabrous ..... **Tenaris**

9b Flowering stems short, usually spreading and branched, often pubescent; leaves pilose, usually with distinct blade narrowing into petiole and to apex; exterior of corolla pilose..... **Brachystelma**

8b Corolla with tube longer than maximum breadth and inner corona lobes exceeding anthers, connivent into column above style head (rarely shorter than anthers) ..... **Ceropegia**

1b Stems fleshy, with leaves reduced to minute rudiments or absent, leaf rudiments borne on tubercles arranged into 4 or more angles along stems; flowers fleshy:

10a Outer and inner series of corona lobes vertically well separated on staminal tube and not partly or wholly fused to one another (outer corona often disc-like):

11a Leaf rudiments with small stipular denticles; corona stipitate, outer series resting on rim or sides of cup formed by annulus ..... **Duvalia**

11b Leaf rudiments without stipular denticles; corona not stipitate, outer series spreading on base of tube and often partly fused to it..... **Huernia**

10b Outer and inner series of corona lobes not vertically separated on staminal tube and partly or wholly fused to one another (outer corona never disc-like):

12a Tubercles on stems arranged into 6 or more angles:

13a Each tubercle on stem armed (at least when young) with 1 or more spines (1.5–)3–15 mm long:

14a Spines 3 per tubercle; flowers deeply tubular; outer corona with long slender lobules, each tipped with a tear-like knob..... **Tavaresia**

14b Spines 1 per tubercle; flowers rotate to shallowly bowl-shaped; lobes of outer corona short, without apical knob:

15a Stem angles > 10; inner corona lobes without dorsal horn ..... **Hoodia**

15b Stem angles 6–9; inner corona lobes each with a conspicuous dorsal horn..... × **Hoodiopsis**

13b Each tubercle on stem with a small persistent leaf < 1 mm long or leafless:

16a Stems with 10 or more angles, each tubercle with small conical leaflet usually sunken into apex..... **Lavrania**

16b Stems with 6–8 angles; leaflet not distinguishable from tubercle:

17a Inflorescences each with a single flower and a single bract; outer corona forming pectinate ring around gynostegium; pollinia broader than long ..... **Pectinaria**

17b Inflorescences each with several flowers and bracts; outer corona not pectinate; pollinia longer than broad... ..... **Notechidnopsis**

12b Tubercles on stems arranged into 4 or 5 angles:

18a Stems, pedicels, sepals and outside of corolla pubescent (stems sometimes ± glabrous); leaves deciduous, erect (spreading in *S. engleriana*); flowers often covered inside with fine slender hairs..... **Stapelia**

18b Stems, pedicels, sepals and outside of corolla glabrous; leaves spreading or absent:

19a Pollinia relatively large with broad, ± cupular caudicle attached to base of pollinium; insertion crest twisted onto dorsal surface of pollinium:

20a Outer corona much reduced to absent (as spreading lobe beneath gynostegial grooves); deep nectarial cavity present behind outer corona; flowers borne near apices of stems; pollinia ± ellipsoidal ..... **Piaranthus**

20b Outer corona not much reduced; nectarial cavity shallow; flowers borne at any height on stem; pollinia ± D-shaped:

21a Surface of stem smooth (± shiny), tubercles tapering into leaf rudiments, not obtuse or leafless:

22a Leaf rudiments deltoid to subulate, usually with clearly demarkated base, caducous, with small multicellular hairs in stipular position and along margin but lacking stipular denticles; corolla usually covered with multicellular papillae ..... **Tridentea**

22b Tubercles on stem tapering to fine point and leaf rudiment without obvious base, without small hairs in stipular position but usually with stipular denticles; corolla from deeply rugulose to smooth but rarely with multicellular papillae ..... **Orbea**

23a Stems creeping; inner corona lobes pubescent..... **Orbeanthus**

23b Stems not creeping; inner corona lobes ± glabrous:

24a Inflorescences with many ± simultaneously opening flowers..... **Orbeopsis**

24b Inflorescences few-flowered:

25a Flowers > 30 mm in diameter ..... **Orbea**, **Pachycymbium lugardii** & **P. rogersii**

25b Flowers < 30 mm in diameter ..... **Pachycymbium & Orbea paradoxa**
21b Surface of stem micropapillate (dull and not shiny), tubercles obtuse and not tapering into leaf rudiments, stem ± leafless ..... **Tromotriche**
19b Pollinia small, with small ± circular attachment on ventral surface of pollinium, insertion crest exactly along outer edge of pollinium:
26a Flowers produced towards apex of stem in many small inflorescences:
27a Stems hard, tubercles tapering into hardened teeth, without differentiated leaf rudiment ..... **Quaqua**
27b Stems soft, tubercles not hardened at tip, bearing small differentiated leaf rudiments ..... **Caralluma**
26b Flowers produced towards base of stem, usually only 1 inflorescence per stem:
28a Inner corona laterally flattened, rising above anthers and connate in centre; pollinia longer than broad... ..... **Stapeliopsis**
28b Inner corona dorsiventrally flattened, adpressed to backs of anthers and not exceeding them; pollinia broader than long ..... **Ophionella**

Acokanthera G.Don 6558000

(Plumerioideae—Carisseae)

Don: 485 (1838); Stapf: 499 (1907); Codd: 245 (1963); Kupicha: 41 (1982); Kupicha: 404 (1985).

Shrubs or small trees, unarmed. **Leaves** thickly coriaceous, opposite or subopposite, simple, entire, subrotund to lanceolate or oblanceolate; axillary glands 0 or minute; stipules 0. **Inflorescence** axillary, usually much contracted, many-flowered, shortly pedunculate or sessile, corymbose or shortly racemose. **Flowers** subsessile, white or tinged with pink, scented. **Calyx** small, divided almost to base, eglandular within; lobes imbricate, ovate, acute. **Corolla** salver-shaped; tube cylindric, slightly widened at mouth, much longer than calyx, hairy within; lobes much shorter than tube, overlapping to the left. **Stamens** enclosed in widened part of tube; filaments terete; anthers 4-locular, ovate-oblong, mucronate, sometimes pilose at apex, shortly 2-lobed at base. **Disc** 0. **Ovary** entire, 2-locular, with a single, pendulous ovule in each locule; style filiform; stigma at level of anthers, conic or cylindric, with a ring of papillae at base and a minutely 2-lobed hairy tip. **Fruit** a globose to ellipsoid berry. **Seeds** 1 or 2, black or brown, elliptic, somewhat flattened. $x = 11$.

Species 5, from Yemen through E Africa to Cape region; 3 in sthn Afr., Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Adenium Roem. & Schult. 6680000

(Apocynoideae—Wrightieae)

Roemer & Schultes: xxxv, 411 (1819); Stapf: 513 (1907); Codd: 278 (1963); Plaizier: 464 (1985).

Idaneum H.Post & Kuntze: 296 (1904).

Succulent shrubs or shrublets; stems often large and swollen at base, sometimes largely subterranean, with fleshy branches. **Leaves** alternate or in spirals, often in terminal fascicles, simple, entire, sessile or shortly petioled; axillary glands conspicuous, several in each axil; stipules minute or 0. **Inflorescence** a few-flowered, subsessile, terminal cyme. **Flowers** usually showy, pink, red or purple, or sometimes partly white. **Calyx** divided almost to base; lobes lanceolate or subulate, eglandular within. **Corolla** funnel-shaped or campanulate from a short, cylindric base; lobes ± as long as tube, ovate or obovate, overlapping to the right, with paired, small or obscure scales in mouth alternating with lobes, ± confluent and forming obtriangular pockets. **Stamens** 4, inserted at base of widened part of corolla tube; filaments very short; anthers 4-locular, conniving in a cone and fused with stigma, lanceolate, with long, filiform, terminal appendages, sagittate at base, polliniferous in upper portion only, with foot of connective bearing small projection in centre and brush-like cushion below. **Disc** 0. **Ovary** of 2 free carpels; style cylindric, short; stigma capitate with basal rim and minute, bifid apiculus; ovules many, pluriseriate. **Mericarps** follicular. **Seeds** linear-oblong with a deciduous tuft of hairs at each end. $x = 11$.

Species 5, S Arabian Peninsula, Socotra, Northeast, West central Africa; 4 in sthn Afr., Namibia, Botswana, Northern Province, North-West, Mpumalanga, Swaziland, KwaZulu-Natal, Northern and Eastern Cape.

Ancylobothrys Pierre 6562020

(Plumerioideae—Carisseae)

Pierre: 91 (1898); Kupicha: 422 (1985).

Landolphia P.Beauv.: 54, t. 34 (1806) in part.

Tendrilous lianes or low shrubs; latex present; spines 0. **Leaves** coriaceous, petiolate, elliptic, oblong or obovate-elliptic, veins closely spaced, ± straight or distantly spaced and looping towards margin; stipules 0. Cymes grouped into long terminal panicles with sensitive branches. **Calyx** lobes imbricate, united at base. **Corolla** hypocrateriform; tube usually pubescent on outer surface; lobes contorted, overlapping to the left, fringed with white hairs. **Stamens** inserted in lower half of corolla tube; filaments very short; anthers 4-locular, introrse, dorsifixed, with carina. **Ovary** hairy, uni- or bilocular; placentation axile or parietal with very prominent placentae; ovules many; style glabrous; style head cylindrical or ovoid; stigma bifid but with arms connivent. **Fruit** a many-seeded berry with densely velutinous surface; sclerified layer absent; pulp edible. **Seeds** endospermous, firmly embedded in placental pulp.

Species 10, Africa and Madagascar; 2 in sthn Afr., Botswana, Northern Province, North-West, Gauteng, Mpumalanga, KwaZulu-Natal and Northern Cape.

Anisotoma Fenzl 6868000

(Asclepiadoideae—Ceropegieae)

Fenzl: 330 (1844); Brown: 865 (1909).

Perennial herbs with woody rootstock and prostrate branches. **Leaves** petiolate, ovate- or orbicular-cordate. **Flowers** in pedunculate or sessile, umbel-like cymes. **Sepals** lanceolate, hirsute, with scales at base within. **Corolla** with shallow, basin-shaped tube; lobes longer than tube, reflexed. **Corona** arising near or at base of staminal column, 2-seriate, longer than staminal column, appearing as 5 dorsally flattened, entire or denticulate or bifid lobes opposite anthers, with a long appendage on their inner face. **Staminal column** arising from base of corolla. **Anthers** without an appendage, but with 2 or more hairs at their tips. **Pollinia** oblong or ovate, with pellucid margin in apical half, erect; caudicles short. **Follicles** narrowly fusiform, acuminate.

Species 2, sthn Afr., KwaZulu-Natal and Eastern Cape.

*Araujia Brot. 6771000

(Asclepiadoideae—Asclepiadeae)

Brotero: 62 (1817); Henderson & Anderson: 238 (1966); Forster & Bruyns: 746 (1992); Forster: 211 (1996).

Robust perennial climbers with milky sap; roots fibrous. **Leaves** petiolate, lower surface white-pubescent; colleters present. **Flowers** in axillary cymes or solitary. **Corolla** tubular below, with inflated base; lobes spreading. **Corona** corolline, of 5 discrete lobes adnate to base of staminal column and sides of corolla tube. **Anthers** 2-locular, with terminal appendage. **Pollinia** pendulous, ellipsoidal; corpuscle oblong with apical appendage; caudicles not winged. **Follicles** ovoid, spongy, up to 120 mm long. **Seeds** flattened, ovate, with micropylar tuft of hairs. $x = 10$ (1 report).

Species 5, native to South America; 1 species: **Araujia sericifera* Brot., has become widespread, especially overgrowing hedges.

Asclepias L. 6791000

(Asclepiadoideae—Asclepiadeae)

Linnaeus: 214 (1753); Brown: 663 (1907).

Perennial or annual herbs or shrubs with milky sap. **Leaves** opposite or whorled, usually sessile. **Flowers** in pedunculate or occasionally sessile umbels, lateral at nodes and terminal. **Sepals** usually with scales within base. **Corolla** rotate, tube very short, deeply 5-lobed. **Corona** of 5 lobes arising from near base of staminal column; lobes erect or radiating, laterally compressed, cucullate or compressed-cucullate or with a fissure down inner face, sometimes with 1(2) horns or other process within cavity and rarely with a dorsal lobule or reflexed horn. **Anthers** 2-locular, with terminal, membranous, incumbent or erect appendage. **Pollinia** pendulous, ellipsoidal; caudicles shorter than pollinia. **Follicles** usually solitary by abortion, globose to fusiform, smooth or with processes on surface. **Seeds** brownish, oblong, convex on back and concave on face, or flattened and narrowly winged, usually with protuberances, with tuft of hairs at micropylar end. $x = 11$ (10, 12).

Species ± 150, Africa, Arabian Peninsula, America; ± 50 in sthn Afr., widespread. Note: *Trachycalymma pulchella* is recognised as *Asclepias pulchellum*, but the remainder of the genus which occurs outside the FSA region, is retained in *Trachycalymma* (K.Schum.) Bullock.

Aspidoglossum E.Mey. 6778010

(Asclepiadoideae—Asclepiadeae)

Meyer: 200 (1838); Kupicha: 633 (1984).

Perennial herbs with annual flowering shoots; sap milky. **Stems** erect or rarely ascending, branched or unbranched, with indumentum evenly distributed or in vertical lines. **Leaves** simple, entire, usually opposite, less often verticillate or irregularly inserted; petiole short or absent; lamina usually very narrowly linear, rarely elliptic, suborbicular, hastate or obovate, hairy or glabrous; margin revolute, in narrowly linear leaves usually only midrib visible on lower surface. **Flowers** in fascicles at distal nodes of stem; bracteoles inconspicuous; pedicels pilose. **Calyx** shorter than corolla; segments triangular, dorsally pilose, ventrally glabrous, margin ciliate. **Corolla** campanulate; lobes elliptic, spreading or rarely reflexed at anthesis, very rarely (*A. connatum*) tips remaining united; dorsal surface usually pilose, less often glabrous; ventral surface pubescent or pilose, indumentum variously distributed, or glabrous, left-hand margin glabrous, right-hand margin ciliate or glabrous. **Corona**: lobes alternating with petals, each representing a dorsal outgrowth from opposing stamen, delicate or slightly chartaceous, never fleshy. **Stamens** united at base to form a hollow column from which corona lobes arise. **Anthers** 2-locular, with a membranous apical appendage resting on style head, and horny anther wings. **Pollinia** pendulous, ± sausage-shaped; germination zone, when present, represented by a limited, thinner, transparent area at point of attachment to short, slender caudicle; corpuscle linear, not flanged (except in *A. hirundo*). **Follicles** with or usually without soft appressed bristles. **Seeds** many, compressed-ovoid with dark brown rugose testa and apical tuft of hairs.

Species 34, distributed throughout southern and tropical Africa; 22 in sthn Afr., mainly along eastern side of subcontinent.

Aspidonepsis Nicholas & Goyder 6778030

(Asclepiadoideae—Asclepiadeae)

Nicholas & Goyder: 24 (1992).

Perennial geophytic herbs; rootstock a globose, fusiform or napiform tuber. **Stems** 1 (3 in *A. flava*), erect, never more than 650 mm tall. **Leaves** spreading to ascending, linear, lanceolate to narrowly elliptic, older leaves shorter and broader; petiole 0–5 mm long. **Inflorescences** umbelliform, terminal, subterminal and nodal; bracts present at anthesis. **Corolla** saucer-shaped or reflexed with lobe apices ascending. **Corona** with lower parts fused to staminal column; lobes produced 0.5–1.8 mm above corolla, cucullate; cavity saccate, with or without appendage. **Style head** swollen; apex truncated. **Anthers** 2-locular; appendages shaped like a kidney or a goat's foot, with a deep apical cleft, or rectangular; pollinaria wishbone-shaped; corpuscle fusiform, corpuscle and caudicles articulated and winged; pollinia semicircular to hemiovoid or clavate.

Species 5, confined to the high altitude mountain grasslands of the sthn Afr. Drakensberg in Mpumalanga, KwaZulu-Natal and Eastern Cape.

Astephanus R.Br. 6758000

(Asclepiadoideae—Asclepiadeae)

Brown: 43 (1810); Brown: 547 (1907).

Slender perennial twiners. **Leaves** petiolate. **Flowers** in small, subaxillary umbels. **Sepals** usually separate to near base, without scales. **Corolla** 5-lobed, with campanulate tube, longer than sepals, sometimes angled, with 5 patches of hair within. **Corona** 0. **Staminal column** arising from near base of corolla. **Anthers** 2-locular, with short, ovate, erect, membranous appendages, not or only shortly spurred at base. **Pollinia** oblong; caudicles very short. **Follicles** solitary by abortion, terete-fusiform, acuminate. **Seeds** crowned with a tuft of hairs.

Species ± 30, Africa and America; 2 in sthn Afr., Western and Eastern Cape.

Baissea A.DC. 6663000

(Apocynoideae—Apocyneae)

Candolle: 424 (1844); Codd: 276 (1963); De Kruif: 495 (1985); Van Dilst: 89 (1995).

Zygodia Benth.: 716 (1879). *Perinerion* Baill.: 758 (1888). *Guerkea* K.Schum.: 180, fig. 59 (1895). *Conodura* K.Schum.: 229 (1896).

Woody climbers, often very tall. **Leaves** opposite, simple, entire, shortly petioled, penninerved, often acuminate; axillary glands 0; stipules 0. **Inflorescence** terminal or axillary, paniculate or corymbose, rarely a few-flowered cyme. **Flowers** relatively small, white or purple, usually fragrant. **Calyx** small, divided almost to base, eglandular or with 5 glands; lobes imbricate, lanceolate, ovate-lanceolate, or rotundate. **Corolla** funnel-shaped or campanulate, usually widest or slightly constricted at mouth, glabrous within, usually with

fleshy, projecting calli or scales just above insertion of stamens; lobes longer than tube, mostly very narrow, overlapping to the right. **Stamens** inserted above base of corolla tube; filaments very short, stout; anthers 4-locular, conniving in a cone around style, lanceolate, apiculate, long-sagittate at base, polliniferous in upper part only, with foot of connective hollowed out. **Disc** saucer-shaped or cupular, subtruncate, sinuate or 5-lobed. **Ovary** of 2 free carpels, slightly inferior, subtruncate, usually pubescent; style shorter than stamens; stigma ellipsoid with 5 pits and small, 2-lobed apex. **Mericarps** 2, follicular, usually cylindric and slender. **Seeds** linear-lanceolate to oblong, truncate at tip with a deciduous, apical tuft of hairs. $x = 11$.

Species 18, continental Africa, Angola, Zambia; 1 in sthn Afr.: *Baissea wulfhorstii* Schinz, N Namibia, N Botswana.

Brachystelma R.Br. 6870000

(Asclepiadoideae—Ceropegieae)
Brown: t. 2343 (1822); Brown: 833 (1908); Phillips: 607 (1951); Dyer: 1 (1980); Dyer: 12 (1983).

Dichaelia Harv.: 241 (1868); Bullock: 358 (1953b); Huber: 28 (1967c). *Brachystelmaria* Schltr.: 50 (1895). *Aulostephanus* Schltr.: 451 (1896). *Blepharanthera* Schltr.: 146 (1913). *Kinepetalum* Schltr.: 149 (1913). *Siphonostelma* Schltr.: 148 (1913); Huber: 52 (1967c).

Perennial herbs, usually dwarf, with a single tuber or a cluster of fusiform roots; with 1–few annual stems, prostrate to erect, rarely twining. **Leaves** sessile or petiolate. **Flowers** in a terminal umbel or umbel-like cyme or 1–several together, lateral at nodes, pedicellate, rarely shortly pedunculate. **Sepals** often with scales within base. **Corolla** campanulate to flattish, sometimes ± tubular; lobes longer or shorter than united base, variously spreading, or united at tips and forming a cage-like structure. **Corona** arising from staminal column, 2-seriate or sometimes appearing 1-seriate, longer or shorter than staminal column; outer corona of distinct lobes bifid or divided almost to base, or cup- or saucer-shaped, forming pockets between base of inner lobes, with 5 or 10 teeth or lobules, occasionally reduced to cushion-like thickenings; inner corona lobes opposite anthers, usually linear-oblong, erect or incumbent, rarely clavate. **Anthers** 2-locular, incumbent or inflexed on staminal column or suberect, oblong or subquadrate, without apical appendage. **Pollinia** subglobose, oblong or suborbicular, sometimes compressed, erect or horizontal, sometimes largely exposed in each anther theca; caudicles short; corpuscle hard, often winged. **Follicles** fusiform, smooth, green, sometimes mottled. **Seeds** oblong, convex on one side, flat or concave on other, with narrow, marginal wing, crowned with tuft of hairs. $x = 11$.

Species over 100, Africa, India to Australia; ± 80 in sthn Afr., widespread, but rarely common.

Callichilia Stapf 6607000

(Plumerioideae—Tabernaemontaneae)
Stapf: 130 (1902); Beentje: 1 (1978); Beentje: 449 (1985).

Ephippiocarpa Markgraf: 309 (1923); Codd: 272 (1963). *Hedranthera* (Stapf) Pichon: 225 (1948).

Shrubs, glabrous, with white latex; branches unarmed, lenticellate; trunk dichotomously branched. **Leaves** decussate, those of a pair equal or unequal, subsessile or petiolate; petiole with colleters at base; stipules intrapetiolar. **Inflorescences** 1 or 2 in forks of branches, pendulous, pedunculate, congested, cymose; bracts with colleters. **Flowers** often fragrant. **Sepals** connate at extreme base only, imbricate, much shorter than corolla, inside with 1–4 rows of minute glands near base. **Corolla** tube carnose, glabrous except for pilose ridges leading downward from base of filaments inside; tube cylindrical in lower part, wider in upper part and there cylindrical or infundibuliform; lobes membranous, obtriangular, oblique, with 2 apices, 1 acute, 1 rounded. **Stamens** included, connivent in a cone; filaments shorter than anthers; anthers 4-locular, glabrous, auriculate at base, 2-celled. **Ovary** glabrous; carpels connate at very base only; disc present; style slender, style head 5-winged; stigma small. **Fruit** berry-like, semisyncarpous, several-seeded, thin-walled. **Seeds** ovoid, testa longitudinally striate and rough, brown; endosperm copious, surrounding straight embryo. $x = 11$.

Species 7, Africa; 1 in sthn Afr.: *Callichilia orientalis* S.Moore, N KwaZulu-Natal.

*Calotropis R.Br. 6792000

(Asclepiadoideae—Asclepiadeae)
Brown: 28 (1810); Rahman & Wilcock: 301 (1991).

Large erect shrubs or small trees. **Stems** slightly woody, much branched at base, with cottony tomentum when young. **Leaves** thick, fleshy, broad, with cottony tomentum on lower surfaces, nearly sessile, oblong-obovate to broadly obovate, apex apiculate, base narrowly cordate. **Inflorescence** cymes, lateral, umbellate, mostly solitary at nodes. **Calyx**: lobes ovate-lanceolate, glandular within. **Corolla** broadly campanulate, pink above and white at base; lobes ovate-lanceolate, erect. **Corona** of broad scales, laterally compressed with a dorsal spur, adnate to and equalling or longer than staminal column, apex bifid; basal spur acute, incurved. **Anthers** with thin white membranous tips. **Pollinia** pendulous in each anther theca; corpuscle dark brown, rod-shaped, 2-celled. **Style head** 4 mm long, pentagonal. **Follicles** inflated, subglobose to obliquely ovoid. **Seeds** ovate, with a tuft of silky hairs.

Species 3, distributed in tropical and subtropical Africa and Asia, and introduced into Central and South America; 1 naturalised in sthn Afr.: **Calotropis procera* (Aiton) R.Br.

Caralluma R.Br. 6884000

(Asclepiadoideae—Ceropegieae)
Brown: 14 (1810); Brown: 872 (1909); White & Sloane: 151 (1937a); Gilbert: 10 (1990).

Austrolluma Plowes: 54 (1995).

Dwarf, glabrous succulent forming small clumps. **Stems** ± 4-angled, fleshy, erect, from horizontal underground runners, silvery grey-green mottled with purple; tubercles rectangular in outline, tipped by rudimentary leaf, occasionally developing brownish callus. **Inflorescences** 3–10 per stem arising in upper half of stem, each with 1 or 2 flowers on short pedicels, ± without peduncle. **Sepals** ± ovate-lanceolate, often with scales within base. **Corolla** rotate, outside pale green, inside with white hairs; lobes, ± triangular, sometimes elongate, without marginal cilia. **Corona** 2-seriate, sometimes appearing 1-seriate; outer corona often united into a cup-shaped tube or forming pockets between inner lobes and margin variably divided into 5–20 teeth; inner corona lobes 5, subulate to oblong to club-shaped, sometimes much overtopping staminal column. **Anthers** 2-locular, horizontal on top of style head. **Pollinia** horizontal or ascending, with amber inner margin, usually compressed, with short caudicles and winged corpuscle. **Follicles** fusiform. **Seeds** ± oblong, convex on one side, concave on other, with apical tuft of hairs. $x = 11$ (aneuploids, polyploidy).

Species 1, in sthn Afr.: *Caralluma peschii* Nel, Namibia.

Carissa L. 6559000

(Plumerioideae—Carisseae)

Linnaeus: 189 (1767a); Linnaeus: 7, 52 (1767b) name conserved; Stapf: 496 (1907); Codd: 250 (1963); Kupicha: 398 (1985).

Shrubs or small trees, much branched, spiny, sometimes scandent; spines opposite, simple or forked, often very stout. **Leaves** leathery, opposite, simple, entire, broadly ovate to ovate-lanceolate, petiolate; axillary stipules 0; axillary glands very small or 0. **Inflorescence** terminal or pseudo-axillary, usually much contracted, umbellate or corymbose, rarely a cyme. **Flowers** subsessile, often conspicuous, white or tinged with pink, scented. **Calyx** small, divided almost to base, eglandular within or rarely multiglandular; sepals (4)5, imbricate, ovate, acute. **Corolla** salver-shaped; tube cylindric, slightly wider below mouth or near middle, hairy within, sometimes densely hairy in throat; lobes longer or shorter than tube, overlapping to the right or to the left. **Stamens** enclosed in widened part of corolla tube; filaments short, slender; anthers 4-locular, linear-oblong, sometimes apiculate. **Disc** 0. **Ovary** entire, 2-locular, with 1–4, rarely many, ovules in each locule, with a 2-lobed, hairy tip. **Fruit** a globose to oblong berry. **Seeds** usually 1–4 rarely more, flat, irregularly shaped; testa rough or smooth. $x = 11$ (polyploidy).

Species ± 20, tropics and subtropics of Africa, Madagascar, the Mascarenes, Asia and Australia, 7 in Africa; 5 in sthn Afr., in all countries and provinces.

*Catharanthus G.Don 6597000

(Plumerioideae—Plumerieae)

Don: 95 (1837); Codd: 267 (1963); Plaizier: 453 (1985).

Vinca L.: 209 (1753) in part; *Lochnera* Rchb. ex Endl.: 583 (1838).

Perennial, rarely annual herbs or subshrubs. **Leaves** opposite, simple, entire, shortly petioled, penninerved; axillary glands many in a fringe; stipules 0. **Flowers** axillary, solitary or paired, fairly large, white or pink. **Calyx** small to medium-sized, divided almost to base; lobes 5, subulate. **Corolla** salver-shaped; tube slender, cylindric, slightly widened near mouth; mouth constricted, velvety within, without appendages; lobes large, overlapping to the left. **Stamens** in widened part of tube; filaments very short; anthers 4-locular, free from stigma, ovate-lanceolate, acute, shortly and obtusely 2-lobed at base. **Disc** replaced by two long, linear glands; glands alternating with carpels. **Ovary** of 2 free carpels; style filiform; stigma depressed-capitate with a long, hyaline, reflexed frill at base and a minute, obtuse, 2-lobed apiculus surrounded by a very short, erect, membranous rim; ovules many, 2-seriate. **Mericarps** 2, follicular, cylindric, slightly spreading. **Seeds** small; testa rugose; hilum lateral. $x = 8$.

Species 8, 1 in India and Sri Lanka, the others confined to Madagascar; a Madagascan species, **Catharanthus roseus* (L.) G.Don, is a widespread, sometimes cultivated, weed of waste places in warm, dry areas, especially in eastern sthn Afr.

Ceropegia L. 6874000

(Asclepiadoideae—Ceropegieae)

Linnaeus: 211 (1753); Brown: 804 (1908); Huber: 5 (1957); Huber: 114 (1967); Bruyns: 21 (1980); Dyer: 43 (1980); Dyer: 133 (1983).

Perennial herbs, with a tuber, or clusters of fusiform, or occasionally fibrous roots. **Stems** prostrate to erect, often twining, sometimes succulent. **Leaves** sessile or petiolate, sometimes fleshy, occasionally rudimentary on fleshy stems. **Flowers** in umbel-like clusters, racemes, or 1–several developing together or in succession, mainly lateral on nodes. **Corolla** with tube usually longer than lobes, often ± inflated near base, narrowed above, then expanding to mouth, often with long hairs within; lobes recurved, pendulous, connate at tips into a cage-like structure, forming umbrella-like canopy, or a capitate and winged apical body; free margins often replicate, often ciliate. **Corona** 2-seriate; outer corona cupular, campanulate, 5-notched, 5- or 10-toothed, of 5 bifid lobes, or reduced to pockets between bases of inner lobes and confluent with them; inner corona lobes linear, linear-lanceolate, spatulate or filiform, sometimes with dilated tips, usually longer than staminal column and incumbent upon it. **Anthers** 2-locular, without appendages. **Pollinia** ascending or subhorizontal; caudicles short; corpuscle usually winged. **Follicles** narrowly fusiform, acute or obtuse, smooth or rugose. **Seeds** obovate, narrowly winged, crowned with a tuft of hairs. $x = 11$ (aneuploids, polyploidy).

Species over 160, Africa and Madagascar to Australia; more than 50 in sthn Afr., widespread, but rarely common; rare in Western Cape.

Cordylogyne E.Mey. 6783000

(Asclepiadoideae—Asclepiadeae)

Meyer: 218 (1838); Brown: 585 (1907).

Perennial herbs, erect, with thickened rootstock. **Leaves** sessile, slender. **Flowers** in terminal, peduncled, dense umbels, 1 or 2(3 or 4) to a stem. **Sepals** with scales within base. **Corolla** 5-lobed almost to base, yellow to brown; lobes oblong. **Corona** of 5 lobes arising from base of staminal column; lobes erect, spatulate-hastate or oblong-linear, with a minute tooth about middle of each side and with 2 keels and a transverse ridge or flap on inner face, without other processes at base. **Staminal column** arising from base of corolla, cylindric. **Anthers** 2-locular, with erect, deeply concave, membranous appendages. **Pollinia** pendulous, oblong-linear, attached by slender caudicles to a minute corpuscle. **Style head** produced above anther appendages into a club-shaped structure. **Follicles** narrowly fusiform. **Seeds** brown, flattened, ovate, with a narrow, marginal wing.

Species 1: *Cordylogyne globosa* E.Mey., widespread in sthn Afr., mainly eastern parts in damp or marshy places of high grasslands.

Cryptolepis R.Br. 6740000

(Periplocoideae—Cryptolepideae)

Brown: 58 (1811); Brown: 242 (1904); Brown: 526 (1907).

Curroria Planch. ex Benth.: 457 (1849). *Ectadiopsis* Benth.: 741 (1876).

Large to slender climbers or woody shrubs; roots not tuberous. **Leaves** linear to ovate or orbicular, opposite or subfascicled on short shoots, herbaceous to coriaceous, small to large, petiolate to sessile. **Inflorescences** terminal and/or axillary, racemose, few- to many-flowered. **Flowers** with gynostegium enclosed in corolla tube. **Sepals** ovate to triangular. **Corolla**: tube campanulate, lobes longer than tube, oblong-ovate to narrowly ovate; secondary corona of corniculate or filiform processes sometimes arising from corolla sinus pockets. **Corona** arising at ± middle of corolla tube; lobes clavate and fleshy or filiform. **Stamens** arising from near base of corolla tube; filaments free, short; anthers 4-locular, deltoid to hastate. **Style head** conical. **Follicles** paired, widely to narrowly divergent, linear-terete to very narrowly ovoid. **Seeds** oblong to obliquely ovate, smooth or warty, with tuft of hairs.

Species ± 25, Africa, Madagascar and Asia, from semidesert to savanna and tropical rain forest; 6 in sthn Afr., Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal and Northern Cape.

Cynanchum L. 6834000

(Asclepiadoideae—Asclepiadeae)

Linnaeus: 212 (1753); Brown: 743 (1908); Liede: 503 (1993).

Perennials, usually twining, sometimes erect or decumbent. **Leaves** usually petiolate. **Flowers** small, never exceeding 10 mm in diameter, fasciculate, or in simple or compound, pedunculate cymes, rarely in racemes, subaxillary or lateral at nodes. **Sepals** often with scales within base. **Corolla** deeply 5-lobed, white or cream. **Corona** arising from or near base of staminal column, annular, cup-shaped or tubular, truncate, toothed or lobed or divided nearly to base into 5 entire or toothed lobes, sometimes with a tooth, lobule, thickening or keels near base of inner surface. **Anthers** 2-locular, with obovate-oblong, lanceolate or linear, membranous, inflexed or erect appendage, with membranous margin. **Pollinia** pendulous, ellipsoid, ovate or oblong; caudicles shorter than pollinia. **Follicles** usually solitary, sometimes winged or keeled, smooth. **Seeds** compressed, elliptic and narrowly winged or convex on one side and flat on other, with protuberances. $x = 11$ (aneuploids, polyploidy).

Species ± 100, cosmopolitan; 12 in sthn Afr., widespread.

Diplorhynchus Welw. ex Ficalho & Hiern

(Plumerioideae—Plumerieae) 6589000

Ficalho & Hiern: 22 (1881); Codd: 264 (1963); Plaizier: 451 (1985).

Shrubs or small trees. **Leaves** opposite, simple, entire, petioled; axillary glands obscure or 0; stipules 0. **Inflorescence** a terminal, often lax, panicle. **Flowers** fairly small, fragrant. **Calyx** small, eglandular within; sepals 5, almost free, ovate, pubescent. **Corolla** salver-shaped; tube much longer than calyx, cylindric to subcampanulate, without appendages, slightly widened above middle and constricted at mouth, glabrous within; lobes oblong to linear-oblong, overlapping to the left. **Stamens** 5, included, inserted in widened part of tube; filaments short; anthers 4-locular, ovate, acute, longer than filaments, bilobed at base. **Disc** 0. **Ovary** of 2 free carpels; style shorter than corolla tube, terete; stigma at level of anthers, thickened, with bifid apiculus; ovules 2–4 in each carpel. **Mericarps** 2, follicular, woody, spreading, oblong, compressed, sometimes slightly curved, apiculate, lenticellate, dehiscent. **Seeds** compressed, winged. $x = 11$ (1 report).

Species 1: *Diplorhynchus condylocarpon* (Müll.Arg.) Pichon; tropical and sthn Afr., in Namibia, Botswana, Northern Province, North-West, Gauteng and Mpumalanga.

Duvalia Haw. 6883000

(Asclepiadoideae—Ceropegieae)

Haworth: 44 (1812); Brown: 1024 (1909); White & Sloane: 741 (1937b); Leach: 45 (1969); Dyer: 363 (1971); Leach: 21 (1974a); Meve: 194 (1988); Meve: 1 (1997).

Dwarf, succulent, leafless perennials, decumbent to erect; occasionally rhizomatous. **Stems** 4–6-angled, glabrous, fleshy; angles tubercled with rudimentary leaves from centre of tubercle and minute glandular stipules on each side of base of rudimentary leaves. **Flowers** on rudimentary peduncles; 1 or more opening together or in succession, mainly in lower half of stem. **Sepals** ovate-lanceolate, acuminate, sometimes with scales within base. **Corolla** raised into a cushion-like, fleshy, circular to pentagonal annulus in centre, lobes spreading, ± lanceolate, usually with strongly replicate margins, sometimes ciliate with fixed or vibratile hairs. **Corona** 2-seriate, arising from near top of staminal column; outer corona hidden by or sometimes hiding annulus, flat and disc-like, or occasionally slightly 5(or 10)-angled, with or without hairs or papillae; inner corona of 5 ± turgid lobes, with swollen bases and inner face somewhat incumbent on anthers and rising symmetrically around centre of staminal column. **Anthers** 2-locular, ± horizontal on top of style head, without apical appendage. **Pollinia** ± ellipsoid with pellucid inner margin. **Follicles** erect, terete-fusiform, glabrous, smooth. **Seeds** with apical tuft of hairs. $x = 11$ (aneuploids, polyploidy).

Species 17, Africa; 13 in sthn Afr., widespread in drier areas.

Ectadium E.Mey. 6735000

(Periplocoideae—Cryptolepideae)

Meyer: 188 (1838); Harvey: 230 (1838); Brown: 531 (1907); Huber 113: 3 (1967b); Venter *et al.*: 113 (1990).

Erect to decumbent shrubs; roots simple. **Leaves** shortly petiolate; lamina linear-ovate to narrowly ovate to obovate, elliptic or orbicular, coriaceous with hairy stomatal crypts and grooves, puberulous to tomentose, becoming glabrous with age, base rounded to cuneate, apex acuminate to acute and mucronate. **Inflorescences** few- to many-flowered, axillary. **Flowers** with gynostegium enclosed in corolla tube. **Sepals** ovate to narrowly ovate, puberulous to tomentose. **Corolla** pale green to yellow, trumpet-shaped; tube cylindrical; lobes oblong, apex obtuse to obliquely obtuse. **Corona** arising in corolla mouth, lobes subulate with bases dilated, fused laterally to bases of corolla lobes forming sinus-pouches. **Stamens** arising near base of corolla tube; filaments free; anthers 4-locular, hastate with subulate, hairy upper parts. **Style head** broadly angularly ovoid, apex acute and bifid. **Follicles** paired, horizontally opposite, narrowly to very narrowly ovoid. **Seeds** narrowly subovoid, with tuft of silvery-white hairs.

Species 3, Namib Desert of Namibia; very arid, windswept coastal plains with night fog.

Emplectanthus N.E.Br. 6899010

(Asclepiadoideae—Ceropegieae)

Brown: 771 (1908); Meve 124 (1998).

Delicate, leafy, herbaceous twiners; stems slender, unifariously pubescent. **Leaves** petiolate, cordate, acuminate, membraneous. **Inflorescence** lateral at nodes, in lax, peduncled cymes. **Corolla** deeply 5-lobed; united part forming a broad shallow cupular tube; lobes valvate in bud. **Corona** double, arising from staminal column; outer corona 5-lobed, lobes small, pouch-like, spreading; inner corona of 5 simple lobes, erect to suberect, ± adnate to stamens, with free tips overtopping stylar head; dorsally connected with base of outer corona lobes. **Anthers** 2-locular, erect or incurved-ascending, adnate to sides of or subincumbent upon truncate style apex, without apical appendage; pollinia erect, minute, ovoid to subquadrate with a pellucid margin on inner side; caudicles very short. **Follicles** only 1 per flower, long and slender-fusiform, terete.

Species 2, KwaZulu-Natal.

Eustegia R.Br. 6785000

(Asclepiadoideae—Asclepiadeae)

Brown: 40 (1810); Brown: 759 (1908); Bruyns: 36 (1999a).

Perennial herbs, with tuberous rootstock and with many short, decumbent or ascending branches. **Leaves** small, narrow, sessile or subsessile. **Flowers** in peduncled umbels, lateral at nodes. **Sepals** sometimes with scales within base. **Corolla** deeply 5-lobed, green; lobes oblong-lanceolate. **Corona** arising from base of staminal column, consisting of 3 series of erect, membranous

lobes, ± as long as column; outer series of 5 lobes opposite corolla lobes, oblong or linear and broadened at base, entire or bifid; middle series subsimple, linear or deeply divided into linear segments alternating with corolla lobes; inner series of 5 linear, entire lobes alternating with corolla lobes. **Anthers** 2-locular, with ovate, membranous appendages. **Pollinia** pendulous, ovate-oblong; caudicles as long as pollinia; corpuscle shortly winged. **Follicles** usually solitary by abortion, ± fusiform, smooth.

Species 1, sthn Afr., Northern and Western Cape.

Fanninia Harv. 6779000

(Asclepiadoideae—Asclepiadeae)
Harvey: 235 (1868); Brown: 662 (1907).

Perennial herbs with tuberous rootstock. **Leaves** shortly petiolate or subsessile, lanceolate, ellliptic, or oblong, pubescent. **Flowers** in a few-flowered, terminal umbel, white with purple corona lobes. **Sepals** with scales in sinuses, pilose. **Corolla** lobed nearly to base; lobes oblong-elliptic, pilose, showy. **Corona** arising from staminal column, appearing stipitate, of 5 conspicuous lobes, three-quarters the length of corolla lobes, linear-oblong, slightly emarginate at apex, with distinct midrib and 2 erect, acute lobules from near base. **Anthers** 2-locular, united to style with fringed, membranous appendages. **Pollinia** pendulous. **Follicles** not known.

Species 1: *Fanninia caloglossa* Harv., KwaZulu-Natal to Eastern Cape near East London.

Fockea Endl. 6924000

(Asclepiadoideae—Marsdenieae)
Endlicher: 17 (1839); Brown: 777 (1908).

Perennial herbs, erect or twining, with tuberous, sometimes very large and partially exposed rootstock. **Leaves** sessile or shortly petiolate, linear or elliptic, sometimes undulate. **Flowers** in small, axillary clusters or cymes. **Sepals** shorter than corolla tube. **Corolla** with campanulate tube; lobes longer than tube, lanceolate to filiform. **Corona** complex, arising near mouth or towards base of corolla tube together with staminal column, longer than staminal column, tubular, toothed at top and with 1–3 superposed series of 5 teeth or filiform processes placed between or decurrent as 5 pairs of wings within tube. **Staminal column** arising near mouth or towards base of corolla tube. **Anthers** 2-locular, with very large, membranous appendages. **Pollinia** erect; caudicles short. **Style** minutely 2-lobed. **Follicles** fusiform, usually acuminate. **Seeds** obovate or elliptic, flattish, with a marginal wing.

Species 6, tropical and sthn Afr.; 6 in sthn Afr., widespread in arid regions.

Gomphocarpus R.Br. 6787000

(Asclepiadoideae—Asclepiadeae)
Brown: 26 (1810); Bullock: 405 (1952).

Perennial herbs or shrublets 0.5–2(–5) m tall, with fibrous rootstock. **Stems** bifarious, hollow. **Leaves** paired (ternate in *G. rivularis*); colleters 0 (except in *G. rivularis*). **Inflorescence** umbelliform (shortly cymose in *G. rivularis*). **Corolla** white to pale greenish yellow. **Corona** lobes saccate; with or without appendages. **Anthers** 2-locular, with terminal, membranous, incumbent or erect appendage. **Pollinia** pendulous; caudicles shorter than pollinia. **Follicles** beaked, echinate and inflated; occasionally smooth and not inflated.

Species 25–32, Africa and Asia; 10 in sthn Afr., widespread.

Gonioma E.Mey. 6581000

(Plumerioideae—Plumerieae)
Meyer 188 (1838); Stapf: 503 (1907); Codd: 262 (1963).

Shrubs or small trees. **Leaves** opposite or 3- or 4-nate; axillary glands few, minute; stipules 0. **Inflorescence** a terminal corymb. **Flowers** small, fragrant. **Calyx** small, eglandular within; sepals 5, free, ovate-elliptic, imbricate. **Corolla** salver-shaped; tube cylindric, much longer than calyx, scarcely widened above middle, without appendages, pilose within; lobes shorter than tube, overlapping to the left. **Stamens** 5, included, inserted ± middle of corolla tube; filaments short, filiform; anthers 4-locular, longer than filaments, lanceolate, acute. **Disc** 0. **Ovary** of 2 free carpels; style shorter than corolla tube, terete; stigma at level of anthers, somewhat thickened, ovate, 2-lobed at apiculate apex; ovules many in each locule, multiseriate. **Mericarps** 2, follicular, coriaceous, oblong or linear-oblong, apiculate, subterete, straight or slightly curved. **Seeds** flat, broadly cuneate or subrectangular, winged at each end.

Species 1, *Gonioma kamassi* E.Mey., in Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Holarrhena R.Br. 6582000

(Apocynoideae—Wrightieae)
Brown: 51 (1810); Codd: 263 (1963); De Kruif: 456 (1985).

Shrubs or trees. **Leaves** opposite or subopposite, membranous, shortly petioled or subsessile, glandular towards base of petiole; stipules 0. **Inflorescence** a terminal or pseudo-axillary corymb, many-flowered. **Flowers** white, fragrant. **Calyx** small, eglandular within or with 2–5 glands alternating with sepals; sepals 5, ovate-lanceolate to subulate. **Corolla** salver-shaped; tube slender, subcylindric, slightly widened below middle, throat contracted; lobes overlapping to the right. **Stamens** 5, inserted near base of corolla tube; anthers 4-locular, included, oblong-lanceolate to linear, mucronate, rounded at base; filaments short, filiform. **Disc** 0. **Ovary** of 2 free carpels; style very short, filiform; stigma ellipsoid to fusiform, apex entire or 2-toothed, viscous. **Mericarps** 2, follicular, divaricate, slender, terete, often falcate. **Seeds** many, subterete, grooved on flat (ventral) side, with tuft of hairs at apex; cotyledons broad, complicate; radicle short; endosperm scanty. $x = 11$.

Species 4, Asia and Africa, 2 in Africa; 1 in sthn Afr.: *Holarrhena pubescens* (Buch.-Ham.) Wall. ex G.Don, in Northern Province, Mpumalanga and KwaZulu-Natal.

Hoodia Sweet ex Decne. 6878000

(Asclepiadoideae—Ceropegieae)
Decaisne: 644 (1844); Brown: 896 (1909); White & Sloane: 1050 (1937c); Bullock: 508 (1957); Bruyns: 182 (1993).

Trichocaulon N.E.Br.: 164 (1878) in part; Brown: 888 (1909); White & Sloane: 991 (1937c).

Spiny succulents, small to large, with few to many stems, branching mainly from base. **Stems** cylindric, erect (rarely prostrate), glabrous, 25–60(–110) mm thick, covered with obtuse tubercles vertically arranged into 11–31 rows, each tubercle tipped with a weak to hard, sharp spine 3–12 mm long. **Flowers** 1 to many in groups, opening successively (rarely simultaneously), near apex of stem. **Calyx** lobes overlapping slightly at broad bases, glabrous. **Corolla** 8–170 mm diam., small and deeply lobed to large, flat and saucer- to shallowly cup-shaped, lobes valvate in bud, glabrous outside and inside, papillate to smooth within, each papilla ending in a hair. **Corona** 2-seriate, arising from staminal column, mostly glabrous; outer corona at least basally cupular,

emarginate or bifid towards apex; inner corona of 5 dorsiventrally flattened lobes incumbent on backs of anthers, dorsally connected to outer lobes. **Staminal column** arising near base of corolla tube. **Anthers** 2-locular, incumbent on top of style head, subquadrate, without apical appendage; style head not produced beyond anthers, truncate-depressed at apex. **Pollinia** ± horizontal, with short caudicles. **Follicles** teretefusiform, slender, paired, with horns somewhat diverging, uniformly coloured, glabrous, smooth. $x = 11$.

Species 13, Africa; 12 in sthn Afr., Namibia, Botswana, Northern Province and western half of South Africa (west of 25°E).

× Hoodiopsis C.A.Lückh. 6878010

(Asclepiadoideae—Ceropegieae)
Lückhoff: 231 (1933); White & Sloane: 1091 (1937c).

Leafless, tufted succulents. **Stems** 7–9-angled, with angles tuberculate; tubercles tipped with rudimentary leaves. **Flowers** several from rudimentary peduncles arising from above middle of stems, produced successively, or sometimes 2 open together. **Corolla** star-shaped, with small, central tube surrounding corona; lobes with slightly recurved margins. **Corona** arising from staminal column; outer corona of 5 spreading lobes grooved down face; inner corona lobes horned. **Staminal column** arising from base of corolla tube. **Anthers** 2-locular, incumbent on column. **Pollinia** ± erect, with short caudicles. **Follicles** not known.

Species 1, sthn Afr.: × *Hoodiopsis triebneri* C.A.Lückh., Namibia; thought to be a natural hybrid between *Hoodia* and *Orbeopsis*.

Huernia R.Br. 6887000

(Asclepiadoideae—Ceropegieae)
Brown: 11 (1810); Brown: 902 (1909); White & Sloane: 819 (1937c); Leach: 1 (1988).

Succulent, dwarf, perennial herbs, caespitose or creeping, rarely prostrate or pendent. **Stems** glabrous, mostly 4- or 5(6)-angled and prominently toothed along angles, rarely subcylindric. **Leaves** modified to form acute tips to tubercle teeth, without stipules, sometimes persisting and becoming hardened, acute points, rarely rudimentary, in a few species forming soft bristles at apex of teeth. **Inflorescence** glabrous, usually 1 per stem, a successively flowering, shortly pedunculate cyme in lower half of stem, rarely single-flowered; peduncle short, stout. **Corolla** tubular, campanulate, bicampanulate or subrotate, with or without an annulus; corolla 5-lobed with 5 intermediate lobes in sinuses, seldom exceeding 50 mm in diameter; outside smooth or sometimes scabrellous, rarely minutely asperate, glabrous; inside mostly papillate or tuberculate, rarely smooth, often provided with simple bristles or setae, clavate and/or much inflated hairs; lobes spreading to reflexed, flat or concave, sometimes canaliculate towards apex, very slightly convex but never replicate, margins without cilia. **Corona** 10-lobed in 2 alternating series, sessile outer lobes partially adnate to base of tube, velvety textured, united to form a flattish or somewhat conical, or convex disc merging into staminal column; inner lobes arising at top of staminal column, smooth-textured, simple, incumbent on anthers, ovate, triangular-oblong, obtuse or subacute, subulate, or variably clavate, apical portion often minutely tuberculate, usually with a transverse ridge or gibbosity at their base, and sometimes shortly decurrent below, the gibbosity is much enlarged and sometimes erect. **Staminal column** erect, anther wings erect, diverging at base, forming a 'gape' with ± triangular nectarial orifice behind and a small fleshy tubercle in front. **Anthers** 2-locular, horizontal on top of style head. **Pollinia** compressed oblong-ellipsoid; caudicles short; corpuscle relatively short and broad, attached to edge of pentagonal style head by short lateral wings. **Follicles** erect, fusiform, glabrous. **Seeds** ± ovate, much compressed, almost flat, with a tuft of hairs. $x = 11$ (polyploidy).

Species 64, Africa and S Arabian Peninsula; 39 in sthn Afr., widespread in drier areas.

Kanahia R.Br. 6780000

(Asclepiadoideae—Asclepiadeae)
Brown: 28 (1810); Brown: 295 (1902); Field *et al.*: 787 (1986).

Perennial herbs with woody rootstock, branched from base, rarely above. **Leaves** subsessile, slender, with minute colleters in leaf axils. **Flowers** in pseudoumbels lateral at nodes, with peduncles racemosely scattered along upper part of branches. **Sepals** with row of scales within base. **Corolla** lobed to halfway or more, greenish; lobes spreading or erect, slightly overlapping to left in bud, with upper surface bordered with woolly hairs and pubescent within. **Corona** of 5 lobes, arising from staminal column; lobes ± complicate or fissured on inner surface, and projected into 2 short horns directed over staminal column. **Staminal column** arising from base of corolla. **Anthers** 2-locular, with membranous appendages deflexed on column, bluntly spurred at base. **Pollinia** terete, attached horizontally to corpuscle by caudicles. **Follicles** ± ellipsoid, rounded and smooth on outer side, grooved on inner side. **Seeds** convex on one side, concave on other, tapering to apex, with tuft of hairs.

Species 4, Africa and Arabian Peninsula; 1 in sthn Afr.: *Kanahia laniflora* (Forssk.) R.Br., Northern Province, in rocky watercourses.

Landolphia P.Beauv. 6562000

(Plumerioideae—Carisseae)
Beauvois: 54, t. 34 (1806) name conserved; Stapf: 492 (1907); Codd: 258 (1963); Kupicha: 408 (1985).

Shrubs or woody climbers, climbing by sensitive inflorescences or tendrils (modified inflorescences), rarely dwarf shrubs or undershrubs, glabrous or hairy; sap milky. **Leaves** leathery, opposite, shortly petioled, penninerved; axillary glands minute, obscure, or subulate to filiform; stipules 0. **Inflorescence** terminal, many-flowered, corymbose or paniculate. **Flowers** small to medium-sized, sessile or pedicelled, white or often tinged with red or purple, scented. **Calyx** small, leathery, eglandular, divided almost to base. **Corolla** salver-shaped; tube ± narrowly cylindric, widened and staminiferous near base or sometimes near or above middle; mouth somewhat constricted, glabrous; lobes overlapping to the left, usually longer than tube. **Stamens** 5; filaments short; anthers 4-locular, ovate to lanceolate, dehiscing to minutely 2-lobed base. **Disc** 0. **Ovary** entire, 1-locular, glabrous or hairy; ovules many from 2 parietal placentas; style terete; stigma level with base of anthers, conical from a thickened base, shortly bifurcate. **Fruit** a globose or pear-shaped berry, up to size of a small orange. **Seeds** few or many, embedded in pulp. $x = 11$.

Species ± 55, Africa and Mascarene Islands; 3 in sthn Afr., Botswana, Northern Province, North-West, Gauteng, Mpumalanga, KwaZulu-Natal and Northern Cape.

Lavrania Plowes 6879050

(Asclepiadoideae—Ceropegieae)
Plowes: 123 (1986); Bruyns: 240 (1993).

Leachia Plowes: 11 (1992a) name illegitimate. *Leachiella* Plowes: 15 (1992b) name illegitimate. *Larryleachia* Plowes: 5 (1996); Bruyns: 305 (1999b).

Solitary succulents or forming small clumps up to 0.3 m tall, branching from base. **Stems** 1–many, decumbent to

erect, cylindrical to clavate; tubercles mostly < 3 mm long, flattened, rounded, polygonal, covering stem and arranged roughly into 10–19 rows along stem, each tipped with small conical to dorsiventrally flattened persistent leaf < 1 mm long, usually sunken into depression near apex. **Inflorescence** glabrous, 1–30 per stem, arising all over stems though usually concentrated towards apex (rarely basal only), bearing 1–6(–15) flowers, forming peduncular patches with many narrowly deltoid bracts (often with lateral teeth near base) and basal bract seated on tubercle like those on stem; pedicel 0.5–3 mm long. **Sepals** 1.5–2.5 mm long, overlapping slightly at bases, occasionally with ciliate margins. **Corolla** shallowly campanulate, rotate or with strongly reflexed lobes, (5–)7–16 mm diam., deeply lobed; outside glabrous and smooth; inside glabrous, smooth to papillate, papillae dome-like to obtusely conical and usually tipped with a short apical hair; tube mostly shallow, up to 3 mm deep; lobes spreading, 3–6 mm long, ovate-deltoid to lanceolate, margins reflexed so convex above, eciliate. **Corona** 1.5–3 × 2–6 mm, 2-seriate, arising from staminal column, glabrous, ± sessile at base of corolla tube; outer lobes erect, emarginate to deeply bifid into usually ascending lobules, laterally fused with bases of inner lobes and forming small pouch, dorsiventrally flattened and often channelled down inner surface; inner lobes adpressed to backs of anthers for most of anthers' length, sometimes exceeding them and rising up in centre in small column, dorsiventrally flattened, with dorsal process fused into cup with outer lobes or forming discrete, spreading, obtuse lobule in series with outer lobules. **Anthers** 2-locular, horizontal above style head, margins shrinking and exposing pollinia, rectangular. **Pollinia** D-shaped, longer than broad, pellucid margin twisting from outer edge onto dorsal surface. **Follicles** terete-fusiform obclavate, glabrous, smooth.

Species 5, in very arid western parts of sthn Afr., Namibia and Northern Cape.

Macropetalum Burch. ex Decne. 6865000

(Asclepiadoideae—Ceropegieae)
Decaisne: 626 (1844); Brown: 798 (1908).

Perennial herbs with tuberous rootstock. **Stems** slender, erect, simple or branched. **Leaves** sessile, simple, linear-filiform. **Flowers** 2–4 together, fascicled at nodes. **Calyx** shortly basin-shaped at base, with lobes longer than tube. **Corolla** with very short tube; lobes linear-filiform, reflexed against pedicel. **Corona** of 5 lobes, arising above base of staminal column and adnate to it up to base of anthers, free above; lobes opposite anthers, simple or sometimes minutely 2- or 3-toothed at apex. **Anthers** 2-locular, with an ovate, erect, membranous appendage. **Pollinia** erect, elliptic, with very short caudicles. **Style head** semiglobose. **Follicles** erect, slender, smooth.

Species 1, sthn Afr.: *Macropetalum burchellii* Decne., Northern Province, North-West, Mpumalanga, Free State and Eastern Cape.

Marsdenia R.Br. 6911000

(Asclepiadoideae—Marsdenieae)
Brown: 460 (1810); Forster: 722 (1995).

Gymnema R.Br.: 461 (1810); Brown: 782 (1908); Bullock: 65 (1953a); Schultes: 57 (1820). *Dregea* E.Mey.: 199 (1837) name conserved; Bullock: 512 (1957).

Perennial vines, lianes or subshrubs. **Leaves** petiolate, elliptic or ovate to lanceolate, sometimes cordate at base, sometimes acuminate. **Flowers** in lateral, subaxillary umbels, often 2 opposite umbels from same node in umbellate cymes, or in fascicles along branches of cymes or panicles; peduncles lateral at nodes or axillary. **Sepals** elliptic, with scales within base. **Corolla** lobed half-way or more; tube campanulate; lobes reflexed, oblong, oblong-ovate or linear, minutely notched at apex, sometimes hairy within base. **Corona** arising from corolla tube, either of 5 fleshy lobes channelled on face and adnate up to mouth of corolla tube, or of 5 pairs of fleshy ridges on lower part of corolla tube, alternating with corolla lobes. **Staminal column** arising from base of corolla. **Corona** of 5 fleshy lobes arising from and adnate to staminal column, with free tips and often with free margins, sometimes with tubercle-like projections at base which are sometimes confluent and look like an outer corona. **Anthers** 2-locular, terminated by membranous appendages which are free or connate and ± incumbent on top of style apex or applied to side of its conical tip or beak. **Pollinia** sessile, linear-oblong, ellipsoid or linear, erect in each anther theca, with short caudicles. **Style head** conical or cylindrical, mitre-shaped, produced beyond staminal column. **Follicles** often winged, smooth or sometimes hairy. **Seeds** many with narrow, marginal wing, convex-concave. $x = 11$.

Species over 300, in Mediterranean, Africa, Asia, Malesia, Melanesia, Australia and Central and South America.; 3 in sthn Afr., widespread except in Free State, Lesotho and Western Cape.

Microloma R.Br. 6752000

(Asclepiadoideae—Asclepiadeae)
Brown: 42 (1810); Brown: 549 (1907); Wanntorp: 1 (1988); Bruyns & Linder: 453 (1991).

Perennial, sinistrorsely twining climbers or much-branched, often rigid to spinescent shrubs up to 1 m high, tomentose to glabrous, greenish, later becoming covered with grey, corky bark; with clear sap; rootstock with fibrous or fusiform roots. **Leaves** mostly opposite, erect to pendent, pubescent to glabrous, slightly fleshy to coriaceous; petiole 0.5–3 mm long; blade deltoid to linear, often with auriculate base, generally small. **Inflorescence** extra-axillary, finely pubescent, 1–15-flowered. **Sepals** divided nearly to base, ± lanceolate, usually pubescent, green to pink-red. **Corolla** tube urceolate to tubular or campanulate, 5-angled with prominent ridges descending from bases of lobes, greenish yellow, green, pink or red, inside usually with 5 patches of stiff, downward-pointing golden-yellow hairs; lobes orbicular to deltoid, usually folded inwards along midrib, contorted and twisted, rarely spreading, usually connivent-erect to depressed into mouth of tube and closing it completely. **Corolline corona** present in some species, as five rounded lobes projecting from walls of corolla tube and alternating with patches of tawny hairs (hairs all round in sect. *Haemax*). **Staminal corona** 0. **Gynostegium** narrowing from base of gynostegial grooves to acute apex. **Anthers** with membranous apical appendage adpressed to style head, tipped with many intertwined hairs. **Pollinia** pendulous, mostly flat and long; corpuscle hard, black. **Follicles** fusiform, pendulous, tapering to long-acute point, glabrous. $x = 10, 11$.

Species 11 in sthn Afr., Namibia, Namaqualand (Northern Cape), Free State, Western and Eastern Cape.

Miraglossum Kupicha 6778020

(Asclepiadoideae—Asclepiadeae)
Kupicha: 625 (1984).

Perennial herbs with annual flowering shoots; sap milky. **Stems** erect, unbranched, with indumentum evenly distributed or rarely in vertical lines. **Leaves** irregularly inserted (or sometimes opposite) below inflorescence,

verticillate (rarely irregular) in inflorescence, usually hairy, occasionally glabrous; petiole short; lamina linear to narrowly triangular; margin revolute. **Flowers** in fascicles at distal nodes of stem, terminal fascicle appearing umbellate in those species that have reduced upper leaves; inconspicuous; pedicels pilose; bracteoles filiform. **Calyx** shorter than corolla; segments triangular, usually with indumentum on ventral, as well as dorsal, surface; margin ciliate. **Corolla**: lobes elliptic, characteristically reflexed at anthesis (except in *M. davyi*); dorsal surface with variable indumentum, ventral surface always densely puberulous except for a glabrous band along left hand margin (seen from centre of flower); right hand margin ciliate. **Corona** arising from staminal column; lobes thick, fleshy, not dorsiventrally or laterally compressed, alternating with petals, each representing a dorsal outgrowth from opposing stamen. **Anthers** 2-locular, with apical, membranous, often strongly undulate appendage resting on style head; anther wings horny; wings of adjacent anthers closely opposed, forming a narrow gynostegial groove between them blocked at its upper end by a corpuscle. **Pollinia** pendulous, sausage-shaped, slightly dorsiventrally compressed, without a defined germination zone; caudicels flattened, ribbon-like; corpuscle often flanged. **Follicles** densely lanate-pubescent, covered with soft, appressed bristles or bristles 0. **Seeds** many, compressed-ovoid, dark brown, rugose and with apical tuft of hairs.

Species 7, endemic to sthn Afr., eastern half of sthn Afr.

Mondia Skeels 6729000

(Periplocoideae—Periploceae)
Skeels: 45 (1911); Bullock: 203 (1961).

Chlorocodon Hook.f.: t. 5898 (1871a); Brown: 254 (1904); Brown: 541 (1907).

Tall lianas with stems up to 20 m or longer; roots tuberous. **Leaves** large, ovate, base cordate, apex caudate, petiolate, midgreen; interpetiolar stipules (colleters?) well developed, frill-like. **Inflorescences** many-flowered in axillary paniculate cymes. **Flowers** with gynostegium exserted from corolla. **Sepals** ovate. **Corolla** subrotate; lobes broadly ovate with obtuse apex, green outside, reddish brown to maroon inside with basal yellow-green nectariferous spot. **Corona** lobes arising at corolla mouth, free, fused with staminal filaments basally, broadly obcordate, white, with or without pinkish brown dorsal, corniculate segment. **Stamens** arising from base of corolla; filaments free; anthers 4-locular, triangular, glabrous, apically connivent and connate in a white cone over style head. **Style head** broadly angularly obovoid. **Follicles** narrowly ovoid, obtuse, widely to horizontally divergent. **Seeds** obliquely ovate, keeled on both faces, with apical tuft of hairs.

Species 2, tropical Africa; 1 in sthn Afr.: *Mondia whitei* (Hook.f.) Skeels, KwaZulu-Natal; lianas of the tree canopy of riverine and swamp forest.

*__Nerium__ L. 6687000

(Apocynoideae—Wrightieae)
Linnaeus: 209 (1753); Leeuwenberg: 397 (1985).

Shrubs or small trees 1–6 m high. **Leaves** ternate, petiole 3–10 mm long; lamina coriaceous, narrowly elliptic, 50–210×10–35 mm, acuminate or acute at apex, cuneate at base. **Inflorescence** terminal or axillary, thyrsoid, lax. **Flowers** actinomorphic, ornamental. **Calyx** free, narrowly triangular to narrowly ovate. **Corolla** showy, white, pink to wine-red, yellow or salmon; tube infundibuliform; lobes in bud overlapping to the right, obovate, rounded, entire; corona of 5 truncate epipetalous parts, 3–8-lobed. **Stamens** 5; filaments short, anthers 4-locular, narrowly triangular, fertile at sagittate base, introrse, with filiform apical appendages. **Ovary** broadly ovoid. **Mericarps** 2, follicular, narrowly oblong. **Seeds** oblong with 9–12 mm long tuft of hairs at truncate apex. $x = 11$.

**Nerium oleander* L., a highly poisonous but popular, evergreen garden shrub cultivated for ornament and screening, has toxic, clear, sticky sap; often occurs as an escape, and is a proposed declared invader, especially in rocky and gravelly, usually dry watercourses in semi-arid regions (Henderson 1995).

Notechidnopsis Lavranos & Bleck 6877010

(Asclepiadoideae—Ceropegieae)
Lavranos & Bleck: 255 (1985); Bruyns: 327 (1999c).

Echidnopsis Hook.f.: t. 5930 (1871b); White & Sloane: 975 (1937c).

Small, succulent perennials, wholly glabrous, forming mats or ± diffuse clumps. **Stems** 6–8-angled, procumbent or ascending, branching and re-branching, in part subterranean, entirely leafless, tesselate, tubercles convex or pyramidal, tipped with a soft green apiculus which dries and hardens with age. **Flowers** in fascicles of usually 5–15, from abbreviated, persistent peduncles near angles on upper and middle parts of stems, developing in quick succession. **Sepals** small, fleshy. **Corolla** ± 9 mm in diameter with very shallow tube completely filled by corona, almost rotate, outside greyish white to pale green, glabrous except for tube and base of lobes which are sparsely covered with short, rigid, erect bristles; inside yellowish, with obtuse, conical papillae, each tipped with an acute seta; lobes spreading to reflexed, margins folded back, without cilia. **Corona** 2-seriate, seemingly arising from surface of flat corolla and extending much above it with staminiform lobes emarginate or incised into 10 almost equal segments; these ascending with the 5 styliform lobes or incumbent on gynostegium. **Anthers** 2-locular, horizontal on style head. **Pollinia** ellipsoidal with pellucid margin along outer edge. **Follicles** erect, slender, glabrous, smooth. $x = 11$ (1 report).

South Africa, species 2, Northern and Western Cape (endemic to Namaqualand).

Oncinema Arn. 6842000

(Asclepiadoideae—Asclepiadeae)
Arnott: 261 (1834); Bullock: 184 (1963).

Glossostephanus E.Mey.: 217 (1837); Brown: 740 (1908); Phillips: 604 (1951).

Perennial, twining herb. **Leaves** shortly petiolate, slender. **Flowers** in lax cymes or racemes, lateral at nodes. **Corolla** with shallowly campanulate tube and 5 suberect, linear lobes. **Corona** of 5 lobes ± as long as staminal column; lobes free, erect, laterally compressed, linear, grooved down the back. **Anthers** 2-locular, with ovate, membranous appendages; pollinia minute; caudicles shorter than pollinia. **Style** produced into tapering, bifid column as long as corolla. **Follicles** solitary by abortion, narrowly fusiform. **Seeds** brown, linear-lanceolate, convex on back, concave on face, narrowly winged, smooth or with irregular ridges.

Species 1, sthn Afr.: *Oncinema lineare* (L.f.) Bullock; S Western Cape to Uitenhage District (Eastern Cape).

Oncinotis Benth. 6686000

(Apocynoideae—Apocyneae)
Bentham: 451 (1849); Stapf: 512 (1907); Codd: 288 (1963); Kupicha: 492 (1985).

Scandent shrubs to tall, woody climbers. **Leaves** opposite, shortly petioled or subsessile, obovate, oblong-

elliptic or elliptic, often abruptly acuminate; axillary glands 0; stipules 0. **Inflorescence** terminal or axillary, consisting of a panicle of few–many-flowered, contracted cymes. **Flowers** relatively small, inconspicuous, often greenish. **Calyx** small, divided almost to base, eglandular within or rarely with 5 minute glands; sepals 5, imbricate, oblong-lanceolate to ovate-oblong. **Corolla** salver-shaped; tube short, widest in middle, hairy without and within, with 5 ligulate scales in mouth, alternating with lobes; lobes spreading or reflexed, ± as long as tube, linear to linear-oblong, overlapping to the right. **Stamens** 5, inserted above base of corolla tube; anthers 4-locular, sessile, conniving in a cone, sublinear, apiculate, shortly sagittate with foot of connective produced into a linear appendage which lies in a channel in the anther, with a cushion of hairs at base, polliniferous in upper part only. **Disc** cupular, 5-lobed or 5-partite. **Ovary** of 2 free carpels, shortly exserted and free from disc; style very short; stigma shortly spindle-shaped with 2-lobed apiculus. **Mericarps** 2, follicular, cylindric and slender to spindle-shaped. **Seeds** lanceolate, linear or oblong with apical tuft of hairs. $x = 11$ (1 report).

Species 7, Africa and Madagascar; 1 in sthn Afr.: *Oncinotis tenuiloba* Stapf (= *O. inandensis* J.M.Wood & M.S.Evans), KwaZulu-Natal and Eastern Cape border.

Ophionella Bruyns 6889020

(Asclepiadoideae—Ceropegieae)
Bruyns: 70 (1981).

Pectinaria Haw. in part.

Dwarf, leafless, succulent perennials, glabrous in all parts except sometimes inside of flower. **Stem** acutely to obtusely 4-angled, usually procumbent, often arching and rerooting as it elongates, tuberculate and acutely toothed along angles when young, often with a distinct bud in axil of each tubercle. **Inflorescences** 1–4 per stem, arising near base, each with 1–4 flowers developing in gradual succession on a short peduncle. **Sepals** acute to ovate-acute. **Corolla**: tube ± spherical, cupular or campanulate; lobes ovate-lanceolate to lanceolate, sometimes connate at apex; interior of corolla sometimes with erect rigid hairs, white or cream with deep red patches; outside smooth to papillate, pink to white. **Corona** 2-seriate; outer corona lobes truncated, entire, joining to dorsal projection of inner lobes near base; inner lobes with large, thick, subclavate dorsal projection pointing horizontally outwards and not rising much above stigmatic surface, with broad base adnate to base of anther, forming a small channel in which anther wings are situated, with small narrow limb adnate to back of anther, usually longer than anther. **Anthers** 2-locular, ± horizontal on top of style head, rectangular, without apical appendages. **Pollinia** with short caudicles and winged corpuscle. **Follicles** erect, terete-fusiform, short, smooth.

Species 1: *Ophionella arcuata* (N.E.Br.) Bruyns, with 2 subspecies, growing between Willowmore in the west and Addo in the east (Eastern Cape).

Orbea Haw. 6885050

(Asclepiadoideae—Ceropegieae)
Haworth: 37 (1812); Leach: 4 (1985).

Diplocyatha N.E.Br.: 167 (1878); Brown: 923 (1909); White & Sloane: 722 (1937b). *Stultitia* Phillips: t. 520 (1933); Phillips: 613 (1951).

Dwarf, glabrous, succulent perennials forming compact to diffuse clumps, branching from base, often rhizomatous. **Stems** erect to prostrate, obtusely 4-angled, prominently acutely toothed along angles; teeth conical or compressed-deltoid, spreading, usually widely so, each tipped with a soft, acute to acuminate leaf rudiment, usually subtended by a pair of stipular denticles shortly below apex. **Inflorescences** 1–3(–5) per stem, developed normally from near base of stem, each with 1–40 flowers usually developing in succession. **Flowers** often humifuse, ± 10–100 mm in diameter, not or only faintly odorous. **Corolla** rotate to campanulate, often thickened below bases of lobes to form a prominent annulus; outside smooth, often streaked with purple; inside rugulose to ± smooth; lobes spreading to reflexed, ± flat above, often with vibratile clavate cilia on margins. **Corona** 2-seriate, glabrous, mostly with 10 lobes in 2 alternating series, on a mostly short stipe, generally accessible to relatively large pollinators; outer corona usually of 5 spreading to erect, ± subquadrate lobes beneath anther wings, protruding above relatively large nectarial cavity with nectarial orifice at its rear and corresponding outer corona lobe spreading from its base; inner lobes adpressed to backs of anthers, often exceeding them and rising up connivent in centre, dorsiventrally flattened to terete, often with fin-like dorsal appendage. **Anthers** 2-locular, horizontal on top of style head. **Pollinia** ± broadly ovate or subcircular, with a ± straight inner margin, as long as or slightly longer than broad. **Follicles** erect, terete-fusiform, glabrous, smooth. $x = 11$ (polyploidy).

Species 20; 18 in sthn Afr., in all countries and provinces, except Lesotho.

Orbeanthus L.C.Leach 6885060

(Asclepiadoideae— Ceropegieae)
Leach: 71 (1978a).

Glabrous succulent perennials. **Stems** obtusely 4-angled, creeping; stems and branches with adventitious roots and sharp, tuberculiform, widely spreading teeth often slightly reflexed, rarely over 3 mm long, lacking stipular denticles along angles. **Flowers** 1 or 2, usually arising towards base of stems or branches, opening successively, at least 25 mm in diameter, with a broad, smooth (not rugulose nor verrucose), glabrous annulus. **Corona** hairy, outer lobes deeply bifid, spreading-erect, greatly exceeding anthers. **Staminal column** hollowed below anther wings, with a nectarial orifice behind anther wings. **Anthers** horizontal above style head, margins often not shrinking back and frequently covering pollinia. **Pollinia** ± D-shaped, pellucid margin twisting onto dorsal surface. **Follicles** erect, terete-fusiform, glabrous, smooth. $x = 11$.

Species 2, Northern Province.

Orbeopsis L.C.Leach 6885070

(Asclepiadoideae— Ceropegieae)
Leach: 61 (1978a).

Low, caespitose, ± leafless, glabrous, succulent perennials. **Stems** obtusely 4-angled, with tubercle-like, deltoid, short teeth very prominent and widely spreading, arranged along angles of stem, usually with stipular denticles. **Flowers** few to many in umbelliform-fasciculate inflorescences, with few to many flowers opening together or in quick succession; usually rotate, lacking an annulus, with or without a distinct tube; mostly strongly foetid. **Corona** glabrous, ± cyathiform, partly or completely included, outer lobes usually broadly spreading, inner lobes erectly spreading, usually much exceeding anthers, sometimes recurved. **Staminal column** hollowed below anther wings with an inwardly directed nectarial orifice. **Anthers** horizontal above style head, margins often not shrinking back and frequently cover-

ing pollinia. **Pollinia** ± D-shaped, pellucid margin twisting onto dorsal surface. **Follicles** erect, terete-fusiform, glabrous, smooth. $x = 11$ (polyploidy).

Species 10, Angola and sthn Afr.; 9 in sthn Afr., Namibia, Botswana.

Orthanthera Wight 6862000

(Asclepiadoideae—Ceropegieae)
Wight 48 (1834); Brown: 784 (1908); Huber: 46 (1967c).

Perennial herbs with prostrate stems, or ± virgate subshrubs. **Leaves** subsessile or shortly petiolate, rarely undeveloped. **Flowers** in pedunculate or subsessile clusters or umbels, lateral at nodes. **Sepals** lanceolate with scales within base, hairy. **Corolla**: tube globose, 5-winged or -angled at base, then cylindric, hairy outside; lobes shorter than tube, linear, with reflexed margins, sometimes with minute, pocket-like thickenings at sinuses between them. **Corona** arising at or near base of staminal column and almost as long as it, of 5 lobes; lobes halfmoon-shaped or transversely oblong, reflexed outwards or V-shaped. **Anthers** 2-locular, with a subulate or lanceolate, membranous appendage. **Pollinia** erect, oblong, with pellucid, apical patch, with short caudicles. **Follicles** large, fusiform, acuminate, smooth. **Seeds** brown, ovate with a narrow, marginal wing, convex on one face, flat on other; with tuft of hairs. $x = 11$ (1 report).

Species 4, Africa and India; 2 in sthn Afr., Namibia, Botswana, South Africa excluding KwaZulu-Natal, Free State and Eastern Cape.

Pachycarpus E.Mey. 6787010

(Asclepiadoideae—Asclepiadeae)
Meyer: 209 (1838); Brown: 714 (1908); Bullock: 329 (1953b); Smith: 399 (1988); Goyder 338 (1998a).

Perennial herbs, erect, often robust, with tuberous rootstock or fusiform roots. **Leaves** petiolate or subsessile, usually distinctly penninerved. **Flowers** in 2–several-flowered umbels, lateral at nodes. **Sepals** usually with scales within base, usually ciliate, often pilose. **Corolla** usually deeply 5-lobed, sometimes with broadly campanulate tube. **Corona** arising at or from near base of staminal column, of 5 lobes; lobes shorter to longer than staminal column or nearly as long as corolla, erect or deflexed or inflexed over style head, often shortly and thickly stalked, dorsally flattened, spatulate, oblong-spatulate, broadly ovate, obovate, oblong, sometimes bluntly 3-lobed or produced into a linear lobe, usually with 2 flaps on inner face, sometimes attached by a broad foot to staminal column and consisting of 2 fleshy keels separated by a deep, narrow fissure. **Anthers** 2-locular, with membranous appendages usually resting on style head. **Pollinia** oblong or ovate-oblong, pendulous, caudicles usually shorter than pollinia. **Style head** crater-like, depressed-truncate or dome-like. **Follicles** usually solitary by abortion, ± fusiform, obtuse, winged at least in upper part, sometimes toothed or echinate along wings. **Seeds** brown, oblong, convex on back, concave on face with thickened margin, covered with short protuberances. $x = 11$ (1 report).

Species ± 30, Africa; 27 in sthn Afr., widespread, excluding Namibia and Botswana; in high grassveld.

Pachycymbium L.C.Leach 6885080

(Asclepiadoideae—Ceropegieae)
Leach: 69 (1978a); Gilbert: 20 (1990); Plowes: 103 (1993b).

Glabrous, succulent perennials. **Stems** arising from rhizomatous rootstocks, obtusely 4-angular, with tubercle-like, deltoid or broken, acute, very prominent, widely spreading teeth along angles; teeth often with stipular denticles towards apex. **Flowers** in few-flowered inflorescences, appearing together or in quick succession, shortly pedicellate, arising in small fascicles along sides of stems, usually towards apex. **Corolla** campanulate, under 25 mm in diameter, thick, rigidly fleshy, with a thickened glabrous annulus surrounding mouth of tube. **Corona** entirely enclosed in tube, deeply urceolate, inner lobes closely incumbent upon anthers, not erectly produced. **Anthers** horizontal above style head, margins often not shrinking back and frequently covering pollinia. **Pollinia** ± D-shaped, pellucid margin twisting onto dorsal surface. **Follicles** erect, terete-fusiform, glabrous, smooth. $x = 11$ (polyploidy).

Species 2, in sthn Afr., Northern Province, Gauteng and Mpumalanga; one extending to Zimbabwe.

Pachypodium Lindl. 6681000

(Apocynoideae—Echiteae)
Lindley: t. 1321 (1830); Stapf: 515 (1907); Codd: 283 (1963); Kupicha: 462 (1985).

Belonites E.Mey.: 187 (1837).

Succulent shrubs or small trees up to 6 m tall; stems usually large and swollen at base. **Leaves** alternate or spirally arranged, often in terminal fascicles, sessile or shortly petioled; axillary glands 0; stipules transformed into rigid spines in pairs, forming a swollen cushion at base. **Inflorescence** cymose, sessile or peduncled, few- or many-flowered. **Flowers** usually showy, pink, purple or yellow, or sometimes partly white. **Calyx** small, divided almost to base, eglandular within; lobes 5, ovate to linear-oblong. **Corolla** salver-shaped, funnel-shaped, or subcampanulate; tube constricted near base, cylindric or broadly cylindric below, tubular to campanulate above; lobes shorter than or almost equalling tube, overlapping to the right. **Stamens** 5, inserted above constriction; anthers 4-locular, subsessile, conniving in a cone, lanceolate, with only a short, terminal appendage, sagittate, polliniferous in upper part only, with projection near foot of connective and often a brush-like cushion below. **Disc** cupular, slightly 5-lobed or replaced by 2–5 distinct glands. **Ovary** of 2 free carpels; style cylindric or compressed, short; stigma subcylindric, with an annular rim or membrane at base, very obscurely 2-lobed; ovules many, pluriseriate. **Mericarps** follicular, cylindric or spindle-shaped. **Seeds** ovate to oblong with apical tuft of hairs. $x = 9$.

Species 18, 13 native to Madagascar; 5 in sthn Afr., arid areas or dry situations in Namibia, Botswana, Northern Province, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

Parapodium E.Mey. 6762000

(Asclepiadoideae—Asclepiadeae)
Meyer: 221 (1838); Brown: 557 (1907).

Perennial, erect herbs with thickened rootstock. **Leaves** opposite, petiolate or subsessile, simple, sometimes margin undulate. **Flowers** in lateral umbels. **Sepals** 5, separate almost to base, sometimes nearly as long as corolla, with scales within sinuses. **Corolla** with shortly campanulate tube and with lobes spreading or recurved at tips; greenish yellow. **Corona** of 5 lobes; lobes as broad as long, or obcordate, adnate to basal portion of corolla tube, free above and slightly projecting beyond mouth of corolla tube, free from staminal column. **Anthers** 2-locular, with ovate, membranous, apical appendages. **Pollinia** pendulous, with caudicles nearly as long as pollinia. **Style** exserted beyond anther appendages or shorter and depressed at apex. **Follicles** coriaceous, with

few scattered protuberances. **Seeds** elliptic, concave-convex, with prominent ridges.

Species 3, sthn Afr., excluding Namibia, Botswana, Swaziland, Northern and Western Cape.

Pectinaria Haw. 6889000

(Asclepiadoideae—Ceropegieae)
Haworth: 14 (1819); Brown: 867 (1909); White & Sloane: 727 (1937b); Bruyns: 62 (1981).

Dwarf, mat-forming, leafless, glabrous, succulent perennials. **Stem** usually procumbent, often arching and re-rooting as it elongates, 6-angled, tuberculate-tesselate, acutely toothed along angles when young, often with a distinct bud in axil of each tubercle. **Flowers** solitary of rarely in pairs, arising between angles near stem apex. **Sepals** lanceolate, acuminate. **Corolla**: tube cupular or campanulate; lobes ovate-lanceolate to lanceolate, usually connate at apex. **Corona** 2-seriate, glabrous; outer lobes bifid into 2 slightly diverging, erect to semi-erect horns, joining to dorsal projection of inner lobes; inner lobes adnate to backs of anthers; dorsal projections divided into many semi-erect processes forming a pectinate ring with outer lobes. **Anthers** 2-locular, without apical appendages. **Pollinia** suberect or nearly horizontal, broader than long, with short caudicles and winged corpuscle. **Follicles** erect, terete-fusiform, glabrous, smooth. $x = 11$.

Species 3, Northern and Western Cape.

Pentarrhinum E.Mey. 6810000

(Asclepiadoideae—Asclepiadeae)
Meyer: 199 (1838); Brown: 741 (1908); Liede & Nicholas: 475 (1992).

Perennial, twining herbs. **Leaves** petiolate, cordate. **Flowers** in pedunculate, umbel-like cymes, lateral at nodes. **Sepals** with scales within base. **Corolla** deeply 5-lobed. **Corona** arising from base of staminal column, of 5-lobes; lobes in side view obconic, trumpet- or slipper-shaped, with infolded margins forming a channel or narrow, funnel-shaped cavity within, with truncate or rounded upper margin and with an inward-directed horn. **Anthers** 2-locular, with inflexed, ovate, membranous appendage. **Pollinia** terete, linear, pendulous; caudicles shorter than pollinia. **Follicles** lanceolate, ± beaked and echinate. **Seeds** brown, ovate, planoconvex, narrowly winged, with scattered, raised markings. $x = 9$ (1 report).

Species 3, Africa; 2 in sthn Afr., widespread except in Lesotho and Western Cape.

Pergularia L. 6917000

(Asclepiadoideae—Asclepiadeae)
Linnaeus: 135, 191 (1767a); Brown: 757 (1908); Huber: 48 (1967c).

Twining perennial herbs. **Leaves** petiolate, simple, cordate-subacuminate. **Flowers** in long, pedunculate corymbs or racemes, sublateral at nodes. **Sepals** with scales within base. **Corolla** 5-lobed to ± halfway; tube cylindric to campanulate; lobes elliptic, fimbriate or ciliate. **Corona** 2-seriate; outer corona arising at base of staminal column, membranous, annular, 5-lobed; inner corona lobes 5, erect, fleshy, adnate to base of staminal column, free above, horn-like, incurved, produced into a spreading, deflexed spur or pouch at base. **Staminal column** arising in mouth of corolla tube and exserted. **Anthers** terminated by a transversely oblong, membranous appendage inflexed over style head. **Pollinia** transversely oblong, pendulous, with obsolete caudicle. **Style head** 5-angled, dome-shaped. **Follicles** somewhat ovoid, sometimes acuminate, smooth or echinate. **Seeds** ovate, with toothed marginal wing, hairy. $x = 11$ (aneuploids).

Species 5, Africa to India and Madagascar; 1 in sthn Afr.: *Pergularia daemia* (Forssk.) Chiov.; widespread except in Free State, Lesotho, Northern, Western and Eastern Cape.

Periglossum Decne. 6783010

(Asclepiadoideae—Asclepiadeae)
Decaisne: 520 (1844); Brown: 581 (1907).

Perennial herbs, with tuberous rootstock, producing single, erect stems. **Leaves** sessile, slender. **Flowers** few to many, in 2–4 globose umbels, arranged racemosely along upper part of stem. **Sepals** often with scales within base. **Corolla** 5-lobed nearly to base. **Corona** shortly connate at base, 5-lobed, sometimes almost as long as corolla lobes; lobes erect, spatulate-oblong or sagittate, or oblong-linear, with a transverse ridge or flap and often 2 keels on inner face, sometimes reflexed at apex, sometimes with process at base. **Staminal column** arising from base of corolla. **Anthers** 2-locular, with terminal, membranous appendages which are inflexed on style head. **Pollinia** pendulous, curved, sausage-shaped, attached to corpuscle by doubly curved caudicles twice as long as pollinia. **Follicles** narrowly fusiform, tapering to a beak. **Seeds** concave on one side, convex on other, with short protuberances and a pleated rim round concave surface.

Species 4, Africa, all in sthn Afr., in all countries and provinces.

Petopentia Bullock 6730020

(Periplocoideae—Periploceae)
Bullock: 362 (1954).

Pentopetia Decne. in part; Schlechter: 257 (1894b). *Tacazzea* Decne. in part; Brown: 541 (1907).

Lianas with stems up to 10–15 m long; roots tuberous, often with subspherical part above ground, up to 0.6 m in diameter. **Leaves** semicoriaceous, petiolate, with axillary tooth-like and hair-like colleters, with interpetiolar line; blade broadly oblong, base broadly rounded and truncate to cordate, apex rounded and cuspidate, dark green, glabrous and glossy, secondary veins patent. **Inflorescences** axillary at terminal nodes, few-flowered. **Flowers** with gynostegium exserted from corolla. **Sepals** broadly ovate, semisucculent, pale green. **Corolla** rotate, pale green to yellow; lobes narrowly triangular to triangular-ovate, apex acuminate. **Corona** lobes arising from corolla mouth, erect, filiform. **Stamens** arising at base of corona lobes, free; anthers 4-locular, triangular, glabrous. **Style head** broadly pentangularly ovoid with conical or bifid apex. **Follicles** paired, widely diverging, vary narrowly ovoid with acuminate or acute apex. **Seeds** subovoid, blackish brown, tuft of silvery white hairs.

Species 1: *Petopentia natalensis* (Schltr.) Bullock, KwaZulu-Natal and Transkei region of Eastern Cape; humid, subtropical areas.

Piaranthus R.Br. 6881000

(Asclepiadoideae—Ceropegieae)
Brown: 12 (1810); Brown: 1015 (1909); White & Sloane: 783 (1937b); Meve: 57 (1994); Bruyns: 395 (1999d).

Huerniopsis N.E.Br.: 171 (1878); Brown: 499 (1903); Brown: 922 (1909); White & Sloane: 965 (1937c); Huber: 40 (1967c).

Dwarf, mat-forming, glabrous, succulent perennials. **Stems** cylindrical, sometimes clavate, roundly 4- or 5-angled, angles marked by triangular scars of rudimentary leaves. **Inflorescence** cymose-thyrsoid cyme, 1–3 per stem, on upper parts; floral bracts lanceolate, ± 1 mm

long. **Flowers** 1–5, produced on rudimentary peduncles, usually opening in succession. **Sepals** ovate-lanceolate, acuminate, with scales within base. **Corolla** rotate and deeply lobed to campanulate, tubular or with nearly flat base, 5-lobed in apical part, usually hairy on inner surface; lobes ovate or lanceolate, acuminate, often with revolute margins. **Corona** 1-seriate, yellow, arising from staminal column, of 5 lobes incumbent on anthers, rarely with erect tips, sometimes toothed, dorsally produced or expanded into a truncate, minutely tuberculate or denticulate crest. **Staminal column** arising from base of corolla. **Anthers** 2-locular, ± horizontal on top of style head, without appendages. **Pollinia** ellipsoid, with short caudicles. **Style head** a 5-lobed disc. **Follicles** paired, green, sometimes spotted red, glabrous. **Seeds** flat, ovate, winged, narrowly brown, slightly sculptured; tuft of hairs 10–16 mm long. $x = 11$ (polyploidy).

Species 6; 6 in sthn Afr., Namibia, Botswana, Northern Province, North-West, Mpumalanga, Free State, Northern, Western and Eastern Cape.

Quaqua N.E.Br. 6884010

(Asclepiadoideae—Ceropegieae)

Brown: 8 (1879); Bruyns: 35 (1983); Gilbert: 1 (1990); Plowes: 83 (1993a); Bruyns: 311 (1999e).

Succulent, sometimes spiky subshrubs or shrubs, branching at or above base to form clumps. **Stems** 4(5 or 6)-angled, not stoloniferous, glabrous, leafless, grey to purplish, with angles rounded, bearing stout, convex tubercles each armed with a hardened, conical, horizontal to decurved, yellow-brown tooth, each tooth sometimes flanked by two denticles, tubercles from adjacent angles meeting in middle of stem with well-defined groove. **Inflorescences** 1–20 per stem, glabrous, mainly in upper part of stem. **Flowers** solitary or produced in fascicles arising from peduncular patches in groove in middle of stem formed by tubercles. **Corolla** variously expanding, depending on number of flowers in fascicle, frequently papillate and spiculate, rarely hairy within, 7–25 mm diam., mostly much smaller than diameter of stems; tube rarely absent, bowl-shaped to conical, up to 5 mm deep; lobes ovate-lanceolate to linear-acute, margins sometimes ciliate, sometimes conspicuously folded back, 3–15 mm long. **Corona**: outer lobes deeply bifid, to shallowly bifid or entire and entirely enclosing space between inner lobes to form cup around column, arising near base of inner lobes; inner lobes adpressed to backs of anthers for most of length of anthers, occasionally initially incumbent and then rising up in centre in a small column, mostly dorsally flattened. **Anthers** 2-locular, horizontal on top of style head, rectangular. **Pollinia** ellipsoidal, with pellucid margin along outer edge. **Follicles** terete-fusiform, erect, diverging at up to 90°. **Seeds** flattened, brown, finely papillate on surface, with tuft of hairs. $x = 11$.

Species 19, Namibia, North-West, Northern, Western and Eastern Cape.

Raphionacme Harv. 6747000

(Periplocoideae—Gymnanthereae)

Harvey: 22 (1842); Brown: 268 (1904); Brown: 532 (1907); Huber: 5 (1967b); Retief & Venter: 326 (1983); Venter & Verhoeven: 149 (1986a); Venter & Verhoeven: 332 (1986b); Venter & Verhoeven: 177 (1987); Venter & Verhoeven: 603 (1988a); Venter & Verhoeven: 607 (1988b); Verhoeven & Venter: 123 (1988).

Geophyte with aerial stems seasonal, climbing, erect or decumbent; root tuber napiform to cylindrical-ovoid; subterranean stems perennial. **Leaves** petiolate, lamina linear to ovate to broadly ovate or elliptic to obovate, herbaceous, glabrous or variously hairy, base rounded to cuneate, apex obtuse, rounded or acute to acuminate. **Inflorescences** racemose to capitulate, terminal and/or axillary, few- to many-flowered. **Flowers** with gynostegium exserted from corolla. **Sepals** glabrous to hairy. **Corolla** green, brown, white, yellow, pink, violet to blue; tube cylindrical to campanulate, with nectariferous swellings on inner face below filament bases, longitudinally channelled with pockets at base; lobes ovate to obovate to triangular, apex obtuse to rounded. **Corona** arising in corolla mouth, lobes free, entire, bifid, trifid or trisegmented and variously shaped, e.g. filiform, ovate, lobular and corniculate; colours as in corolla. **Stamens** arising at mouth of corolla tube and adnate to bases of corona lobes; filaments filiform, sometimes dilated at base; anthers 4-locular, hastate, triangular or ovate, glabrous. **Style**s long, fused from low down, often glandular. **Style head** pentangularly ovoid, apex obtuse. **Follicles** paired and widely diverging or solitary and erect, narrowly ovoid to linear-ovoid or obovoid with acuminate apices. **Seeds** narrowly subovoid, with tuft or ring of hairs.

Species 39, Africa, 1 in Arabian Peninsula, with the majority occurring south of the equator; 18 in sthn Afr., mostly found in arid to subhumid savanna, a few in desert, a few in swampy habitat: Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Lesotho, Northern and Eastern Cape.

Rauvolfia L. 6619000

(Plumerioideae—Alyxieae)

Linnaeus: 208 (1753); Stapf: 501 (1907); Codd: 274 (1963); De Kruif: 458 (1985); Van Dilst & Leeuwenberg: 21 (1991).

Ophioxylon L.: 1043 (1753). *Dissolaena* Lour.: 137 (1790). *Cyrtosiphonia* Miq.: 401 (1857). *Heurckia* Müll.Arg.: 53 (1870).

Trees or shrubs, usually glabrous. **Leaves** opposite or whorled, often large, shortly petioled, penninerved; axillary glands many in a dense fringe or in clusters; stipules 0. **Inflorescence** a terminal or pseudoaxillary, peduncled, usually many-flowered, simple or compound umbel or corymb, rarely a raceme. **Flowers** small, white or yellowish. **Calyx** small, divided almost to base or united into a shallow, 5-toothed cup, eglandular within; sepals or segments imbricate. **Corolla** salver-shaped; tube cylindric, slightly widened below mouth, very rarely just below middle; mouth constricted, without appendages; lobes shorter than tube, overlapping to the left. **Stamens** in widened part of tube; filaments short, terete; anthers 4-locular, free from stigma, ovate, acute to obtuse, shortly 2-lobed at base. **Disc** annular or cup-shaped, entire or slightly lobed. **Ovary** of 2 free or coherent carpels; style subterete; stigma capitate or shortly cylindric, minutely papillose and slightly viscous, with a basal, deflexed rim and a very short, slightly bilobed apiculus arising from a shallow depression; ovules 2 in each locule, collateral. **Mericarps** 2 (or often 1 by abortion) free, or ± united, drupaceous; pyrenes crustaceous, 1- or 2-seeded, ± compressed. **Seeds** ovoid. $x = 11$ (aneuploids, high polyploidy).

Species ± 60, pantropical, 7 in Africa, 3 in Madagascar; 1 in sthn Afr.: *Rauvolfia caffra* Sond. (= *R. natalensis* Sond.); Northern Province, North-West, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Rhyssolobium E.Mey. 6890000

(Asclepiadoideae—Marsdenieae)

Meyer: 217 (1838); Brown: 784 (1908).

Shrublets, much branched, whitish puberulous. **Leaves** opposite or subfasciculate, small, thick, with revolute margins. **Flowers** 1–3, subsessile at nodes. **Sepals** lanceolate, acute, thick. **Corolla** 5-lobed, somewhat fleshy with campanulate tube; lobes slightly spreading,

densely bearded within. **Corona** 0. **Staminal column** arising from base of corolla; filaments with horny margin on upper part. **Anthers** 2-locular, with membranous appendage. **Pollinia** erect, with short caudicles and corpuscle.

Species 1: *Rhyssolobium dumosum* E. Mey., Namibia and Northern Cape (Namaqualand); very arid, windswept coastal plains with night fog.

Riocreuxia Decne. 6875000

(Asclepiadoideae—Ceropegieae)
Decaisne: 640 (1844); Brown: 799 (1908); Dyer: 83 (1980); Dyer: 227 (1983).

Ceropegia in sense of Huber: 167 (1957) in part.

Perennials, herbaceous or becoming somewhat woody, twining or with several suberect branches from rootstock with long fleshy roots. **Leaves** mostly cordate at base. **Flowers** in laxly branched cymes or in fascicles at 2 or 3 nodes of flowering axis. **Sepals** usually with scales within base. **Corolla** with ± inflated tube; lobes ± as long as tube, usually connate at tips. **Corona** (1)2- or 3-seriate, arising from and ± as long as staminal column; outer corona a shallowly 5-lobed, basin-shaped structure or a 5-lobed collar, with lobes shortly or deeply divided; inner corona lobes linear or subulate or shortly linear-oblong, incurved over anthers, rarely obsolete. **Anthers** 2-locular, tipped with a short, fleshy appendage or apiculus. **Pollinia** subglobose or ellipsoid; caudicles short. **Follicles** terete or fusiform, acuminate, ± beaded, smooth. **Seeds** linear or oblong, convex on one side, flat on other, winged, with tuft of hairs at apex.

Species ± 10, Africa, 1 in India; 7 in sthn Afr., widespread.

Sarcostemma R.Br. 6849000

(Asclepiadoideae—Asclepiadeae)
Brown: 462 (1810); Brown: 755 (1908).

Perennial, ± leafless, ± glabrous succulents or subsucculents, trailing or twining, or occasionally shrubby. **Leaves** rudimentary. **Flowers** in lateral or terminal, sessile umbels. **Sepals** narrowly ovate-triangular, with scales within base. **Corolla** deeply lobed; lobes oblong or oblong-elliptic, margins recurved. **Corona** 2-seriate, arising from filament part of staminal column; outer corona annular, cup- or basin-shaped, 5-angled, truncate or shortly lobed; inner corona attached to staminal column almost throughout, of 5 fleshy, compressed or keeled lobes, enclosed at base by outer corona. **Anthers** 2-locular, with membranous, ovate, inflexed or ascending appendages. **Pollinia** very narrowly ovate, pendulous; caudicles shorter than pollinia; corpuscle very narrowly ovate, deep maroon. **Follicles** narrowly fusiform, usually bluntly beaked, often with somewhat membranous surface. **Seeds** compressed, ovate, narrowly winged, smooth. $x = 11$ (9, 10).

Species 10, in arid parts of Old World; 2 in sthn Afr., 1 widespread except in southwestern region of Western Cape.

Schizoglossum E.Mey. 6778000

(Asclepiadoideae—Asclepiadeae)
Meyer: 218 (1838); Brown: 588 (1907); Kupicha: 600 (1984).

Perennial herbs with flowering shoots produced annually from a tuber and dying back each year; all parts exuding a milky latex. **Stems** erect, simple or sparsely branched, with opposite and decussate lines of indumentum throughout. **Leaves** simple, entire, opposite and decussate or less often verticillate or irregularly inserted; petiole short; leaf base often sagittate, apex acute or obtuse, margin usually revolute; upper leaf surface usually with an indumentum of appressed scabrid hairs; lower leaf surface with pilose midrib, lamina ± glabrous except for sparsely pilose lateral nerves. **Inflorescences** extra-axillary umbels, always pedunculate (except in *S. bidens* subsp. *pachyglossum*), several to many per stem, few- to many-flowered; bracteoles filiform, inconspicuous; inflorescence axes pilose. **Calyx** shorter than corolla; segments triangular, dorsally appressed-pilose, ventrally glabrous, with ciliate margin. **Corolla** contorted in bud, with lobes overlapping to the left; lobes elliptic, either flat or slightly cucullate or replicate, with variable indumentum; when margin ciliate, hairs present on both right- and left-hand margins. **Corona** lobes alternating with petals, each representing a dorsal outgrowth from opposing stamen; form of corona variable, lobes dorsiventrally flattened and often with 1 or 2 appendages on ventral face. **Stamens** united at base to form a hollow column from which corona lobes arise; each anther comprising a central area of 2 thecae, each containing one pollinium, an apical membranous appendage lying against or cupped over gynostegium, and two horny lateral margins; margins of adjacent anthers closely opposed, forming a narrow gynostegial groove between them, blocked at its upper end by a corpuscle. **Pollinia** pendulous, obtriangular, ellipsoid, reniform or sausage-shaped, dorsiventrally compressed, always with a germination zone present on circumference but never at point of attachment to caudicle; caudicles short, slender or somewhat flattened; corpuscle sometimes flanged. **Ovary** of 2 free carpels concealed within staminal column; styles tapering upwards, then uniting and broadening into a flat or umbonate style head. **Follicles** covered with long, soft appressed bristles, surface of carpel and bristles densely crispate-pubescent; fruiting peduncle elongating and pedicels becoming once-coiled at apex. **Seeds** many, compressed-ovoid with dark brown rugose testa and apical tuft of hairs of fine white hairs.

Species ± 80, Africa; 27 in sthn Afr., widespread and mainly in grassland, excluding Namibia and Botswana.

Secamone R.Br. 6860000

(Secamonoideae)
Brown: 44 (1810); Brown: 542 (1907); Endlicher 589 (1838); Goyder: 437 (1992).

Lianes and twining shrubs with milky latex. **Leaves** sessile or subsessile. **Flowers** in 2–many-flowered cymes, axillary and terminal, rarely flowers solitary. **Sepals** ovate to suborbicular, usually with alternisepalous colleters. **Corolla** with shallow, campanulate tube or divided nearly to base, sometimes with a flap in mouth of tube alternating with lobes; lobes oblong, usually with fleshy, submarginal ridges and sometimes also with decurrent, central ridge. **Corona** of 5 simple inner lobes ± adnate to staminal column; lobes usually laterally compressed and curved inwards, sometimes small; outer lobes rarely present as small ridge beneath gymnostegial grooves. **Stamens** arising on staminal curtain surrounding ovaries and adaxially fused to sides of style head. **Anthers** 4-locular, with fimbriate, membranous appendages which are sometimes connate. **Pollinia** 2 in each theca, erect, not surrounded by waxy outer wall; caudicles almost obsolete; corpuscle soft, white, usually larger than pollinia. **Style head** variably shaped, with thick cylindrical part just above ovaries widening slightly towards apex, narrowing above this into usually bifid apex, with 5 stigmatic zones on sides of lower cylindrical part; pollinarium consisting of a small corpuscle, rarely with one or two small caudicles. **Ovary** apocarpous, semi-inferior. **Follicles** paired, fusiform or nar-

rowly cylindric, often acuminate; ventrally dehiscent. **Seeds** brown, compressed, lanceolate or linear, convex-concave or biconvex, with a single rib on one side, sometimes pubescent, with a tuft of hairs.

Species ± 100 in warmer regions of Old World, Africa and Madagascar; 5 in sthn Afr., widespread except in Namibia, Free State and Lesotho.

Sisyranthus E.Mey. 6861000

(Asclepiadoideae—Ceropegieae)
Meyer: 197 (1838); Brown: 786 (1908).

Perennial herbs, with fusiform roots and usually a single, unbranched, slender stem. **Leaves** sessile, slender. **Flowers** in 2–more-flowered, subsessile or pedunculate, lateral or terminal umbels. **Sepals** 5, ovate or lanceolate, often acuminate. **Corolla** cream, with urceolate or campanulate tube, sometimes with decurrent ridges within, alternating with lobes, often bearded within mouth or with 5 small tufts of hairs in throat; lobes 5, oblong or ovate, sometimes hairy on face. **Corona** partly adnate to staminal column by lower, central part of face and as long as or longer than staminal column, of 5 lobes; lobes ovate, deltoid-ovate, oblong, rhomboid, or broadly cuneate, obtuse or acute, entire or 3-toothed with lateral teeth small and central tooth large or prolonged into a subulate or filiform, erect or incurved point. **Anthers** 2-locular, with membranous, apical appendage. **Pollinia** erect, terete, linear or oblong, sometimes curved, often pellucid on one margin; caudicles shorter than pollinia. **Follicles** slender, smooth, tapering into beak. **Seeds** with tuft of hairs.

Species 13, tropical Africa and sthn Afr., widespread in grassland, excluding Namibia and Botswana.

Sphaerocodon Benth. 6896000

(Asclepiadoideae—Marsdenieae)
Bentham: 772 (1876); Brown: 773 (1908).

Perennial herbs with a woody or tuberous rootstock; stems erect, often flexuous, not twining. **Leaves** shortly petiolate, elliptic or obovate. **Flowers** in sublateral, pedunculate, umbel-like cymes. **Sepals** ovate-lanceolate, with scales within base. **Corolla** 5-lobed to ± halfway; tube campanulate. **Corona** of 5 small, fleshy tubercles arising from staminal column somewhat above its base. **Staminal column** arising from base of corolla tube; anthers with membranous margins, without apical appendages. **Pollinia** ellipsoidal, erect, with short caudicles. **Follicles** fat, single, pendulous.

Species 2, Africa; both in sthn Afr., Namibia, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Stapelia L. 6885000

(Asclepiadoideae—Ceropegieae)
Linnaeus: 217 (1753); Brown: 924 (1909); White & Sloane: 409 (1937b); Leach: 4 (1985).

Low, succulent, perennial herbs, branching sympodially from base, but not at all rhizomatose (except somewhat in *S. engleriana*). **Stems** pubescent or rarely glabrous, 4(5 or 6)-angled, ± parallel-sided or slightly tapering, neither tessellately marked nor sharply sulcate down sides, tubercle-toothed along angles. **Leaves** erect (spreading in *S. engleriana*), rudimentary, fleshy, pubescent, caducous or marcescent, decussately or spirally (5- or 6-angled) arranged at apex of tubercle teeth, with a pair of small, usually persistent, stipular glands at their base. **Inflorescence** a successively flowering, shortly pedunculate, pubescent cyme, arising mostly from near base, but in some species randomly disposed along stem; flowers mostly foetid. **Corolla** very variable in size (8–400 mm diameter), mostly deeply lobed, rotate, rarely campanulate, shallowly cup-shaped or funnel-shaped, in one species globose-campanulate, sometimes strongly recurved, usually transversely rugose, mostly to some extent hairy, sometimes densely so, yellowish, brownish, reddish or purplish. **Corona** 2-seriate, shortly raised on a pentagonal pedestal, 10-lobed, with 5 outer lobes simple or very rarely bifid, and inner closely incumbent on backs of anthers, sometimes shorter than or scarcely exceeding them, but mostly produced above them into a horn-like extension, often with a prominent dorsal wing or secondary horn or variably gibbous near base. **Anthers** 2-locular, horizontal on top of style head, rectangular. **Pollinia** obliquely ovate, compressed. **Follicles** fusiform, erect, sparsely pubescent or puberulous, very rarely glabrescent. $x = 11$ (aneuploids, polyploidy).

Species 43, Africa; most from sthn Afr., widespread in drier areas, except Lesotho.

Stapeliopsis Pillans 6885020

(Asclepiadoideae—Ceropegieae)
Pillans: 32 (1928); White & Sloane: 721 (1937b); Phillips: t. 445 (1932); Bruyns: 73 (1981).

Leafless, succulent perennials, sometimes rhizomatous, forming clumps or mats. **Stems** 4-angled, erect or ascending, with flattish sides, minutely papillate; angles with tubercles tapering to small, tooth-like, rudimentary leaf bases. **Inflorescences** 1(3) per stem, arising near base of stem, glabrous to minutely pubescent, with 1–6 flowers opening in gradual succession. **Sepals** ± lanceolate, acuminate. **Corolla** ellipsoidal, ovoid to cylindrical or campanulate with short triangular lobes sometimes joined at tips, exterior glabrous except in *S. neronis*, interior either covered with prominent papillae becoming smaller towards base of tube where they are tipped with a stiff hair, or without papillae but always with stiff hairs and covered with fine spicules. **Corona** 2-seriate; outer lobes either each reduced to a small, truncate (sometimes bifid) tooth at base of inner lobes or modified to form cup containing at least lower half of staminal column, lobes appearing as small indentations or teeth around mouth of cup; inner lobes joined dorsally near their base to outer corona tube or meeting outer lobes laterally near their base, touching anthers only near their base, limb of lobes rising up above stigmatic surface, usually meeting in centre, laterally flattened with rounded tips. **Anthers** 2-locular, horizontal on top of style head, rectangular, without appendages. **Pollinia** ellipsoidal. **Follicles** erect, terete-fusiform, borne on much-elongated pedicel, glabrous, smooth. $x = 11$.

Species 6, sthn Afr., Namibia, North-West, Northern, Western and Eastern Cape.

Stathmostelma K.Schum. 6793000

(Asclepiadoideae—Asclepiadeae)
Schumann: 129 (1893); Goyder: 607 (1998b).

Perennial herbs with a single annual stem arising from a vertical tuber; latex milky. **Stem** branched below, erect or ascending, glabrous or minutely pubescent with short, white hairs. **Leaves** petiolate, linear, acute, base truncate or rounded, pubescent with spreading white hairs. **Inflorescences** terminal or extra-axillary, umbels erect, borne on long or short peduncles. **Calyx** lobed to base. **Corolla** rotate to campanulate, outer face greenish, chrome-yellow within. **Staminal column** with stipe 1–2 mm long. **Corona** of 5 lobes arising above base of staminal column; erect and somewhat fleshy, appearing concave-cucullate for most of its length but in fact solid except

for papillose, proximal and upper margins, inner apical margins extending over head of column as a pair of teeth, cavity sinus without a well-developed central tooth, glabrous except along midline of cavity towards base of lobe. **Anthers** 2-locular; corpuscle subcylindrical, black; caudicle with a membranous, convex and somewhat contorted proximal portion broadening abruptly into a short clasping overlap with pollinium; pollinia flattened, oblong. **Style head** flat. **Follicles** single, erect, fusiform, beaked, not inflated, smooth, minutely pubescent when young, glabrous at maturity; fruiting pedicel not contorted. **Seeds** ovate with a verrucose disc and a narrow inflated rim; tuft of hairs of silky hairs.

Species 13, in eastern tropical Africa; 1 in sthn Afr.: *Stathmostelma fornicatum* (N.E.Br.) Bullock subsp. *fornicatum*, Botswana.

Stenostelma Schltr. 6789000

(Asclepiadoideae—Asclepiadeae)
Schlechter: 6 (1894a); Bullock: 342 (1953b).

Krebsia Harv.: 233 (1868).

Perennial herbs with thickened rootstock. **Leaves** shortly petiolate, linear. **Inflorescence** of very shortly pedunculate subglobose umbels lateral at nodes. **Calyx** 5-partite; segments linear-lanceolate to lanceolate, with scales within at base. **Corolla** 5-lobed; lobes green without, white within, ovate-oblong, recurved at tips and sometimes notched at apex; tube shallowly basin-shaped. **Corona** 5-lobed, arising at or near base of staminal column, exceeding corolla lobes, simple, erect, narrowly elliptic or lanceolate, keeled all down back and ± acutely triquetrous in cross section, with a rhomboid wing-like dilation on back at base, tapering above into an acute incurved-hooked apex, without an appendage on inner face; purplish. **Anthers** 2-locular, with a membranous ovate appendage. **Pollinia** pendulous, oblong or oblong-ovate; caudicles shorter than pollinia. **Style head** slightly projecting above staminal column, depressed-truncate, with 5 short, thick, fleshy lobes.

Species 2, Namibia and Botswana to Eastern Cape.

Stigmatorhynchus Schltr. 6911010

(Asclepiadoideae—Marsdenieae)
Schlechter: 141 (1913); Bullock: 373 (1954); Huber: 65 (1967c).

Shrublets or shrubs, stiffly twiggy. **Leaves** shortly petiolate, ± spatulate, shortly pubescent. **Flowers** small, few together in subsessile or shortly pedicellate, extra-axillary umbels or fascicles. **Calyx** much shorter than corolla, puberulous, 5-parted. **Corolla** narrowly campanulate, 5-lobed to about middle, glabrous outside, bearded within. **Corona** of 5 fleshy lobes arising from and adnate to staminal column, with free tips. **Staminal column** arising from base of corolla. **Anthers** with a cartilaginous margin, terminated by membranous appendages which are applied to base of elongated beak; pollinia small, ± ellipsoid, erect-inclined, with short, slender caudicles and a small corpuscle. **Staminal column** elongate, subcylindric; carpels 2-ovulate. **Fruit** of 2 one-seeded follicles.

Species 3, Africa; 1 in sthn Afr: *Stigmatorhynchus hereroensis* Schltr., Namibia.

Stomatostemma N.E.Br. 6741000

(Periplocoideae—Cryptolepideae)
Brown: 252 (1902); Brown: 530 (1907).

Lianas or shrubs; roots simple; stems up to ± 5 m long. **Leaves** glabrous, semicoriaceous, petiolate, with reddish dentate interpetiolar ridges; blade linear, narrowly ovate, elliptic or obovate, apex acute to acuminate to cuspidate, base cuneate to rounded. **Inflorescences** terminal to axillary, few- to many-flowered. **Flowers** with gynostegium enclosed in corolla tube. **Sepals** narrowly triangular to narrowly ovate. **Corolla** creamy white to yellowish green with purplish centre or completely white; tube campanulate with nectariferous swellings on inner face at filament bases; lobes very narrowly oblong-ovate to ovate, apex obtuse. **Corona** lobes arising from corolla sinuses, clavate. **Stamens** arising from nectariferous swellings near base of corolla tube; filaments free; anthers 4-locular, narrowly triangular, glabrous. **Style head** pentangularly ovoid, apex acute to obtuse. **Follicles** paired, slightly diverging, angularly cylindrical-ovoid. **Seeds** narrowly subovoid.

Species 2, Zambia, Mozambique and Zimbabwe; 1 in sthn Afr., Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland and KwaZulu-Natal; dry woodland of sandy plains and mountain sides.

Strophanthus DC. 6688000

(Apocynoideae—Wrightieae)
Candolle:122, t. 8 (1802); Stapf: 509 (1907); Codd: 289 (1963); Beentje: 468 (1985).

Cercocoma Wall. ex G.Don: 84 (1837). *Christya* Ward & Harvey: 134 (1842). *Roupellia* Wall. & Hook.: t. 4466 (1849). *Zygoneurion* Baill.: 758 (1888).

Shrubs or woody climbers; bark often becoming corky with age. **Leaves** opposite, rarely ternate, shortly petioled; axillary glands 2–6, rarely more, subulate, scale-like or conical; stipules 0. **Inflorescence** terminal, often at end of branchlets, corymbose, many- or few-flowered or reduced to solitary flowers. **Flowers** mostly showy. **Calyx** divided to base with few to many glands at base within; sepals imbricate, linear or linear-lanceolate, sometimes foliaceous. **Corolla** funnel-shaped or campanulate, with a short or long cylindric, basal tube; mouth with paired appendages alternating with lobes; lobes much longer than tube, attenuate, linear or produced into filiform, usually spirally twisted, appendages. **Stamens** inserted deep in corolla tube; filaments short, linear; anthers 4-locular, conniving in a cone, lanceolate, acuminate, with a long or short, apical appendage, bluntly or acutely sagittate at base, with foot of connective produced into an appendage or horizontal ridge and often hairy at base. **Disc** 0. **Ovary** of 2 free carpels with many ovules in each; style filiform, shorter than stamens; stigma capitate, 5-grooved, with membranous, reflexed frill at base and a minutely bifid apiculus. **Mericarps** 2, follicular, divaricate, oblong or spindle-shaped, sometimes pustulate. **Seeds** spindle-shaped, or flat and lanceolate, with an apical, plumose awn, and with or without a deciduous, basal tuft of hairs at maturity. $x = 10$ (9, 11).

Species 38, Asia, Africa, Madagascar, 30 species in Africa; 6 in sthn Afr., Namibia, Botswana, Northern Province, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Tabernaemontana L. 6603000

(Plumerioideae—Tabernaemontaneae)
Linnaeus: 210 (1753); Codd: 268 (1963); Leeuwenberg: 438 (1985); Leeuwenberg: 1 (1991).

Pandaca Noronha ex Thouars: 10 (1806). *Conopharyngia* G.Don: 98 (1837); Stapf: 505 (1907).

Shrubs or trees. **Leaves** opposite, relatively large, shortly petioled, penninerved; stipules united into a very short, tubular sheath, usually with many resiniferous glands within. **Inflorescence** a terminal or pseudo-axillary corymb, rarely a panicle, or reduced to a few-

flowered cyme. **Flowers** fragrant, usually large and showy or medium-sized. **Calyx** relatively small with several minute glands at base inside; sepals almost free, ovate, imbricate. **Corolla** salver-shaped, usually white, often fleshy; tube cylindric, spindle- or barrel-shaped, widest at or below middle, sometimes twisted, naked in mouth, usually tomentose within; lobes overlapping to the left, as long as tube, elliptic, with a broad ear on one side. **Stamens** included or shortly exserted, ± free or conniving into a cone inserted in widest part of tube, subsessile; filaments reduced to a callus swelling; anthers 4-locular, ovate-lanceolate, apiculate, sagittate at base. **Disc** present or absent. **Ovary** of 2 free carpels; style relatively short, compressed; stigma cylindric, grooved, with an entire or lobed, projecting rim or short frill at base and a minute 2-lobed apiculus, more rarely elliptic or globose, delicately papillose, not grooved, usually with a toothed rim at base and a conspicuous, 2-fid, papillose apiculus as long as or longer than rest of stigma; ovules many in each locule. **Mericarps** 2, baccate, usually ± globose or ovoid, smooth or rarely keeled or warty, with milky latex. **Seeds** many, embedded in a fleshy pulp, ± ellipsoid, deeply grooved ventrally, with many narrow grooves on back. $x = 11$ (polyploidy).

Species ± 110, pantropical, 18 in Africa, 15 in Madagascar, 1 in Mascarene Islands; 2 in sthn Afr., Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Tacazzea Decne. 6730000

(Periplocoideae—Periploceae)
Decaisne: 492 (1844); Brown: 260 (1902); Brown: 540 (1907); Bullock: 350 (1954); Venter *et al.*: 93 (1990).

Tall lianas or erect shrubs; roots tuberous; stems up to ± 20 m long. **Leaves** mostly opposite, sometimes alternate; petiolate with toothed interpetiolar ridges; lamina linear-ovate, narrowly to broadly ovate or elliptic to broadly elliptic, adaxially glabrous to puberulous, abaxially puberulous, base cuneate, obtuse or cordate, apex apiculate, acuminate to obtuse or emarginate and mucronate. **Inflorescences** terminal and axillary many-flowered panicles. **Flowers** with gynostegium exserted from corolla. **Sepals** broadly ovate, glabrous to puberulous. **Corolla** pale green, pale yellow or reddish; tube very shallow; lobes broadly ovate to oblong-ovate, apex obtuse. **Corona** lobes arising from corolla mouth, filiform or narrowly ovate; interstaminal discs subquadrate. **Stamens** free, fused to inner base of corona lobes; anthers 4-locular, ovate, glabrous. **Style head** broadly angularly ovoid. **Follicles** paired, cylindrical-ovoid to ovoid and apiculate. **Seeds** narrowly ovate with tuft of hairs.

Species 4, Africa and Asia; 1 in sthn Afr.: *Tacazzea apiculata* (Oliv.) Venter, Botswana, Namibia and KwaZulu-Natal; in riverine and swamp forest.

Tavaresia Welw. 6880000

(Asclepiadoideae—Ceropegieae)
Welwitsch: 79 (1854); Brown: 901 (1909); White & Sloane: 1103 (1937c); Bullock: 508 (1957); Furtado: 443 (1967); Leach: 349 (1974b).

Decabelone Decne.: 404 (1871); Bullock: 509 (1957).

Spiny, glabrous, usually densely tufted, succulent perennials. **Stems** erect or ascending, 6–12-angled, with angles tuberculate-toothed; each tubercle furnished with 3(1) apical, bristle-like, modified leaves. **Inflorescence** 1 per stem with 1–few flowers produced in succession from near base of stem. **Sepals** ± ovate-lanceolate. **Corolla** with campanulate or elongate-campanulate tube up to 150 mm long and lobes up to 25 mm long, spreading, with small projecting points in sinuses; outside longitudinally flecked and barred with maroon on cream to greenish; inside densely covered with papillae, each tipped with a short seta, with maroon spots on pale yellow coalescing towards base into dark maroon patch around base of gynostegium. **Corona** 2-seriate, arising from staminal column; outer lobes shortly united at base, produced into 10 filiform segments sometimes with knob-like apex, with tooth between pairs at base; inner corona lobes 5, linear, incumbent on back of anthers. **Staminal column** arising from base of corolla. **Anthers** 2-locular, descending towards centre of style head, without apical appendage. **Pollinia** ± horizontal, with short caudicles. **Follicles** erect, fusiform, glabrous, smooth. **Seeds** with tuft of hairs. $x = 11$ (1 report).

Species 2, Africa; 1 in sthn Afr.: *Tavaresia barklyi* (Dyer) N.E.Br. (*T. meintjesii* R.A.Dyer, recorded from Northern Province and Mpumalanga, is thought to be a hybrid), widespread excluding KwaZulu-Natal, Lesotho and Swaziland.

Telosma Coville 6917010

(Asclepiadoideae—Marsdenieae)
Coville: 384 (1905); Brown: 775 (1908).

Prageluria N.E.Br.: 523 (1907); Brown: 776 (1908).

Perennial twiners. **Leaves** petiolate, elliptic or ovate-elliptic. **Flowers** in pedunculate or subsessile, umbel-like cymes which are subaxillary or lateral at nodes. **Sepals** elliptic, membranous, ciliate. **Corolla** with inflated base, then constricted into a neck, densely hairy in mouth and throat; lobes longer than tube. **Corona** of 5 erect, obovate lobes arising from base of staminal column, with a linear process from inner face which is longer than the lobe and projects above style head. **Staminal column** arising from base of corolla. **Anthers** 2-locular, with erect, membranous, ovate appendages reaching style apex. **Pollinia** linear, solitary and erect, with short caudicles. **Style head** pentagonal-ovoid. **Follicles** smooth. **Seeds** crowned with a tuft of hairs. $x = 11$.

Species 10, Africa to Malaya; 1 in sthn Afr.: *Telosma africana* (N.E.Br.) N.E.Br., Northern Province, Mpumalanga to KwaZulu-Natal.

Tenaris E.Mey. 6921000

(Asclepiadoideae—Ceropegieae)
Meyer: 198 (1838); Brown: 795 (1908).

Perennial, slender herbs with small, tuberous rootstock. **Leaves** sessile, linear or filiform. **Flowers** 1–3 together, in sessile or pedunculate fascicles, or in slender racemes or panicles. **Sepals** lanceolate, as long as or longer than corolla tube. **Corolla** with a shortly campanulate tube; lobes much longer than tube, linear, linear-spatulate, or filiform. **Corona** 2-seriate, small, arising from staminal column above its base; outer corona of 5 broadly ovate or subquadrate lobes or of minute pouches; inner corona lobes 5, linear-subulate or filiform, incumbent on backs of anthers. **Staminal column** arising from base of corolla, included in corolla tube. **Anthers** 2-locular, usually without appendages. **Pollinia** ellipsoid, subascending, with short caudicles. **Follicles** erect, somewhat diverging, slender, smooth. **Seeds** crowned with a tuft of hairs.

Species 7, Africa; 4 in sthn Afr., widespread excluding Namibia, Free State and Lesotho.

Tridentea Haw. 6885090

(Asclepiadoideae—Ceropegieae)
Haworth: 34 (1812); Leach: 4 (1978b); Bruyns: 192 (1995).

Dwarf succulents, tufted, forming compact clumps, rarely slightly rhizomatous. **Stems** decumbent, obtusely 4(–6)-angled, softly fleshy, smooth, glabrous to the na-

ked eye, tubercles submammose, each bearing a thick, glabrous, subulate, widely spreading, caducous leaf 1.5–10.0 mm long (leaving a whitish scar), subtended by a patch of stipular hairs on either side sometimes extending along margin. **Inflorescence** glabrous, 1 per stem, arising near base of stem with 1–5 flowers developing in gradual succession on a stout, gradually lengthening peduncle and pedicels (up to 80 mm long), spreading to ascending. **Calyx** 5-lobed, glabrous or with few marginal cilia. **Corolla** rotate to campanulate, usually lobed to ± half of radius or less, 20–100 mm in diameter, with shallow, funnel-shaped depression in centre, outside glabrous, inside glabrous and smooth to slightly rugose or papillate (papillae often with apical cilia), margins usually ciliate. **Corona** 2-seriate, arising from staminal column, glabrous; outer corona of 5 ascending to spreading, dorsiventrally flattened, simple to bifid or trifid lobes, fused only at base to bases of inner lobes; inner lobes incumbent on anthers, usually much exceeding them and rising up above centre of style head, dorsiventrally flattened at least towards base (often cylindrical above), often with laterally flattened, ± deltoid dorsal 'fin' in lower half. **Staminal column** arising near base of corolla tube on short stipe; style head not produced beyond anthers, truncate depressed at apex. **Anthers** 2-locular, incumbent on top of style head, subquadrate, horizontal, without apical or lateral appendages. **Pollinia** nearly horizontal, D-shaped, with short caudicles, corpuscle winged, ± as long as broad. **Follicles** terete-fusiform, slender, mottled with purple, glabrous, smooth. $x = 11$.

Species 8, sthn Afr., Namibia, Botswana, North-West, Free State, Northern, Western and Eastern Cape.

Tromotriche Haw. 6885100

(Asclepiadoideae—Ceropegieae)
Haworth: 36 (1812); Leach: 549 (1984); Bruyns: 198 (1995).

Dwarf, glabrous, tufted succulents, sometimes forming compact clumps, sometimes extensively rhizomatous with widely separated above-ground stems, occasionally with long stems pendulous from cliffs, or creeping. **Stems** 4(–6)-angled, very variable in length, 6–25 mm thick, fleshy, with matt surface, subtessellate, tubercles obscure and obtuse, with small deltoid leaf, subtended by 2 stipular denticles to leafless and without stipules. **Flowers** in groups of 1–5, developing successively on gradually lengthening peduncles randomly situated on stem; pedicel spreading to ascending, glabrous. **Calyx** glabrous. **Corolla** rotate to tubular-campanulate, deeply to shallowly lobed, (12)15–70 mm in diameter, inside often reticulately to transversely rugose, usually with small unicellular papillae, especially in tube. **Corona** 2-seriate, arising from staminal column, glabrous; outer corona of 5 ascending to spreading, dorsiventrally flattened, simple lobes fused to inner lobes at base or fused laterally to lower sides of inner lobes to form cup around column; inner lobes incumbent on anthers, usually much exceeding them and rising up above centre of style head, dorsiventrally flattened at least towards base, mostly with laterally flattened deltoid to clavate dorsal 'fin' in lower half. **Staminal column** arising near base of corolla tube on short stipe; style head not produced beyond anthers, truncate, depressed at apex. **Anthers** 2-locular, horizontal on top of style head, subquadrate, without apical or lateral appendages. **Pollinia** D-shaped, with short caudicles, corpuscle winged, ± as long as broad. **Follicles** terete-fusiform, slender, mottled with purple, glabrous, smooth. $x = 11$ (polyploidy).

Species 11, SW Namibia, Northern, Western and Eastern Cape (winter-rainfall zone).

Tylophora R.Br. 6899000

(Asclepiadoideae—Marsdenieae)
Brown: 17 (1810); Brown: 764 (1908).

Twining or sometimes erect. **Leaves** petiolate, oblong, linear, ovate, or lanceolate. **Flowers** in a pedunculate or sessile, umbel-like cyme, or in clusters scattered along a single-jointed axis, or along branches of a dichotomously branched cyme or panicle, lateral at nodes. **Sepals** ± as long as corolla tube, sometimes with glands within base. **Corolla** 5-lobed to more than halfway; tube saucer-shaped. **Corona** usually of 5 tubercles adnate to or radiating from near base of staminal column, usually not exceeding filaments. **Anthers** 2-locular, tipped by small, membranous appendage; pollinia globose or ellipsoid, suberect, horizontal or pendulous with short caudicles. **Follicles** usually narrowly fusiform, smooth or transversely ridged. **Seeds** ovate, with narrow, marginal wing. $x = 11$ (aneuploids).

Species 50, tropical and subtropical parts of Old World; 10 in sthn Afr., Namibia, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Western Cape as far as Knysna District and Eastern Cape.

Voacanga Thouars 6612000

(Plumerioideae—Tabernaemontaneae)
Thouars:10 (1806): Stapf: 507 (1907); Codd: 273 (1963); Leeuwenberg: 434 (1985).

Annularia Hochst.: 670 (1841). *Cyclostigma* Endl.: 56 (1842); Endlicher: 828 (1844b). *Piptolaena* Harv.: 25 (1842).

Shrubs or trees. **Leaves** opposite, relatively large, shortly petioled, penninerved; leaf bases united into a rim or short sheath; axillary glands present; stipules small, united in an interpetiolar rim or short sheath. **Inflorescence** terminal, frequently paired, corymbose or umbellate, rarely racemose. **Flowers** usually large and showy, white, yellow or greenish- to violet-brown, sometimes unpleasantly scented. **Calyx** tubular or subcampanulate, with a ring or zone of scattered glands within near base, early circumscissile at base and deciduous or more persistent; lobes shorter than tube, obtuse, imbricate. **Corolla** salver-shaped, often fleshy; tube cylindric, constricted below middle and at mouth with callus thickenings round the often very narrow orifices and with prominent filamental ridges within; lobes overlapping to the left, ovate, unequal at base. **Stamens** sessile; anthers 4-locular, adnate by a broad base to corolla tube, ovate-lanceolate, deeply sagittate. **Disc** usually annular, fleshy, surrounding base of ovary or cupular and concealing ovary, rarely reduced to inconspicuous ring. **Ovary** of 2 free or rarely connate carpels; style columnar, thickened upwards, compressed; stigma subcapitate, 5-grooved, with a fleshy, wavy ring or frill at base; ovules many in each locule. **Mericarps** 2, baccate, globose or pear-shaped, with a sticky latex. **Seeds** many, embedded in fleshy pulp, ellipsoid, grooved ventrally; testa grooved or ruminate. $x = 11$.

Species 12, Old World, 7 in Africa; 1 in sthn Afr.: *Voacanga thouarsii* Roem. & Schult. (= *V. dregei* E.Mey.), KwaZulu-Natal and border area of Eastern Cape.

Woodia Schltr. 6790000

(Asclepiadoideae—Asclepiadeae)
Schlechter: 30 (1894a); Brown: 560 (1907).

Perennial herbs with tuberous rootstock, usually single-stemmed, erect. **Leaves** shortly petiolate, penninerved. **Flowers** in sessile or pedunculate umbels, lateral at nodes and terminal. **Sepals** 5, with scales within base. **Corolla** deeply 5-lobed; lobes with revolute margin. **Corona** arising from base of staminal column, of 5

lobes; lobes dorsally flattened, deeply trilobulate; lobules sinulate, ovate-oblong or side lobules linear-oblong and middle one usually curved. **Anthers** 2-locular, with a membranous appendage; pollinia pendulous, ovate or somewhat quadrate; caudicles shorter than pollinia; corpuscle with narrow, membranous wings. **Style head** flat, 5-angled. **Follicles** with short, spine-like processes.

Species 3, sthn Afr., Mpumalanga, KwaZulu-Natal to Eastern Cape.

Wrightia R.Br. 6689000

(Apocynoideae—Wrightieae)
Brown: 762 (1810); Stapf: 508 (1907); Codd: 295 (1963); Leeuwenberg: 480 (1985).

Balfouria R.Br.: 70 (1811). *Anasser* Blanco: 112 (1837) non Juss. (1789). *Piagiaea* Chiov.: 290 (1932). *Walidda* Pichon: 87 (1951). *Scleranthera* Pichon: 88 (1951).

Trees or shrubs. **Leaves** opposite, entire or faintly crenate, shortly petiolate, lanceolate or ovate-lanceolate; stipules 0. **Inflorescence** a terminal or pseudoaxillary cyme. **Flowers** small to rather large, usually scented. **Calyx** divided almost to base, glandular within; sepals imbricate, ovate. **Corolla** ± salver-shaped; tube cylindric, usually short, with variously divided or entire, connate or free appendages in throat (rarely without); lobes longer than tube, overlapping to the left. **Stamens** inserted in mouth of corolla; filaments short, stout, with tuft of hairs at back; anthers 4-locular, conniving in a cone, exserted, lanceolate, acute to acuminate, sagittate, with a small, projecting appendage from foot of connective. **Disc** a narrow rim or 0. **Ovary** of 2 free carpels; style filiform; stigma capitate with small or obscure frill at base and minute, cleft tip. **Mericarps** 2, follicular, cylindric or spindle-shaped, subparallel. **Seeds** cylindric or spindle-shaped, glabrous except for basal tuft of hairs. $x = 11$.

Species 23, Old World, 2 in Africa; 1 in sthn Afr.: *Wrightia natalensis* Stapf, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Xysmalobium R.Br. 6777000

(Asclepiadoideae—Asclepiadeae)
Brown: 27 (1810); Brown: 564 (1907).

Perennial herbs, with tuberous rootstock or fusiform roots; sap milky. **Leaves** often sessile. **Flowers** in umbels; umbels sessile or pedunculate, few to several, lateral at nodes, or a single, terminal umbel. **Sepals** 5, sometimes with scales within sinuses. **Corolla** 5-lobed nearly to base, with lobes erect to reflexed. **Corona** of 5 lobes arising from staminal column; lobes fleshy, ± as thick as broad, sometimes bifid or obscurely 3-lobed, keelless or with one longitudinal median keel on inner face, never cucullate nor complicate nor with process from inner face. **Staminal column** arising from base of corolla. **Anthers** 2-locular, terminated by a membranous, ovate or transversely oblong appendage, rarely spurred at base; pollinia pendulous, caudicles short. **Follicles** smooth or with slender processes. **Seeds** oblong, convex on one side, depressed on reverse, with rim tubercled and with apical tuft of hairs.

Species ± 40, Africa; 21 in sthn Afr., widespread in all countries and provinces, in grassland.

Aquifoliaceae

(Asteridae—Aquifoliales)

Compiled by R.H. Archer

Trees or shrubs, monoecious, sometimes dioecious, evergreen. **Leaves** alternate, petioled, simple, entire or toothed, glabrous; stipules minute, semipersistent. **Flowers** unisexual, regular, small, in 1–few-flowered, pubescent, axillary cymes. **Calyx** 5- or 6- lobed, imbricate, ciliate. **Corolla** 5- or 6-lobed, imbricate, ciliate, white. **Stamens** 5 or 6, alternating with but basally adhering to petals; anthers 2-thecous with longitudinal dehiscence. **Ovary** superior, 5- or 6-locular, with 1 or 2 pendulous ovules in each locule; stigma sessile, capitate or discoid, prominent. **Fruit** a small globose drupe, ripening pink to crimson, containing 5 or 6 pyrenes. **Seeds**: embryo small, endosperm copious. $x = 10$ (9 or 12, 17, 19) (high polyploidy).

Genera 2; species ± 400, cosmopolitan, but mostly in Asia and tropical America.

Sonder: 472 (1860); Mendes: 353 (1966); Andrews: 163 (1994).

Ilex L. 4614000
Linnaeus:125 (1753); Sonder: 473 (1860); Andrews: 163 (1994).

Description as for family.

Species ± 400, mostly Asia and America, 1 in sthn Afr.: *Ilex mitis* (L.) Radlk. var. *mitis*, widespread in subtropical and temperate forests.

Araliaceae

(Rosidae—Apiales)

Compiled by C.L. Bredenkamp

Trees, shrubs or herbs, sometimes scandent, sometimes dioecious. **Leaves** alternate, very rarely opposite, usually petioled, sometimes sheathed, simple, digitately lobed or once or twice digitately compound; stipules adnate to petioles. **Flowers** regular, bisexual or unisexual, in heads, umbels, spikes, or racemes, with the racemes panicled or umbellate, rarely flowers solitary; bracts and bracteoles usually present. **Calyx** attached to ovary, annular or shortly cupular. **Petals** usually 5, valvate or slightly imbricate. **Stamens** as many as petals, rarely more; anthers ovate or oblong, 2-thecous. **Disc** epigynous, variable. **Ovary** inferior, 2-locular, with a solitary, pendulous ovule in each locule; styles as many as locules, distinct or connate at base. **Fruit** a berry or drupe, or of 2 readily separable mericarps, sometimes flattened and membranous, oil tubes indistinct or absent. **Seeds** sometimes solitary by abortion.

Genera 59, species ± 800, fairly cosmopolitan, especially well represented in the Malaysian region; sthn Afr.: genera 5, species ± 18, some naturalised.

Sonder: 568 (1862b); Strey: 191 (1973); Burtt & Dickinson: 449 (1975); Strey: 515 (1975); Strey: 66 (1981); Cannon: 621 (1978); Reyneke: 241 (1981); Reyneke: 369 (1984); Reyneke & Kok: 317 (1987); Plunkett, Soltis & Soltis: 565 (1997).

Based on evidence from DNA sequence data (Plunkett, Soltis & Soltis 1997) some genera of the Hydrocotyloideae under Apiaceae (*Centella* and *Hydrocotyle*) have been transferred to the Araliaceae.

Key to genera

1a Perennial herbs or shrublets, erect or prostrate, often rooting at the nodes:
2a Petiole with membranous stipules at the base; furrows between the fruit ribs smooth ..... **Hydrocotyle**
2b Petiole sheathing at base, without stipules; furrows between the fruit ribs wrinkled ..... **Centella**
1b Trees, shrubs or scramblers:
3a Fruit somewhat fleshy; leaves digitately divided or twice divided, sometimes palmatifid:
4a Flowers umbellate, in panicles ..... **Schefflera**
4b Flowers in spikes or racemes ..... **Cussonia**
3b Fruit flattened, membranous, with distinct, longitudinal veins; leaves digitately lobed ..... **Seemannaralia**

Centella L. 5894000
(Hydrocotyloideae)
Linnaeus: 28 (1760); Sonder: 526 (1862a), under *Hydrocotyle*; Schreiber: 1(1967); Adamson: 1 (1951); Burtt: 190 (1991); Pimenov & Leonov: 33 (1993); Schubert & B-E. van Wyk: 301 (1997).

Perennial herbs or shrublets, erect to prostrate, rarely rooting at nodes. **Leaves** simple, petiolate or sessile; blade variously shaped from needle-like to ovate, sometimes cordate. **Flowers** in small, unisexual or bisexual, pendunculate, capitate umbels (umbellules), occasionally solitary; each umbel with a single, bisexual (functionally female) flower surrounded by 4 male flowers, or more often with a single-flowered bisexual umbel and several (1)3–5(7)-flowered male umbels (andromonoecious or androdioecious), rarely all flowers bisexual; bracts 2–4, usually lanceolate. **Calyx** appearing as annular ring. **Petals** valvate, ovate-acute, often with incurved tips. **Disc** ± flat. **Stamens** with anthers ± as long as linear flaments. **Fruit** of 2 laterally compressed mericarps; mericarps smooth or 9–11-ribbed, with ribs usually connected by network of veins; oil ducts indistinct or 0. $x = 9$ (11) (polyploidy, B-chromosomes).

Species ± 50, mostly in the southwestern and eastern parts of sthn Afr., but a few extending to Zimbabwe and Malawi and 1: *Centella asiatica* (L.) Urban, cosmopolitan and pantropical.

Cussonia Thunb. 5872000
Thunberg: 210 (1780); Sonder: 568 (1862b); Strey: 191 (1973); Strey: 515 (1975); Cannon: 621 (1978); Reyneke: 243 (1981); Reyneke: 369 (1984); Reyneke & Kok: 317 (1987).

Trees or shrubs. **Leaves** often crowded at ends of branches, palmatifid, or digitately divided, or twice digitately divided, petioled; leaflets entire to variously divided; stipules adnate to petiole. **Flowers** in dense spikes or racemes. **Calyx** 5-toothed or subentire; tube subcylindric to obsolete above ovary. **Petals** 5, often somewhat fleshy, valvate. **Stamens** 5; filaments often fleshy; anthers ovate, subequal to filaments. **Disc** flat, depressed or conical in middle. **Ovary** 2-locular; styles 2, short or elongated, often thick and stigmatose on inner face. **Fruit** fleshy, laterally compressed or subglobose. **Seeds** globose to oblong and planoconvex in cross-section.

Species 25, tropical to sthn Afr. and Mascarene Islands; ± 10 in sthn Afr., Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Lesotho, Northern, Western and Eastern Cape.

Hydrocotyle L. 5893000
(Hydrocotyloideae)
Linnaeus: 234 (1753); Sonder: 526 (1862a), in part; Schreiber: 1 (1967); Eichler: 1 (1987); Burtt: 215 (1991); Pimenov & Leonov: 62 (1993).

Prostrate, perennial herbs in damp places, often rooting at nodes and matted. **Leaves** simple, blade often peltate, deeply cordate or divided nearly to base into 3, 5 or more segments, petioled; cauline leaves stipulate. **Flowers** bisexual, usually in small, simple or branched, pedunculate umbels, rarely in cymes; bracts obsolete or 0.

Calyx appearing as annular ring. **Petals** valvate, ovate, acute, often with incurved tips. **Disc** ± flat. **Stamens** with linear filaments; anthers ± as long as filaments; subdidynamous. **Fruit** lenticular, laterally compressed, orbicular or somewhat depressed, smooth or rugose, of 2 5-ribbed mericarps; oil ducts indistinct or 0. **Seeds** lenticular. $x = 9$, 8 or 12 (10, 11) (high polyploidy).

Species ± 130, more or less cosmopolitan; 3 in sthn Afr. and 2 other naturalised, fairly widespread.

Schefflera J.R.Forst. & G.Forst. 5852000

Forster & Forster: 45, t. 23 (1776) name conserved; Cannon: 622 (1978).

Heptapleurum Gaertn.: 472, t. 178, fig. 3 (1791); Hiern: 29 (1877).

Trees, shrubs, or scramblers. **Leaves** digitately compound or sometimes simple; leaflets entire or serrulate; stipules connate with petiole. **Flowers** in panicles or racemes of small umbels; bracts 0 or minute. **Calyx** 5-toothed or rim-like. **Petals** 5, valvate. **Stamens** 5; anthers ovate to ovoid. **Disc** with undulate margin. **Ovary** 2-locular; styles 2, free or stigmas subsessile and papilla-like. **Fruit** a small, subglobose, 2-locular berry. $x = 12$ (polyploidy).

Species 200, Africa to Madagascar, Far East and New Zealand; 1 in sthn Afr.: *Schefflera umbellifera* (Sond.) Baill., Northern Province, Mpumalanga, Swaziland to KwaZulu-Natal and Eastern Cape border.

Seemannaralia R.Vig. 5872010

Viguier: 116 (1906); Burtt & Dickinson: 449 (1975).

Tree or large shrub. **Leaves** simple, digitately lobed and veined, toothed, petiolate; stipules adnate to petiole. **Flowers** in axillary and terminal panicles of umbels. **Calyx** indistinctly 5-toothed; tube saucer-shaped. **Petals** 5, slightly imbricate. **Stamens** 5; anthers ± as long as filaments, ovate, sagittate. **Ovary** 2-locular; styles thick, somewhat cohering. **Fruit** flattened, elliptic with lateral veins. **Seeds** solitary by abortion, discoid.

Species 1: *Seemannaralia gerrardii* (Seem.) R.Vig.; Northern Province and Mpumalanga to KwaZulu-Natal and Eastern Cape border area.

*Aristolochiaceae

(Magnoliidae—Aristolochiales)

Compiled by M. Jordaan

Erect, twining or scrambling perennial herbs or shrubs, often with prostrate or tuberous rhizomes or rootstocks. **Leaves** alternate, entire or 2–7-lobed, cordate, 3–7-nerved, petiolate, conduplicate in bud; stipules 0 but an axillary bud often producing a clasping, broadly reniform leaf (pseudostipule). **Flowers** bisexual, irregular, epigynous, solitary or in fascicles, axillary, with or without bracts. **Perianth** simple, fused to form a straight, curved, or S-shaped, coloured tube, inflated at basal part (utricle), then contracted or narrowed above in a cylindrical to funnel-shaped part (tube), gradually elongated, enlarged and expanded into the 1-lipped or (1–6)-lobed limb, often with dark reddish or brownish colour and foetid smell; inside of utricle often provided with 2(–6) glandular bodies. **Stamens** usually 6 or more; filaments scarcely distinguishable from column; anthers sessile and adnate to style column in a gynostemium, 4-celled, dehiscing longitudinally. **Ovary** inferior, 3–6-carpellate, oblong or elongate, slightly 6-angular and 5- or 6-locular; placentation axile; ovules many, anatropous; styles 3, 5 or 6, marginally connate, fleshy, with coroniform to subcapitate stigmatic lobes. **Fruit** a capsule, septicidally dehiscent, with 6 valves or splitting through placentas, obovoid to short-cylindrical. **Seeds** usually many, ovate, deltoid or triangular, compressed, mostly winged all round or thick with an elaiosome; testa crustaceous or hard, finely verrucose or smooth; embryo well developed but minute; endosperm abundant, oily, starch-free. $x = 7$ (4, 5, 6, 8, 13) (polyploidy).

Genera ± 12, with 450–500 species, with a pantropical, an Indomalayan, and a holarctic branch; sthn Afr.: genus 1, species 2 (introduced).

Asteraceae (Compositae)

(Asteridae—Asterales)

Compiled by P.P.J. Herman, E. Retief, M. Koekemoer and W.G. Welman

Annual, biennial or perennial herbs, subshrubs, shrubs, occasionally scramblers or lianes, sometimes trees, rarely aquatic or epiphytic, sometimes succulent, sometimes spinescent, rarely monoecious or dioecious; typically with resin ducts or latex canals (tribe Lactuceae). **Leaves** alternate or opposite, sometimes whorled, or radical and rosulate, sessile or petiolate, usually simple, entire or toothed, lobed or variously dissected, glabrous or pubescent and/or glandular; stipules 0 but stipuliform appendages sometimes present. **Inflorescence** a capitulum (or head) with 1–many individual flowers (florets) ± sessile and aggregated on a common receptacle and surrounded by an involucre of 1–many rows of bracts, often resembling a single flower; capitula solitary and terminal on scapes or leafy stems, or few to very many in lax or ± clustered corymbose or paniculate synflorescences, sometimes cymose, spicate, racemose or aggregated into secondary capitula or glomerules. **Receptacle** flat, hemispherical or conical, with scales or setae subtending florets (paleate), or epaleate and surface smooth, areolate or shallowly to deeply honeycombed (alveolate); alveolae often fimbriate or setose. **Involucral bracts** (phyllaries) in 2–many rows, free and imbricate or ± connate, or sometimes in 1 row and united or with cohering overlapping margins, persistent or rarely caducous, occasionally accrescent, sometimes apically appendaged; thickened region in lower part of bracts referred to as stereome; sometimes additional outer row of smaller bracts (calyculus) present (e.g. in *Senecio*). **Florets** epigynous, small, 1–500 or more per capitulum, bisexual, unisexual or sterile, regular or irregular. Two types of regular florets (no.1 and no. 2): (1) **disc** or **central florets**: tubular, with (3)4 or 5 apical lobes, bisexual, or functionally male or unisexual; (2) **tubular-filiform (outer) florets**: tube slender (anthers absent) with 2 or 3 small apical lobes, female. Four main types of irregular florets (nos 3–6): (3) **bilabiate disc florets**: ± tubular below, bilabiate above, with 3 outer and 2 inner lobes, mostly bisexual, rarely functionally male or female, situated on disc/central part of capitulum; (4) **bilabiate ray florets**: ± tubular below, bilabiate above with 2 small inner lobes and a 3-lobed, short to long, strap-shaped lamina, mostly female, rarely bisexual, situated on periphery of capitulum; (5) **true ray florets**: lamina strap-shaped with 3(4) apical lobes, inner lobes absent, usually female or neuter; (6) **ligulate florets** (ligules): lamina strap-shaped with 5 apical lobes, mostly bisexual (tribe Lactuceae), rarely female or male. (Note: all florets on the periphery of the receptacle, regardless of their morphology, are often referred to as marginal, outer or female florets, those occurring on the receptacle/disc, as disc or central florets). **Capitula** may be grouped into two broad categories: **heterogamous capitula** containing florets with different sex arrangements (e.g. female and bisexual); **homogamous capitula** containing florets with similar sex arrangements (mostly either bisexual or unisexual). Further groupings are as follows: **Radiate capitula** are usually heterogamous, containing bilabiate ray florets (no. 4) or true ray florets (no. 5) on periphery (mostly in 1 row) and central disc florets (no. 1) or bilabiate disc florets (no. 3). **Disciform capitula** are usually heterogamous with at least two types of nonradiating florets, usually tubular-filiform outer florets (no. 2), in 1 or more rows, and central disc florets (no. 1). **Discoid capitula** are usually homogamous containing only disc florets (no. 1). **Ligulate capitula** are homogamous, containing only ligulate florets (no. 6), as in the tribe Lactuceae. Whether capitula are heterogamous or homogamous can be deduced from the description of the florets. **Calyx**, if present, represented by a pappus consisting of persistent or caducous, 1–many-seriate hairs, bristles, awns or scales, or pappus elements ± fused to form annular or ± cup-shaped or ear-shaped corona borne apically on ovary/fruit; pappus setae scabrid, barbellate or ± plumose. **Corolla** usually gamopetalous, of (3–)5 ± united petals, rarely 0. **Stamens** (3–)5; filaments free, arising on corolla tube, contractile; anthers introrse, usually apically appendaged, usually laterally connate into a cylinder around style, thecae rounded, sagittate (tailed/caudate) and/or calcarate at base; pollen usually echi-

nate, sometimes echinolophate or lophate. **Style** of bisexual or functionally male florets elongating within anther tube, shallowly to deeply bifid, occasionally undivided in functionally male florets; style branches with stigmatic areas on inner sides, apex acute, rounded or truncate, or branches produced beyond stigmatic surfaces as triangular, subulate or clavate appendages, variously papillate or hairy, usually with brush of collecting hairs that sweep pollen from anther tube; style of female florets simpler, with acute to rounded style branches and without sweeping hairs. **Ovary** inferior, of 2 united carpels, unilocular with 1 erect basal ovule. **Fruit** unilocular, 1-seeded, indehiscent (a cypsela/achene), very rarely fleshy with single seed enclosed in hard endocarp (drupe) (*Chrysanthemoides*), sometimes produced apically into a beak (rostrum), crowned by persistent or caducous pappus, or epappose; endosperm 0 or vestigial.

Genera ± 1535 and 25000 species; cosmopolitan, absent only from Antarctica; sthn Afr.: 246 genera, 2305 species.

Asteraceae Dumort.: 55 (1822) alternative name; Merxmüller: 1 (1967a); Bremer: 13 (1994).

Compositae Giseke: 538 (1792) name conserved; Harvey: 44 (1865); Hilliard: 1 (1977); Pope: 1 (1992).

Cichoriaceae Juss., Merxmüller: 1 (1967b).

Key to the tribes after Anderberg (1989), Keeley and Jansen (1991), Jeffrey & Pope: 2 (1992), Karis: 197 (1992) and Robinson: 199 (1992). In the key to tribes the Helenieae key out twice together with the Heliantheae. The main difference between these two tribes is the presence (Heliantheae) or absence (Helenieae) of receptacular paleae. The insufficiently known genus *Cypselodontia* DC. was not considered in the compilation of the keys.

Key to tribes and to *Corymbium* (not assigned to a tribe)

1a Plants monocotyledonous in appearance; capitula discoid, 1-flowered; upper involucral bracts sheathing flower ..... **Corymbium**

1b Plants not exhibiting the above characters in combination:

2a Corollas all strap-shaped, equally 5-toothed at the apex (florets ligulate – no. 6); latex present in plant ..... **Lactuceae** (p. 115)

2b Corollas not strap-shaped, if radiate, then these with 4 or fewer equal or unequal apical teeth; latex rarely present:

3a Style branches with sweeping hairs consisting of 2 or 3 cells separated by vertical walls; endothecial cells with transverse thickenings in only basal half; lobes of disc florets with accessory apical vein ..... **Eremothamneae** (p. 109)

3b Sweeping hairs, endothecial cells and lobes of disc florets not as above:

4a Style branches with conspicuous papillose appendages; capitula discoid, with florets all bisexual, not yellow; corollas with 5(4) relatively short, broad apical lobes; mature cypselas black[1] ..... **Eupatorieae** (p. 109)

4b Style branches, capitula, corollas and mature cypselas not showing the above combination of character states:

5a Involucral bracts uniseriate, cohering by their overlapping margins, or partly or wholly connate, with or without a calyculus; pappus present:

6a Involucral bracts with evident elongated oil glands; cypselas black[1] when mature ..... **Helenieae** (p. 113)

6b Involucral bracts without elongated oil glands; cypselas not black[1] when mature ..... **Senecioneae** (p. 117)

5b Involucral bracts imbricate, in 2 or more rows, free or connate; OR uniseriate but then bracts not cohering or pappus 0 or capitula unisexual or cypselas densely villous with long hairs from base:

7a Style branches long, gradually attenuate-acute, shortly hairy on outside, style shaft similarly hairy on upper part; capitula homogamous, all florets bisexual ..... **Vernonieae** (p. 119)

7b Styles and capitula not exhibiting above combination of character states, or capitula unisexual:

8a Capitula with all or only outer florets bilabiate; corollas with 3-toothed outer lips and 2-lobed inner lips..... ..... **Mutisieae** (p. 116)

8b Capitula without any such bilabiate florets:

9a Capitula discoid; involucral bracts without scarious unlobed appendages or apices, and without scarious margins; OR capitula radiant (capitula discoid but outer florets ± enlarged and sterile, not true ray flowers); OR capitula unisexual and plants dioecious; appendages of involucral bracts, if present, spiniform and/or pinnately divided:

10a Leaves spiny or bristly spiny at least towards base:

11a Anthers tailed (caudate); receptacle densely setose ..... ***Cardueae** (p. 108)

11b Anthers not tailed (ecaudate); receptacle alveolate with fringed alveolae ..... **Arctoteae** (p. 105)

10b Leaves neither spiny nor bristly spiny:

12a Corolla lobes of tubular florets much longer than broad; leaves alternate; capitula of more than 1 floret, not aggregated into glomerules:

13a Receptacle densely setose; inner florets bisexual, outer sterile ..... ***Cardueae** (p. 108)

13b Receptacle naked, not setose; all florets unisexual; plants dioecious..... **Tarchonantheae** (p. 118)

12b Corolla lobes ± as long as broad, or if much longer than broad then leaves opposite; capitula sometimes of only 1 floret, or capitula aggregated into glomerules ..... go to couplet 14

9b Capitula radiate or disciform but not radiant as above; OR capitula discoid and involucral bracts with unlobed, scarious, often white or coloured appendages or apices or with scarious, usually brownish margins, but not with spiniform and/or pinnately divided appendages; OR capitula unisexual and plants monoecious:

14a Style branches of disc florets connate in lower part, connate part thicker than style shaft and abruptly marked off from it by ring of short hairs at its base; capitula always bisexual ..... **Arctoteae** (p. 105)

14b Style branches of disc florets long to short or 0 but connate lower part of style branches, if present, not as above or capitula unisexual and plants monoecious:

15a Receptacle paleate and leaves opposite, or leaves not opposite and mature cypselas black[1] and/or capitula glomerulate; OR receptacle epaleate and pappus of scales and/or leaves opposite and/or mature cypselas black and/or capitula unisexual and/or capitula glomerulate; pappus not of slender bristles, or if of bristles then bristles plumose..... **Heliantheae** (p. 113) and **Helenieae** (p. 113)

15b Receptacle epaleate (although sometimes hairy or fimbrillate); OR receptacle paleate and leaves not opposite (although sometimes opposite on upper stem) and cypselas not black[1] when mature,

or capitula not unisexual; capitula glomerulate or not; OR if lower leaves opposite then pappus of slender barbellate bristles, at least in disc florets, or pappus 0, receptacle naked and capitula not glomerulate:

16a Style branches of bisexual or functionally male florets each with a subulate to triangular papillose appendage:

17a Receptacle alveolate; pappus a deeply and unequally laciniate corona; capitula disciform... ..... **Heliantheae** (p. 113) and **Helenieae** (p. 113)

17b Receptacle, pappus and capitula not showing the above combination of character states..... ..... **Astereae** (p. 106)

16b Style branches of bisexual or functionally male florets acute to rounded, or truncate and fringed with short hairs or papillae, or shortly conical at apex with subdistal fringe of hairs, not appendaged; or style undivided:

18a Involucral bracts with scarious, usually brown, often erose margins, not appendaged; leaves often pinnatipartite; style branches apically truncate and fringed, or style undivided and truncate; pappus 0, or if present, then a short lacerate crown or lobed auricle, or leaves pinnatipartite and outer pappus of 5 white petaloid scales ..... **Anthemideae** (p. 103)

18b Involucral bracts green and herbaceous (though often with hyaline margins), or with scarious, membranous, often white or coloured appendages or apices, or rarely appendages foliose; leaves never pinnatipartite; a pappus of hairs or scales present in at least some florets, or if 0 then style branches not truncate and fringed:

19a Pappus 0; fruit large, curved, angular or winged cypselas, or smooth drupes; capitula radiate..... **Calenduleae** (p. 108)

19b Pappus present or 0; fruit small cypselas and not as above; capitula radiate or disciform:

20a Capitula radiate; ray florets neuter, or if fertile then style branches shortly conical at apex with subdistal fringe of hairs ..... **Mutisieae** (p. 116)

20b Capitula radiate, disciform or discoid; ray florets, if present, female; style branches not as above:

21a Stems without resin ducts; leaves generally entire, with hairs of type B (hairs with 1 basal cell and a very long terminal cell); involucral bracts with entire or divided sclerenchymatous basal portion; pollen with 2-layered double sexine..... ..... **Gnaphalieae** (p. 110)

21b Stems with or without resin ducts; leaves dentate, denticulate, serrulate or pinnatifid, rarely entire, with hairs of type A (multiseptate hairs with short cells); involucral bracts with undivided sclerenchymatous portion; pollen with 1-layered sexine:

22a Female florets in 1 row, radiate, miniradiate, rarely filiform, or absent; style with acute sweeping hairs ending above furcation, rarely with obtuse sweeping hairs (*Anisopappus*) ..... **Inuleae** (p. 115)

22b Female florets in several rows, filiform or rarely radiate; style with obtuse sweeping hairs..... **Plucheeae** (p. 117)

[1] consider cypselas to be black if the body of the mature cypsela is shiny-black, at least in part; paler striations, ribs or wings may be present.

Tribe **Anthemideae**

Annual or perennial herbs, subshrubs or shrubs, rarely spinescent, usually aromatic. **Leaves** alternate or rarely opposite or fasciculate or rosulate, generally variously dissected, pinnatisect, pinnatifid, lobed or serrate-dentate or rarely entire, rarely succulent. **Capitula** radiate, disciform or discoid, solitary, corymbose or paniculate, rarely aggregated, often pedunculate, sometimes sessile. **Involucral bracts** in 3 or more rows, rarely in 1 or 2 rows, imbricate, almost always with scarious margins and apex. **Receptacle** paleate or epaleate, rarely pilose or hirsute. **Ray florets** (in radiate capitula) female, fertile or sterile or neuter, lamina white, yellow or rarely blue-violet, pink, cream-coloured or reddish. **Outer florets** (in disciform capitula) female, in 1 or more rows, tubular or filiform, rarely without corollas. **Disc florets** bisexual or functionally male, yellow or rarely whitish or red, sometimes distinctly divided into tube and limb, sometimes more funnel-shaped, rarely somewhat irregular, basally often swollen and saccate in fruit; 5- or 4-lobed, rarely 3-lobed. **Anthers** mostly ecalcarate and ecaudate, rarely shortly caudate or calcarate; apical appendage ovate to lanceolate-oblong, flat, sometimes with resin sacs; endothecial tissue generally radial or rarely polarised. **Style branches** almost always truncate and penicillate, hairs obtuse, with stigmatic areas in 2 marginal stripes, sometimes undivided in functionally staminate florets. **Cypselas** generally terete to weakly angled or ribbed or flattened, sometimes winged, thin- or thickwalled. **Pappus** generally of rather few scarious scales, corona or auricle, often 0.

Genera 109, worldwide but with main concentrations in Central Asia, Mediterranean region, sthn Afr., less often North America, rarely South America and Australia; 34 genera and 293 species in sthn Afr.

Cassini: 192 (1819a); Bremer & Humphries: 90 (1993); Bremer: 447 (1994).

Key to the genera of the tribe Anthemideae after Bremer & Humphries: 84 (1993).

Key to genera

1a Receptacle distinctly paleate with paleae subtending florets:

2a Capitula radiate:

3a Rays yellow, rarely abaxially reddish:

4a Involucral bracts in 5–7 rows ..... **Ursinia**

4b Involucral bracts in 1 row..... **Eriocephalus**

3b Rays white or rarely pink to reddish on both sides:
5a Pappus of 5 (rarely 8–10) large obovate scales and sometimes 5 additional subulate scales ..... **Ursinia**
5b Pappus a shallow corona, an auricle or of small scales or 0:
6a Cypselas copiously villous:
7a Involucral bracts in 2–4 rows ..... **Lasiospermum**
7b Involucral bracts in 1 row ..... **Eriocephalus**
6b Cypselas glabrous, sometimes glandular or papillose:
8a Shrubs with opposite leaves (leaves alternate in *Eumorphia davyi*); cypselas with 10 or more ribs ..... **Eumorphia**
8b Herbs or rarely shrubs with alternate leaves (rarely with some leaves opposite basally on stem); cypselas various:
9a Cypselas dorsiventrally flattened and with 2 lateral ribs but no wings ..... ***Achillea**
9b Cypselas various, sometimes dorsiventrally flattened but then rhombic in cross-section and without 2 lateral ribs and not or only narrowly winged:
10a Leaves serrate-dentate, rarely pinnatifid or entire; anthers caudate ..... **Osmitopsis**
10b Leaves pinnatisect to variously lobed; anthers not caudate ..... ***Anthemis**
2b Capitula discoid or disciform:
11a Pappus present, of scales, an auricle or a corona:
12a Pappus of 5 (rarely 8–10) large obovate scales and sometimes 5 additional subulate scales ..... **Ursinia**
12b Pappus a shallow corona, an auricle or of small scales:
13a Capitula narrowly oblong-obconical, slender and few-flowered; indumentum of stellate hairs ..... **Hymenolepis**
13b Capitula rather widely urceolate to cyathiform-campanulate; indumentum of simple or bifid hairs ..... **Inulanthera**
11b Pappus 0 but cypselas sometimes apically with obtuse rim (rarely with pseudopappus of bristle-like stalked glands in *Athanasia*):
14a Cypselas glabrous, sometimes glandular ..... **Athanasia**
14b Cypselas copiously villous:
15a Involucral bracts in 2–4 rows ..... **Lasiospermum**
15b Involucral bracts in 1 row ..... **Eriocephalus**
1b Receptacle completely epaleate (though sometimes pilose or hirsute) or capitula few-flowered and presence of paleae unclear:
16a Capitula radiate:
17a Rays yellow, rarely partly white or reddish or abaxially reddish:
18a Pappus present in ray or disc cypselas or generally in all cypselas, of scales, an auricle or a corona:
19a Cypselas dorsiventrally flattened and with 2 lateral broad wings, annual herbs with entire, fleshy leaves ..... **Adenoglossa**
19b Cypselas oblong, 4-angled, perennial herbs, leaves not fleshy ..... **Inezia**
18b Pappus 0 but cypselas sometimes apically with obtuse rim:
20a Ray cypselas triquetrous, winged; disc cypselas prismatic with narrow adaxial wing or terete and apparently ribbed ..... ***Chrysanthemum**
20b Cypselas all equal, oblong or obovoid, without wings or dorsiventrally flattened and laterally winged:
21a Disc corolla 4-lobed; rays not true ray florets but outer disc florets with 1 corolla lobe expanded to a limb; cypselas dorsiventrally flattened ..... **Cotula**
21b Disc corolla 5-lobed; rays true ray florets with apically 3-lobed laminas; cypselas oblong or obovoid, ribbed. ..... ***Leucanthemum**
17b Rays white, rarely pink to reddish, bluish violet or creamy orange, but not yellow:
22a Pappus present at least in ray cypselas, of scales, an auricle or a corona (sometimes almost absent in *Tanacetum* but cypselas then apically with acute rim):
23a Annual herbs ..... **Foveolina**
23b More or less suffruticose perennials, shrublets or shrubs:
24a More or less suffruticose perennials ..... ***Tanacetum**
24b Woody shrubs or shrublets:
25a Cypselas dorsiventrally flattened and laterally winged ..... **Leucoptera**
25b Cypselas ± terete, not winged ..... **Cymbopappus**
22b Pappus 0 but cypselas sometimes apically with obtuse rim (mainly abaxial and somewhat toothed in *Oncosiphon*):
26a Disc corolla 4-lobed:
27a Leaves entire, lanceolate to linear ..... **Thaminophyllum**
27b Leaves variously lobed or pinnatisect, not entire:
28a Disc corolla tube very much swollen and brittle ..... **Oncosiphon**
28b Disc corolla tube not or only slightly swollen:
29a Leaves with few, oblong to rounded, apically mucronate lobes; receptacle pilose ..... **Lidbeckia**
29b Leaves variously pinnatisect; receptacle glabrous:
30a Shrubs; cypselas subglobose with 2 or 3 adaxial faint ribs ..... **Hilliardia**
30b Herbs; cypselas dorsiventrally flattened:
31a Rays not true ray florets but outer disc florets with 1 corolla lobe expanded to a limb, ray florets and cypselas stalked ..... **Cotula**
31b Rays true ray florets with apically 3-lobed or entire lamina, ray florets and cypselas sessile ..... **Inezia**

26b Disc corolla 5-lobed:
32a Leaves opposite ..... **Eumorphia**
32b Leaves alternate:
33a Disc corolla tube confluent with cypsela; cypsela ribs with resin ducts; leaves serrate ..... **Adenanthellum**
33b Disc corolla tube not confluent with cypsela; cypsela ribs without resin ducts; leaves entire or few-lobed... ..... **Phymaspermum**
16b Capitula discoid or disciform:
34a Pappus present, of scales, an auricle or a corona:
35a Annual herbs:
36a Cypsela wall and pappus white and spongy, abaxially thin ..... **Foveolina**
36b Cypsela wall not white and spongy; with 1 adaxial and 2 lateral ± thick ribs; pappus a stiff corona covered with myxogenic cells ..... **Myxopappus**
35b Perennial herbs or often subshrubs, shrublets or shrubs:
37a Capitula closely aggregated at stems; leaves small, ericoid, entire or occasionally few-lobed; pappus of 7–10 oblong, adaxially longer scales ..... **Marasmodes**
37b Capitula solitary or laxly to densely corymbose; leaves and pappus various:
38a Capitula narrowly oblong-obconical, slender and few-flowered; pubescent shrubs; indumentum of stellate hairs ..... **Hymenolepis**
38b Capitula generally urceolate to cyathiform or campanulate; habit various; indumentum if present of simple or bifid hairs:
39a Shrubs with corymbose capitula and pinnatisect leaves; cypselas 8–10-ribbed; pappus of small scales projecting from cypsela ribs ..... **Inulanthera**
39b Shrubs with ± ericoid leaves; pappus of scales not distinctly projecting from cypsela ribs, a corona or an auricle ..... **Pentzia**
34b Pappus 0 but cypselas sometimes apically with obtuse rim (mainly abaxial and somewhat toothed in *Oncosiphon*; rarely with pseudopappus of bristle-like stalked glands in *Athanasia*):
40a Leaves opposite; shrubs with sessile or corymbose capitula:
41a Leaves entire; capitula sessile ..... **Athanasia**
41b Leaves pinnatifid; capitula corymbose ..... **Gymnopentzia**
40b Leaves alternate, rarely opposite but then habit or capitula different:
42a Capitula in elongated and paniculate, rarely racemiform or spiciform synflorescences, often small and many.... ..... **Artemisia**
42b Capitula solitary or in lax to dense corymbs, small to medium-sized:
43a Central floret corolla 4-lobed (rarely 3-lobed in *Cotula*):
44a Cypselas dorsiventrally flattened with 2 lateral ± distinct ribs or wings:
45a Shrublets or subshrubs with corymbose or occasionally solitary capitula ..... **Schistostephium**
45b Annual or perennial herbs with solitary capitula, rarely few together:
46a Capitula sessile; outer female florets without corolla and with style persistent and spinescent in fruit.. ..... ***Soliva**
46b Capitula ± pedunculate; outer female florets with corolla; style not persistent ..... **Cotula**
44b Cypselas not or only slightly dorsiventrally flattened without or with 3–5 ribs and no wings:
47a Disc corolla tube very much swollen and brittle ..... **Oncosiphon**
47b Disc corolla tube not or only slightly swollen; cypsela wall either white and spongy with 1 adaxial and 2 lateral weak ribs, abaxially thin or cypselas almost terete and thin-walled all around ..... **Foveolina**
43b Central floret corolla 5-lobed:
48a Annual herbs ..... **Foveolina**
48b Perennial herbs or often subshrubs, shrublets or shrubs:
49a Cypselas dorsiventrally flattened, with or without lateral wings ..... **Hippia**
49b Cypselas not dorsiventrally flattened, not winged:
50a Cypsela ribs acute, with secretory cavities; corolla gradually expanded and funnel-shaped ..... **Athanasia**
50b Cypselas without ribs or ribs faint or rounded, without secretory cavities; corolla ± distinctly divided into tube and limb:
51a Cypselas 10–18-ribbed ..... **Phymaspermum**
51b Cypselas with 0 or fewer than 10 ribs:
52a Corolla lobes cucullate, anthers shortly calcarate, involucral bracts in 3(4) rows, inner row smaller than outer 2 and membranous ..... **Rennera**
52b Corolla lobes not cucullate, anthers ecalcarate; involucral bracts in 3–5 rows ..... **Pentzia**

Tribe **Arctoteae**

Herbs, subshrubs or shrubs; latex sometimes present. **Leaves** alternate, rosulate, rarely opposite, entire or frequently dentate-pinnatisect to lobed, often spiny or spinulose or unarmed. **Capitula** generally radiate or discoid, rarely disciform; solitary or corymbose, rarely in racemiform synflorescences or aggregated to secondary heads. **Involucral bracts** imbricate in several rows, often with scarious appendages or spine-tipped; free or ± connate. **Receptacle** areolate-alveolate, sometimes deeply alveolate with enclosed cypselas, rarely almost smooth, naked or often with denticulate to bristly pit margins. **Ray florets** female, fertile, sterile or neuter, often with staminodes; with long radiate and yellow or variously coloured lamina, apically 3- or 4-lobed. **Disc florets** bisexual or sometimes functionally

male, regular and rather shallowly to deeply 5-lobed; yellow or sometimes variously dark-coloured, frequently with stalked glands. **Anthers** calcarate, mostly ecaudate or shortly caudate; apical appendage elongate and obtuse-rounded to broadly ovate-triangular and distinctly demarcated from thecae; endothecial tissue polarised or radial; filaments smooth or rarely papillose. **Style** slender or with much thickened apical part, bilobed or with short to long style branches, mostly with ring of longer hairs beneath style branches or at base of apical part; hairs acute. **Cypselas** ellipsoid-oblong to obovoid-obconical, frequently distinctly ribbed, often sericeous-villous with twin hairs or glabrous. **Pappus** of scales or 0.

Genera 16, Africa, mainly sthn Afr., also in SW Asia and Australia; 14 genera and 198 species in sthn Afr.

Cassini: 159 (1819a); Pope: 229 (1992); Bremer: 256 (1994).

Key after Dyer: 659 (1975) and Hilliard: 529 (1977).

Key to genera

1a Capitula discoid, massed in a cushion covering the crown of the root and surrounded by a rosette of leaves ..... **Platycarpha**
1b Capitula radiate, if discoid, then not massed in a cushion surrounded by leaves:
2a Involucral bracts ± free, the inner ones at least obtuse, scarious at the tips and on the margins:
3a Pappus with subplumose bristles ..... **Heterolepis**
3b Pappus 0 or of scales:
4a Ray florets sterile, not producing cypselas; pappus 0 or of small scales ..... **Arctotheca**
4b Ray florets female, producing cypselas:
5a Acaulescent herbs:
6a Cypselas flat and deeply grooved on one face, convex and tubercled on the other ..... **Arctotis**
6b Cypselas turbinate ..... **Haplocarpha**
5b Stems diffuse or matted:
7a Stems forming dense mats; pappus of two rings of short, ovate-acuminate, laciniate scales ..... **Dymondia**
7b Stems diffusely branched; pappus 0 or of 1 or 2 rows of larger or small scales ..... **Arctotis**
2b Involucral bracts connate at base or higher, acute or acuminate, often spine-tipped:
8a Pappus 0; shrublets; branches slender, densely leafy up to the capitula ..... **Cullumia**
8b Pappus present:
9a Receptacle with outer honeycomb-cavities thick-walled, inner ones membranous; pappus scales ciliate to fimbriate:
10a Involucre bracts in 3 rows, the middle ones the largest; receptacle not breaking up at maturity ..... **Heterorhachis**
10b Involucre bracts in 2 rows, outer ovate, inner slender; receptacle breaking up at maturity ..... **Didelta**
9a Receptacle uniformally honeycombed:
11a Annual herbs, sometimes wiry; seeds germinating from within old capitula:
12a Disc florets with only a few fertile; pappus short, coroniform, hidden by hairs of cypselas ..... **Gorteria**
12b Disc florets bisexual, all fertile; pappus scales linear ..... **Cuspidia**
11b Perennial herbs, subshrubs or shrubs, rarely annuals; seeds not germinating within capitula; pappus biseriate:
13a Involucre bracts slightly fused at base, pungent-toothed or -lobed ..... **Berkheya**
13b Involucre bracts fused in the lower half, sometimes setose, not spinescent:
14a Pappus scales of outer whorl not overlapping, the inner ones equal or somewhat longer; sap milky ..... **Gazania**
14b Pappus scales of outer whorl spirally overlapping, inner whorl small or obsolete ..... **Hirpicium**

Tribe **Astereae**

Herbs, subshrubs or shrubs, sometimes vines, rarely dioecious, rarely spiny. **Leaves** mostly alternate or rosulate, rarely opposite, usually entire or serrate-dentate only, less often pinnatifid-pinnatisect, rarely succulent. **Capitula** radiate, disciform or discoid, solitary, corymbose or paniculate. **Involucral bracts** generally imbricate in several rows. **Receptacle** mostly epaleate, sometimes paleate. **Ray florets** often many, female, fertile or sometimes sterile, rarely neuter with mostly slender blue, violet, purple, pink or frequently yellow or white lamina. **Outer florets** in disciform capitula frequently in several rows, female, tubular or filiform. **Disc florets** bisexual or often functionally male, sometimes distinctly divided into tube and limb, sometimes more funnel-shaped, 5-lobed, mostly yellow. **Anthers** mostly ecalcarate and ecaudate, rarely shortly caudate; apical appendage ovate-lanceolate, flat; endothecial tissue mostly of elongated cells, radial or rarely partly polarised. **Style** with oblong-linear style branches, above stigmatic portions prolonged into acute triangular-lanceolate to subulate, ventrally glabrous, dorsally pilose, sterile appendages; hairs mostly obtuse; stigmatic areas always in 2 separate lines. **Cypselas** rather uniform, mostly oblong-obovoid and ± ribbed, rarely shortly beaked; glabrous or pubescent with twin hairs. **Pappus** of scabrid-barbellate, rarely plumose, fine or coarse bristles, or scales, or both bristles and scales or 0.

Genera 174, worldwide, especially frequent in SW North America, along Andes in South America, sthn Afr., Australia, New Zealand and central Asia; 21 genera and 269 species in sthn Afr.

Cassini: 195 (1819a); Bremer: 398 (1994).

Key compiled from descriptions in Bremer (1994); Hilliard (1977) and key by Nesom: 86 (1994).

Key to genera

1a Plants dioecious ..... *Baccharis
1b Plants monoecious:
2a Pappus uniseriate:
3a Anthers shortly caudate; receptacle paleate ..... Poecilolepis
3b Anthers ecaudate; receptacle epaleate:
4a Capitula distinctly radiate:
5a Cypselas ellipsoid-oblong, with swollen margin and apically surmounted by horny collar ..... Polyarrhena
5b Cypselas strongly compressed, without apical ring:
6a Pappus of plumose bristles:
7a Fertile cypselas moderately to densely strigose-sericeous with filiform hairs; rays white to blue or yellow; pappus of ray cypselas similar to that of disc (sterile) cypselas, of plumose bristles ..... Zyrphelis
7b Fertile cypselas moderately to densely invested with short, white papillae or glabrous to glabrate; rays white to blue; pappus of ray cypselas 0 or of only 1 or 2 plumose or short-serrate bristles (with many bristles in 1 species), disc (sterile) cypselas with more bristles ..... Gymnostephium
6b Pappus of barbellate bristles:
8a Scandent or twining shrubs ..... Microglossa
8b Herbs or shrubs, not scandent or twining:
9a Disc florets bisexual, rarely functionally male; pappus bristles many ..... Felicia
9b Disc florets functionally male; pappus bristles 0 or 1–3 ..... Gymnostephium
4b Capitula disciform or discoid:
10a Capitula discoid ..... Felicia
10b Capitula disciform or shortly radiate:
11a Outer female florets in 1 row ..... Nolletia
11b Outer female florets in 2 to many rows:
12a Receptacle ± swollen; style branches with lanceolate appendages; pappus 0 or of 1 or 2 bristles ..... Dichrocephala
12b Characters not as above:
13a Pappus of few basally connate scaly bristles, a corona or 0 ..... Grangea
13b Pappus of many barbellate bristles:
14a Disc florets functionally male; cypselas turbinate; shrubs ..... Psiadia
14b Disc florets bisexual, rarely some functionally male; cypselas obovoid-oblong or ellipsoid, compressed; annual or perennial herbs, rarely shrubs:
15a Marginal florets (short rays) yellow ..... Nidorella
15b Marginal florets (short rays) white, pink or mauve:
16a Style branch appendages larger than stigmatic area, lanceolate-linear, acute or acuminate; cypselas obovoid-oblong, somewhat compressed, pubescent and glandular ..... Aster
16b Style branch appendages lanceolate to triangular; cypselas obovoid-oblong, sometimes compressed, pubescent ..... Conyza
2b Pappus biseriate:
17a Capitula radiate:
18a Pappus of bristles only:
19a Leaves in basal rosette; pappus of plumose bristles ..... Mairia
19b Leaves alternate, scattered along stem; pappus of barbellate bristles:
20a Style branch appendages longer than stigmatic area, lanceolate-linear, acute or acuminate ..... Aster
20b Style branch appendages shorter than stigmatic areas, lanceolate to triangular, acute or obtuse ..... *Erigeron
18b Pappus an outer row of scales and an inner row of bristles:
21a Pappus bristles plumose ..... Mairia
21b Pappus of barbellate bristles:
22a Leaves opposite ..... Engleria
22b Leaves alternate, rarely lower ones opposite:
23a Receptacle mostly paleate ..... Amellus
23b Receptacle epaleate:
24a Leaves small, ericoid; cypselas with 2 resin sacs in ribs ..... Chrysocoma
24b Leaves usually broad or long, not ericoid; cypselas without ribs and resin sacs ..... Aster
17b Capitula disciform or discoid:
25a Capitula disciform:
26a Pappus of bristles only ..... Conyza
26b Pappus of bristles and scales ..... Amellus
25b Capitula discoid:
27a Pappus of bristles only:
28a Perennial herbs; leaves alternate, sometimes radical; cypselas oblong-obovoid, slightly compressed, usually 3-ribbed, glandular ..... Heteromma
28b Shrublets or shrubs; leaves mostly opposite, sometimes fascicled or alternate; cypselas obovoid or turbinate, sometimes compressed, sometimes narrowed into short, apical beak, glabrous to villous ..... Pteronia

27b Pappus of bristles and scales:
29a Cypselas without resin sacs; receptacle mostly paleate ..... **Amellus**
29b Cypselas with resin sacs in ribs; receptacle epaleate:
30a Leaves opposite ..... **Engleria**
30b Leaves alternate, ericoid ..... **Chrysocoma**

Tribe **Calenduleae**

Herbs, subshrubs, shrubs or small trees; unarmed or sometimes spinescent. **Leaves** alternate or rarely opposite, petiolate or sessile, entire or serrate, dentate to variously lobed or dissected, glabrous, glandular or pubescent. **Capitula** radiate, corymbose or solitary, subsessile or shortly pedunculate to scapose. **Involucral bracts** uniseriate and subequal to imbricate with outer bracts gradually smaller. **Receptacle** epaleate. **Ray florets** female, rarely neuter; fertile or sterile; lamina short or long, yellow, white, pink, mauve, purple or blue, sometimes differently coloured on upper and lower side. **Disc florets** bisexual or more often functionally male, regular, funnel-shaped or indistinctly differentiated in tube and subcampanulate limb, 5-lobed, yellow, orange or reddish. **Anthers** ecalcarate, caudate; apical appendage ovate-triangular, obtuse or acute-acuminate, flat or somewhat concave; endothecial tissue polarised. **Style** sterile, shallowly bifid with short apical collar of hairs; or deeply bifurcate with hairs extending down below branches, or fertile, shortly bilobed, or deeply bifurcate; hairs mamillate or sometimes acute; stigmatic areas in 2 apically confluent lines. **Cypselas** homo-, di-, tri- or polymorphic; ray cypselas terete or triquetrous to 3-winged, smooth, tuberculate, aculeate or beaked, straight or curved, with or without cavities; or fruit a drupe; disc cypselas (when developed) laterally flattened with thickened margin, obovate, orbicular or elliptic. **Pappus** 0.

Genera 8, mainly sthn Afr., but also tropical and North Africa, Atlantic islands, southern and central Europe, SW and W Asia, east to Afghanistan; 8 genera and 88 species in sthn Afr.

Cassini: 161 (1819a); Nordenstam: 372 (1994).

Key compiled from genus descriptions after Nordenstam (1994).

Key to genera

1a Fruit a drupe ..... **Chrysanthemoides**
1b Fruit a cypsela:
2a Style deeply bifurcate with hairs reaching below point of furcation ..... **Garuleum**
2b Style shallowly bifid or bilobed with short apical collar of hairs:
3a Cypselas homomorphic, rarely hetero- or dimorphic:
4a Ray cypselas kidney-shaped with ventral cavity ..... **Gibbaria**
4b Ray cypselas 3-winged with apical fenestrate airchamber; sometimes some cypselas wingless and rostrate ..... **Tripteris**
4c Ray cypselas straight or somewhat curved, triquetrous, 3-winged or terete or ribbed or tuberculate or with various processes; with or without apical cavities ..... **Osteospermum**
3b Cypselas hetero- or polymorphic:
5a Disc florets mostly bisexual, fertile; disc cypselas laterally flattened with thickened margins ..... **Dimorphotheca**
5b Disc florets functionally male:
6a Outer ray cypselas cymbiform, somewhat curved, rostrate or triquetrous; inner distinctly curved, sometimes winged, sometimes annular; dorsally rugose to tuberculate-aculeate ..... ***Calendula**
6b Ray cypselas slightly curved and wingless or straight and 3-winged or rostrate and wingless, with or without apical cavity; smooth or rugose-aculeate ..... **Oligocarpus**
6c Ray cypselas straight or somewhat curved, triquetrous, 3-winged or terete or ribbed or tuberculate or with various processes; with or without apical cavities ..... **Osteospermum**

Tribe ***Cardueae**

Herbs or sometimes subshrubs or shrublets; latex sometimes present. **Leaves** alternate or sometimes rosulate, entire or dentate-pinnatisect to lobed, very often spiny or spinulose or unarmed. **Capitula** discoid, disciform or 'radiate' (radiant: not true ray florets); solitary or corymbose, sometimes clustered. **Involucral bracts** imbricate in several rows, chartaceous to scarious, often spine-tipped or with fimbriate-ciliate, lacerate or variously shaped appendages; innermost bracts rarely much elongated, spreading and coloured, simulating rays. **Receptacle** mostly densely setose, rarely areolate with fringed or scaly pit margins, paleate or epaleate. **Florets** regular or slightly irregular; mostly with slender tube and deeply or shallowly 5-lobed limb; outer florets sometimes elongated and radiating, sometimes tubular and irregularly few-lobed; all or central florets bisexual; outer florets sometimes female or neuter; functionally male and female florets in separate capitula in some *Cirsium* spp.; florets red, pink, purple, violet or blue, less frequently yellow or orange. **Anthers** calcarate and distinctly caudate; tails entire or fringed, rarely very short; apical appendage elongate, acute to acuminate and often somewhat thickened and rounded at apex, flat; endothecial tissue mostly polarised. **Filaments** often papillose-pilose or glabrous, rarely connate to a tube. **Style** with rather long, linear, dorsally papillose-pilose, sometimes connate style branches and with ring of hairs on a thickening beneath branches, rarely bilobed or with short branches; hairs acute. **Cypselas** oblong to obovoid-obconical, often laterally somewhat compressed or angular, generally glabrous or sometimes sparsely pubescent, or more densely sericeous, pale yellowish brown or frequently with dark brown to blackish streaks or spots, or entirely brown-blackish, mostly with distinct apical rim. **Pappus** of scabrid, barbellate or plumose bristles, sometimes deeply cleft, or of scales, or a short corona; bristles in 1 to several rows, subequal or very unequal and gradually longer inwards; simple or double with inner row of bristles, hairs or scales, rarely totally absent.

Genera 83, Eurasia and North Africa, few genera in tropical Africa and North America, few in South America and Australia; 6 genera and 12 species in sthn Afr., mostly weeds.

Cassini: 155 (1819a); Pope: 49 (1992); Bremer: 134 (1994).

Key to genera

1a Dwarf shrubs; leaves with a spinose-dentate margin ..... *Carthamus
1b Herbs; leaves not as above:
2a Pappus with hairs connate at base:
3a Pappus of plumose hairs ..... *Cirsium
3b Pappus of scabrid hairs:
4a Filaments free ..... *Carduus
4b Filaments connate ..... *Silybum
2b Pappus with hairs free to base:
5a Pappus of long, subacuminate scales surrounded by long hairs ..... *Mantisalca
5b Pappus of several rows of simple, sometimes scale-like, hairs ..... *Centaurea

Tribe **Eremothamneae**

Erect, much-branched shrubs. **Leaves** alternate, sessile, oblanceolate to thorn-like. **Capitula** radiate or discoid; sessile or subsessile, solitary or in small clusters in axils of distal leaves. **Involucral bracts** multiseriate, glabrous, usually with short apical spine. **Receptacle** epaleate. **Ray florets** (if present) female, corolla yellow, with 3 small apical lobes. **Disc florets** bisexual, 5-lobed, lobes linear, with or without glands or hairs outside; surface cells elongate, with rows of low papillae on marginal cells. **Anthers** calcarate and caudate; endothecial cells with transverse thickenings in basal half only; apical appendage of thin-walled cells. **Style** branches elongate, slender, with single continuous stigmatic surface inside each branch, with sweeping hairs on top of shaft and on backs of branches consisting of 2 or 3 cells divided longitudinally. **Cypselas** prismatic, densely setuliferous with long biseriate hairs. **Pappus** capillary, in 2 or 3 rows, inner bristles sometimes narrowly winged below.

Genera 2, *Eremothamnus* O.Hoffm. and *Hoplophyllum* DC., endemic to sthn Afr.

Robinson & Brettell: 164 (1973); Robinson: 34 (1994).

Key to genera after Robinson: 36 (1994).

Key to genera

Capitula discoid; leaves spiniform; corolla limbs glabrous; anther appendages shortly oblong with apiculate tips..... **Hoplophyllum**
Capitula radiate; leaves oblanceolate; corolla limbs with hairs and glands outside; anther appendages lanceolate.... **Eremothamnus**

Tribe **Eupatorieae**

Herbs, shrubs or vines. **Leaves** generally opposite, frequently entire, sometimes serrate or lobed, usually petiolate, rarely sessile, frequently trinerved. **Capitula** discoid; usually corymbose-paniculate, rarely solitary, few- to many-flowered. **Involucral bracts** mostly unequal and subimbricate to imbricate in several rows or subequal in 1 or 2 rows (eximbricate). **Receptacle** mostly epaleate and glabrous, rarely paleate. **Disc florets** bisexual, regular, 5-lobed, white, pink, purple, violet or blue, never yellow. **Anthers** ecalcarate or rarely shortly calcarate, ecaudate; anther appendage ovate-lanceolate to oblong; endothecial tissue radial; filament collar elongate-oblong, sometimes widened, cells often with annular thickenings. **Style** with very long, filiform-linear to oblanceolate-clavate, smooth-mamillose to papillose-pilose, usually coloured, sterile style branch appendages; hairs obtuse; stigmatic areas in 2 short, widely separated marginal lines at base of each style branch; glands sometimes present between stigmatic bands; style base sometimes pubescent. **Cypselas** rather uniform, black, mostly oblong and prismatic with ± 5 ribs, more rarely with 7–10 ribs, rarely flattened; glabrous or pubescent with twin hairs. **Pappus** usually of many scabrid-barbellate bristles, or of few bristles or scales, or both bristles and scales, rarely coroniform or 0.

Genera 170, mainly South, Central and North America, West Indies, a few pantropical genera in Africa and South America and pantropical weeds, only 1 genus extending through Asia to Europe and North Africa; 7 genera and 13 species in sthn Afr.

Cassini: 202 (1819a); Bremer *et al.*: 643 (1994).

Key to genera

1a Anthers without an apical appendage or minutely apiculate; pappus of 3 or 5 gland-tipped processes..... **Adenostemma**
1b Anthers with an apical appendage; pappus of eglandular bristles or scales:
2a Pappus of scales ..... *Ageratum
2b Pappus of bristles:
3a Involucral bracts 4 or 5; plant a twiner or scrambler ..... **Mikania**
3b Involucral bracts many, if few; plant erect, not twining:
4a Receptacle rounded to conical ..... *Campuloclinium
4b Receptacle flat or convex:
5a Individual pappus bristles easily deciduous ..... *Ageratina

5b Pappus bristles persistent, not easily deciduous:
6a Involucral bracts with tips coloured, deciduous; pappus of many, capillary bristles ..... *Chromolaena
6b Involucral bracts and pappus not as above; cypselas 5- to 8-ribbed, with many setulae ..... Stomatanthes

Tribe Gnaphalieae

Herbs or often shrubs or shrublets. **Leaves** alternate or opposite, sessile or petiolate; margin flat, involute or revolute, mostly entire with hairs of type B (hairs with 1 basal cell and a very long terminal cell). **Capitula** disciform or discoid, rarely radiate, solitary or in groups or forming secondary heads of various shapes. **Involucral bracts** imbricate in several rows, papery, sometimes chartaceous or herbaceous; with white, pink, yellow or purple opaque papery lamina or brownish or hyaline, transparent; stereome generally undivided but characteristically divided (fenestrate) in some groups. **Receptacle** generally flat to somewhat convex and epaleate, sometimes conical or peg-like; rarely paleate; squamose or fimbrilliferous. **Outer florets** often 0, when present, filiform or radiate, rarely bilabiate, female, yellow or purple to white, sometimes blue, in 1 or several rows, fewer than or outnumbering central florets. **Central florets** bisexual or often functionally male; corolla yellow or purple to blackish, corolla lobes erect or retrofract. **Anthers** ecalcarate, caudate with short or long tails; apical appendage mostly ovate, sometimes oblong, rarely cordate, flat, sometimes concave and/or narrow. **Style** usually with oblong-linear, truncate and apically penicillate style branches or sometimes obtuse with hairs dorsally or acute or prolonged; hairs obtuse; stigmatic areas in 2 separate lines. **Cypselas** often small, generally oblong or obovoid, sometimes triquetrous, variously hairy with either elongated, short, clavate or globose twin hairs, myxogenic or not, sometimes glabrous (exceptionally glandular); epidermis smooth or rarely papillose. **Pappus** of free or connate, plumose or barbellate, capillary bristles in 1 to several rows, rarely with scales and bristles or scales only, or 0; basally with or without patent cilia; apical cells acute or sometimes clavate; opaque or not.

Genera 176, worldwide but particularly in sthn Afr. and Australia; 56 genera and 553 species in sthn Afr.

Lecoq & Juillet: 296 (1831); Bentham: 452 (1866); Anderberg: 59 (1991a); Anderberg: 320 (1994).

Key after Anderberg: 34 (1991a); Anderberg & Bremer: 1068 (1991); Nordenstam: 407 (1996).

Key to genera

1a Leaves denticulate, dentate, serrulate, serrate or lobed; involucral bracts cartilaginous or herbaceous, without papery lamina:
2a Capitula radiate:
3a Receptacle paleate:
4a Pappus of barbellate bristles and crown of scales ..... Philyrophyllum
4b Pappus of rigid awns:
5a Involucral bracts with terminal arista; ray florets purple; disc florets yellow; pappus of 5 scale-like awns with bristle-like projection ..... Alatoseta
5b Involucral bracts without arista; ray florets creamy white or blue; disc florets purplish black; pappus of few rigid canaliculate awns ..... Callilepis
3b Receptacle epaleate:
6a Ray florets yellow or white; pappus of bristles in 1 row with outer row of scales (N.B. some *Printzia* species may have yellow or greenish ray florets but then with pappus of bristles in many rows) ..... Pentatrichia
6b Ray florets purple; pappus of bristles in several rows:
7a Leaves broad (more than 10 mm); anthers projecting out of corolla at early stage, preflorally ..... Printzia
7b Leaves narrow (less than 10 mm); anthers projecting at later stage, postflorally:
8a Involucral bracts with shortly stalked glandular hairs; cypselas hairy but without glands; leaves xeromorphic, needle-like ..... Athrixia
8b Involucral bracts with long-stalked glandular hairs; cypselas hairy and glandular; leaves herbaceous..... Lepidostephium
2b Capitula discoid or disciform:
9a Pappus of slender, capillary bristles and scales; involucral bracts recurved; capitula discoid:
10a Leaf surface smooth, veins indistinct; capitula large (more than 10 mm); pappus with 5–8 bristles ..... Anisothrix
10b Leaf surface more or less rugose, veins distinct; capitula small (less than 10 mm); pappus with 4 or 5 bristles..... Pentatrichia
9b Pappus of bristles only or of rigid awns or of short rigid bristles and scales; involucral bracts not recurved; capitula discoid or disciform:
11a Leaves large, deeply lobed; capitula small, discoid, in large divaricate, leafy panicles; corolla very deeply lobed... Anisochaeta
11b Leaves smaller, not lobed; capitula disciform, not in divaricate panicles; corolla with short lobes:
12a Stem and leaves villose; florets yellow; pappus of short rigid bristles and short scales ..... Artemisiopsis
12b Stem and leaves glabrous or puberulous; florets white or blue; pappus of 1 plumose capillary bristle only ..... Denekia
1b Leaves entire or else involucral bracts have a papery lamina:
13a Involucral bracts cartilaginous or herbaceous; capitula radiate:
14a Leaves small, densely tomentose to villose on both sides ..... Printzia
14b Leaves often glabrous and shiny above, not tomentose or villose on both sides:
15a Pappus of triquetrous awns; ray florets creamy white or blue; disc florets purplish black ..... Callilepis
15b Pappus of capillary bristles; florets not as above:

16a Pappus bristles in several rows; ray florets not yellow (*Athrixia* and *Lepidostephium*, but see also *Macowania pinifolia*) ..... go to couplet 8
16b Pappus of bristles in 1 row or 0; ray florets yellow or white:
17a Leaves very long and slender, acicular; pappus 0 ..... **Oxylaena**
17b Leaves not very slender, short to moderately long, not acicular; pappus of barbellate bristles:
18a Leaves flat, very pungent; corolla with long woolly hairs; pappus bristles caducous ..... **Arrowsmithia**
18b Leaves revolute, pungent or not; corolla without woolly hairs; pappus bristles persistent ..... **Macowania**
13b Involucral bracts with papery lamina or else capitula disciform or discoid:
19a Capitula radiate:
20a Ray florets yellow:
21a Plants compact, cushion-forming ..... **Oreoleysera**
21b Plants not cushion-forming:
22a Pappus of capillary bristles, scales 0 ..... **Antithrixia**
22b Pappus at least in ray florets with conspicuous scales, bristles present or 0:
23a Pappus bristles distinctly plumose ..... **Leysera**
23b Pappus bristles scabrid-barbellate or 0:
24a Annual or biennial herbs:
25a Cypselas densely hairy with long, apically coiled hairs ..... **Rhynchopsidium**
25b Cypselas almost glabrous ..... **Nestlera**
24b Perennial subshrubs, shrublets or shrubs:
26a Disc florets with 1–4 pappus bristles ..... **Rosenia**
26b Disc florets without pappus bristles:
27a Plants glabrous (if hairy then with capitula congested in secondary heads); capitula generally cymose-corymbose to clustered in secondary heads (if solitary then with glabrous, ± distinctly 1-nerved leaves) ..... **Oedera**
27b Plants ± hairy or glandular-hairy (if glabrous then with distinctly 3–9-nerved leaves); capitula generally solitary (if corymbose then with hairy leaves):
28a Leaves with long, glandular hairs ..... **Comborhiza**
28b Leaves without long, glandular hairs ..... **Relhania**
20b Ray florets purple, pink or white:
29a Plants compact, moss-like; disc florets wine-red ..... **Bryomorphe**
29b Plants not moss-like; disc florets yellow, pink or white:
30a Pappus of 5 broad scale-like awns with bristle-like projection; involucral bracts with long terminal arista… ..... **Alatoseta**
30b Pappus of plumose capillary bristles:
31a Capitula few-flowered, in dense globose clusters ..... **Disparago**
31b Capitula with more florets; well separated in loose clusters ..... **Amphiglossa**
19b Capitula disciform or discoid:
32a Involucral bracts entirely cartilaginous or herbaceous or sometimes with minute papery apical portion:
33a Capitula 1-flowered ..... **Stoebe**
33b Capitula with 2 or more florets:
34a Capitula arranged in spikes or in dense glomerules ..... **Elytropappus**
34b Capitula solitary, neither arranged in spikes nor in dense glomerules:
35a Capitula small; pappus of plumose bristles ..... **Amphiglossa**
35b Capitula larger; pappus of barbellate bristles ..... **Lachnospermum**
32b Involucral bracts conspicuously papery:
36a Florets purple, at least apically or basally:
37a Leaves adaxially concave, often tomentose adaxially only:
38a Leaves twisted or straight; capitula discoid; pappus barbellate:
39a Capitula large, more or less campanulate, rather few:
40a All involucral bracts conspicuously white; leaves linear, ericoid ..... **Hydroidea**
40b Only innermost bracts conspicuously white; leaves neither ericoid, nor linear:
41a Apical pappus cells white, opaque ..... **Atricantha**
41b Apical pappus cells hyaline, transparent ..... **Calotesta**
39b Capitula small, narrowly cylindrical, many:
42a Apical pappus cells clavate ..... **Metalasia**
42b Apical pappus cells acute ..... **Planea**
38b Leaves straight; capitula disciform or sometimes discoid but then pappus plumose:
43a Capitula large (more than 10 mm):
44a Cypselas villose; involucral bracts pink; leaves minute, extremely densely adpressed ..... **Phaenocoma**
44b Cypselas pilose or almost glabrous; involucral bracts white, yellow, reddish or brown; leaves not minute:
45a Leaves small, triangular, erect, adpressed, adaxially concave and tomentose, abaxially glabrous… ..... **Edmondia**
45b Leaves not small and triangular, flattened, not erect, nor glabrous abaxially ..... **Syncarpha**

43b Capitula small (less than 10 mm):
46a Disc florets generally bisexual; pappus bristles basally with patent cilia, apical cells clavate; endothecial tissue radial ..... **Ifloga**
46b Disc florets functionally male; pappus bristles basally without patent cilia, apical cells not clavate; endothecial tissue polarised ..... **Trichogyne**
37b Leaves flat or revolute, not tomentose adaxially only:
47a Capitula discoid or disciform with female florets not outnumbering disc florets:
48a Capitula discoid (or occasionally with 1 or 2 filiform female florets):
49a Capitula few, on filiform peduncles ..... **Troglophyton**
49b Capitula several, ± sessile, in glomerules ..... **Vellereophyton**
48b Capitula disciform (female florets frequent):
50a Stereome divided:
51a Capitula few, on filiform peduncles ..... **Troglophyton**
51b Capitula several, ± sessile, in glomerules ..... **Vellereophyton**
50b Stereome undivided:
52a Receptacle paleate:
53a Leaves revolute, glabrous above, decurrent; cypselas with scattered, short, clavate myxogenic hairs ..... **Tenrhynea**
53b Leaves flat, villose above, not decurrent; cypselas villose with elongated nonmyxogenic hairs... ..... **Petalacte**
52b Receptacle epaleate:
54a Involucral bracts not unguiculate; outer ones without petaloid portion, inner ones with elongate petaloid portion; pappus bristles with apical teeth short, subclavate, opaque; disc floret style bifurcate ..... **Langebergia**
54b Inner involucral bracts unguiculate with broader petaloid portion, outer ones partly membranous, not clawed:
55a Leaves glabrous above (or sparsely pilose); flowering branches apically usually with reduced leaves (= corymbophore present); corolla purplish; pappus reduced especially in female florets ..... **Anaxeton**
55b Leaves tomentose on both sides (though sometimes glabrescent above with age); flowering branches evenly leafy to top (= corymbophore 0); corolla white or yellow; pappus bristles well-developed in all florets ..... **Anderbergia**
47b Capitula disciform with female florets outnumbering disc florets:
56a Stereome divided:
57a Pappus bristles basally connate in groups, pappus plumose ..... ***Facelis**
57b Pappus bristles basally free or cohering by patent cilia:
58a Stereome conspicuously divided; pappus generally distinctly plumose or else cypselas with 2-celled, globose or unicellular, clavate hairs ..... **Lasiopogon**
58b Stereome indistinctly divided; pappus barbellate or possibly subplumose but then cypselas not as above:
59a Capitula few, on filiform peduncles ..... **Troglophyton**
59b Capitula several, ± sessile, in glomerules ..... **Vellereophyton**
56b Stereome undivided:
60a Cypselas with globose hairs; pappus basally connate ..... ***Gamochaeta**
60b Cypselas with clavate or elongated hairs; pappus free, connate or 0:
61a Perennial herbs with long, straggling branches ..... **Plecostachys**
61b Perennial or annual herbs; branches never long and straggling ..... **Gnaphalium**
36b Florets yellow:
62a Leaves minute, densely adpressed; involucral bracts white; cypselas villose ..... **Dolichothrix**
62b Characters not as above:
63a Outer involucral bracts subtending single female floret; pappus apically plumose:
64a Disc florets generally bisexual; pappus bristles basally with patent cilia, apical cells clavate; endothecial tissue radial ..... **Ifloga**
64b Disc florets functionally male; pappus bristles basally without patent cilia, apical cells not clavate; endothecial tissue polarised ..... **Trichogyne**
63b Outer involucral bracts not subtending single female floret; pappus various:
65a Capitula surrounded by involucre of lanate, radiating leaves ..... **Galeomma**
65b Capitula not surrounded by lanate, radiating leaves:
66a Capitula discoid:
67a Ovaries with relatively large and conspicuous white hairs, pappus bristles fused at base in a smooth ring, shaft usually plumose, rarely barbellate or smooth ..... **Syncarpha**
67b Ovaries either without large white hairs or pappus bristles not fused at base (although they may cohere strongly by patent cilia) ..... **Helichrysum**
66b Capitula disciform:
68a Female florets outnumbering disc florets:
69a Pappus bristles apically plumose, basally connate; stereome undivided; cypselas with globose, myxogenic twin-hairs ..... **Helichrysopsis**

69b Pappus bristles barbellate, basally free; stereome divided; cypselas never with globose twin-hairs:
70a Capitula with less than 20 florets ..... **Helichrysum**
70b Capitula with more than 20 florets ..... **Pseudognaphalium**
68b Female florets fewer than disc florets:
71a Capitula large, solitary or few together; pappus basally connate, of many distinctly plumose bristles; cypselas with globose hairs ..... **Syncarpha**
71b Capitula large or small; pappus barbellate or only somewhat plumose but then with few, basally free bristles and cypselas not with globose hairs:
72a Capitula large, solitary; leaves small, triangular, adpressed, concave and adaxially tomentose.. ..... **Edmondia**
72b Capitula small or, if large, then leaves not as above ..... **Helichrysum**

Tribe **Helenieae**

Herbs, subshrubs or shrubs. **Leaves** generally opposite, at least below, sometimes alternate throughout or rosulate, entire or serrate-dentate to pinnatisect or lobed, often trinerved. **Capitula** radiate or discoid, rarely disciform, solitary or corymbose-paniculate. **Involucral bracts** generally in 1 or 2, sometimes 3, rarely 4 rows, generally herbaceous, occasionally scarious, sometimes partly or wholly connate. **Receptacle** generally epaleate. **Ray florets** female, rarely female-sterile or neuter, mostly yellow or white, sometimes violet, pink, reddish, orange, purplish, brownish or greenish. **Disc florets** bisexual, rarely functionally male, generally with narrow tube and expanding limb, sometimes funnel-shaped, generally 5-lobed or sometimes 4-lobed, generally yellow, rarely white, pink, violet, purple, orange or greenish. **Anthers** generally shortly calcarate or sometimes distinctly ecalcarate, usually ecaudate, rarely caudate; appical appendage generally ovate to cordate, rarely narrowly oblong, sometimes glandular; endothecial tissue polarised, rarely radial; filament collar sometimes broadened towards base, dilated. **Style** with oblong-linear style branches generally with sterile appendages of ± fused hairs, or sometimes truncate and apically penicillate; hairs obtuse; stigmatic areas in 2 separate lines. **Cypselas** brown to blackish, with or without striations, usually with short to long twin hairs; ray cypselas generally triquetrous, sometimes partly or wholly enclosed by subtending involucral bracts; disc cypselas generally terete or prismatic. **Pappus** generally of scales with or without extended bristle-like midrib, entire or sometimes dissected, sometimes of barbellate or plumose bristles; sometimes 0.

Genera 110, North, Central and South America, more rarely in tropical Africa and Asia, Eurasia, Hawaiian Islands, 1 species native to Australia; 5 genera and 5 species in sthn Afr., mostly naturalised weeds.

Lindley: 1074 (1829); Bentham: 199 (1873a); Karis & Ryding: 533 (1994).

Key based on Hilliard: 324 (1977).

Key to genera

1a Involucral bracts connate for most of their length, gland-dotted ..... ***Tagetes**
1b Involucral bracts free; not gland-dotted:
2a Involucral bracts many, appressed hairy, margins with long bristles ..... ***Gaillardia**
2b Involucral bracts few (± 3–6), glabrous:
3a Leaves pinnate, alternate; individual heads solitary on long peduncles ..... ***Schkuhria**
3b Leaves simple, opposite:
4a Capitula small, aggregated into secondary capitula, terminal and axillary; pappus 0 ..... ***Flaveria**
4b Capitula large, solitary on long peduncles at ends of branches; pappus present, of ± fimbriately winged setae, usually uncinate ..... **Hypericophyllum**

Tribe **Heliantheae**

Herbs, subshrubs or shrubs, sometimes aquatic herbs. **Leaves** generally opposite, at least below, sometimes alternate throughout or rosulate; entire or serrate-dentate to pinnatisect or lobed, often trinerved, often scabrid with multiseptate hairs or woolly hairs or glabrous. **Capitula** radiate, discoid or rarely disciform, solitary or in variously arranged synflorescences. **Involucral bracts** in 1–3, sometimes many, rows; generally herbaceous, sometimes scarious, chartaceous, membranous or foliaceous, sometimes distinctly dimorphic or with scarious margins. **Receptacle** paleate, paleae flat or often conduplicate, membranous or with herbaceous, or rarely lignified-pungent tip, deciduous or persistent. **Ray florets** generally female and fertile, sometimes sterile or neuter, usually yellow, sometimes white, rarely pink, red or purple. **Disc florets** bisexual or functionally male, generally with narrow tube and expanding limb, shallowly 5-lobed, sometimes shallowly 4-lobed, generally yellow, rarely white, purplish or greenish; lobes frequently papillose adaxially. **Anthers** shortly calcarate, ecaudate, usually blackish, sometimes pale, rarely reddish, greenish or yellowish; apical appendage generally ovate to cordate, concave, acute, sometimes truncate to emarginate or acuminate, often glandular; endothecial tissue usually polarised, rarely radial; filament collar generally broadened towards base, dilated, sometimes continuous around filament. **Style** with oblong-linear style branches, generally with sterile appendages of ± fused hairs or sometimes truncate and apically penicillate; hairs obtuse; stigmatic areas in 2 separate lines or sometimes with continuous stigmatic areas. **Cypselas** brown to blackish, usually with short to long twin hairs, sometimes glabrous; ray cypselas generally triquetrous, sometimes dorsiventrally compressed and then generally with multiseptate hairs, or rarely laterally compressed; disc cypselas angular or laterally compressed and ± enclosed by subtending paleae, sometimes dorsiventrally compressed. **Pappus** of stout to fragile awns, scales and/or barbellate to plumose bristles, rarely coroniform or sometimes 0.

Genera 189, worldwide but mainly in North and South America; 25 genera and 46 species in sthn Afr., mostly naturalised weeds.

Cassini: 189 (1819a); Karis & Ryding: 578 (1994).

Key after Wild: 1 (1967) and Hilliard: 290 (1977).

Key to genera

1a Capitula unisexual:
- 2a Involucral bracts of male capitula connate; female capitula 1-flowered; cypsela clasped by female involucre which bears 4–6 spines ..... ***Ambrosia**
- 2b Involucral bracts of male capitula free; female capitula 2-flowered; cypsela clasped by female involucre bearing hooked spines ..... ***Xanthium**

1b Capitula bisexual:
- 3a Florets of disc sterile:
  - 4a Cypselas tightly clasped by one of the inner involucral bracts which developed hooked spines; pappus 0 ..... ***Acanthospermum**
  - 4b Cypselas clasped by an involucral scale and 2 lateral, concave, involucral paleae; pappus of 2 recurved awns clasping the margin of the cypsela ..... ***Parthenium**
- 3b Florets of disc fertile (or only innermost sterile):
  - 5a Receptacular paleae ± flat not clasping cypselas:
    - 6a Involucral bracts quite free, the inner merging gradually into the receptacular paleae; leaves simple:
      - 7a Pappus 0; lamina of ray florets golden yellow ..... ***Guizotia**
      - 7b Pappus present; lamina of ray florets white, cream or yellow:
        - 8a Pappus of densely plumose bristles ..... ***Tridax**
        - 8b Pappus of scales, persistent or caducous:
          - 9a Pappus of 2 scales, soon caducous, cypselas winged; large yellow rays ..... ***Coreopsis**
          - 9b Pappus of several scales, cypselas not winged; very small, white rays ..... ***Galinsoga**
    - 6b Involucral bracts of the inner row connate at base, outer row fewer and mostly smaller or narrower; leaves variously divided:
      - 10a Leaves alternate ..... ***Chrysanthellum**
      - 10b Leaves opposite:
        - 11a Ray florets yellow, golden, orange or 0 ..... **Bidens**
        - 11b Ray florets white, pink, lilac or red ..... ***Cosmos**
  - 5b Receptacular paleae ± conduplicate and clasping or enfolding cypselas:
    - 12a Involucral bracts 4, in 2 rows of opposite pairs, leafy; flower heads axillary, sessile or subsessile ..... **Enydra**
    - 12b Involucral bracts 3 to many, but not in 2 rows of opposite pairs and leafy; capitula not sessile or subsessile and axillary:
      - 13a Inner involucral bracts embracing fertile ray cypselas; involucral bracts spathulate and densely glandular ..... ***Sigesbeckia**
      - 13b Inner involucral bracts not embracing outermost cypselas:
        - 14a Leaves alternate as a rule; receptacular paleae cymbiform, clasping cypselas and produced above into a ± tubular neck; ray florets 0 or neuter ..... **Sclerocarpus**
        - 14b Leaves opposite, sometimes alternate above:
          - 15a Cypselas surmounted by a distinct, often lacerate cupule; additional pappus bristles present or 0:
            - 16a Ray florets sterile (although style and stigmas rarely present); all cypselas ± alike, bilaterally convex or obscurely 4-angled ..... **Aspilia**
            - 16b Ray florets fertile (with style and stigmas and producing mature cypselas; outer cypselas ± triquetrous:
              - 17a Laminas conspicuous, yellow; leaves lobulate; petioles short; capitula long-pedunculate; cypselas tuberculate with caducous aristae ..... ***Sphagneticola**
              - 17b Laminas small, white; leaves simple; petioles slender; capitula subsessile or shortly pedunculate; cypselas minutely transversely rugulose with persistent barbellate awns ..... **Blainvillea**
          - 15b Cypselas without pappus or with pappus of various kinds, but not a cupule:
            - 18a Ray florets persistent; annual herbs up to 0.6 m tall; unbranched; leaves narrowly oblong-ovate ..... ***Zinnia**
            - 18b Ray florets not persistent:
              - 19a Cypselas 4-sided; capitula large and showy with orange-red or yellow ray florets; apex of peduncles becoming very thick ..... ***Tithonia**
              - 19b Cypselas ± compressed or, if not noticeably compressed, peduncles not swollen above:
                - 20a Receptacular paleae obovate, truncate-emarginate and caudate-spinescent at apex; perennial shrubs up to 6 m tall with white rays ..... ***Montanoa**
                - 20b Receptacular paleae not caudate-spinescent:
                  - 21a Disc florets deep purple, at least above ..... ***Helianthus**
                  - 21b Disc florets not purple:
                    - 22a Disc florets white; receptacular paleae very narrow and often setiform ..... ***Eclipta**
                    - 22b Disc florets not white, ± yellowish:
                      - 23a Cypselas thick or angular, not compressed, pubescent at apex, not winged or margined ..... ***Melanthera**
                      - 23b Cypselas ± compressed, winged or with a hyaline cartilaginous margin:

24a Cypsela with broad, irregular margin; lamina of ray florets 10 mm long or more..... *Verbesina
24b Cypsela with hyaline, cartilaginous margin; ray florets ± 1.3 mm long or 0 ..... Spilanthes

Tribe **Inuleae**

Herbs, subshrubs or shrubs, occasionally with winged stems. **Leaves** generally alternate, sometimes opposite, entire to pinnatifid or pinnatisect, serrate or dentate, often glandular and hairy, hairs of type A (multiseptate hairs with short cells). **Capitula** radiate, disciform or discoid, solitary, corymbose or paniculate. **Involucral bracts** imbricate in several rows, chartaceous or herbaceous. **Receptacle** flat or convex, usually smooth, sometimes honeycombed, generally epaleate, rarely paleate. **Ray florets** female, in 1, 2 or rarely several rows, lamina generally yellow or whitish and well-developed, but sometimes very short or 0; occasionally outer florets filiform and sometimes pink to crimson; adaxial epidermal cells of ray florets elongated with rugose or longitudinally striate cuticle. **Disc florets** bisexual, yellow, sometimes purple or white, generally with 5 short lobes; corolla epidermal cells with straight walls. **Anthers** ecalcarate or calcarate, caudate, tails long and branched or short and ± unbranched; endothecial tissue generally of elongate cells, radial or polarised. **Style** with oblong to linear, rounded style branches and hairs reaching to bifurcation, rarely below bifurcation; hairs acute or rarely obtuse; stigmatic areas in 2 apically confluent lines. **Cypselas** ellipsoid, turbinate or triquetrous, often with ribs, glabrous or with elongated not myxogenic twin hairs; cypsela epidermis sometimes with 1 elongated calcium oxalate crystal in each cell. **Pappus** of scales only or composed of ± free, barbellate, rarely plumose, capillary bristles in 1 row, with or without outer row of small scales or rarely 0.

Genera 38, mainly northern hemisphere, particularly Europe, North Africa, Arabian Peninsula, Middle East and Central Asia; few genera in tropical and sthn Afr.; 12 genera and 47 species in sthn Afr.

Cassini: 193 (1819a); Anderberg: 85 (1991b); Anderberg: 282 (1994).

Key to the genera of the Inuleae partly after Anderberg: 85 (1991b).

Key to genera

1a Pappus 0, or of wide scales, often with protruding bristle-like mid-portion, or very short, not of capillary bristles:
2a Receptacle epaleate:
3a Receptacle clothed with many bristles..... **Geigeria**
3b Receptacle without bristles..... **Calostephane**
2b Receptacle paleate:
4a Stem winged; pappus of very short barbellate bristles..... **Ondetia**
4b Stem not winged; pappus of scales or 0 ..... **Anisopappus**
1b Pappus of well-developed capillary bristles:
5a Pappus of bristles and scales:
6a Pappus bristles plumose ..... **Pegolettia** in part
6b Pappus bristles barbellate:
7a Pappus scales forming short connate cup; capitula generally disciform..... **Pulicaria**
7b Pappus scales ± free; capitula discoid ..... **Pegolettia** in part
5b Pappus of bristles only:
8a Capitula discoid:
9a Leaves pinnatifid or profoundly lobed..... **Antiphiona**
9b Leaves neither pinnatifid nor lobed:
10a Capitula small, few-flowered..... ***Pentanema**
10b Capitula larger, many-flowered..... **Inula glomerata**
8b Capitula radiate or disciform:
11a Marginal florets female, filiform:
12a Leaves linear-lanceolate, sessile, margin entire; involucral bracts linear-lanceolate, distinctly imbricate; stems sometimes narrowly winged ..... **Pechuel-Loeschea**
12b Leaves elliptic to ovate, petiolate, margins serrate; involucral bracts many, linear-filiform; stems never winged ..... **Blumea**
11b Marginal florets female, radiate or miniradiate:
13a Endothecial tissue radial..... **Inula paniculata**
13b Endothecial tissue polarised ..... ***Dittrichia**

Tribe **Lactuceae**

Herbs, rarely subshrubs; latex abundant. **Leaves** alternate or often rosulate, entire or frequently dentate-pinnatisect to lobed, sometimes spinulose. **Capitula** ligulate; solitary or cymose to corymbose-paniculate, rarely in spike-like or racemose synflorescences. **Involucral bracts** in several rows or frequently in 2 distinct unequal rows, rarely in single row; often herbaceous, sometimes scarious-margined. **Receptacle** mostly epaleate and naked or rarely paleate. All **florets** bisexual, ligulate (i.e. strap-shaped with 5 apical lobes), mostly yellow or often violet, blue, pink, purple or white, rarely orange-red, sometimes with pilose tube. **Anthers** calcarate and caudate; apical appendage elongate and obtuse-rounded; endothecial tissue radial; filaments smooth. **Style** slender, mostly with rather long and slender style branches, evenly pilose with long or short hairs on shaft and along branches; hairs acute. **Cypselas** terete to ellipsoid-

fusiform to obovoid-obconical, sometimes compressed or flattened, frequently ribbed or angular, sometimes scabrid-muricate or tuberculate, mostly glabrous or sparsely pubescent, often with long beak. **Pappus** mostly of scabrid-barbellate bristles, more rarely of plumose bristles, sometimes with outer row of hairs or with intermixed hairs, rarely of minute scales, sometimes 0.

Genera 98, mainly northern hemisphere and especially southern Europe, North Africa, SW and central Asia, western North America, rarely in tropical and sthn Afr., tropical Asia, South America, Australia and New Zealand; 13 genera and 51 species in sthn Afr., mostly weeds.

Cassini: 151 (1819a); Pope: 189 (1992); Bremer: 175 (1994).

Key after Hilliard: 596 (1977).

Key to genera

1a Pappus of small scales up to 2 mm long ..... ***Cichorium**
1b Pappus of hairs or bristles at least 4 mm long:
2a Hairs of pappus feathery or at least inner ones so:
3a Receptacular paleae present ..... ***Hypochaeris**
3b Receptacular paleae 0:
4a Plants glabrous at maturity, sometimes floccose when young ..... ***Tragopogon**
4b Plants rough hairy:
5a Pappus in 1 row; fruit with a stout hollow beak ..... ***Urospermum**
5b Pappus in 2 rows; fruit beak slender, not hollow ..... ***Picris**
2b Hairs of pappus not feathery, at most somewhat barbellate:
6a Cypselas 2–3.5 mm long, obconic, truncate above, pappus of comparatively few coarse scabrid bristles ..... **Tolpis**
6b Cypselas and pappus not as above:
7a Cypselas tuberculate in upper part with a long slender beak; scapes one-headed, hollow ..... ***Taraxacum**
7b Cypselas and scapes not as combined above, or plants not scapigerous:
8a Pappus dimorphic:
9a Pappus of setae and fine down-like hairs intermixed ..... **Sonchus**
9b Pappus in outer florets a small corona, in inner florets of few coarse, basally flattened and scale-like, scabrid bristles ..... ***Hedypnois**
8b Pappus of setae only, monomorphic, rarely with an outer ring of very short setae:
10a Cypselas truncate, without ascending hairs or ascending rough projections on the ribs or margins ..... **Launaea**
10b Cypselas beaked or at least somewhat attenuate above with ascending hairs or rough projections on the ribs or at least on the margins:
11a Cypselas ± compressed and equal-ribbed, with ascending evident or submicroscopic hairs on the ribs or at least the margins; involucres mostly cylindrical ..... ***Lactuca**
11b Cypselas ± terete and equal-ribbed, rough with ascending projections on the ribs; involucres usually ob-conic:
12a Capitula many-flowered; involucre hairy ..... ***Crepis**
12b Capitula with 8–15 flowers; involucre glabrous ..... ***Youngia**

Tribe **Mutisieae**

Herbs, shrubs or trees, sometimes xerophytic and spiny. **Leaves** alternate or rosulate, entire to variously dentate-lobed or sometimes pinnatisect. **Capitula** discoid, disciform or radiate, solitary or variously arranged. **Involucral bracts** generally chartaceous and in several rows, more rarely herbaceous and in few rows. **Receptacle** epaleate. **Marginal florets** (if present) bilabiate with expanded lamina, only occasionally without adaxial lobes, bisexual, female or neuter; few species with disciform capitula with inconspicuous, female marginal florets. **Disc florets** regular and deeply 5-lobed or frequently bilabiate, bisexual or functionally male or female. **Anthers** calcarate and caudate; tails often branched (pilose); apical appendage often rather long and coloured, flat; endothecial tissue polarised. **Style** variable; style branches frequently rather short, glabrous to papillose or pilose dorsally and apically; hairs acute or obtuse-rounded; stigmatic areas cover inside of style branches. **Cypselas** oblong-obovoid, sometimes rather slender, often ribbed. **Pappus** of many scabrid to barbellate, sometimes plumose bristles, rarely of scales, or with additional scales.

Genera 74, pantropical, greatest concentration in South America; also in Central America, West Indies, southern North America, tropical and sthn Afr., Madagascar, tropical and East Asia, Hawaiian Islands, Australia; 5 genera and 40 species in sthn Afr.

Cassini: 199 (1819a); Pope: 4 (1992); Bremer: 93 (1994).

8b Pappus bristles many ..... **Laggera**

Tribe **Senecioneae**

Herbs, shrubs, subshrubs, trees or vines. **Leaves** alternate or sometimes rosulate, entire to variously serrate-dentate or lobed, pinnately or sometimes palmately veined, rarely succulent. **Capitula** radiate, disciform or discoid, solitary or cymose to corymbose-paniculate. **Involucral bracts** mostly in 1 row, oblong-lanceolate, calyculate (outer row of smaller bracts) or ecalyculate; rarely in 2 subequal rows (biseriate), sometimes connate. **Receptacle** always epaleate and mostly naked. **Ray florets** female, fertile, yellow, white or variously coloured. **Disc florets** bisexual or sometimes functionally male, 5-lobed, yellow, whitish or variously coloured; outer florets in disciform capitula female, tubular or filiform. **Anthers** ecalcarate, ecaudate or sometimes caudate; apical appendage ovate-lanceolate to oblong, flat; endothecial tissue of elongated cells, radial or polarised; filament collar slender or often much dilated with swollen cells. **Style** in bisexual florets with oblong-linear, dorsally glabrous or rarely papillose style branches, apically usually truncate and penicillate, sometimes almost glabrous, sometimes acute to acuminate with sterile appendage and ± fused hairs; hairs obtuse; stigmatic areas in 2 separate lines or partly or wholly continuous ventrally on style branches. **Cypselas** rather uniform, mostly ellipsoid-oblong and ribbed, rarely compressed, glabrous or pubescent with twin hairs, rarely myxogenic. **Pappus** of scabrid-barbellate (never plumose), fine or coarse bristles; bristles rarely reduced and short or 0.

Genera 120, worldwide, especially abundant in Central and South America, tropical and sthn Afr.; 20 genera and 593 species in sthn Afr.

Cassini: 196 (1819a); Bremer: 494 (1994).

Key to the genera of the tribe Senecioneae compiled from descriptions in Bremer (1994) and key by Jeffrey: 874 (1986).

Key to genera

1a Aquatic herbs:
2a Capitula radiate; style undivided; pappus of coarse, rigid, scabrid bristles ..... **Cadiscus**
2b Capitula discoid; style divided; pappus of fine bristles ..... **Emilia**
1b Plants not aquatic:
3a Pappus 0 in all florets:

4a Annual herbs ..... **Steirodiscus**
4b Perennial herbs, shrubs or shrublets ..... **Euryops**
3b Pappus present, at least in ray florets:
5a Involucre calyculate:
6a Anther bases with sterile tailed auricles (caudate):
7a Petiole auriculate, capitula discoid ..... **Delairea**
7b Petioles basally thickened and climbing, exauriculate; capitula disciform ..... **Mikaniopsis**
6b Anther bases ecaudate:
8a Ovary wall crystals simple, plate-like or needle-like or 0:
9a Outer (ray) cypselas dorsiventrally compressed ..... **Cineraria**
9b Outer (ray) cypselas not compressed, or radiate florets 0:
10a Style branch apices not appendaged, truncate or rounded ..... **Senecio**
10b Style branch apices with very short to elongated appendage of fused papillae ..... **Crassocephalum**
8b Ovary wall crystals compound, drusiform:
11a Subsucculent; style branches truncate, sometimes with central tuft of fused papillae ..... **Solanecio**
11b Succulent; style branches with conical to somewhat elongated appendages ..... **Kleinia**
5b Involucre ecalyculate:
12a Capitula radiate with epidermis of ray lamina papillose; anther bases caudate ..... **Phaneroglossa**
12b Capitula discoid, disciform or if radiate, epidermis of ray lamina different; anther bases ecaudate:
13a Capitula discoid:
14a Style branches with continuous stigmatic areas ..... **Lamprocephalus**
14b Style branches with separate stigmatic areas:
15a Style branches linear-obtuse with long, filiform, papillose appendages ..... **Lopholaena**
15b Style branches linear, truncate to obtuse with smaller appendages or appendages 0:
16a Style branches with small appendages:
17a Annual or perennial herbs; involucral bracts free; florets orange, red, pink, purple, violet or white..... **Emilia**
17b Perennial herbs, subshrubs or shrubs; involucral bracts basally connate; florets yellow or whitish..... **Othonna**
16b Style branches without appendages:
18a Florets orange, red, pink, purple, violet or white ..... **Emilia**
18b Florets yellow ..... **Euryops**
13b Capitula radiate or disciform:
19a Capitula disciform:
20a Annual herbs; disc florets bisexual; cypselas compressed; pappus 0 in marginal florets ..... **Stilpnogyne**
20b Perennial herbs, shrublets or shrubs; disc florets functionally male; cypselas ellipsoid to oblong; pappus present:
21a Style of central florets undivided ..... **Othonna**
21b Style of central florets divided, with oblong-linear, obtuse or truncate branches ..... **Hertia**
19b Capitula radiate:
22a Endothecial tissue of anthers polarised ..... **Alciope**
22b Endothecial tissue radial:
23a Annual herbs:
24a Leaves alternate, scattered along stem ..... **Oligothrix**
24b Leaves rosulate:
25a Capitula small, corymbosely arranged on long scapes ..... **Gymnodiscus**
25b Capitula large, solitary on long scapes ..... **Euryops**
23b Perennial herbs, shrublets or shrubs:
26a Disc florets bisexual, rarely functionally male; style bifid, sometimes undivided ..... **Euryops**
26b Disc florets functionally male:
27a Style undivided ..... **Othonna**
27b Style divided ..... **Hertia**

Tribe **Tarchonantheae**

Shrubs or trees, dioecious; often aromatic. **Leaves** alternate, petiolate or subsessile, entire, spinulose-denticulate, coarsely dentate, serrate or 3-lobed at apex, leathery, sometimes pale and tomentose below. **Capitula** discoid, in terminal or axillary panicles. **Involucre** campanulate to elliptic or obconic; involucral bracts in 1–several rows, often imbricate. **Receptacle** epaleate. **Florets** yellowish or whitish. **Male capitula** with 5-lobed, tubular corollas. **Anthers** exserted, calcarate and caudate; endothecial tissue polarised. **Style** filiform, minutely bifid at tips or undivided. **Female capitula** with 3–5-lobed, tubular to filiform corolla, very short in *Tarchonanthus*. **Style** simple, exserted, with short often recurved branches, flattened or blunt near tip. **Cypselas** angled or few-ribbed, pubescent. **Pappus** 0 (*Tarchonanthus*) or of 1 or 2 rows of rough bristles (*Brachylaena*).

Genera 2, *Brachylaena* R.Br. and *Tarchonanthus* L. restricted to Africa, Madagascar and associated islands; both in sthn Afr.

Kosteletzky: 668 (1833); Keeley & Jansen: 179 (1991).

Key to the genera of the tribe Tarchonantheae after Hilliard (1977).

Key to genera

Pappus of scabrid bristles..... **Brachylaena**
Pappus 0..... **Tarchonanthus**

Tribe **Vernonieae**

Herbs, shrubs, small trees or vines. **Leaves** mostly alternate, sometimes rosulate or opposite or verticillate, mostly entire or serrate-dentate only. **Capitula** mostly discoid; very variously arranged, solitary, corymbose, paniculate, scorpioid cymose, clustered, etc. **Involucral bracts** generally imbricate in several rows. **Receptacle** generally epaleate. **Disc florets** bisexual, regular, 5-lobed, often glandular and sometimes pilose; white, pink, violet, blue, red or purple, rarely yellow or orange. **Anthers** calcarate but mostly ecaudate; apical appendage elongate, obtuse-rounded; endothecial tissue polarised. **Style** slender with long, filiform branches, pilose dorsally along style branches and on shaft below; hairs mostly acute. **Cypselas** oblong to obovoid-obconical, often ribbed or angled; frequently sericeous with twin hairs or glabrous, often glandular. **Pappus** of scabrid-barbellate bristles, rarely plumose, or of scales, or a corona, frequently double with outer row of much shorter scales or bristles, sometimes 0.

Genera 98, pantropical, South America, Central and North America, West Indies, tropical and sthn Afr., Madagascar, few in tropical Asia and 1 in N Australia; 7 genera and 51 species in sthn Afr.

Cassini: 203 (1819a); Pope: 56 (1992); Bremer: 212 (1994).

Key to genera

1a Pappus 0, cypsela crowned with apical rim..... ***Ethulia**
1b Pappus of bristles or scales:
2a Pappus of a few, caducous bristles:
3a Leaves alternate, minutely pellucid-dotted; pappus bristles shortly hairy..... **Erlangea**
3b Leaves opposite or whorled, not pellucid-dotted; pappus bristles hispid..... **Bothriocline**
2b Pappus in 2 rows, outer row of short scales or rarely bristles, inner row of many long, serrated bristles:
4a Flowers yellow or orange and/or leaves trinervate..... **Distephanus**
4b Flowers creamy-white, shades of purple or blue; leaves pinnately veined:
5a Pollen without colpi; endothecial tissue with cells thickened on both horizontal and radial walls; filament collars narrowly cylindrical, elongate, straight; style bases conspicuously ring-like..... ***Cyanthillium**
5b Pollen with colpi; endothecial tissue polarised; filament collars and style bases different:
6a Inner involucral bracts with membranous and frequently coloured, spreading appendages; style bases surrounded by long keeled nectaries..... **Baccharoides**
6b Inner involucral bracts without appendages; style bases different..... **Vernonia**

***Acanthospermum** Schrank 9130000

(Heliantheae)
Schrank: t. 53 (1820); Candolle: 5 (1836); Phillips: 812 (1951); Wild: 5 (1967); Hilliard: 292 (1977); Karis & Ryding: 609 (1994).

Erect or prostrate, annual herbs. **Leaves** opposite, sessile or petiolate, simple, margins dentate or pinnatisect. **Capitula** radiate; solitary, sessile or pedunculate, in leaf axils or forks of branches. **Involucre** in 2 rows; outer bracts herbaceous, inner enlarging in fruit, indurate, spiny, enveloping cypselas of ray florets. **Receptacle** conical, paleate. **Ray florets** 5–8, female fertile; corolla yellow, shortly strap-shaped. **Style** branches linear, obtuse. **Cypselas** oblong, smooth, tightly enveloped in one of the involucral bracts. **Pappus** 0. **Disc florets** bisexual, functionally male; corolla yellow, usually campanulate with narrow tube, 5-toothed. **Anthers** with obtuse bases, apical appendage present. **Style** undivided, somewhat clavate. **Ovary** of disc florets abortive. $x = 10, 11$.

Species 6, Central and South America; 3 naturalised in sthn Afr., widespread, absent from Northern and Western Cape.

***Achillea** L. 9332000

(Anthemideae)
Linnaeus: 896 (1753); Linnaeus: 382 (1754); Hilliard: 344 (1977); Bremer & Humphries: 128 (1993); Bremer: 462 (1994).

Perennial herbs, usually hairy, sometimes aromatic. **Leaves** alternate, usually pinnatisect. **Capitula** radiate, small, in corymbs. **Involucre** ovoid or campanulate, rarely subglobose; bracts in few rows, outer shorter than inner, margins scarious. **Receptacle** nearly flat, convex or elongated, paleate. **Ray florets** female, fertile; corolla strap-shaped, usually short and broad; tube ± flattened; white, yellow or rosy. **Disc florets** bisexual, fertile, white or yellow; tube usually compressed, 2-winged below, dilated above, 5-toothed. **Anthers** ecalcarate and ecaudate, with ovate apical appendage. **Style** branches linear, truncate, penicillate. **Cypselas** oblong or obovate, strongly compressed, with 2 lateral ribs. **Pappus** 0. $x = 9$ (aneuploids, high polyploidy, B-chromosomes).

Species 115, Europe, Asia, Africa, North America, Australia and New Zealand; 1 naturalised as weed in sthn Afr.: **Achillea millefolium* L., Botswana, Gauteng, Mpumalanga, KwaZulu-Natal and Eastern Cape.

Adenanthellum B.Nord. 9341050

(Anthemideae)
Nordenstam: 160 (1979); Bremer & Humphries: 145 (1993); Bremer: 470 (1994).

Adenanthemum B.Nord. not of Conw.; Nordenstam: 157 (1976).

Perennial herbs. **Leaves** alternate, sessile, lanceolate-ovate-elliptic, flat, herbaceous, pubescent-glabrescent, with serrate margins. **Capitula** radiate, terminal, solitary or laxly corymbose on ± distinctly pedunculoid branch ends. **Involucre** broadly campanulate; involucral bracts imbricate, lanceolate-oblong-narrowly obovate, herba-

ceous, acute, with membranous margins and tips. **Receptacle** somewhat convex, epaleate. **Ray florets** many, female, fertile, white, without distinct tube; lamina apically bifid or subentire, with densely colliculate upper surface and glandular smooth lower surface, confluent with cypsela. **Disc florets** many, bisexual, yellow; corolla tubular ± regular, 5-lobed, glandular, confluent with cypsela. **Anthers** ecalcarate and ecaudate, with broadly ovate-oblong obtuse-rounded appendage; endothecial cells with many thickenings on vertical walls; filament collar oblong, of subequal cells. **Style** fertile with truncate branches; style base swollen, placed on top of and partly immersed in short and broad nectary. **Cypselas** oblong, somewhat compressed with 10 ribs, 10 veins and 10 associated resin ducts, glandular. **Pappus** 0.

Monotypic: *Adenanthellum osmitoides* (Harv.) B.Nord.; endemic to sthn Afr., Mpumalanga, Swaziland and N KwaZulu-Natal.

Adenoglossa B.Nord. 9341010

(Anthemideae)

Nordenstam: 137 (1976); Bremer & Humphries: 157 (1993); Bremer: 472 (1994).

Erect annual herbs. **Leaves** opposite or alternate, narrowly linear, entire, fleshy, semiterete or subterete. **Capitula** radiate, terminal, solitary, pedunculate. **Involucre** broadly campanulate-hemispherical; involucral bracts imbricate, broad and rounded, herbaceous. **Receptacle** conical, epaleate. **Ray florets** female, fertile, few, yellow; tube short, somewhat compressed, sparsely glandular; lamina short, oblong-obovate, usually reflexed, glabrous, 3-fid at apex. **Style** branches oblong, truncate. **Disc florets** bisexual; corolla yellow, irregular, 5-lobed; limb campanulate; tube somewhat compressed, glandular. **Anthers** ecalcarate and ecaudate; apical appendage ovate, obtuse, with distinct orange-yellow resin gland; endothecial tissue partly polarised; filament collar oblong-cylindric, of subequal cells. **Style** fertile with truncate branches; base distinctly swollen, placed on top of narrower, conical-oblong, distinct nectary. **Cypselas** dorsiventrally compressed and laterally winged, adaxially smooth, abaxially with closely set longitudinal striae, ending in hair-like apical projections and becoming mucilaginous when soaked; wings hyaline, apically auriculate. **Pappus** of 5 or 6 scales.

Monotypic: *Adenoglossa decurrens* (Hutch.) B.Nord.; endemic to sthn Afr., Northern Cape (Richtersveld).

Adenostemma J.R. & G.Forst. 8785000

(Eupatorieae)

Forster & Forster: 89 (1776); Harvey: 57 (1865); Oliver & Hiern: 299 (1877); Phillips: 777 (1951); Cufodontis: 1079 (1966); Merxmüller: 19 (1967a); Hilliard: 47 (1977); Bremer *et al.*: 648 (1994).

Perennial herbs, glandular-pilose or glabrous. **Leaves** opposite, dentate or subentire. **Capitula** discoid; many-flowered, pedunculate, in lax corymbose panicles. **Involucre** campanulate; bracts in ± 2 rows, ± connate at base. **Receptacle** honeycombed, epaleate. **Corolla** white or mauve; tubular, widening gradually upwards; lobes 5, shorter than tube, glandular-hairy. **Anthers** linear, blunt at base; with or without small, apical appendage. **Style** branches long, dilated above, obtuse, sometimes subpetaloid, papillose on outer surface. **Cypselas** 3- or 5-angled. **Pappus** of 3 or 5 short, rigid gland-tipped processes. $x = 10$.

Species 24, South and Central America, West Indies, Africa, Asia, Pacific Islands; 2 in sthn Afr.: *Adenostemma caffrum* DC. widespread but not known from the Western Cape and *A. viscosum* J.R.Forst. & G.Forst., occurring in the Northern Province, Mpumalanga, KwaZulu-Natal and Eastern Cape.

*Ageratina Spach 8816030

(Eupatorieae)

Spach: 286 (1841); King & Robinson: 211 (1970a); Bremer *et al.*: 644 (1994).

Eupatorium L.: 836 (1753) in part; Hilliard: 52 (1977).

Annual or perennial herbs or shrubs. **Leaves** opposite, alternate or sometimes whorled. **Capitula** discoid; few- to many-flowered, in dense corymb or occasionally paniculate. **Involucre** tubular; bracts in 1–many rows. **Receptacle** flat, epaleate. **Corolla** purple, blue or white; tubular and scarcely widened upwards, or cylindric below, campanulate above; lobes 4 or 5, much shorter than tube. **Anthers** obtuse at base. **Style branches** filiform, obtuse, papillose outside. **Cypselas** prismatic or fusiform, setose and/or glandular. **Pappus** of many scabrid, usually deciduous bristles. $x = 17$ (aneuploids, B-chromosomes, polyploidy).

Species ± 290, America; 3 naturalised in sthn Afr., Gauteng, KwaZulu-Natal and Western Cape.

*Ageratum L. 8795000

(Eupatorieae)

Linnaeus: 839 (1753); Linnaeus: 363 (1754); Harvey: 57 (1865); Oliver & Hiern: 300 (1877); Phillips: 777 (1951); Johnson: 13 (1971); Hilliard: 50 (1977); Bremer *et al.*: 649 (1994).

Annual or perennial herbs or subshrubs. **Leaves** opposite or upper alternate, entire or dentate, with large glandular spots on lower surface. **Capitula** discoid; many-flowered, in dense corymbs or occasionally a lax panicle. **Involucre** campanulate; bracts in 2 or 3 rows, free, ribbed, with membranous margins. **Receptacle** honeycombed, conical, naked or paleate. **Corolla** purple, blue or white; tube cylindric below, campanulate above; lobes 5, much shorter than tube, glandular. **Anthers** obtuse at base, with oblong, apical appendage. **Style** terete, with short glandular branches. **Cypselas** 4- or 5-ribbed, glabrous or short-setose on ribs; carpopodium usually large and asymmetrical. **Pappus** coroniform, of 5 or 6 free scales or awns or 0. $x = 10$ (aneuploids, polyploidy).

Species 44, all natives of Central and South America, the West Indies; 2 naturalised in sthn Afr.: **Ageratum conyzoides* L. occurring in the Northern Province and Mpumalanga, and **A. houstonianum* Mill., known from KwaZulu-Natal and Eastern Cape.

Alatoseta Compton 9090010

(Gnaphalieae)

Compton: 314 (1931); Anderberg: 46 (1991a); Anderberg: 321 (1994).

Annual herbs. **Stems** spreading, slender, stiff, softly hairy. **Leaves** alternate, sessile, narrowly linear, inrolled, entire margins, glandular-hairy, mucronate and pungent. **Capitula** radiate; solitary, terminal. **Involucre**: bracts in several rows; outer bracts narrowly winged, rough, pungent, spreading or reflexed; inner narrow, margin papery. **Receptacle** flat, with many, narrow paleae among the florets. **Ray florets** female, in one row, fewer than disc florets; corolla purple; tube short; lamina narrowly ovate. **Cypselas** short, hairy. **Pappus** of five rigid, scale-like awns with two flattened basal wings. **Disc florets** bisexual; corolla yellow; tube with a fold below the middle; lobes 5, erect. **Anthers** minutely appendiculate. **Style** branches long, semiterete, obtuse with a sterile; apical appendage and hairs dorsally, with longer hairs below the apex. **Cypselas** similar to those of ray florets, but vestigial and glabrous. **Pappus** a short rim.

Monotypic, endemic in sthn Afr.: *Alatoseta tenuis* Compton is known from the Northern and Western Cape.

Alciope DC. 9391000

(Senecioneae)

Candolle: 209 (1836a); Harvey: 60 (1865); Bremer: 512 (1994).

Perennial herbs, woolly. **Leaves** alternate, shortly petiolate, elliptic or ovate, sometimes toothed, white-woolly beneath, tomentose-glabrescent above. **Capitula** radiate, solitary or laxly corymbose, pedunculate, many-flowered. **Involucre** ecalyculate, campanulate; bracts in 2 rows, leathery, ciliate above, woolly on back. **Receptacle** flat, epaleate. **Ray florets** female, corolla yellow; tube with linear to linear-oblong, 3-toothed lamina up to two and a half times its length. **Staminodes** sometimes present. **Disc florets** bisexual, fertile, corolla tube widened above, with 5 linear-lanceolate lobes. **Anthers** ecalcarate and ecaudate or shortly sagittate at base, with lanceolate, apical appendage; endothecial tissue polarised. **Style** terete, thickened at base; branches linear, obtuse; stigmatic areas continuous. **Cypselas** oblong, pubescent. **Pappus** of many fine bristles.

Species 2, *Alciope lanata* (Thunb.) DC. and *A. tabularis* (Thunb.) DC., endemic to sthn Afr., Western Cape.

*Ambrosia L. 9146000

(Heliantheae)

Linnaeus: 987 (1753); Linnaeus: 425 (1754); Oliver & Hiern: 370 (1877); Phillips: 813 (1951); Wild: 2 (1967); Hilliard: 295 (1977); Karis & Ryding: 621 (1994).

Annual or perennial herbs, sometimes shrubby, monoecious. **Leaves** usually alternate, petiolate, simple, lobed or pinnately dissected, margins entire. **Capitula** unisexual. **Male capitula** in leafless spikes or racemes, usually drooping, hyaline, many-flowered. **Involucre** cup-shaped; bracts connate. **Receptacle** with filiform paleae or epaleate. **Corolla** tubular, campanulate above, 5-lobed. **Anthers** ± free, with incurved, linear apical appendage, base entire. **Style** undivided, truncate, penicillate. **Ovary** abortive. **Female capitula** sessile, solitary or clustered in upper leaf axils below males, 1-flowered. **Involucre** enveloping cypsela and becoming indurated, turbinate, with 4–6 spines on shoulder below neck through which long, linear, papillose style branches exserted. **Corolla** 0. **Cypselas** ovoid, smooth. **Pappus** 0. $x = 9$ (8) (aneuploids, high polyploidy).

Species 43, North and South America; 3 naturalised in sthn Afr., known from North-West, Gauteng, Mpumalanga, Free State, KwaZulu-Natal, Lesotho, Eastern Cape.

Amellus L. 8887000

(Astereae)

Linnaeus: 1225 (1759); Harvey: 61 (1865); Merxmüller: 20 (1967a); Rommel: 584 (1977); Bremer: 410 (1994).

Susanna E.Phillips: 17 (1950)

Annual or perennial herbs or small subshrubs, branched, thickly hairy. **Leaves** alternate or sometimes lower ones opposite, entire or toothed, linear to oblanceolate or spathulate, subsessile, both sides strigillose or canescent. **Capitula** radiate, disciform or discoid, solitary, on axillary or terminal, rarely bracteate peduncles. **Involucre** hemispherical to campanulate; bracts imbricate, in 2–7 rows, with membranous margins, tomentose or pilose. **Receptacle** with linear or linear-lanceolate or club-shaped paleae, or epaleate. **Ray florets** sometimes reduced or 0, female, in 1 row; corolla blue, purple or white; tube cylindric, glandular below, produced into oblong, 3-toothed lamina. **Style** with 2 long branches. **Staminodia** sometimes present. **Disc florets** bisexual and fertile; corolla yellow or white, sometimes flushed reddish purple; tube cylindric below, expanded above or tube expanded from base, 5-lobed, laxly glandular. **Style** branches with narrowly to broadly triangular appendages. **Anthers** ecalcarate and ecaudate, with long triangular, apical appendage. **Cypselas** obovate, with 2 or more marginal veins, light brown, greyish white or white, hairy; cypselas of ray florets often glabrescent and hairy only on margins. **Pappus** almost always consisting of a row of caducous, barbellate bristles and a row of persistent scales. $x = 8$ (6, 9).

Species 12; sthn Afr.; Namibia, Botswana, Free State, Northern, Western and Eastern Cape.

Amphiglossa DC. 9046000

(Gnaphalieae)

Candolle: 258 (1838a); Harvey: 275 (1865); Bentham: 324 (1873a); Anderberg: 78 (1991a); Anderberg: 330 (1994); Koekemoer: 65 (1999).

Pterotlirix DC.: 279 (1838a).

Perennial, woody, much branched, wiry shrubs or dwarf-shrubs, erect or decumbent, *Amphiglossa callunoides* DC. stoloniferous and *A. corrudifolia* DC. rhizomatous. **Branches** glabrous or with a thin layer of arachnoid hairs, tips spinescent in *A. triflora* DC. **Leaves** small, ericoid, imbricate or widely spaced, in fascicles in some species, sessile or inconspicuously stalked, involute, abaxial surface arachnoid or glabrous, adaxial surface woolly, margins smooth, tips mucronate, acute or rounded. **Capitula** radiate or discoid, terminal, sessile, solitary or in small groups, 3–12-flowered. **Involucral bracts** in several rows; outermost chaffy or foliaceous; innermost chaffy, longer and narrower than outermost. **Receptacle** a small disc, nude or with small extensions around cypsela bases. **Ray florets** present in some species, white or pink, female, as long as wide or strap-shaped, to 3.5 mm long, 1.8 mm wide. **Disc florets** white or pink, tubular, bisexual, 5-lobed. **Anthers** apically acuminate, basally tailed. **Style** bifid, stigmatic area in two strips along margins of style branches, inflated cells at branch tips short, rounded. **Nectary** a small disk between style base and cypsela, present in all flowers. **Cypselas** small, asymmetrical, glabrous, papillate. **Pappus** bristles 18–32, densely plumose from tip to base, in one row, free (or fused only at very base in *A. celans* Koekemoer).

Species 11, endemic to sthn Afr.: *Amphiglossa triflora* DC. widespread in Namibia, North-West, Gauteng, Mpumalanga, Free State, Lesotho, Northern, Western and Eastern Cape; *Amphiglossa tomentosa* (Thunb.) Harv. in Namibia, Northern and Western Cape; the other species have localised distributions in Namibia, North-West, Northern, Western and Eastern Cape.

Anaxeton Gaertn. 8998000

(Gnaphalieae)

Gaertner: 406 (1791); Harvey: 289 (1865); Lundgren: 22 (1972); Anderberg: 92 (1991a); Anderberg: 335 (1994).

Shrublets, usually woolly. **Leaves** alternate, linear to elliptic, sessile, usually crowded and with revolute, entire margins and pungent apex, tomentose (hair type B). **Capitula** disciform, aggregated in dense corymbs at end of long peduncles (corymbophore), rarely sessile. **Involucre** ± ellipsoid; bracts in 4–6 rows, outer pilose or hairy at base; inner with white or reddish, petaloid appendage; stereome undivided. **Receptacle** epaleate, flat or somewhat convex, smooth. **Female florets** few; corolla purple, tubular or filiform, sparsely glandular, 5-toothed. **Disc florets** functionally male, outnumbering female florets; corolla purple, tubular below, narrowly campanulate above, with 5 short, ovate lobes. **Anthers** ecalcarate, caudate, with short tails, with ovate, apical

appendage; endothecial tissue polarised. **Style** branches flattened, linear, truncate with obtuse sweeping hairs apically. **Cypselas** narrowly oblong to narrowly elliptic to narrowly ovate, glabrous or pubescent with elongated, nonmyxogenic twin hairs (glandular hairs present in some species). **Pappus** barbellate to subplumose, free at base or basally fused into annulus, reduced in female florets.

Species 10, endemic to sthn Afr., Western Cape.

Anderbergia B.Nord. 8998010

(Gnaphalieae)
Nordenstam: 407 (1996).

Erect or diffuse shrublets without stolons, with greyish whitish tomentum. **Leaves** alternate, sessile, simple, entire, tomentose, eglandular, with revolute margins. **Capitula** disciform, small, in terminal dense corymbs. **Involucral bracts** dimorphic, ± tomentose, with undivided stereome; outer involucral bracts narrowly linear to oblong or spathulate with membranous brown distal portion; inner involucral bracts unguiculate with linear-oblong, ± tomentose claw and white opaque, glabrous, petaloid apical portion. **Receptacle** epaleate. **Female florets** (0)1 or 2; corolla white or yellowish, shortly lobed. **Style** bifurcate. **Cypsela** ellipsoid-oblong, glabrous or shortly hirsute with papilliform nonmyxogenic twin hairs, rarely also sparsely setose with longer narrower hairs. **Ovary wall** crystals prismatic (rectangular, hexa- or octagonal), homomorphic or heteromorphic. **Pappus** bristles uniseriate, basally shortly connate or nearly discrete, without patent cilia, barbellate throughout with usually short acute to obtuse teeth. Functionally **male florets** few (3–6); corolla white or yellow, tubular below, with campanulate 5-lobed limb; lobes erect to spreading, with marginal veins reaching lobe apex. **Anthers** with basal tails and apical flat ± ovate-triangular appendage; endothecium polarised; filament collar elongate, straight. **Style** sterile, simple with subclavate or truncate tip, sometimes minutely bifid, with obtuse, short sweeping hairs; stylophore distinct, broader than style. **Ovary** aborted, glabrous, 2-veined. **Pappus** bristles uniseriate, basally shortly connate or almost discrete, without patent cilia, barbellate throughout with acute to obtuse or subclavate teeth.

Species 6, endemic to sthn Afr., Western Cape.

Anisochaeta DC. 9068000

(Gnaphalieae)
Candolle: 109 (1836a); Harvey: 57 (1865); Hilliard: 278 (1977); Anderberg: 47 (1991a); Anderberg: 323 (1994).

Scandent shrubs, sometimes wide-climbing. **Leaves** alternate, petiolate, broadly ovate, coarsely incised-dentate to repand. **Capitula** discoid, pedunculate, small, in divaricately branched panicles. **Involucre** campanulate; bracts in 5 rows, imbricate; stereome undivided. **Receptacle** epaleate, honeycombed. **Disc florets** bisexual, fertile; corolla white or creamy white, tubular below with 5 long, narrow lobes equalling tube. **Anthers** calcarate, caudate, with lanceolate, apical appendage; endothecial tissue polarised. **Style** branches obtuse, dorsally with obtuse sweeping hairs not reaching furcation; stigmatic surfaces basally separated but apically confluent. **Cypselas** 4- or 5-angled, glandular. **Pappus** of elongated scale-like awns.

Monotypic: *Anisochaeta mikanioides* DC., endemic to sthn Afr., KwaZulu-Natal and Eastern Cape.

Anisopappus Hook. & Arn. 9096000

(Inuleae)
Hooker & Arnott: 196 (1837); Oliver & Hiern: 369 (1877); Phillips: 811 (1951); Hilliard: 288 (1977); Wild: 48 (1964); Wild: 80 (1982); Anderberg: 283 (1994).

Eenia Hiern & S.Moore: 373 (1899).

Annual or perennial herbs, rarely shrubs, hairy and glandular. **Leaves** alternate, petiolate, usually toothed, simple, lobed or pinnatipartite, rarely linear. **Capitula** radiate or discoid, several-flowered, in lax or dense, terminal corymbs. **Involucre** campanulate or hemispherical; bracts in 3–5 rows, lanceolate or oblong, variously hairy and glandular outside. **Receptacle** flat, paleate; paleae ciliate, ± enfolding disc florets. **Ray florets** female; in 1 row; corolla yellow, tube oblong or elliptic, 3- or 4-toothed, lamina ± as long as tube; ovary ellipsoid or linear-oblong, somewhat ribbed. **Disc florets** bisexual; corolla dull yellow, tube constricted in lower half or rarely widening gradually upwards, lower part of tube usually glandular, upper part usually glabrous; lobes 5, ovate. **Anthers** tailed, apical appendage lanceolate. **Style** terete; branches flat, linear, obtuse, papillose outside toward blunt apices. **Cypselas** ellipsoid or subcylindric, often ribbed, usually hairy. **Pappus** of linear, lanceolate or broad scales with longer, narrower scales interspersed; or scales equal; or 0 or cypsela crowned by shallow rim. $x = 7$ (polyploidy).

Species 32, southern and tropical Africa, Madagascar, China; 5 in sthn Afr., known from Namibia, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Anisothrix O.Hoffm. 9072000

(Gnaphalieae)
Hoffmann: 129 (1898); Anderberg: 363 (1988); Anderberg: 46 (1991a); Anderberg: 323 (1994).

Shrublets or shrubs, glabrous. **Leaves** alternate, sessile, small, glabrous or with scattered glandular hairs, margins entire or dentate to almost pinnatifid. **Capitula** discoid, solitary, terminal. **Involucre** cyathiform to slightly campanulate; bracts in many rows, imbricate; stereome undivided. **Receptacle** flat, epaleate. **Disc florets** bisexual and fertile; corolla yellow; tube with narrow, cylindric, 5-lobed limb; lobes strongly retrofract when dry; glandular-hairy or glabrous. **Anthers** ecalcarate, caudate; apical appendage acute, flat; endothecial tissue polarised. **Style** bifid; style branches obtuse with obtuse sweeping hairs dorsally, not reaching furcation; stigmatic surface basally separated but apically confluent. **Cypselas** cylindric, terete, sparsely to moderately hairy with elongated twin hairs. **Pappus** of few, free barbellate bristles in 1 row and outer row of narrow scales. $x = 7$.

Species 2: *Anisothrix integra* (Compton) Anderb. and *A. kuntzei* O.Hoffm., endemic to sthn Afr., Western Cape; rare.

*__Anthemis__ L. 9330000

(Anthemideae)
Linnaeus: 893 (1753); Linnaeus: 381 (1754); Henderson & Anderson: 318 (1966); Hilliard: 343 (1977); Bremer & Humphries: 132 (1993); Bremer: 464 (1994).

Annual or perennial herbs, often with unpleasant smell, hairy or glabrous. **Leaves** alternate, incise-dentate, pinnatifid or pinnatisect. **Capitula** radiate, medium to large, usually solitary and pedunculate, terminal, rarely laxly corymbose. **Involucre** hemispherical, bracts in several rows, outer shorter than inner, margins scarious. **Receptacle** flat to convex, finally conical or oblong, paleate, paleae scarious and oblong or subulate, truncate to acute to acuminate. **Ray florets** female, fertile or neuter; co-

rolla white or rarely yellow, strap-shaped. **Disc florets** bisexual, yellow; tube ± compressed, sometimes 2-winged, sometimes investing top of ovary, usually dilated above, 5-toothed. **Anthers** ecalcarate and ecaudate, with ovate apical appendage. **Style** branches linear, truncate, penicillate. **Cypselas** oblong, turbinate, 4- or 5-angled, 8–10-ribbed or multistriate. **Pappus** 0, or sometimes of minute scales or minutely coroniform. $x = 9$ (7, 8) (aneuploids, polyploidy).

Species 211, Europe, Asia, Africa, North America, Australia and New Zealand; 2 naturalised in sthn Afr.: **Anthemis arvensis* L., only in KwaZulu-Natal, and **A. cotula* L., in North-West, Gauteng, Mpumalanga, KwaZulu-Natal, Western and Eastern Cape.

Antiphiona Merxm. 9065010

(Inuleae)

Merxmüller: 431 (1954a); Merxmüller: 24 (1967a); Anderberg: 107 (1991b); Anderberg: 284 (1994).

Previously under *Iphiona* Cass.

Shrubs or shrublets, glandular. **Leaves** alternate, pinnatisect or bi- to tripinnatisect. **Capitula** discoid, single, several, or panicled at ends of branches. **Involucre** obconic, 8–10 mm long; bracts in several rows, imbricate, linear-lanceolate, inner ones ciliate towards apex. **Receptacle** smooth, epaleate. **Disc florets** bisexual, tubular; corolla yellow turning purple; lobes shortly ciliate and glandular at apex. **Anthers** minutely calcarate, caudate, with long tails; endothecial tissue polarised. **Style** branches with acute sweeping hairs not reaching furcation. **Cypselas** ellipsoid, with dense, adpressed, silky hairs. **Pappus** of many yellowish, barbellate bristles.

Species 2: *Antiphiona fragrans* (Merxm.) Merxm. and *A. pinnatisecta* (S.Moore) Merxm., endemic to sthn Afr.: Namibia.

Antithrixia DC. 9056000

(Gnaphalieae)

Candolle: 277 (1838a); Harvey: 293 (1865); Bremer: 449 (1978b); Anderberg: 65 (1991a); Anderberg: 330 (1994).

Perennial shrublets with young branches cobwebby. **Leaves** in fascicles, alternate or decussate, linear, sessile, involute, adaxially tomentose, apically mucronate, margins entire. **Capitula** radiate, solitary, terminal, many-flowered. **Involucral bracts** imbricate, linear-oblong, scarious. **Receptacle** flat, epaleate. **Ray florets** female, fewer than disc florets, yellow with purple bands dorsally, cypsela and pappus as in disc florets. **Disc florets** bisexual, corolla tube cylindrical, 5-toothed, yellow, lobes erect. **Anthers** ecalcarate, with short tails. **Style** bifid, branches truncate with obtuse sweeping hairs apically, stigmatic surface separated. **Cypselas** rod-like, with 10 vascular bundles, glabrous or with a few scattered twin hairs. **Pappus** of rigid, subscabrid bristles in 1 row, sometimes connate at base.

Monotypic: *Antithrixia flavicoma* DC., endemic to Namaqualand (Western Cape).

Arctotheca Wendl. 9432020

(Arctoteae)

Wendland: 41 (1798); Beauverd: 51 (1915); Lewin: 48 (1922); Phillips: 844 (1951); Hilliard: 541 (1977); Pope: 235 (1992); Bremer: 258 (1994).

Cryptostemma R.Br.: 141 (1813). *Microstephium* Less.: 92 (1831).

Perennial herbs, rosulate or stems creeping or decumbent. **Leaves** alternate, petiolate, lyrate-pinnatifid, rarely undivided, whitish woolly beneath. **Capitula** radiate, many-flowered, solitary, peduncled, terminal or axillary. **Involucre** campanulate; bracts in many rows, imbricate, margins scarious. **Receptacle** flat, honeycombed. **Ray florets** neuter; corolla yellow, lamina strap-shaped, ± obovate-oblong, 3-toothed; tube flattened; staminodes sometimes present. **Disc florets** bisexual; corolla yellow; tube funnel-shaped, with 5 lanceolate lobes sometimes with process at back of apex; ovary ± obovoid or cylindric. **Anthers** linear, sagittate at base, with ovate appendage. **Style** terete, thickened above, sometimes intruse or with collar at base of cylindric portion, 2-fid. **Cypselas** obovoid, thinly ribbed, densely to laxly villous or occasionally glabrous. **Pappus** of small hyaline, ciliate scales, or crown of membranous scales, or 0. $x = 9$.

Species 4, Mozambique and sthn Afr., known from the North-West, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

Arctotis L. 9432000

(Arctoteae)

Linnaeus: 922 (1753); Harvey: 448 (1865); Lewin: 54 (1922); Bremer: 258 (1994).

Annual or perennial herbs, sometimes almost stemless, or subshrubs, ± canotomentose or glandular. **Leaves** alternate, sessile or petiolate, entire to lobed-pinnatisect. **Capitula** radiate, solitary, pedunculate, many-flowered. **Involucre** campanulate; bracts in 5 or 6 rows, ovate to linear, acuminate or with foliaceous apex and often with membranous margin, sometimes ciliate. **Receptacle** flat, honeycombed, margins of pits extended into linear processes. **Ray florets** female; corolla white, cream, yellow, orange, pink, purple, violet or bluish; tube compressed, oblong-linear, with linear, 3-toothed lamina up to 6 × longer than tube. **Staminodes** often present. **Style** linear or terete, often swollen globose at base, thickened above, with ± elliptic-lanceolate branches. **Disc florets** bisexual, fertile or female-sterile; corolla yellow or dark coloured; tube abruptly widened above, with 5 lanceolate, usually glandular lobes. **Anthers** calcarate, shortly caudate, with ovate apical appendage; endothecial tissue radial. **Style** terete, with ring at base and thickened above, shortly bifid. **Cypselas** obovoid-conical, ventrally smooth or rugose and without ribs, dorsally with 3–5 strong ribs or wings sometimes forming 2 dorsal furrows or concavities at maturity, sericeous or pilose or glabrous, often with basal tuft of long hairs. **Pappus** of 1 or 2 rows of large or small scales as long as corolla tube, sometimes 0. $x = 9$.

Species ± 64, sthn Afr. and Angola; ± 64 in sthn Afr.; mostly Eastern and Western Cape and Namaqualand, a few species more widespread, absent from Swaziland.

Arrowsmithia DC. 9058000

(Gnaphalieae)

Candolle: 254 (1838b); Harvey: 524 (1865); Hilliard & Burtt: 230 (1985); Anderberg: 51 (1991a); Anderberg: 323 (1994).

Shrublets, somewhat ericoid, up to 0.6 m high. **Leaves** alternate, sessile, crowded, ovate, with entire, flat to somewhat revolute margins, pungent, glabrous on upper side, hairy on lower (hair type B) and glandular-hairy. **Capitula** radiate, sessile, 1–3-nate at end of branches. **Involucre** subglobose; bracts in ± 7 rows, oblong to oblong-linear, main veins fading well below tips of bracts, with large, membranous, elliptic-obtuse, apical appendage; stereome undivided. **Receptacle** slightly convex, epaleate. **Ray florets** female, in 1 row; corolla yellow; tube with minutely 3-toothed, obovate-elliptic, villous lamina longer than tube. **Cypselas** with 20 ribs. **Disc florets** functionally male; corolla yellow, tube widened above, glandular, villous, with 5 short, ovate lobes. **Anthers** ecalcarate, caudate, with short tails; endothecial tissue polarised; apical appendage ovate, acute. **Style** bifid; style branches obtuse, dorsally with obtuse

sweeping hairs, not reaching furcation; stigmatic surface basally separated but apically converging. **Cypselas** with 12 ribs, glabrous or with scattered, elongated twin hairs, glandular-hairy. **Pappus** of barbellate, caducous bristles shorter than corolla tube, in 1 row.

Monotypic: *Arrowsmithia styphelioides* DC., endemic to sthn Afr., Eastern Cape.

Artemisia L. 9358000

(Anthemideae)

Linnaeus: 845 (1753); Linnaeus: 367 (1754); Harvey: 169 (1865); Tutin, Persson & Gutermann: 178 (1976); Hilliard: 360 (1977); Bremer & Humphries: 120 (1993); Bremer: 458 (1994).

Perennial herbs or subshrubs, aromatic, often canescent. **Leaves** alternate, incised or variously pinnately dissected. **Capitula** disciform, small, mainly pendulous, in racemose panicles, few-flowered. **Involucre** ovoid or broadly campanulate; bracts in few rows with scarious margins. **Receptacle** flat, convex or hemispherical, epaleate, sometimes pilose. **Marginal florets** female, fertile; corolla narrowly tubular, sometimes swollen below, 2- or 3-toothed. **Disc florets** bisexual, fertile or functionally male; corolla yellow, cylindric, sometimes narrowed or swollen at base, sometimes dilated above, 5-lobed. **Anthers** ecalcarate and ecaudate or minutely pointed at base; apical appendage deltoid, sometimes subulate-acuminate. **Style** of female florets linear, truncate, penicillate; of bisexual florets linear or linear-spathulate, usually penicillate; undivided in functionally male florets. **Cypselas** subglobose, smooth, 2-ribbed or multistriate, thin-walled, occasionally hairy. **Pappus** 0. $x = 9$ (8, 13, 17) (aneuploids, high polyploidy, B-chromosomes).

Species 388, mainly northern hemisphere but few species in South America, Africa and Hawaiian Islands; 2 in sthn Afr.: *Artemisia afra* Jacq. ex Willd. (indigenous) and **A. vulgaris* L. (naturalised), widespread but absent from Northern Cape.

Artemisiopsis S.Moore 8973000

(Gnaphalieae)

Moore: 331, t. 8 (1902); Merxmüller: 28 (1967a); Anderberg: 55 (1991a); Anderberg: 323 (1994).

Annual herbs. **Leaves** alternate, linear, sessile, mucronate, woolly hairy (hair type B) and glandular-hairy, margin flat, dentate. **Capitula** disciform, few together in small clusters. **Involucral bracts** in few rows, cartilaginous, woolly hairy; stereome divided. **Receptacle** flat, epaleate. **Female florets** yellow, filiform, in several rows, more than disc florets. **Disc florets** bisexual; corolla yellow, tubular; lobes erect. **Anthers** ecalcarate, caudate; endothecial tissue polarised; apical appendage flat, narrower than thecae. **Style** bifid; style branches truncate with apical tuft of obtuse sweeping hairs; stigmatic surface separated. **Cypselas** basally sparsely hairy with elongated, not myxogenic twin hairs, glandular-hairy; epidermis smooth. **Pappus** of few free, barbellate, capillary bristles in 1 row with outer row of narrow, fused scales; basally without patent cilia.

Monotypic: *Artemisiopsis villosa* (O.Hoffm.) Schweick.; tropical and sthn Afr., Namibia, Botswana and Northern Province.

Aspilia Thouars 9195000

(Heliantheae)

Thouars: 12 (1806); Oliver & Hiern: 378 (1877); Wild: 199 (1966); Phillips: 816 (1951); Hilliard: 393 (1977).

Wedelia Jacq. in part, Karis & Ryding: 600 (1994).

Annual or perennial herbs, erect or prostrate. **Leaves** opposite, simple, entire or toothed. **Capitula** radiate, terminal and solitary, in lax cymes, or ± sessile in condensed corymbs in upper leaf axils. **Involucre** ovoid, campanulate or hemispherical; bracts in 2 or 3 rows, the outer herbaceous. **Receptacle** convex or somewhat conical, paleate; paleae conduplicate, enfolding disc florets. **Ray florets** neuter or female, sterile; corolla strap-shaped, patent, conspicuous, orange, yellow, white, lilac or various shades of purple. **Disc florets** bisexual, fertile; corolla same colour as ray florets, tubular, dilated above, 5-fid. **Anthers** with base obtuse or very shortly saggitate; apical appendage triangular. **Style branches** narrowly oblong with subulate apical appendage, conspicuous sweeping hairs outside. **Cypselas** obovoid, bilaterally compressed. **Pappus** a laciniate cupule. $x = 7$, 13 (6, 17, 1 report each) (aneuploids, B-chromosomes, polyploidy).

Species 60, tropical America, Africa and Madagascar; 4 in sthn Afr., known from Namibia, Botswana, Northern Province, Gauteng, Mpumalanga, KwaZulu-Natal and Eastern Cape.

Aspilia is regarded as a synonym of *Wedelia* by some authors, but until a thorough revision of the genus in Africa is done, the genus is recognised as such.

Aster L. 8900000

(Astereae)

Linnaeus: 872 (1753); Linnaeus: 373 (1754); Lippert: 153 (1973); Hilliard: 59 (1977); Bremer: 413 (1994).

Perennial, rarely annual, herbs. **Leaves** alternate, sessile, entire, toothed or rarely incised, often nerves conspicuously raised, hairy or glabrous and sometimes glandular. **Capitula** radiate, large or medium-sized, occasionally small, solitary or in panicles or corymbs, pedunculate. **Involucre** campanulate or subhemispherical; bracts imbricate, in 3 or 4(5) rows. **Receptacle** flat or convex, epaleate. **Ray florets** female, fertile or rarely sterile; staminodes sometimes present; corolla blue, violet or white, in 1 or 2 rows, tubular below, mostly glandular-hairy, often hairy as well, produced into a strap-shaped, 3-toothed lamina in upper part. **Disc florets** bisexual, fertile or rarely inner ones functionally male; corolla yellow, rarely purplish, tubular, expanded above, 5-toothed, always glandular-hairy. **Anthers** ecalcarate and ecaudate; apical appendage ovate-lanceolate, flat. **Style** branches narrowly oblong; apex triangular, with conspicuous sweeping hairs outside. **Cypselas** elliptic to obovate, compressed, bright to dark brown to blackish, usually with thickened margins, hairy and with multicellular glands. **Pappus** in 2 rows, inner row of bristles, outer of short narrow scales or bristles or in 1 row, of bristles only. $x = 8, 9$ (5, 7) (aneuploids, high polyploidy, B-chromosomes).

Species ± 250, mainly northern hemisphere, America, Europe and Asia; 16 in sthn Afr., 1 naturalised; widespread. J.C. Semple (University of Waterloo, Canada) (pers. comm.) believes there are no true *Aster* species in sthn Afr.

Athanasia L. 9326000

(Anthemideae)

Linnaeus: 1180 (1763); Harvey: 187 (1865); Hilliard & Burtt: 328 (1973); Källersjö: 530 (1985); Källersjö: 15 (1991); Bremer & Humphries: 95 (1993); Bremer: 448 (1994).

Stilpnophyton Less.: 264 (1832). *Asaemia* (Harv.) Benth.: 433 (1873a); Bremer: 193 (1983).

Shrubs or subshrubs, glabrous or variously pubescent, indumentum of stellate, rarely simple, hairs. **Leaves** alternate, rarely opposite, sessile, often imbricate, ericoid, entire, dentate or pinnatifid, linear to ovate to spathulate in outline, occasionally somewhat fleshy. **Capitula** discoid, small, densely corymbose, rarely

solitary. **Involucre** linear, campanulate or urceolate to rotundate; bracts in 3–5 rows, scarious, sometimes ciliate, glabrous or pilose, sometimes glandular. **Receptacle** flat, generally paleate, sometimes epaleate; paleae scarious, flat or canaliculate, entire or apically lacerate, glabrous or with few hairs. **Disc florets** bisexual, fertile; corolla yellow, rarely creamy white, funnel-shaped, gradually expanding into wide 5-lobed limb; tube generally with long-stalked glands. **Anthers** ecalcarate and ecaudate; apical appendage ovate; endothecial tissue polarised. **Style** branches apically truncate, with obtuse sweeping hairs. **Cypselas** cylindrical-obovoid, generally with 5–12 protruding and narrow ribs, glabrous or occasionally glandular. **Pappus** 0 or often a pseudopappus of stalked glands. $x = 8$ (polyploidy).

Species 39, endemic to sthn Afr., Northern, Western and Eastern Cape, 1 extending to KwaZulu-Natal and 1 extending to Namibia.

Athrixia Ker Gawl. 9055000

(Gnaphalieae)

Ker Gawler: t. 681 (1823); Harvey: 291 (1865); Kroner: 46 (1980); Anderberg: 47 (1991a); Anderberg: 323 (1994).

Perennial herbs or shrubs. **Leaves** alternate, sometimes radical, sessile, leafbases often decurrent, lanceolate, ovate-lanceolate, linear, sometimes needle-like, frequently with revolute, entire margins, hairy (hair type B) and glandular-hairy. **Capitula** radiate, solitary, terminal, sessile or pedunculate, rarely aggregated and spike-like. **Involucre** cup-shaped or campanulate; bracts in 6–8 rows, lanceolate to linear, spreading and bristle-pointed and often ciliate above and woolly on back; stereome undivided. **Receptacle** flat, epaleate. **Ray florets** female, in 1 row; corolla white or purple; tube usually cylindric, with minutely 3-toothed elliptic to lanceolate lamina ± as long as tube, glandular-hairy. **Disc florets** bisexual; corolla yellow or white; tube slightly widening upwards, with 5 ovate lobes. **Anthers** ecalcarate, caudate; with oblong, apical appendage, endothecial tissue polarised. **Style** bifid; style branches obtuse, dorsally with obtuse sweeping hairs not reaching furcation; stigmatic surface basally separated but apically converging. **Cypselas** 3–6-ribbed, brown, sparsely hairy with elongated twin hairs. **Pappus** white, persistent, in 2 rows, outer row of scales, rarely subbarbellate bristles, inner row of subbarbellate bristles.

Species 14, south and tropical Africa and Madagascar; 9 in sthn Afr., widespread but absent from Namibia, Botswana and Northern Cape.

Atrichantha Hilliard & B.L.Burtt 9045010

(Gnaphalieae)

Hilliard & Burtt: 219 (1981); Anderberg: 74 (1991a); Anderberg & Bremer: 1061 (1991); Anderberg: 330 (1994).

Dwarfshrub or subshrub to 1 m tall. **Leaves** ericoid, sessile, twisted, concave, adaxially tomentose, subtending short, densely leafy axillary shoots. **Capitula** discoid, solitary or a few in clusters, 17–140-flowered. **Involucral bracts** in 5–9 rows, imbricate, outer ones adaxially villous; stereome undivided or rarely with a few pellucid lines, lamina lanceolate, subacute, opaque, snow-white, sometimes scarlet above stereome, exceeding florets, radiant. **Receptacle** shortly alveolate. **Disc florets** bisexual, purple, lobes erect, glabrous, deltoid. **Style** branches truncate, very slightly rounded, penicillate, pilose in upper part. **Cypselas** cylindric, very obscurely 5-costate, glabrous, cells of epidermis convex or almost flat. **Pappus** subplumose above, clavate cells not spirally thickened, shaft scabrid, base with spreading, noncohering hairs.

Monotypic: *Atrichantha gemmifera* (Bolus) Hilliard & B.L.Burtt, endemic to the Western Cape mountains.

***Baccharis** L. 8933000

(Astereae)

Linnaeus: 860 (1753); Linnaeus: 370 (1754); Hellwig: 1 (1990); Bremer: 413 (1994).

Baccharidastrum Cabrera: 175 (1937). *Baccharidiopsis* Barroso: 95 (1975).

Usually viscid shrubs or subshrubs, sometimes small trees, generally dioecious or only rarely monoecious. **Stems** or branches commonly striate or angled. **Leaves** alternate, rarely opposite, simple, entire, toothed or lobed, occasionally reduced to scales. **Capitula** discoid or very rarely disciform, small, solitary or in racemes. **Involucre** campanulate or cup-shaped; bracts imbricate, recurved in female plants when fruit mature. **Receptacle** flat or convex, mostly epaleate. **Male capitula** with bisexual functionally male florets; corolla tubular below, campanulate to funnel-shaped above, tube hairy, rarely also glandular, 5-lobed, yellowish white. **Anthers** ecalcarate and ecaudate; with ovate-lanceolate, flat apical appendage. **Style** without papillae, shortly bilobed, not spreading, with sweeping hairs. **Pappus**: 1 row of persistent bristles. **Floret base** with ring-like nectarium. **Female capitula** with filiform female florets only, very rarely with few central bisexual florets as well, pubescent and glandular, apex 5-lobed, greenish white. **Style** without sweeping hairs, 2-lobed, spreading. **Cypselas** cylindrical or spindle-shaped, rarely ovate or elliptic, somewhat compressed, 8–10-(12-)ribbed, glabrous. **Pappus** of accrescent bristles in many rows. $x = 9$ (5—1 report) (aneuploids, B-chromosomes, polyploidy).

Species ± 400; South and North America; 1 naturalised in sthn Afr.: **Baccharis pingraea* DC., KwaZulu-Natal.

Baccharoides Moench 8751040

(Vernonieae)

Moench: 578 (1794); Robinson: 249 (1990); Isawumi: 311 (1993); Bremer: 217 (1994); Isawumi *et al.*: 218 (1996).

Vernonia subsect. *Stengelia* Sch.Bip. ex Walp.: 946 (1843). *Vernonia* sect. *Stengelia* (Sch.Bip. ex Walp.) Benth.: 127 (1873a). *Stengelia* Steetz: 360 (1864).

Annual or perennial herbs or subshrubs. **Leaves** alternate, petiolate or subsessile, pubescent to glabrescent, sometimes glandular or gland-dotted, margin serrate. **Capitula** discoid, solitary, terminal or lateral to many, aggregated in paniculate to corymbose groups. **Involucre** broadly campanulate or cup-shaped. **Involucral bracts** in many rows, apically appendaged, slightly pubescent to woolly tomentose; appendages white or variously coloured. **Receptacle** epaleate. **Disc florets** bisexual; corolla whitish or purple, with long slender basal tube, abruptly expanded cylindrical limb and short erect lobes; veins forming arch at corolla lobe without median trace; lobes pubescent, also hairs at throats of limbs and tubes. **Anthers** calcarate, ecaudate; apical appendage flat, ovate, with blunt or acute tips; endothecial tissue polarised; filament collar cylindrical, sometimes slightly dilated distally. **Style** bifid; branches apically tapering, long-exserted, with distinct stigmatic areas throughout inner portions, outsides covered with unicellular hairs down to upper portion of shaft; style base enclosed by long and cylindrical nectary. **Cypselas** homomorphic, brown to dark brown, cylindrical, turbinate or elongated, 8–20-costate, pubescent or glabrous, with or without twin hairs, with or without glands, with or without carpopodium (fruit stalk); ovary crystals narrowly elongate, hexagonal, sometimes large. **Pappus** bristles in many

rows, sometimes with outer row of small scales, inner capillary ones flat or widened towards apex, caducous or persistent, barbellate on margins, sometimes connate to form annulus.

Species ± 30, tropical Africa and India; 2 in sthn Afr.: *Baccharoides adoensis* (Sch.Bip. ex Walp.) H.Robinson and *B. anthelmintica* (L.) Moench, Namibia, Botswana, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Berkheya Ehrh. 9438000

(Arctoteae)

Ehrhart: 137 (1788); Harvey: 501 (1865); Oliver & Hiern: 428 (1877); Phillips: 847 (1951); Roessler: 104 (1959); Hilliard: 547 (1977); Bremer: 261 (1994).

Crocodilodes Adans.: 127 (1763). *Stephanocoma* Less.: 485 (1865). *Stobaea* Thunb.: 141 (1800).

Perennial herbs or subshrubs, sometimes cobwebby or woolly. **Leaves** alternate or radical, rarely opposite, sometimes decurrent, subentire, toothed, pinnatifid or pinnatisect, teeth spinescent. **Capitula** radiate or discoid, several- to many-flowered, terminal on single stems or on branchlets, rarely axillary, rarely corymbose or umbellate. **Involucre** campanulate; bracts in few to many rows, connate at base, tips and often margins spiny. **Receptacle** flat, honeycombed fimbrilliferous. **Ray florets** neuter, in single row, strap-shaped. **Disc florets** bisexual, fertile or sometimes inner ones male, tubular, dilated above, deeply 5-lobed. **Anthers** linear, sagittate at base; with lanceolate, apical appendage. **Style** terete, undivided or with linear, obtuse branches. **Cypselas** ± obovoid, ribbed, pilose or glandular, pubescent to glabrous. **Pappus** of short or long scales or bristles. $x = 7, 8$.

Species 75, Africa; 71 in sthn Afr., widespread.

Bidens L. 9237000

(Heliantheae)

Linnaeus: 831 (1753); Linnaeus: 362 (1754); Candolle: 593 (1836); Oliver & Hiern: 392 (1877); Sherff: 1 (1937); Phillips: 818 (1951); Henderson & Anderson: 326, 328 (1966); Hilliard: 316 (1977); Mesfin: 24 (1984); Mesfin: 437 (1993); Karis & Ryding: 614 (1994).

Annual or perennial herbs. **Leaves** opposite, sessile or petiolate, simple to deeply and irregularly 2- or 3-pinnatisect; blade or segments linear to broadly ovate, entire, serrate-crenate, or variously incised. **Capitula** radiate, occasionally ray florets 0, on long peduncles, solitary and terminal or arranged in lax corymbiform or paniculiform cymes. **Involucre** campanulate or subhemispherical; bracts ± in 2 rows, outer herbaceous to coriaceous, inner one membranous to subcoriaceous. **Receptacle** flat to conical. **Ray florets** neuter, rarely female; corolla white, pink, crimson, orange or yellow, strap-shaped. **Disc florets** bisexual, fertile; corolla yellow, narrowly cylindric below, expanded above, 5-lobed with lobes papillose. **Anthers** obtuse or minutely sagittate at base; with ovate apical appendage. **Style** swollen at base, terete; branches narrowly oblong, apex acute with subulate appendage, short sweeping hairs on outer face. **Cypselas** 3- or 4-angled or dorsiventrally compressed, linear-oblong to broadly ovate, sometimes beaked. **Pappus** of 2–4 awns, usually barbed. $x = 6, 8$ (5, 11, 17, 23) (aneuploids, high polyploidy, B-chromosomes).

Species 233, cosmopolitan; 6 in sthn Afr., 2 of them, **Bidens bipinnata* L. and **B. pilosa* L. are introduced, widespread, roadside weeds and noxious weeds of cultivation, absent from the Western Cape.

Blainvillea Cass. 9190000

(Heliantheae)

Cassini: 493 (1823); Candolle: 492 (1836); Bentham: 369 (1873a); Oliver & Hiern: 374 (1877); Phillips: 815 (1951); Wild: 38 (1967); Karis & Ryding: 589 (1994).

Perennial herbs with striate, glabrescent branches. **Leaves** opposite, shortly petiolate, elliptic to lanceolate, entire or remotely toothed, scantily pubescent. **Capitula** radiate or almost disciform, few-flowered, in lax cymose panicles, often solitary in forks of inflorescence branches. **Involucre** campanulate or subglobse; bracts in 2–5 rows. **Receptacle** somewhat convex, paleate; paleae as long as florets, membranous, irregularly toothed above. **Ray florets** female, fertile; corolla white; tube cylindric with short, obovate, shortly bifid lamina. **Style** terete; branches linear, obtuse. **Cypselas** 2- or 3-angled, dorsiventrally compressed. **Pappus** of 3 barbellate awns. **Disc florets** bisexual, fertile; corolla white; tube cylindric, campanulate above, shortly 5-lobed. **Anthers** faintly eared at base; apical appendage ovate. **Style** terete, base swollen; branches linear, obtuse. **Cypselas** oblong 2–4-angled, usually laterally compressed. **Pappus** of 2 barbellate awns or unequal, shortly connate scales. $x = 17$ (8, 9) (polyploidy).

Species 10, pantropical; 1 in sthn Afr.: *Blainvillea gayana* Cass., N Botswana and Northern Province.

Blumea DC. 8939000

(Inuleae)

Candolle: 514 (1833) name conserved; Harvey: 119 (1865); Randeria: 176 (1960); Merxmüller: 35 (1967a); Wild: 125 (1969a); Hilliard: 113 (1977); Anderberg: 105 (1991b); Anderberg: 284 (1994).

Annual or perennial herbs, usually pubescent, aromatic; stems not winged. **Leaves** alternate, simple, dentate or serrate, sessile or shortly petiolate. **Capitula** disciform, in loose or dense corymbs or panicles. **Involucre** campanulate or hemispherical; bracts in few to many rows, narrow, cartilaginous. **Receptacle** flat or slightly convex, epaleate, with scale-like ridges. **Outer florets** female, in several rows, filiform, 2–4-toothed, yellow. **Central florets** bisexual, tubular, widening upwards, with 5 short lobes, yellow, sometimes white or purplish. **Anthers** caudate and minutely calcarate; endothecial tissue polarised. **Style** bifid with acute sweeping hairs, not reaching the furcation. **Cypselas** narrowly oblong, hairy; epidermis with elongated crystals. **Pappus** of barbellate, capillary bristles in 1 row. $x = 9$ (8, 10, 11) (aneuploids, high polyploidy, B-chromosomes).

Species ± 100, tropical Africa to Asia and Australia; 1 in sthn Afr.: *Blumea mollis* (D.Don) Merrill, Namibia, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland and KwaZulu-Natal.

Bothriocline Oliv. ex Benth. 8746000

(Vernonieae)

Bentham: 226 (1873a); Oliver & Hiern: 265 (1877); Phillips: 776 (1951); Bremer: 218 (1994).

Volkensia O.Hoffm.: 387 (1889).

Perennial or rarely annual herbs or shrubs. **Leaves** alternate, opposite or sometimes whorled, subsessile, broadly lanceolate, serrate. **Capitula** discoid, many-flowered; solitary or corymbose. **Involucre** campanulate or cyathiform; bracts in few to many rows, the outer smallest with scarious margins. **Receptacle** plane or alveolate. **Corolla** purple or mauve; tube cylindric below, widening above; lobes 5, ovate-lanceolate. **Anthers** shortly and bluntly sagittate, with lanceolate, membranous, apical appendage; connective ± slightly swollen near base. **Style** exserted; arms filiform, thinly hispid. **Cypselas**

oblong-obovoid, 4-angled, often strongly 4-ribbed, glabrous except for minute tubercles between ribs. **Pappus** of few, barbellate, caducous bristles. $x = 10$ (9—1 report) (polyploidy).

Species ± 30, in tropical Africa; 1 in sthn Afr.: *Bothriocline laxa* N.E.Br., Northern Province, Mpumalanga and Swaziland.

Brachylaena R.Br. 8936000

(Tarchonantheae)

Brown: 115 (1817); Harvey: 115 (1865); Phillips & Schweickerdt: 205 (1937); Paiva: 368 (1972); Hilliard: 105 (1977); Pope: 5 (1992); Bremer: 97 (1994); Herman: 42 (1998a).

Shrubs or trees, dioecious, rarely florets bisexual. **Leaves** alternate, shortly petiolate or subsessile, entire or spinulose-denticulate or repand or coarsely dentate towards apex, glabrous above and often pale tomentose beneath. **Synflorescences** arranged in clusters or glomerules; capitula pedunculate or sessile, unisexual, discoid; flowers yellow. **Involucre** oblong, ovoid or campanulate; bracts in 3 to many rows, imbricate. **Receptacle** flat or slightly convex, honeycombed, epaleate. **Male capitula** with corolla tubular below, expanded above, usually 5(6)-lobed. **Anthers** calcarate and caudate; apical appendage long, flat; endothecial tissue polarised. **Style** terete, filiform, thickened above, simple or bifid; ovary abortive. **Pappus** of scabrid or subplumose bristles in 1 row, sometimes sparingly developed. **Female capitula** with corolla filiform, 5-lobed; staminodes sometimes present. **Style** branches short, flat, ovate-lanceolate. **Cypselas** subcylindric-fusiform, ± 8-ribbed, pubescent or subglabrous. **Pappus** of scabrid bristles in several rows.

Species ± 15, Africa and Mascarene islands; 9 in sthn Afr., widespread but absent from Namibia, Free State and Northern Cape.

Bryomorphe Harv. 9047000

(Gnaphalieae)

Harvey: 151 (1863); Harvey: 277 (1865); Bentham: 324 (1873a); Levyns: 283 (1942); Anderberg: 70 (1991a); Anderberg: 330 (1994).

Small, tufted, copiously branched, moss-like plants, up to 70 mm tall. **Main branches** woody, leafy throughout, up to 1.5 mm diameter, pressed tightly together in rock crevices; aerial roots present. **Leaves** sessile, closely imbricate, ascending, linear, margins entire, slightly involute, adaxial surface woolly. **Capitula** radiate or almost disciform, 12–14-flowered, 5–6 mm long, 3–4 mm wide, 1–3 heads terminal on branches, partially concealed by uppermost leaves. **Involucral bracts** 24–31; outer bracts foliaceous in upper part and along midvein, ovate; inner bracts scarious, up to 5 mm long, linear to narrowly oblong, hyaline-winged at apex. **Receptacle** conical, less than 2 mm in diameter, honeycombed. **Ray florets** 6 or 7, female, white; lamina 3-lobed, ± 2 mm long, 1.5 mm wide; tube 4.5–5.5 mm long. **Disc florets** 7–9, bisexual, 5-lobed, wine-red, 3.5–4.0 mm long. **Anthers** apically acuminate, basally tailed. **Style** branches truncate with obtuse sweeping hairs apically, stigmatic surfaces separated. **Nectary** a small disc between style base and cypsela. **Cypselas** rod-like, ± 1 mm long, straw-coloured, surface smooth. **Pappus**: bristles free, 22–28, ± 4.5 mm long, barbed in lower three-quarters, plumose in upper quarter.

Monotypic: *Bryomorphe aretioides* (Turcz.) Druce, endemic to Western Cape.

Cadiscus E.Mey. ex DC. 9287000

(Senecioneae)

Candolle: 254 (1838b); Harvey: 134 (1865); Phillips: 819 (1951); Bremer: 499 (1994).

Fleshy, aquatic herbs. **Leaves** alternate, linear, amplexicaul, margin entire, glabrous. **Capitula** radiate; with many florets, solitary, pedunculate, opposite the leaves. **Involucre** campanulate, of 8–10 scales connate into cup in lower half. **Receptacle** slightly convex, epaleate. **Ray florets** female; corolla white; tube short, slender, lamina ovate, entire or 3-toothed, longer than tube. **Style** linear; branches linear, obtuse. **Cypselas** terete, ribbed, hirsute on ribs. **Pappus** of setose, somewhat accrescent awns. **Disc florets** functionally male; corolla yellow, tube slender, campanulate above, lobes 5. **Anthers** obtuse at base, apiculate. **Style** undivided. $x = 10$.

Species 1: *Cadiscus aquaticus* E.Mey. ex DC., endemic in the Western Cape.

***Calendula** L. 9423000

(Calenduleae)

Linnaeus: (1735); Meikle: 206 (1976); Nordenstam: 373 (1994).

Annual or perennial herbs, sometimes woody at base, often glandular and aromatic. **Leaves** alternate, simple, sessile, entire or shallowly toothed. **Capitula** radiate, solitary and pedunculate; sometimes branched. **Involucre** campanulate or hemispherical; bracts in 1 or 2 rows, linear, acuminate, subequal, with narrow scarious margin. **Receptacle** flat, epaleate. **Ray florets** female, fertile, strap-shaped, yellow or orange. **Disc florets** functionally male, tubular, yellow, orange, brown or violet-purple. **Anthers** ecalcarate, sagittate-caudate; filaments free; endothecial tissue polarised. **Style** of disc florets undivided, with acute conical tip surrounded by ring of short hairs. **Outer cypselas** with narrow beak, sometimes cymbiform, or 3-winged; inner smaller, strongly falcate or almost annular, sometimes winged; all dorsally tuberculate-rugose. **Pappus** 0. $x = 8$ (5, 7, 9, 11) (aneuploids, polyploidy).

Species ± 15, Macaronesia, Africa, Mediterranean region, southern and central Europe, Turkey, Iraq, Iran, Yemen; 1 naturalised as weed in sthn Afr.: **Calendula arvensis* L., KwaZulu-Natal.

Callilepis DC. 9094000

(Gnaphalieae)

Candolle: 671 (1836a); Harvey: 136 (1865); Phillips: 810 (1951); Hilliard: 286 (1977); Anderberg: 46 (1991a); Anderberg: 324 (1994).

Zoutpansbergia Hutch.: 350 (1946).

Perennial herbs with tuberous or subwoody rootstocks, producing annual stems, or small shrubs. **Leaves** alternate, sessile, linear to elliptic, glabrous or with glandular hairs, margin flat, usually entire. **Capitula** radiate; many-flowered, solitary at end of long peduncles. **Involucre** campanulate; bracts in 3 rows, narrowly lanceolate, glabrous. **Receptacle** flat, paleate; palea boat-shaped. **Ray florets** female, in 1 row, fewer than disc florets; staminodes often present; corolla white, tube with linear-oblong or elliptic, 3-toothed lamina, longer than tube. **Cypselas** triquetrous. **Disc florets** bisexual; corolla purplish; tube somewhat campanulate above, with lanceolate lobes ± 1/3–1/2 as long as tube. **Anthers** linear, tailed at base; with lanceolate, apical appendage. **Style** terete; branches obtuse with hairs dorsally ending below apex as ring of longer hairs. **Cypselas** flattened to somewhat triquetrous, sparsely hairy. **Pappus** of scale-like awns.

Species 5, endemic in sthn Afr., known from Northern Province, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Calostephane Benth. 9069000

(Inuleae)

Bentham: 10, t. 1111 (1876); Merxmüller: 37 (1967a); Hilliard: 279 (1977); Anderberg: 89 (1991b); Anderberg: 285 (1994).

Herbaceous plants, often erect annuals. **Leaves** alternate, sessile or petiolate, sometimes decurrent in long wings,

linear to lanceolate, margins dentate. **Capitula** either radiate or discoid, solitary on long peduncles. **Involucre** campanulate; bracts in 2 rows, linear, usually ciliate, strigose or glandular. **Receptacle** flat, epaleate, foveolate. **Ray florets** (if present) female; corolla yellow, strap-shaped, 3-lobed. **Disc florets** bisexual, fertile; corolla yellow, tube widened gradually upwards, glandular-hairy, 5-lobed. **Anthers** minutely calcarate, caudate; with lanceolate apical appendage; endothecial tissue polarised. **Style** branches of female florets linear, obtuse; of bisexual florets linear, subacute; with acute sweeping hairs not reaching furcation. **Cypselas** oblong, subterete, ribbed, glands alternating with ribs. **Pappus** double; outer row of 5 small obovate, membranous scales; inner row of bristles with broad, membranous wings above middle; or of scales similar to those of outer rows.

Species 6, tropical Africa and Madagascar; 2 in sthn Afr.: *Calostephane divaricata* Benth. and *C. marlothiana* O.Hoffm., Namibia, Botswana, Northern Province, Swaziland and KwaZulu-Natal.

Calotesta P.O.Karis 9043010

(Gnaphalieae)

Karis: 25 (1990); Anderberg: 74 (1991a); Anderberg: 330 (1994).

Much-branched shrublet, densely whitish-tomentose with axillary brachyblasts of crowded small leaves; older branches glabrous or subglabrous, often with scale-like withered leaf bases. **Leaves** closely to very closely set, involute ericoid, lanceolate to obovate, entire, acute, mucronate. **Capitula** discoid, mainly solitary, sometimes 2 or 3 together, 15–40-flowered. **Involucre** campanulate, 4–9 mm wide. **Receptacle** broadly conical, epaleate. **Involucral bracts** in 3 or 4 rows, outermost foliaceous or subfoliaceous, lanceolate to narrowly ovate and acute to acuminate, inner bracts with a scarious or mostly conspicuously petaloid lamina and undivided stereome, innermost with few hairs abaxially only. **Disc florets** bisexual, narrowly cylindrical, glabrous, 3.0–3.5 mm long, reddish above; lobes 5, spreading, deltoid. **Anthers** with a weakly narrowing, flat, narrowly ovate apical appendage, caudate, tails long, very branched. **Style** basally thickened, branches narrowly oblong, flat or semiterete, with stigmatic areas in two distinct, not confluent lines, apically truncate, penicillate; sweeping hairs short, obtuse. **Cypselas** narrowly oblong, irregular, dark brown, ribbed. **Pappus** barbellate, soon caducous, bristles free.

Monotypic: *Calotesta alba* Karis, endemic to Western Cape.

*Campuloclinium DC. 8816040

(Eupatorieae)

Candolle: 136 (1836a); Hilliard: 54 (1977) under *Eupatorium*; King & Robinson: 126 (1987); Bremer *et al.*: 658 (1994).

Perennial herbs or subshrubs. **Leaves** opposite or alternate, sessile or on narrowly winged petioles; blades ovate to narrowly oblong. **Capitula** discoid, florets 30–100; in corymbose inflorescences. **Involucral bracts** ± 15–30, eximbricate to weakly subimbricate, in 2 or 3 rows, usually broad. **Receptacle** rounded to conical, with small prominent scars. **Corolla** purplish pink, funnel-shaped with basal tube slightly constricted above nectary; lobes dorsally papillose. **Style** with base usually pubescent; branches with mamillose to papillose appendage. **Cypselas** narrowly cylindric, 4-angled, angles sparsely scabrid, faces black, gland-dotted. **Pappus** of many scabrid bristles, tips pink.

Species 14, Brazil, Paraguay, Argentina; 1 in sthn Afr., a garden escape, **Campuloclinium macrocephalum* (Less.) DC., Northern Province, Gauteng, Swaziland and KwaZulu-Natal.

*Carduus L. 9461000

(Cardueae)

Linnaeus: 820 (1753); Oliver & Hiern: 433 (1877); Phillips: 849 (1951); Kazmi: 300 (1963–1964); Henderson & Anderson: 330 (1966); Hilliard: 576 (1977); Bremer: 143 (1994).

Annual or perennial herbs with spiny-winged stems. **Leaves** rosulate to alternate, serrate, sinuate-dentate or pinnatifid, teeth spinose or occasionally rigidly ciliate. **Capitula** discoid, many-flowered, sometimes terminal, on long peduncles, sometimes subsessile or glomerate. **Involucre** ovoid, globose or cylindric; bracts in many rows, patent or recurved, spiny. **Receptacle** flat or convex, densely setose. **Florets** bisexual, fertile; corolla purple or white, tube narrowly cylindric below, dilated above, deeply lobed or sometimes ± 2-lipped. **Anthers** with bases sagittate, adjacent auricles connate and produced into entire or lacerated tail; filaments glabrous or pilose. **Style** abruptly thickened above with ring of hairs below thickening; branches short, obtuse, minutely papillose, rarely filiform. **Cypselas** obovoid-oblong, smooth, glabrous, with apical rim. **Pappus** of scabrid to barbellate, decidous bristles, basally connate in ring. x = 8, 9, 11 (6, 7, 10, 13) (aneuploids, high polyploidy, B-chromosomes).

Species 91, Eurasia, Mediterranean region, East Africa; 2 in sthn Afr.: **Carduus tenuiflorus* Curtis, known from Gauteng, Western and Eastern Cape, and **C. macrocephalus* Desf., occurring in the Eastern Cape, are introduced weeds.

*Carthamus L. 9477000

(Cardueae)

Linnaeus: 830 (1753); Oliver & Hiern: 439 (1877); Hanelt: 302 (1976); Bremer: 151 (1994).

Branched, annual herbs with glandular indumentum. **Leaves** alternate, pinnatifid to pinnatisect with spiny margins. **Capitula** discoid, solitary. **Involucre** with bracts in many rows, imbricate, spiny, outer leaf-like, inner sometimes with apical appendages. **Florets** all bisexual; corolla yellow. **Anthers** with filaments usually densely bearded. **Cypselas** obovoid to broadly obconical, 4-angled, smooth, glabrous, with apical rim; cypselas in outer florets generally rugose. **Pappus** usually double, outer row of subulate, serrulate-ciliate, persistent scales, inner row with scales shorter and basally connate. x = 6, 10 (8, 11) (aneuploids, high polyploidy, B-chromosomes).

Species 14, Mediterranean region, Asia; 1 in sthn Afr.: *Carthamus lanatus* L., occurs sporadically in the Northern and Western Cape.

*Centaurea L. 9476000

(Cardueae)

Linnaeus: 909 (1753); Linnaeus: 389 (1754); Oliver & Hiern: 436 (1877); Phillips: 849 (1951); Hilliard: 580 (1977); Bremer: 151 (1994).

Annual or perennial herbs, usually cano-tomentose. **Leaves** alternate, sometimes radical, entire or sometimes toothed or pinnatisect. **Capitula** usually disciform or 'radiate' (not true ray florets, radiant), solitary or corymbose, rarely in elongated clusters. **Involucre** ovoid or globose; bracts generally with fimbriate-ciliate or lacerate, variously shaped appendages. **Receptacle** nearly flat, often fleshy, densely setose. **Florets** with outer row of florets neuter, inner bisexual; corolla purple, blue, yellow or white, tube slender below, dilated above, deeply 5-lobed, papillose or hairy; neuter florets sometimes larger. **Anthers** with bases sagittate, adjacent lobes connate and drawn out into long or short, entire or lacerate tail; filaments papillose or hairy. **Style** abruptly thickened below branches and there furnished with ring

of hairs; branches erect, connate, shortly bifid, lanceolate or linear, obtuse. **Cypselas** obovoid-oblong or obconical, somewhat compressed, glabrous or sparsely pilose; attachment scar lateral and oblique. **Pappus** generally double, outer row of scabrid, barbellate or plumose bristles or subulate scales, inner row or entire pappus rarely 0. $x = 9$ (7, 8, 10, 11) (aneuploids, B-chromosomes, polyploidy).

Species ± 450, mainly in the Mediterranean region and Near East; 5 in sthn Afr. as introduced weeds, known from North-West, Gauteng, Mpumalanga, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

*Chromolaena DC. 8816020

(Eupatorieae)

Candolle: 133 (1836a); King & Robinson: 197 (1970b); Henderson *et al.*: 34 (1987); King & Robinson: 383 (1987); Bremer *et al.*: 655 (1994).

Heterolaena Sch.Bip. ex Benth.: 245 (1873a). *Osmia* Sch.Bip.: 251 (1866). *Eupatorium* section *Cylindrocephala* DC.: 141 (1836).

Sparingly to densely branched herbs or semiscandent shrubs. **Leaves** opposite, triangular to elliptic, margins subentire to lobed. **Capitula** discoid; 10–40-flowered, in lax to dense corymbs. **Involucral bracts** imbricate, ovate to lanceolate, apex often herbaceous or coloured. **Receptacle** flat or convex, sometimes paleate. **Corolla** white; cylindrical, glandular, often hairy. **Anther**: appendage sometimes with crenulate margins. **Style**: branch appendage linear, sometimes papillose. **Cypselas** prismatic, with 5, rarely 3 ribs, setose, sometimes glandular. **Pappus** of many capillary, scabrid bristles. $x = 10$ (aneuploids).

Species ± 165, all natives of North and South America, the West Indies; 1 weedy species in sthn Afr.: **Chromolaena odorata* (L.) R.M.King & H.Robinson from South America, naturalised in Mpumalanga and KwaZulu-Natal.

*Chrysanthellum Rich. 9232000

(Heliantheae)

Richard: 471 (1807); Oliver & Hiern: 394 (1877); Wild: 34 (1967); Turner: 417 (1988); Karis & Ryding: 614 (1994).

Annual herbs. **Leaves** alternate, bipinnatisect. **Capitula** radiate, pedunculate, terminal or axillary. **Involucre** hemispheric or campanulate; bracts in 1–3 rows, outer minute. **Receptacle** flat or slightly convex, paleate; paleae membranous, persistent, linear. **Ray florets** female; corolla yellowish, minutely 2-lobed or entire. **Disc florets** bisexual, often functionally male; corolla yellow or brownish, funnel-shaped, 5-lobed. **Anthers** obtuse at base, with apical appendage. **Style branches** of ray florets filiform, acute, those of disc florets well-developed with penicillate appendages. **Cypselas** of ray florets narrow, often with corky wings; disc cypselas compressed, winged or broadly spongy-cartilaginous. **Pappus** in ray florets 0, in disc cypselas of 2 minute teeth or a crown. $x = 8$ (9, 12—1 report each).

Species 13, Mexico, Central America, West Indies, Galapagos Islands; **Chrysanthellum indicum* DC., introduced weed in sthn Afr., known from Namibia, North-West and Northern Cape.

Chrysanthemoides Fabr. 9427020

(Calenduleae)

Fabricius: 144 (1759); Tournefort ex Medikus: 159 (1789); Norlindh: 367 (1943); Nordenstam: 373 (1994).

Osteospermum L. in part, Harvey: 433 (1865).

Shrubs, shrublets or small trees, sometimes spinescent, glabrous or ± cobwebby. **Leaves** alternate, mostly obovate and narrowed into petiole, entire or toothed. **Capitula** radiate, shortly pedunculate, usually few together or solitary, many-flowered. **Involucre** broadly campanulate; bracts in 2–4 rows, free, linear to ovate-lanceolate. **Receptacle** ± convex, glabrous or pubescent, epaleate. **Ray florets** female, fertile; corolla yellow, tube sometimes rudimentary, with ± oblong-elliptic, 3-toothed lamina up to 4½ × its length. **Staminodes** sometimes present. **Style** linear, with linear, obtuse branches. **Fruit** a drupe, shiny black or blue; endocarp hard, globose to obovoid or subcylindric, smooth or with ± raised nerves. **Pappus** 0. **Disc florets** functionally male; corolla tube funnel-shaped, glandular-hairy, with 5 lanceolate lobes. **Anthers** ecalcarate, shortly caudate; with ovate, apical appendage; endothecial tissue polarised. **Style** terete, minutely bifid. **Pappus** 0. $x = 9$ (10—1 report) (high polyploidy).

Species 2; extending into tropical East Africa; 2 in sthn Afr.: *Chrysanthemoides incana* (Burm.f.) Norl. and *C. monilifera* (L.) Norl., widespread but absent from Botswana, North-West and Gauteng.

*Chrysanthemum L. 9341000

(Anthemideae)

Linnaeus: 887 (1753); Harvey: 161 (1865); Bremer & Humphries: 135 (1993); Bremer: 465 (1994).

Annual herbs. **Leaves** alternate, serrate-dentate and pinnatifid, somewhat amplexicaul. **Capitula** radiate, pedunculate, solitary or laxly corymbose, many-flowered. **Involucre** campanulate; bracts in 2–4 rows, often with brown, scarious margin and sometimes membranous tip. **Receptacle** convex, epaleate. **Ray florets** female, fertile; corolla usually white or yellow, tube usually short, with entire or toothed lamina 3 times as long as tube. **Ray cypselas** triquetrous, laterally winged. **Disc florets** bisexual, fertile or sterile; corolla tube campanulate above, glandular, with 5 ovate lobes sometimes awned on back. **Anthers** ecalcarate and ecaudate; with ovate, apical appendage. **Style** with swollen base and with oblong, truncate branches. **Disc cypselas** prismatic with narrow adaxial wing, or terete with thick undulating wall, thus apparently ribbed. **Pappus** 0 in both disc and ray florets. $x = 9$ (7, 8, 10, 17, 19) (aneuploids, high polyploidy, B-chromosomes).

Species 2, Europe, Asia and North Africa; 2 naturalised in sthn Afr.: **Chrysanthemum coronarium* L. and **C. segetum* L., Mpumalanga and Eastern Cape.

Chrysocoma L. 8930000

(Astereae)

Linnaeus: 840 (1753); Harvey: 93 (1865); Merxmüller: 39 (1967a); Bayer: 259 (1981); Bremer: 417 (1994).

Shrublets. **Leaves** ericoid, alternate, sessile, linear to oblanceolate, entire or rarely dentate, glabrous or pubescent. **Capitula** discoid or rarely radiate, usually solitary and terminal, sometimes corymbose, pedunculate. **Involucre** campanulate or globose; bracts in 4 rows, imbricate, with membranous margins. **Receptacle** flat or convex, sometimes honeycombed, epaleate. **Ray florets**, if present, female, yellow or blue. **Style** with 2 branches. **Disc florets** bisexual, fertile, yellow; tube often gradually widened above, 5-lobed. **Anthers** linear, ecalcarate and ecaudate; with triangular, apical appendage. **Style** linear, with 2 linear branches, with long, triangular appendages and sweeping hairs. **Cypselas** compressed, obovate, marginally ribbed, apically usually with 2 resin sacs in ribs, pubescent, brownish. **Pappus** in 2 rows; outer row of short, acute to obtuse scales, basally weakly united, rarely reduced to a ring, sometimes 0; inner row of many barbellate caducous bristles. $x = 9$ (polyploidy).

Species 20, sthn Afr., widespread but not reaching Northern Province, Mpumalanga and Swaziland, 1 extending to Mozambique.

*Cichorium L. 9553000

(Lactuceae)

Linnaeus: 813 (1753); Oliver & Hiern: 446 (1877); Henderson & Anderson: 344 (1966); Hilliard: 597 (1977); Pope: 194 (1992); Bremer: 176 (1994).

Stiffly erect, perennial herbs with milky latex, with long, stout taproot. **Stems** annual, usually divaricately branched above, striate, densely hispid-setose to glabrescent. **Leaves** alternate, often rosulate, pinnatifid or coarsely toothed. **Capitula** ligulate, solitary or few together in sessile axillary clusters, spicately arranged along branches. **Involucre** cylindrical; bracts in 2 rows. **Receptacle** flat, epaleate. **Florets** bisexual; corolla strap-shaped, blue, rarely pink or white. **Anthers** sagittate at base, auricles mucronate-acuminate. **Style** with branches long, slender, obtuse and with sweeping hairs long. **Cypselas** obovoid-obconical, obscurely 5-angled, smooth, glabrous. **Pappus** of minute, rounded-obtuse scales. $x = 9$ (8, 10) (polyploidy).

Species 8, Europe, Mediterranean region, Ethiopia; **Cichorium intybus* L., cultivated in some parts of sthn Afr., now exists as a fairly widespread escape near cultivation, known from North-West, Gauteng, Northern, Western and Eastern Cape.

Cineraria L. 9406000

(Senecioneae)

Linnaeus: 1242 (1763); Linnaeus: 426 (1764); Harvey: 307 (1865); Merxmüller: 41 (1967a); Hilliard: 372 (1977); Bremer: 499 (1994).

Herbs or subshrubs, cano-tomentose to glabrate. **Leaves** alternate, sometimes radical, often broad and incised-toothed or variably pinnatisect, rarely entire, petiolate, sometimes auriculate, palmately veined. **Capitula** radiate, rarely discoid, in lax corymbs. **Involucre** campanulate, calyculate; bracts in 1 row, linear, sometimes with membranous margin. **Receptacle** flat, epaleate. **Ray florets** female; corolla yellow; tube cylindric, slightly to two and a half times shorter than lamina; lamina 3-toothed. **Disc florets** bisexual, fertile, rarely some functionally male; corolla tubular below, widened or narrowly campanulate above, glabrous; lobes 5, ovate. **Anthers** ecalcarate and ecaudate or faintly sagittate; with ovate-oblong, apical appendage; endothecial tissue radial. **Style** terete; branches truncate, penicillate, tipped with minute cone. **Cypselas** obovate, compressed, black or brown, margins thickened or winged, glabrous or ciliate. **Pappus** of several delicate, scabrid bristles, soon caducous. $x = 9$, 10 (polyploidy).

Species ± 50, Africa and Madagascar, 37 in sthn Afr., widespread but absent from Botswana.

*Cirsium Mill. 9462000

(Cardueae)

Miller: [334] (1754); Phillips: 849 (1951); Henderson & Anderson: 348 (1966); Hilliard: 578 (1977); Bremer: 143 (1994).

Perennial or rarely annual herbs. **Leaves** alternate, often decurrent, serrate or pinnately lobed, lobes and teeth spinescent or rarely rigidly ciliate. **Capitula** discoid, many-flowered, solitary, corymbose or variously clustered. **Involucre** ovoid or globose; bracts in many rows, spiny or innocuous. **Receptacle** flat or convex, densely setose. **Florets** bisexual, fully fertile or female; corolla purple, tube narrowly cylindric below, slightly widened above, deeply 5-lobed. **Anthers** linear, sagittate, adjacent auricles connate and prolonged into entire or lacerated tail. **Style** abruptly thickened below branches, often with ring of hairs there; branches, often partly connate, sometimes linear or filiform. **Cypselas** obovoid-oblong, glabrous, with nearly central, horizontal, basal attachment scar. **Pappus** of feathery bristles in several rows; connate at base. $x = 17$ (7, 8, 9, 10, 11, 12, 13, 15) (aneuploids, polyploidy, B-chromosomes).

Species ± 250, temperate regions of Europe and America; 2 in sthn Afr.: **Cirsium arvense* (L.) Scop. known from Mpumalanga and Eastern Cape, and **C. vulgare* (Savi) Ten. occurring in North-West, Gauteng, Northern, Western and Eastern Cape.

Comborhiza Anderb. & K.Bremer 9050030

(Gnaphalieae)

Anderberg & Bremer: 1070 (1991); Anderberg: 330 (1994).

Shrublet or suffrutex. **Stems** arising from subterranean, thick woody tubers or rhizomes. **Leaves** alternate or crowded on brachyblasts, sessile, straight, adaxially concave, glabrous above, glandular-hairy below, margin entire. **Capitula** radiate, solitary, on pedunculoid few-leaved stems or on long leafless peduncles. **Involucral bracts** with spathulate laminas. **Receptacle** flat or flat to convex, epaleate. **Ray florets** female, yellow with purple bands dorsally, in one row, fewer than disc florets. **Cypselas** as in disc florets. **Pappus** of narrow scales. **Disc florets** bisexual, corolla yellow. **Anthers** ecalcarate, with short tails; endothecial tissue polarised; apical appendage acute. **Style** branches truncate with obtuse sweeping hairs apically. **Cypselas** narrowly elliptic with 5 or 3 vascular bundles, glabrous or sparsely hairy with elongated twin hairs. **Pappus** of 5 barbellate capillary bristles and narrow scales, or of ± connate scales only.

Species 2, endemic to sthn Afr., *Comborhiza longipes* (K.Bremer) Anderb. & K.Bremer, Western Cape, and *C. virgata* (N.E.Br.) Anderb. & K.Bremer, KwaZulu-Natal.

Conyza Less. 8926000

(Astereae)

Lessing: 203 (1832); Harvey: 111 (1865); Merxmüller: 43 (1967a); Wild: 247 (1969b); Wild: 35 (1975); Hilliard: 86 (1977); Bremer: 418 (1994).

Annual or perennial herbs, rarely shrubs. **Leaves** alternate, rarely also in basal rosette, entire, toothed or rarely dissected. **Capitula** disciform or shortly radiate, in few-headed loose corymbs or panicles, rarely subglobosely arranged, rarely solitary. **Involucre** ± campanulate; bracts in 2 to many rows, imbricate, linear, usually hairy. **Receptacle** flat or slightly convex, epaleate, honeycombed, sometimes with margins of pits produced. **Marginal florets** female, fertile, usually in many rows; corolla shorter than style, tubular, filiform, truncate or minutely 2–5-lobed or with long or short lamina, white or pink. **Disc florets** bisexual, fertile or some functionally male, tubular, becoming campanulate above, 5-lobed, yellow or white. **Anthers** ecalcarate and ecaudate. **Style** branches of disc florets narrow and flattened, with broadly triangular appendage, with conspicuous sweeping hairs outside or elliptical with minute sweeping hairs. **Cypselas** small, compressed, smooth or 1-nerved on each face. **Pappus** of many barbellate bristles in 1 row, rarely in 2 rows, accrescent, ± concealing flowers. $x = 9$ (8, 12) (aneuploids, high polyploidy, B-chromosomes).

Species ± 60, cosmopolitan in warm areas; 15 in sthn Afr., 4 introduced, naturalised weeds; widespread.

*Coreopsis L. 9227000

(Heliantheae)

Linnaeus: 907 (1753); Linnaeus: 388 (1754); Oliver & Hiern: 387 (1877); Hilliard: 315 (1977); Karis & Ryding: 615 (1994).

Perennial herbs. **Leaves** opposite, rarely alternate, entire, lobed or dissected. **Capitula** radiate, pedunculate,

solitary or in lax corymbs. **Involucre** with bracts in 1 or 2 rows. **Receptacle** flat or slightly convex, paleate. **Ray florets** neuter or female, fertile or sterile; corolla yellow, strap-shaped. **Disc florets** bisexual, fertile or inner ones functionally male; corolla yellow, cylindric or narrowly campanulate, 5-toothed. **Anthers** with bases obtuse or minutely sagittate. **Style** with branches of disc florets truncate, penicillate or with subulate appendage. **Cypselas** compressed, often winged or with spiny or cartilaginous margins. **Pappus** of (1)2 barbed or nude awns or scales. x = 6, 13 (7, 9, 10) (aneuploids, high polyploidy).

Species ± 114, North and South America, Africa; **Coreopsis lanceolata* L., garden escape, occurs as a weed in Northern Province, Gauteng, Mpumalanga and KwaZulu-Natal.

Corymbium L. 8764000

(Not assigned to a tribe)
Linnaeus: 928 (1753); Jussieu: 176 (1789); Harvey: 55 (1865); Phillips: 777 (1951); Weitz: 599 (1989); Bremer: 68 (1994).

Acaulescent, herbaceous, tufted plants, monocotyledonous in appearance in vegetative state. **Leaves** basal, linear to broadly elliptic-lanceolate, parallel venation with or without prominent veins, glabrous, villous or hirsute. **Capitula** discoid, 1-flowered, arranged in racemes, panicles or corymbs. **Involucre** spindle-shaped; bracts in 2 rows with 2 upper bracts sheathing flower, glabrous or scabrid. **Corolla** mauve, pink or white, salverform with short tube; 5-lobed, lobes longer than tube, linear to oblong. **Anthers** linear, connate, shortly sagittate, without distinct apical appendage. **Style** exserted, terete, bifid; branches hispid on outer surface. **Cypselas** linear to elliptic, hirsute or villous. **Pappus** short, crown-like, or of free, fine bristles. x = 8 (1 report).

Species 9, endemic in sthn Afr.; Western Cape, ranging from the Cederberg in the north to the Cape Peninsula in the south, and in an easterly direction as far as Grahamstown (Eastern Cape), excluding the Knysna forest.

***Cosmos** Cav. 9238000

(Heliantheae)
Cavanilles: 9 (1791); Henderson & Anderson: 356 (1966); Correll & Johnston: 1664 (1970); Karis & Ryding: 615 (1994).

Annual herbs. **Leaves** opposite, sessile or with 2 ± widened and clasping petioles, lobed or 1–3-pinnatisect. **Capitula** radiate, solitary on terminal and lateral branches, long-peduncled. **Involucre** subhemispheric; bracts in 2 rows, connate basally, membranous. **Receptacle** flat. **Ray florets** neuter; corolla white, pink, lilac or orange, strap-shaped, entire or subdentate. **Disc florets** many, bisexual, fertile; corolla yellowish, cylindric but widening slightly near apex, equally 5-toothed terminally. **Style** with branches slender, thickened above, hirtellous, tipped with short and acute appendages. **Stamens** with hirsute filaments. **Cypselas** linear, ± fusiform-tetragonal, usually compressed, apically usually attenuate into beak. **Pappus** of 2–4(–8) barbellate or scabrid awns. x = 12 (11, 13, 17) (aneuploids, polyploidy, B-chromosomes).

Species 26, in tropical and warm regions of America, especially Mexico; 2 weeds in sthn Afr.: **Cosmos bipinnatus* Cav. known from the Northern Province, North-West, Gauteng, Mpumalanga, Free State and Lesotho, and **C. sulphureus* Cav. from KwaZulu-Natal.

Cotula L. 9351000

(Anthemideae)
Linnaeus: 891 (1753); Harvey: 177 (1865); Levyns: 131 (1941); Levyns: 805 (1950); Phillips: 826 (1951); Hilliard & Burtt: 119 (1970); Hilliard: 350 (1977); Bremer & Humphries: 157 (1993); Bremer: 472 (1994); Herman: 244 (1995).

Lancisia Fabr.: (1759). *Cenia* Comm.: 183 (1789); Harvey: 184 (1865). *Otochlamys* DC.: 77 (1838a); Harvey: 176 (1865).

Annual or perennial herbs. **Leaves** alternate or sometimes opposite or rosulate, entire to bipinnatisect. **Capitula** disciform or rarely radiate, few- to many-flowered, solitary, pedunculate; peduncle ± solid or sometimes inflated below head. **Involucre** subglobose or campanulate; bracts in ± 2 rows, usually scarious at least at margins. **Receptacle** flat to conical, often toothed with persistent pedicels, epaleate. **Marginal** florets female, fertile, in 1 or several rows, generally stalked; corolla tube short or absent, lamina generally absent, white if present. **Disc florets** bisexual, fertile, or functionally male; corolla tube campanulate, funnel-shaped, tubular or 4-angled, sometimes tubular below, expanded above, sometimes compressed or winged, sometimes pouched at base and wholly or partially enveloping ovary, 4-lobed, occasionally 3-lobed. **Anthers** ecalcarate and ecaudate, with ovate or lanceolate, apical appendage. **Style** branches of female flowers linear-lanceolate, of bisexual flowers oblong, truncate, penicillate. **Cypselas** generally stipitate, dorsally compressed, often laterally winged, generally with blunt uniseriate hairs. **Pappus** 0. x = 13 (8, 9, 10, 12) (aneuploids, high polyploidy).

Species ± 55, Africa, Australia, South America; 43 in sthn Afr.; widespread.

Crassocephalum Moench 9405010

(Senecioneae)
Moench: 516 (1794); Moore: 209 (1912); Merxmüller: 45 (1967a); Hilliard: 368 (1977); Bremer: 499 (1994).

Senecio L. in part, Harvey: 346 (1865). *Gynura* Cass. in part, Phillips: 832 (1951).

Perennial herbs, erect or climbing, or sometimes subshrubs, glabrous or hispid-pubescent. **Leaves** alternate, entire to pinnately dissected, margins dentate. **Capitula** discoid, solitary to corymbose, pedunculate, few- to many-flowered. **Involucre** oblong or campanulate, calyculate; bracts in 1 row, free, with membranous margin. **Receptacle** flat, epaleate. **Disc florets** bisexual, fertile; corolla yellow, red or blue; tube expanded above, with 5 linear to lanceolate lobes. **Anthers** linear, ecalcarate and ecaudate, with lanceolate or deltoid apical appendage; endothecial tissue radial. **Style** branches linear, truncate, penicillate, tipped with well-defined subulate appendage of fused papillae. **Cypselas** cylindric, ribbed. **Pappus** of many, fine, white bristles. x = 10 (polyploidy).

Species 24, Africa, Madagascar, Mascarene Islands, Yemen; 5 in sthn Afr., widespread in summer-rainfall parts but absent from North-West and Free State.

***Crepis** L. 9605000

(Lactuceae)
Linnaeus: 805 (1753); Linnaeus: 350 (1754); Harvey: 530 (1865) under *Anisoramphus*; Oliver & Hiern: 448 (1877); Hilliard: 633 (1977); Pope: 209 (1992); Bremer: 180 (1994).

Annual or perennial herbs, glabrous or pubescent, acaulescent or caulescent, with milky latex. **Leaves** mostly rosulate, glabrous. **Capitula** ligulate, many-flowered, solitary, terminal or in lax corymbs. **Involucre** cylindric-campanulate; bracts in 2 distinct unequal rows. **Receptacle** flat, epaleate, pitted, shortly fimbrilliferous. **Florets** bisexual, fertile; corolla yellow, tube shorter than lamina, oblong, 5-toothed. **Anthers** sagittate, with oblong, apical appendage. **Style** linear, becoming terete and pilose above, with linear, obtuse glandular branches. **Cypselas** subterete or marginal ones compressed, many-ribbed, sometimes attenuate into apical beak. **Pappus** of scabrid-barbellate bristles. x = 3, 4, 5 (7, 8, 10, 11) (aneuploids, B-chromosomes).

Species ± 200, northern hemisphere, tropical and sthn Afr.; **Crepis capillaris* (L.) Wallr. occurs as an introduced weed in KwaZulu-Natal and Eastern Cape, whereas **C. hypochaeridea* (DC.) Thell. is also found in the eastern parts of South Africa and Swaziland.

Cullumia R.Br. ex Aiton 9437000

(Arctoteae)

Aiton: 137 (1813); Harvey: 480 (1865); Phillips: 846 (1951); Roessler: 271 (1959); Bremer: 261 (1994).

Subshrubs or shrubs, sometimes cobwebby. **Leaves** alternate, densely set, small, spinous-ciliate and sometimes spine-tipped. **Capitula** radiate, several- to many-flowered, solitary, sessile, terminal on main and side branches, rarely axillary. **Involucre** campanulate; bracts in 4 rows, connate at base, rigidly spinose-ciliate, sometimes reflexed, glabrous. **Receptacle** flat, honeycombed. **Ray florets** neuter; corolla yellow, strap-shaped; tube somewhat compressed, with oblong-linear, 3- or 4-toothed lamina up to 6 times longer than tube. **Disc florets** bisexual, fertile; corolla yellow, tube slightly expanded or funnel-shaped, with 5 linear lobes. **Anthers** sagittate at base, with lanceolate, apical appendage. **Style** terete, with linear, obtuse branches. **Cypselas** oblong-ellipsoid, smooth, glabrous or very rarely minutely pilose. **Pappus** 0.

Species 15, endemic to Northern and Western Cape.

Cuspidia Gaertn. 9438010

(Arctoteae)

Gaertner: 454 (1791); Harvey: 510 (1865) under *Didelta*; Burtt: 69 (1948); Phillips: 847 (1951); Rocssler: 315 (1959); Bremer: 261 (1994).

Annual herbs, acaulescent or branched. **Leaves** alternate, stem-clasping, spinose-toothed, glabrous. **Capitula** radiate, several-flowered, solitary, terminal, peduncled or subsessile. **Involucre** campanulate; bracts connate; outer bracts ovate to elliptic, becoming lignified, usually with 3 large, marginal spines, membranous, veined; inner bracts spinous, membranous, veined. **Receptacle** flat, honeycombed, with rim of pits produced into membranous cups enclosing ovary. **Ray florets** neuter; corolla yellow; tube 0, lamina oblong, 4-toothed. **Disc florets** bisexual, fertile; corolla yellow; tube narrowly funnel-shaped, somewhat angled, glandular-hairy, with 5 linear lobes. **Anthers** sagittate at base, with lanceolate, apical appendage. **Style** terete, with linear, obtuse branches. **Cypselas** obovoid-obconical, sericeous. **Pappus** of linear, ciliate-barbellate, subulate scales. **Seeds** germinating within capitulum.

Monotypic: *Cuspidia cernua* (L.f.) B.L.Burtt is endemic to the Northern, Western and Eastern Cape.

*Cyanthillium Blume 8751050

(Vernonieae)

Blume: 889 (1826); Robinson: 250 (1990); Pope: 143 (1992); Bremer: 219 (1994); Isawumi: 11 (1995).

Vernonia sect. *Tephrodes* DC.: 24 (1836a). *Vernonia* subsect. *Tephrodes* (DC.) S.B.Jones: 70 (1981). *Seneciodes* L. ex Post & O.Kuntze: 515 (1903).

Annual or perennial herbs. **Leaves** alternate, subspathulate to broadly ovate or lanceolate in upper part, apex shortly acuminate or attenuate, narrowly petiolate. **Capitula** discoid, many in large terminal panicle. **Involucre** campanulate; bracts linear-lanceolate or subulate to lorate, often with greenish outer surface and purplish margins. **Disc flowers** bisexual; corolla pinkish or pale mauve, narrowly funnel-shaped, with 1 row of eglandular trichomes and capitate glands. **Anthers** calcarate; with ovate, obtuse or acute apical appendages; endothecial tissue with horizontal and radial walls thickened; filament collars narrowly cylindrical, elongate, straight and not wider than filaments. **Style** base conspicuously ring-like with cells thickened, cells ± rectangular, 1–5 in a row. **Cypselas** subfusiform, terete, not ribbed, narrowed below, uniformly strigulose pubescent; ovary wall crystals narrowly elongate, hexagonal in surface view and rectangular in side view. **Pappus** in 2 rows; outer of distinct, short, linear, fimbriate scales, sometimes 0; inner of white, barbellate, caducous bristles.

Species ± 3, tropical Africa, Madagascar, tropical Asia; 1 (introduced pantropical weed) in sthn Afr.: **Cyanthillium cinereum* (L.) H.Robinson, Northern Province and KwaZulu-Natal.

Cymbopappus B.Nord. 9341040

(Anthemideae)

Nordenstam: 150 (1976); Nordenstam: 147 (1987); Bremer & Humphries: 151 (1993); Bremer: 473 (1994).

Shrubs or subshrubs. **Leaves** alternate, closely set, linear-filiform, ericoid, entire or lobed-pinnatipartite, sometimes with additional lobes from leaf base ('pseudostipules'), subterete-flattened, herbaceous-coriaceous, pubescent-glabrescent, with impressed glands in hollows or furrows. **Capitula** radiate, solitary, terminal, pedunculate. **Involucre** hemispherical-cup-shaped; involucral bracts imbricate, ovate-oblong-lanceolate or spathulate, coriaceous with brownish membranous margins and tips, glandular and floccose-woolly or glabrescent. **Receptacle** convex-hemispherical or subconical, epaleate. **Ray florets** female, fertile, 9–21, white-pinkish; tube somewhat compressed, glandular; lamina 4(5)-veined, apically 3-fid. **Style** branches oblong, truncate. **Disc florets** bisexual, many, yellow; corolla regular, with somewhat spongy glandular tube and narrow 5-lobed limb. **Anthers** ecalcarate and ecaudate, with ovate-oblong, obtuse-subtruncate apical appendage; filament collar oblong, of subequal cells. **Style** fertile with truncate branches; base not much swollen, partly immersed in short and sometimes indistinct nectary. **Cypselas** oblong, terete or angular, usually 5-ribbed, glandular with broad sessile glands, with myxogenic cell layers, especially abaxially. **Pappus** an oblique, adaxially longer, white, scarious crown or cup; or of one large adaxial and one smaller abaxial scale, often shorter in disc florets.

Species 3, endemic to sthn Afr., Mpumalanga, Western and Eastern Cape, each species in a different province.

Cypselodontia DC. 9067000

(Not assigned to a tribe)

Candolle: 286 (1838b); Harvey: 123 (1865).

Subshrubs. **Leaves** alternate, few, 1-nerved, greyish villous beneath. **Capitula** radiate, solitary at ends of branches. **Involucral bracts** in many rows, imbricate, linear. **Receptacle** honeycombed, with margins of pits toothed. **Ray florets** neuter. **Style** branches obtuse, downy on back near apex. **Cypselas** glabrous, with ring of hairs at base. **Pappus** of few bristles at base. **Disc florets** bisexual and fertile. **Cypselas** obovate, villous, with rufous hairs. **Pappus** copious, of toothed bristles.

Monotypic, endemic to sthn Afr.: *Cypselodontia eckloniana* DC., Eastern Cape (Uitenhage District).

Note by E.G.H. Oliver at Kew: only a poor specimen in Candolle Herbarium, with a single flower head in fruit: hence description limited mainly to cypsela.

Delairea Lem. 9411090

(Senecioneae)

Lemaire: 379 (1844); Jeffrey: 933 (1986); Bremer: 500 (1994).

Senecio L. in part, Harvey: 402 (1865); Hilliard: 491 (1977).

Scandent, climbing, somewhat succulent, perennial herbs. **Leaves** alternate, petiolate, deltoid-ovate in outline, 3–5-lobed on either side, base cordate, auriculate, palmately veined. **Capitula** discoid, in corymbose panicles. **Involucre** calyculate, narrowly campanulate; bracts 8. **Disc florets** bisexual, fertile; corolla yellow. **Anthers** ecalcarate, caudate; endothecial tissue radial. **Cypselas** oblong, ribbed. **Pappus** of many fine bristles.

Monotypic, endemic to sthn Afr.: *Delairea odorata* Lem., KwaZulu-Natal, Lesotho, Western and Eastern Cape.

Denekia Thunb. 8949000

(Gnaphalieae)

Thunberg: 153 (1800); Harvey: 118 (1865); Wild: 134 (1969a); Hilliard: 117 (1977); Anderberg: 55 (1991a); Anderberg: 324 (1994).

Perennial herbs, favouring damp places. **Leaves** alternate, usually amplexicaul and whitish tomentose on lower surface, dentate. **Capitula** small, disciform, in loose corymbs. **Involucre** campanulate or subhemispherical; involucral bracts cartilaginous, in few rows; stereome undivided. **Receptacle** flat, epaleate. **Marginal florets** female, white or blue, bilabiate, in several rows. **Style** bifid, branches truncate with obtuse sweeping hairs apically; stigmatic surface separated. **Cypselas** subterete, sparsely hairy with elongated, not myxogenic, uncinate twin hairs; epidermis smooth. **Pappus** 0. **Disc florets** functionally male; corolla white or blue, funnel-shaped, 5-lobed, lobes retrofract. **Anthers** ecalcarate and ecaudate; endothecial tissue with wall thickenings on all walls; apical appendage concave, as wide as thecae. **Cypselas** reduced. **Pappus** of 1, apically plumose, capillary bristle.

Monotypic: *Denekia capensis* Thunb., widespread in *Flora zambesiaca* area and sthn Afr., but absent from Western Cape; extremely variable in size and pubescence.

Dichrocephala L'Hér. ex DC. 8866000

(Astereae)

Candolle: 517 (1833); Hilliard: 58 (1977); Fayed: 491 (1979); Bremer: 400 (1994).

Annual herbs. **Leaves** alternate, petiolate, oblong-obovate to linear-oblong in outline, dentate or lyrate-pinnatifid, lobes serrate, hairy on both sides. **Capitula** disciform, small, subglobose, in terminal panicles, pedunculate; peduncles bracteate. **Involucre** somewhat flattened or cup-shaped; bracts in ± 2 rows, equal, glabrous, oblong, with fimbriated, membranous margins. **Receptacle** hemispherical, epaleate. **Marginal florets** female, fertile, many, corolla whitish or yellow (rarely reddish), tubular, 2- or 3-denticulate, with few glands. **Disc florets** bisexual, fertile, fewer than marginal flowers, corolla yellowish green, tubular below, campanulate above, laxly glandular, with 4 triangular lobes. **Anthers** oblong, ecalcarate and ecaudate, with minute, triangular apical appendage. **Style** as long as corolla, with 2 short branches; appendages lanceolate. **Cypselas** obovate, slightly compressed, basically and apically with few glands, otherwise glabrous and shiny. **Pappus** usually 0 in ray florets, 0 or 1 or 2 caducous bristles in disc florets. $x = 9$ (6, 10—1 report each).

Species 4, tropical and subtropical Africa, Madagascar and Asia; 1 in sthn Afr.: *Dichrocephala integrifolia* (L.f.) Kuntze subsp. *integrifolia*, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal, Eastern Cape.

Dicoma Cass. 9501000

(Mutisieae)

Cassini: 12 (1817b); Oliver & Hiern: 442 (1877); Phillips: 850 (1951); Wild: 178 (1972); Hilliard: 582 (1977); Lawalrée & Mvukiyumwami: 151 (1982); Pope: 29 (1992); Bremer: 99 (1994).

Annual herbs or subshrubs with annual stems, erect or prostrate, often tomentose. **Leaves** alternate, occasionally subrosulate, sessile, usually discolorous, entire or serrulate or revolute. **Capitula** discoid, all florets bisexual; or disciform, outer florets neuter. **Involucre** subglobose or subcampanulate; bracts in many rows, pungent, glabrous. **Receptacle** flat, epaleate. **Florets** with corolla white or purple; tube of bisexual floret dilated above, deeply 5-lobed; neuter florets narrowly tubular, subbilabiate or subradiate. **Anthers** linear; bases sagittate produced into long, retrorse-ciliate tails; apical appendage lanceolate. **Style** terete, slightly swollen at base, bifid at apex, tips obtuse with minute sweeping hairs. **Cypselas** obovoid to obconical, ribbed, pilose. **Pappus** of various bristles and/or scales in several rows; bristles scabrid to barbellate to plumose, apically pilose. $x = 11$.

Species 35, tropical and sthn Afr., Madagascar, Sokotra, India; 19 in sthn Afr., widespread.

Didelta L'Hér. 9439000

(Arctoteae)

L'Héritier de Brutelle: 55 (1786); Harvey: 510 (1865); Burtt: 69 (1948); Roessler: 304 (1959); Phillips: 848 (1951); Bremer: 261 (1994).

Perennial herbs or subshrubs, glabrous or tomentose. **Leaves** alternate or opposite, sessile, entire or with few spinous teeth, ± fleshy. **Capitula** radiate; several-flowered, solitary, sessile or peduncled. **Involucre** flattened; bracts in 2 rows, outer row of 3–5 large, foliaceous, broadly ovate-triangular bracts, sometimes apiculate, inner row of several ovate-lanceolate bracts, sometimes with spinous margin. **Receptacle** flat, deeply pitted, at maturity breaking into 3–5 outer parts and 1 central part enclosing cypselas, outer parts adnate to 1 of outer involucral bracts, becoming thickened and lignified, central part membranous. **Ray florets** neuter; corolla yellow, tube rudimentary, with ± oblong, 4-toothed lamina; staminodes present. **Disc florets** bisexual, fertile; corolla yellow, tube somewhat campanulate above, with 5 ± linear-lanceolate lobes. **Anthers** sagittate at base, with lanceolate, apical appendage. **Style** terete, discoid at base, with linear, obtuse branches. **Cypselas** obconic, ribbed, pilose or glabrous. **Pappus** a crown of linear, acuminate, ciliate scales up to length of ovary.

Species 2: *Didelta carnosa* (L.f.) Aiton and *D. spinosa* (L.f.) Aiton, endemic to southern part of Namibia and the western parts of the Northern and Western Cape.

Dimorphotheca Vaill. ex Moench 9425000

(Calenduleae)

Moench: 585 (1794); Harvey: 417 (1865); Norlindh: 38 (1943); Nordenstam: 373 (1994).

Castalis Cass.: 331 (1824).

Annual or perennial herbs, subshrubs or shrubs. **Leaves** alternate, entire, toothed to pinnatipartite. **Capitula** radiate, small to large, many-flowered. **Involucre** campanulate; bracts in 1(2) row, free, linear, acuminate, sometimes with membranous margin. **Receptacle** flat or somewhat convex, epaleate. **Ray florets** female, fertile or sterile (rarely neuter); corolla white above and dark-coloured beneath, or yellow to orange or purple; tube with linear to obovate-oblong, obtuse or 3-toothed lamina 4–8 × as long as tube. **Staminodes** often present.

Style linear, with linear, obtuse branches, fertile or sterile, sometimes lacking. **Ray cypselas** (if present) triquetrous or subterete, sometimes ellipsoid or subglobose, straight or slightly curved, smooth or tuberculate or shortly winged, or with many wing-like protuberances. **Pappus** 0. **Disc florets** bisexual, fertile or functionally male; corolla yellow or purple, tube gradually widening above, with 5 lanceolate lobes, sometimes with foot-like appendage. **Anthers** linear, ecalcarate, shortly sagittate; with lanceolate or ovate apical appendage; endothecial tissue polarised. **Style** linear, shortly bilobed, with linear-oblong branches, with annular collar of hairs, with or without stigmatic areas. **Disc cypselas** (if present) laterally flattened with thickened margins, rounded or elliptic to obcordate or obovate in outline. **Pappus** 0. $x = 9$, 10 (B-chromosomes—1 report).

Species 19, sthn Afr., Angola and Zimbabwe; widespread.

Disparago Gaertn. 9039000

(Gnaphalieae)

Gaertner: 463, t. 173 (1791); Harvey: 277 (1865); Levyns: 95 (1936); Anderberg: 77 (1991a); Koekemoer: 197 (1993); Anderberg: 331 (1994).

Wigandia Neck.: 95 (1790) not of Kunth; Lessing: 362 (1832).

Shrublets or shrubs, usually profusely, sympodially branched, larger plants dense, erect or cushion-like and spreading; new shoots developing from below terminal inflorescences of previous season. **Leaves** alternate, small, filiform, oblong or obovate; adaxial surface villous, hairs unicellular; margins entire, involute; apex mucronate, apiculate or obtuse. **Synflorescence** terminal with capitula solitary, in small clusters or in very dense, globose, subglobose or cylindrical aggregations. **Capitula** 1–10-flowered; individual heads radiate or discoid, composed of strap-shaped and/or tubular flowers. **Involucral bracts** in 1–4 rows, chaffy, lacking a distinct stereome, broadly or narrowly cymbiform; apices acute or acuminate; margins entire, sometimes undulate or with clavate outgrowths. **Receptacle** small, conical. **Ray florets** 3-lobed, female or sterile, white or pink, strap-shaped. **Disc florets** 5-lobed, lobes erect or spreading star-like, male or bisexual, white or pink. **Anthers** apically lanceolate, basally tailed. **Style** bifid. **Nectary** present in tubular flowers. **Cypselas** fertile or sterile; small, symmetrical, with 5 or 10 vascular bundles, surface glabrous, puberulous or villous. **Pappus** present or 0, caducous or persistent, of 3–15(–20) plumose or barbed bristles, free or connate in a ring or tube at base. $x = 9$ (1 report).

Species 9, mainly in the fynbos of the Western Cape; inland boundaries of its distribution are along the mountains bordering the Karoo or the transition areas between fynbos and other biomes; *Disparago tortilis* (DC.) Sch.Bip., is more widely distributed and spreads along the south and east coast to Umtamvuna in KwaZulu-Natal, where it occurs in relict fynbos.

Distephanus Cass. 8751020

(Vernonieae)

Cassini: 151 (1817b); Robinson & Kahn: 498 (1986); Bremer: 220 (1994).

Gongrothamnus Steetz: 336 (1864); Merxmüller: 424 (1954a); Merxmüller: 84 (1967a).

Shrubs or scramblers, twigs herbaceous. **Leaves** alternate, ovate to lanceolate, acuminate, shortly petiolate, entire, glandular, lower surface sometimes thinly greyish tomentose. **Capitula** discoid, many, in dense, terminal, corymbose panicles. **Involucre** turbinate; bracts in several rows, imbricate, lanceolate, thinly pubescent. **Receptacle** shallowly honeycombed. **Corolla** yellow or orange, tubular, glandular. **Anthers** sagittate. **Style branches** filiform, somewhat acute, with relatively long hairs on back. **Cypselas** oblong-obovoid, generaly 10-ribbed, glabrous or pilose-sericeous. **Pappus** of many scabrid bristles; outer ones short, inner ones longer.

Species 24, palaeotropical; 4 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

***Dittrichia** Greuter 9061005

(Inuleae)

Greuter: 71 (1973); Anderberg: 104 (1991b); Anderberg: 286 (1994).

Cupularia Godr. & Gren.: 180 (1850) not of Link. *Inula* of other authors, not of L.

Annual or perennial herbs. **Leaves** alternate, sessile, lanceolate to linear, glandular, viscid, ± revolute or flat, entire or faintly denticulate, hairy. **Capitula** radiate, small, many together in rather dense terminal racemes. **Receptacle** epaleate, with scale-like ridges. **Involucre** cyathiform, involucral bracts cartilaginous, glandular. **Ray florets** female; corolla yellow, ± strap-shaped. **Disc florets** bisexual; corolla yellow, lobes short, smooth. **Anthers** ecalcarate, caudate, with branched tails; endothecial tissue polarised. **Style** with acute sweeping hairs, not reaching furcation. **Cypselas** ellipsoid, shorter than corolla, hairy, apically somewhat constricted, glandular; epidermis with elongated crystals. **Pappus** of barbellate, capillary bristles in 1 row, basally connate and concrescent into a cupule. $x = 9$.

Species 2, Mediterranean; 1 naturalised in sthn Afr.: **Dittrichia graveolens* (L.) Greuter, Western Cape.

Doellia Sch.Bip. emended Anderb. 8939010

(Pluecheeae)

Anderberg: 21 (1995); Anderberg: 162 (1991c); Anderberg: 299 (1994).

Perennial herbs or subshrubs. **Leaves** alternate, linear-oblong to oblong-lanceolate, dentate, serrate or almost entire, hairy or subglabrous, auriculate but not decurrent. **Capitula** disciform, campanulate, terminal, solitary or few together in lax corymb. **Involucral bracts** imbricate, narrowly linear. **Receptacle** flat, epaleate. **Marginal florets** female; corolla filiform, 3-lobed, yellow or purplish. **Disc florets** bisexual; corolla yellow or purplish, 5-lobed. **Anthers** calcarate and caudate; endothecial tissue radial. **Style** bifid; style branches with obtuse sweeping hairs reaching far below furcation. **Cypselas** oblong, sparsely hairy, with few conspicuous red resin ducts; epidermis cells without elongated crystals. **Pappus** of barbellate bristles in 1 row and small inconspicuous coroniform ridge.

Species 2, Africa, Arabia and Madagascar; 1 in sthn Afr.: *Doellia cafra* (DC.) Anderb., Namibia, Botswana, Northern Province, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Dolichothrix Hilliard & B.L.Burtt 9045020

(Gnaphalieae)

Hilliard & Burtt: 221 (1981); Anderberg: 71 (1991a); Anderberg: 331 (1994).

Woody plants usually stunted due to growing in rock crevices; main stems usually firmly anchored in crevice, with many secondary and tertiary branches, often appearing one-sided on specimens; very old plants may develop a woody base with many buds and dead stems; new growth white-woolly, greying with age; secondary stems branching copiously from below capitulum of previous season, woolly-hairy; branches foliaceous

throughout. **Leaves** small, scale-like, tightly appressed, not more than 2 mm long and just as wide, surface appearing shiny, very densely glandular. **Capitula** discoid, solitary or 2–4 terminal on branches, 24–28-flowered, spreading funnel-shaped from a narrow base. **Involucral bracts** 48–52, in several rows, white, not translucent, reflexed in upper third, tips opaque, milky-white. **Receptacle** flat, honeycombed. **Flowers** tubular, ± 3.5 mm long, scarcely widening at tip, lobes pilose outside, often reddish. **Anthers** basally tailed, apical appendages acuminate. **Style** bifid, basally swollen, branches slightly rounded. **Nectary** 0. **Cypsela** very densely hairy with twin hairs, hairs white, straight, with 5 narrow ribs. **Pappus** of 18–24 flattened bristles, fused in a ring at base, barbed to shortly plumose throughout, hairs fused into a flat tip with hair apices rounded and inflated.

Monotypic: *Dolichothrix ericoides* (Lam.) Hilliard & B.L.Burtt endemic to Western and Eastern Cape.

Dymondia Compton 9432050

(Arctoteae)

Compton: 110 (1953); Bremer: 260 (1994).

Perennial herbs with shallow rhizomes producing short, matted, leafy branchlets. **Leaves** alternate, spreading, linear-oblanceolate, entire or sinuate-dentate, glabrous on upper surface and whitish woolly on lower. **Capitula** radiate, solitary, sessile, subterminal. **Involucre** campanulate; bracts in several rows, woolly on back of tip. **Receptacle** slightly convex, producing white hairs and paleae round base of cypselas. **Ray florets** strap-shaped, female, fertile; corolla yellow; style short, with ovate-strap-shaped branches. **Disc florets** bisexual; corolla yellow, tubular, expanded above. **Style** swollen above, bifid, minutely hairy on swollen portion. **Cypselas** glabrous. **Pappus** of 2 rings of short, ovate-acuminate, laciniate, hyaline scales.

Monotypic: *Dymondia margaretae* Compton is endemic to the Bredasdorp District (Western Cape).

*Eclipta L. 9166000

(Heliantheae)

Linnaeus: 157 (1771); Oliver & Hiern: 373 (1877); Harvey: 131 (1865); Phillips: 814 (1951); Wild: 9 (1967); Hilliard: 303 (1977); Karis & Ryding: 583 (1994).

Annual or perennial herbs, diffuse or erect, ± strigose pubescent or hirsute. **Leaves** opposite, sessile or shortly petiolate, lanceolate-linear, entire or remotely toothed. **Capitula** radiate, small, few-flowered, pedunculate, solitary or in pairs in upper leaf axils. **Involucre** campanulate or hemispherical. **Receptacle** flat or convex; paleae longer than florets, boat-shaped, ribbed, sometimes 0 from centre of disc. **Ray florets** female or sterile; corolla white; tube somewhat compressed, much shorter than lamina, glabrous; lamina oblong-elliptic, truncate, entire or 2- or 3-toothed, ciliate above, glandular-pilose on back of base. **Style** shortly bifid. **Cypselas** oblong, 3-angled. **Pappus** a ring of delicate hairs. **Disc florets** bisexual; corolla white, tubular below, campanulate above, shortly 4- or 5-lobed. **Anthers** linear, obtuse at base, with ovate to round apical appendage. **Style** oblong, apex deltoid, papillose outside. **Cypselas** oblong, ± compressed. **Pappus** a ring of fine minute hairs or 0. $x = 11$ (9, 10, 12) (aneuploids).

Species 4, pantropical; 1 in sthn Afr.: **Eclipta prostrata* (L.) L., a cosmopolitan weed from Asia, occurring in Namibia, Botswana, Northern Province, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Edmondia Cass. 9006020

(Gnaphalieae)

Cassini: 75 (1818); Hilliard & Burtt: 216 (1981); Hilliard: 314 (1983); Anderberg: 153 (1991a); Anderberg: 356 (1994).

Aphelexis D.Don: 546 (1826). *Helipterum* section *Edmondia* (Cass.) DC.: 214 (1838a). *Helichrysum* section *Edmondia* (Cass.) Harv.: 219, 255 (1865).

Perennial herbs or shrublets, sprawling, ascending or erect, stout, closely leafy throughout. **Leaves** alternate, rigid, ascending, erect or appressed, imbricate, subulate to linear-lanceolate, often rounded abaxially, often long on vegetative shoots, short on flowering shoots, often bract-tipped below involucre, base broad, clasping, margins entire, strongly involute and hiding upper surface in long leaves, flat in short leaves, white-tomentose above (hair type B), glabrous and shining below. **Capitula** discoid or disciform, broadly campanulate, large, often solitary at branch tips, or rarely 2 to several. **Involucral bracts** in many rows, loosely imbricate, radiating, inner much exceeding florets, white, pink or yellow, outer sometimes pale dark brown; stereome divided. **Receptacle** flat, epaleate, fimbrilliferous. **Flowers** ± 85–315, 0–19 female; corolla of female flowers narrowly tubular or filiform; of bisexual flowers campanulate above, 5-lobed; all flowers glandular-hairy on backs of lobes. **Anthers** ecalcarate, caudate, tails ± equalling filament collar; with lanceolate apical appendage; endothecial tissue polarised; staminodes often present in female flowers. **Style** branches truncate and penicillate with obtuse sweeping hairs. **Cypselas** either terete with myxogenic duplex hairs, or (*E. pinifolia*) flattened, winged, glabrous. **Pappus** bristles shortly plumose above, barbellate below, fused at base in smooth ring, also cohering by small patent cilia.

Species 3; endemic to sthn Afr., Western Cape.

Elytropappus Cass. 9041000

(Gnaphalieae)

Cassini: 199 (1816); Lessing: 342 (1832); Harvey: 273 (1865); Bentham: 323 (1873a); Levyns: 89 (1935); Anderberg: 75 (1991a); Anderberg: 331 (1994).

Cyathopappus Sch.Bip.: 27 (183) (1861). *Achyrocome* Schrank: 147, 170 (1824).

Shrubs or subshrubs, glandular. **Leaves** usually small and ericoid, involute, margins entire, covered with matted hairs. **Synflorescences** in spikes, panicles or globose heads, terminal. **Capitula** discoid, 1–6-flowered. **Involucral bracts** imbricate in few rows, inner scarious, outer sometimes woolly hairy, often leafy. **Receptacle** conical, small, naked. **Florets** tubular, usually inconspicuous, 5-lobed, lobes erect or spreading. **Anthers** apically acuminate, basally tailed. **Style** bifid, branches pencilled at summit. **Nectary** 0. **Cypselas** small, terete or subterete, often with a well-developed annulus, surface glabrous, or short-hairy, with longitudinal or transverse ribs. **Pappus** bristles several, plumose at tip and usually fused in a ring at base.

Species 8, endemic to sthn Afr., centre of distribution in Western Cape, *Elytropappus rhinocerotis* (L.f.) Less. extending to Northern and Eastern Cape.

Emilia Cass. 9411010

(Senecioneae)

Cassini: 68 (1817b); Oliver & Hiern: 405 (1877); Merxmüller: 55 (1967a); Jeffrey: 908 (1986); Bremer: 501 (1994).

Pseudactis S.Moore: 118 (1919).

Annual or perennial, mostly glabrous herbs. **Leaves** alternate, radical or cauline, entire to variously lobed,

sometimes petiolate, sometimes amplexicaul or basally auriculate. **Capitula** discoid, usually corymbose, pedunculate. **Involucre** ecalyculate, cylindric or campanulate; bracts in 1 row. **Receptacle** epaleate. **Disc florets** bisexual; corolla tubular, orange, red, pink, purple, violet or white. **Anthers** ecalcarate and ecaudate; endothecial tissue radial. **Style** branches truncate to obtuse, sometimes with appendages of fused papillae. **Cypselas** oblong, mostly ribbed, glabrous or pubescent. **Pappus** of many fine bristles. $x = 5$ (6, 8—1 report each) (polyploidy).

Species ± 90, tropical Africa and Asia; 6 in sthn Afr., Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland and KwaZulu-Natal.

Engleria O.Hoffm. 8861000

(Astereae)

Hoffmann: 273 (1889a); Merxmüller: 56 (1967a); Bremer: 403 (1994).

Annual or perennial herbs, erect or decumbent. **Leaves** opposite or upper subopposite, petiolate, ovate. **Capitula** radiate or discoid, axillary and solitary, on long peduncles or aggregated into cymes, sometimes radiate, several-flowered. **Involucre** campanulate; bracts in 6–many rows, 1-nerved, with membranous margin. **Receptacle** convex, honeycombed, with margin slightly produced. **Ray florets** female, yellow. **Disc florets** bisexual. **Corolla** with tube gradually widening upwards; lobes ovate. **Anthers** linear, obtuse or obtusely lobed at base; with ovate, membranous, apical appendage. **Style** terete, with branches usually lanceolate at hairy apex. **Cypselas** obovoid, somewhat compressed, 2- or 4-ribbed with resin sacs in ribs, hirsute. **Pappus** in 2 rows, of scabrid, barbellate or subpilose bristles, often connate at base.

Species 2, Angola, sthn Afr.: *Engleria africana* O.Hoffm. and *E. decumbens* (Welw. ex Hiern) Hiern, Namibia.

Enydra Lour. 9164000

(Heliantheae)

Loureiro: 510 (1790); Oliver & Hiern: 372 (1877); Wild: 35 (1967); Hilliard: 302 (1977); Karis & Ryding: 610 (1994).

Erect or prostrate, marsh or aquatic herbs. **Leaves** opposite, sessile or subsessile, simple, lanceolate, margins entire or remotely denticulate. **Capitula** radiate, axillary, sessile or shortly pedunculate. **Involucral bracts** 4, leafy, in 2 rows of opposite pairs. **Receptacle** convex or conical; paleae sheathing florets. **Ray florets** female; corolla pale yellowish, strap-shaped, short and broad. **Style** branches linear. **Disc florets** bisexual or functionally male; corolla pale yellowish, tubular, widening above, 5-lobed. **Anthers** with deltoid apical appendage, bases obtuse. **Style** branches oblong, flattened, truncate and shortly penicillate, with minute sweeping hairs outside and marginal stigmatic papillae. **Cypselas** surrounded by persistent paleae, usually somewhat compressed. **Pappus** 0. $x = 11$ (1 report).

Species 10, pantropical; 1 in sthn Afr.: *Enydra fluctuans* Lour., KwaZulu-Natal.

Eremothamnus O.Hoffm. 9373000

(Eremothamneae)

Hoffmann: 278, t. 9b (1889a); Merxmüller: 58 (1967a); Leins: 369 (1970); Bremer: 69 (1994).

Small shrubs, woolly. **Leaves** alternate, obovate, entire or apically 3–5-dentate, spine-tipped, fleshy. **Capitula** radiate, solitary, sessile, terminal, many-flowered. **Involucre** campanulate; bracts in several rows, chartaceous, glabrous, spine-tipped. **Receptacle** areolate, epaleate. **Ray florets** female, fertile; corolla yellow; tube with oblong-elliptic, 3-toothed lamina shorter than tube; staminodes present. **Disc florets** bisexual; corolla yellow, tube widening above, deeply 5-lobed, with linear lobes. **Anthers** calcarate and caudate; with linear, apical appendage. **Style** slender, with long style branches, with short 2- or 3-celled hairs along branches and on shaft. **Cypselas** oblong-obovoid, densely sericeous. **Pappus** of stout, scabrid-barbellate bristles.

Monotypic, endemic to sthn Afr.: *Eremothamnus marlothianus* O.Hoffm., Namibia.

*__Erigeron__ L. 8901000

(Astereae)

Linnaeus: 863 (1753); Harvey: 86 (1865); Henderson & Anderson: 360 (1966); Hilliard: 67 (1977); Bremer: 420 (1994).

Perennial herbs, prostrate. **Leaves** alternate, entire or dentate, narrowly elliptic. **Capitula** radiate, solitary, corymbose or paniculate, pedunculate. **Involucre** hemispherical or campanulate; bracts in several rows, linear, often hairy. **Receptacle** flat or slightly convex, epaleate. **Ray florets** female, in 1, rarely 2, rows; corolla pinkish or white; tube cylindric, with short narrow, bifid lamina. **Disc florets** few, bisexual, rarely functionally male, fertile; corolla yellow, tube cylindric, sometimes slightly widened above, 5(4)-lobed. **Anthers** ecalcarate and ecaudate; with linear-lanceolate, apical appendage. **Style** branches narrowly oblong, flattened, tip triangular with short pollen-sweeping hairs outside. **Cypselas** oblong, compressed, usually margined, glabrous or pubescent. **Pappus** bristles few or copious, in 2 ± distinct rows. $x = 9$ (8, 13) (aneuploids, high polyploidy, B-chromosomes).

Species ± 200, North and South America, Eurasia; 1 naturalised in sthn Afr.: **Erigeron karvinskianus* DC., Northern Province, Gauteng, Mpumalanga, Swaziland and Western Cape.

Eriocephalus L. 9320000

(Anthemideae)

Linnaeus: 926 (1753); Harvey: 200 (1865); Merxmüller: 58 (1967a); Müller: 155 (1988); Bremer & Humphries: 160 (1993); Bremer: 473 (1994).

Many-stemmed, sparsely to much-branched erect to spreading, sometimes spinescent, shrubs, silky-greyish, villous or occasionally glabrous, aromatic. **Leaves** ericoid, mostly opposite but sometimes alternate, often fascicled, entire or pinnatisect with 1–7 linear lobes. **Capitula** radiate or disciform, small, sessile to pedunculate, solitary, racemose, umbellate racemose, or in spikes. **Involucre** subglobose; bracts in single row of 4–6 bracts, often with broad membranous margin, pubescent to glabrous. **Receptacle** paleate; paleae linear or lanceolate, those of marginal flowers totally or partially connate or totally free from each other, hard and thick or transparent membranous, woolly. **Marginal florets** 2 or 3, female, fertile; with or without strap-shaped lamina, corolla yellow, white or reddish, 2–4-toothed or -lobed lamina. **Style** terete with 2 linear, acute branches. **Cypselas** oblong-linear to narrowly obovate, slightly flattened, sometimes slightly angular, lanate or pilose. **Pappus** 0. **Disc florets** functionally male, corolla tubular, slightly widened, trumpet-shaped to infundibuliform, 5-lobed. **Anthers** ecalcarate and ecaudate; with lanceolate, apical appendage; endothecial tissue polarised. **Style** cylindrical, unbranched, apex globose with sweeping hairs, rarely 2-lobed. $x = 9$ (polyploidy).

Species ± 32, endemic to sthn Afr.; widespread, but absent from Gauteng, Swaziland and KwaZulu-Natal.

Erlangea Sch.Bip. 8740000

(Vernonieae)

Schultz 'Bipontinus': 34 (1853); Oliver & Hiern: 265 (1877); Merxmüller: 62 (1967a); Wild & Pope: 362 (1977); Bremer: 220 (1994).

Haarera Hutch. & E.A.Bruce: 96 (1932).

Annual or perennial, erect herbs. **Leaves** alternate, sessile or subsessile; blade ovate-lanceolate to linear-oblong, crenate, serrate or almost entire, minutely pellucid-dotted, glabrous or hairy. **Capitula** discoid, with many florets, broadly campanulate to hemispheric, rather long-pedunculate, in lax terminal cymes. **Involucre** with bracts in ± 3 rows. **Receptacle** minutely reticulate-foveolate, ± plane. **Corolla** purple, narrowly funnel-shaped, 5-dentate, lobes with apical tuft of hairs. **Anthers** shortly sagittate; with lanceolate, membranous apical appendage. **Style** branches filiform, subulate, hirsute, exserted. **Cypselas** 4- or 5-angled, 4- or 5-ribbed, oblong-obovoid, rounded at apex; pitted and glandular between ribs, ± pilose on ribs. **Pappus** of few shortly hairy, caducous bristles. $x = 10$.

Species ± 6, tropical Africa; 2 in sthn Afr.: *Erlangea misera* (Oliv. & Hiern) S.Moore, Namibia, Botswana, North-West, Northern Province and Northern Cape and *E. remifolia* Wild & Pope, Botswana.

***Ethulia** L.f. 8734000

(Vernonieae)

Linnaeus f.: 1 (1762); Harvey: 47 (1865); Oliver & Hiern: 262 (1877); Merxmüller: 63 (1967a); Hilliard: 24 (1977); Gilbert & Jeffrey: 167 (1989); Bremer: 220 (1994).

Hoehnelia Schweinf.: 861 (1892).

Annual or rarely short-lived, perennial herbs. **Leaves** alternate, shortly petiolate, ovate-lanceolate to linear, entire or serrate. **Capitula** discoid; several- to many-flowered, in much-branched corymbs. **Involucre** campanulate or subhemispherical; bracts herbaceous, in 3 to many rows, imbricate, acute or obtuse. **Receptacle** flat, epaleate. **Corolla** mauve or purple; tube cylindric below, shallowly campanulate above; lobes 5, lanceolate, longer than campanulate part of tube. **Anthers** obtuse at base; with short, ovate, membranous apical appendage. **Style** branches filiform, subulate; pollen-sweeping hairs relatively long, exserted. **Cypselas** oblong-obconical, usually strongly 2–6-ribbed, glandular or rarely sparsely pilose between ribs and with thickened apical rim. **Pappus** 0. $x = 10$ (8—1 report) (aneuploids, polyploidy).

Species 19, tropical Africa and less commonly in tropical Asia; the widespread weedy species **Ethulia conyzoides* L.f., is the only introduced representative in sthn Afr, recorded from the Northern Province, Mpumalanga and Gauteng.

Eumorphia DC. 9323000

(Anthemideae)

Candolle: 2 (1838a); Harvey: 153 (1865); Grierson: t. 608 (1972); Källersjö: 538 (1985); Bremer & Humphries: 94 (1993); Bremer: 448 (1994).

Shrubs or shrublets, glabrous or pubescent. **Leaves** opposite, rarely alternate, ericoid, sometimes clustered, entire or lobed. **Capitula** radiate, terminal, solitary, rarely corymbose, shortly pedunculate or subsessile. **Involucre** campanulate to subglobose; bracts in 3–5 rows, outer sometimes with 2–5 glands on back near apex, inner ciliate near apex, sometimes all with broad, membranous apex. **Receptacle** flat or convex, rarely conical, paleate or sometimes epaleate; paleae longer than disc florets, linear, sometimes with bent, apical appendage. **Ray florets** female, fertile; corolla white, tube with oblong to linear, 3-toothed lamina 2–4 times as long as tube, glandular. **Disc florets** bisexual, fertile; corolla tube sometimes campanulate above, with 5 ovate lobes. **Anthers** ecalcarate and ecaudate, with linear, apical appendage; endothecial tissue polarised. **Style** linear, with linear, truncate branches. **Cypselas** 10–12-ribbed, rarely up to 18-ribbed, minutely papillose especially on ribs, with apical rim. **Pappus** 0.

Species 6, endemic to sthn Afr., Northern Province, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Western and Eastern Cape.

Euryops (Cass.) Cass. 9417000

(Senecioneae)

Cassini: 49 (1820a); Harvey: 408 (1865); Nordenstam: 36 (1968); Bremer: 501 (1994).

Ruckeria DC.: 483 (1838a). *Lasiocoma* Bolus: 390 (1906). *Thodaya* Compton: 323 (1931). *Lysichlamys* Compton: 118 (1943).

Shrubs or shrublets, seldom perennial or annual herbs. **Leaves** alternate, sessile, lax or closely set, sometimes appearing rosulate or fascicled, entire, serrate-dentate or pinnatifid. **Capitula** radiate or discoid, lateral or pseudoterminal on unbranched peduncles. **Involucre** ecalyculate, hemispherical, campanulate, cyathiform or urceolate; bracts in 1 or ± 2 rows, connate to various degrees, rarely free. **Receptacle** flat or convex, honeycombed or rarely smooth, epaleate. **Ray florets** rarely 0, female, fertile; tube cylindrical; lamina yellow, orange-coloured or red to coppery on lower surface. **Staminodes** occasionally present. **Disc florets** bisexual, fertile or rarely functionally male; corolla yellow, tubular to campanulate, (3–)5-lobed. **Stamens** 5; anthers linear, ecalcarate and ecaudate to subacute at base; with flat, apical appendage; endothecial tissue radial. **Style** terete or linear, bifid or sometimes simple; style branches linear, truncate, penicillate at apex. **Cypselas** ellipsoid, glabrous or pubescent, ribbed or smooth or sometimes tuberculate or muricate or papillate. **Pappus** of few to many caducous bristles or 0; bristles flexuous, barbellate. $x = 10$ (polyploidy, B-chromosomes).

Species 97, Africa, 1 extending to the Arabian Peninsula and Socotra; 89 in sthn Afr., widespread.

***Facelis** Cass. 8986000

(Gnaphalieae)

Cassini: 94 (1819b); Bentham: 304 (1873a); Cabrera: 151 (1963); Hilliard: 4 (1983); Anderberg: 164 (1991a); Anderberg: 357 (1994).

Tufted annual herbs. **Leaves** alternate, spathulate, ± truncate, mucronate, sessile, lower surface white-woolly, (hair type B), eglandular; margin flat, entire. **Capitula** disciform, cylindric, solitary or crowded at ends of branches. **Involucral bracts** in several rows, papery, brownish, transparent; stereome undivided. **Receptacle** smooth, flat, epaleate. **Marginal florets** female, outnumbering disc florets; corolla filiform, purple. **Disc florets** bisexual; corolla purple, narrowly tubular, lobes erect, with hairs on back. **Anthers** ecalcarate, caudate with short tails ± equalling filament collar, with acute apical appendage; endothecial tissue polarised. **Style** bifid; style branches narrowly linear, pointed, with obtuse sweeping hairs extending to point of division. **Cypselas** turbinate, villous with elongated, not myxogenic twin hairs, hairs unicellular with thickened walls and basal cushion; epidermis smooth. **Pappus** bristles plumose, bases connate in ring. $x = 7$ (1 report, polyploidy).

Species 3, South America; 1 naturalised in sthn Afr.: **Facelis retusa* (Lam.) Sch.Bip., KwaZulu-Natal and Eastern Cape.

Felicia Cass. 8919000

(Astereae)

Cassini: 165 (1818) name conserved; Levyns: 768 (1950); Merxmüller: 417 (1954a); Merxmüller: 66 (1967a); Grau: 255 (1973); Hilliard: 68 (1977); Bremer: 420 (1994).

Aster L. in part, Harvey: 69 (1865); Phillips: 782 (1951). *Charieis* Cass.: 68 (1817b); Grau: 255 (1973), genus proposed for rejection.

Annual or perennial herbs or shrublets. **Leaves** alternate, opposite, or in basal rosette, sometimes tufted, mostly entire, rarely toothed, often linear to lanceolate, pubescent or rarely glabrous. **Capitula** radiate, rarely discoid, mostly solitary, terminal, pedunculate. **Involucre** hemispherical to campanulate; bracts in 3 or 4 rows, imbricate, unequal or strictly in 2 rows, equal. **Receptacle** flat, epaleate. **Ray florets** female, fertile or rarely sterile, in 1 row, strap-shaped; corolla blue, mauve, pink or white, rarely yellow; 0 in 1 species. **Staminodes** sometimes present. **Disc florets** bisexual, fertile, rarely all inner ones functionally male, tubular, slightly dilated above, 5-lobed, yellow. **Anthers** ecalcarate and ecaudate; apical appendage triangular. **Style** branches narrowly oblong, apex with triangular appendage, with conspicuous pollen-sweeping hairs. **Cypselas** compressed, obovate with thickened margins, mostly hairy, bright brown or black. **Pappus** in 1 row, of persistent or caducous scabrid or barbellate bristles, rarely 0 in ray florets. $x = 9$ (5, 6, 8) (polyploidy).

Species 83, sthn Afr. to Nigeria, Ethiopia and Saudi Arabia; 78 in sthn Afr., widespread.

***Flaveria** Juss. 9282000

(Helenieae)

Jussieu: 186 (1789); Phillips: 819 (1951); Hilliard: 324 (1977); Karis & Ryding: 542 (1994).

Annual, erect herbs, sometimes becoming woody at base, glabrous or minutely puberulous. **Branches** divaricate, leafy. **Leaves** opposite, sessile, simple, lanceolate to elliptic, margin entire or toothed. **Capitula** discoid, few-flowered, often sessile, corymbose or in axillary glomerules. **Involucre** ± cylindric; bracts 2–4 in 1 row, sometimes subtended by 1 or 2 smaller ones. **Receptacle** epaleate. **Disc florets** bisexual, corolla yellow, tubular below, turbinate-campanulate above, 5-toothed. **Anthers** with bases obtuse; apical appendage oblong. **Style** branches oblong, truncate, minutely penicillate. **Cypselas** elliptic, narrowing slightly to base, 10-ribbed. **Pappus** 0. $x = 9$ (polyploidy).

Species 21, Central and South America, Mexico, Australia; 1 in sthn Afr.: **Flaveria bidentis* (L.) Kuntze, introduced from America and now a widespread weed in South Africa and Swaziland.

Foveolina Källersjö 9366040

(Anthemideae)

Källersjö: 316 (1988); Bremer & Humphries: 155 (1993); Bremer: 474 (1994).

Matricaria L.: 891 (1753), in part excluding type. *Pentzia* Thunb.: 145 (1800), in part excluding type. *Gastrosulum* Sch.Bip.: 29 (1844), section *Gastrolepis* Sch.Bip.

Pubescent annual herbs. **Leaves** alternate, bipinnatisect. **Capitula** discoid, disciform or radiate, solitary, pedunculate. **Involucre** hemispherical or spherical; bracts in 3–5 rows, apically obtuse, with scarious margins, with or without central resin canal. **Receptacle** flat to convex-conical, epaleate. **Ray florets**, if present, female, fertile, white. **Cypselas** white, adaxially ± flat or inconspicuously 3-ribbed, without or with very few myxogenic cells, but with 2 lateral rows of short-stalked glands, immersed in small cavities, abaxially rounded and covered with myxogenic cells; pericarp spongy, containing abundance of druses, several cell-layers thick adaxially, but very thin and almost transparent abaxially, thus revealing dark brown colour of testa. **Pappus** white and spongy, coroniform, or more often an adaxial auricle. **Marginal florets** of disciform capitula female, fertile, 2-lobed, almost filiform. **Cypselas** ± terete, tapering at both ends, conspicuously rugose with short-stalked glands scattered all over, but without myxogenic cells; pericarp spongy and containing druses. **Pappus** 0. **Disc florets** bisexual, 4- or 5-lobed, number of lobes varying within same species; corolla tube of thin texture, often dilated at base; limb campanulate, partly enervate. **Anthers** ecalcarate and ecaudate. **Style** branches with or without resin ducts. **Cypselas** of 2 kinds, either as in rays, or, in some species, obovoid with thin pericarp all around, myxogenic especially abaxially. **Pappus** 0.

Species 5, endemic to sthn Afr., Namibia, Northern and Western Cape.

***Gaillardia** Foug. 9306000

(Helenieae)

Fougeroux: 55 (1788); Hilliard: 327 (1977); Karis & Ryding: 552 (1994).

Erect, branched, annual herbs, softly pubescent. **Leaves** alternate, usually sessile, oblong or spathulate, margins entire, toothed or lobed. **Capitula** radiate; several-flowered, usually solitary on long, nude peduncles, terminating branches. **Involucre** broad; bracts in 2 or 3 rows, usually becoming reflexed. **Receptacle** globose or reflexed. **Ray florets** neuter, rarely female and fertile; corolla yellow or crimson, often bicoloured, strap-shaped, rarely irregularly enlarged. **Disc florets** bisexual; corolla yellow or purplish, tubular below, campanulate above, 5-toothed. **Anthers** with bases eared or minutely sagittate; apical appendage acuminate. **Style** linear, truncate, penicillate; usually with long or short, hairy, subulate appendage. **Cypselas** obpyramidal, 4- or 5-angled, often ribbed. **Pappus** of 5, awned scales. $x = 17$ (9, 19) (aneuploids, high polyploidy).

Species 28, North and South America; 1 naturalised in parts of sthn Afr.: **Gaillardia pulchella* Foug., especially in KwaZulu-Natal, also known from North-West, Free State and Eastern Cape.

Galeomma Rauschert 8987010

(Gnaphalieae)

Rauschert: 557 (1982); Hilliard: 13 (1983); Anderberg: 135 (1991a); Anderberg: 357 (1994).

Eriosphaera Less.: 270 (1832); Harvey: t. 149 (1863); Harvey: 264 (1865); Bentham: 321 (1873a); Hilliard & Burtt: 211 (1981).

Prostrate woolly annual herbs. **Leaves** alternate, spathulate or oblong-spathulate, sessile, tomentose (hair type B), eglandular, margins flat, entire. **Capitula** discoid or disciform, in terminal glomerules embedded in wool. **Involucral bracts** in few rows, tip of lamina very acute to acuminate, whitish or pale straw-coloured; stereome divided. **Receptacle** honeycombed, flat, epaleate. **Flowers** 11–125, female, if present, outnumbering bisexual, corolla yellow, with hairs on backs of erect lobes. **Anthers** ecalcarate, caudate with short tails; apical appendage flat, as wide as thecae; endothecial tissue polarised. **Style** bifid; style branches truncate and penicillate with obtuse sweeping hairs apically; stigmatic surface separated. **Cypselas** oblong, with common duplex hairs, myxogenic or not. **Pappus** bristles either very few, nude below with apical tuft of much inflated cells, or many, evenly barbed with ± patent cilia tending to intermingle.

Species 2, endemic to sthn Afr.: *Galeomma oculus-cati* (L.f.) Rauschert and *G. stenolepis* (S.Moore) Hilliard, Namibia, Botswana and Northern Cape.

*Galinsoga Ruiz & Pav. 9246000

(Heliantheae)

Ruiz & Pavón: t. 24 (1794); Phillips: 819 (1951); Wild: 9 (1967); Hilliard: 322 (1977); Karis & Ryding: 607 (1994).

Annual herbs, glabrous or pilose. **Leaves** opposite, petiolate, ovate, sometimes faintly crenate on margins. **Capitula** radiate, pedunculate, in small cymes, terminal or axillary. **Involucre** broadly campanulate or hemispherical; bracts in 1 or 2 rows, ovate, membranous. **Receptacle** conical, paleate; paleae flat, membranous. **Ray florets** female, fertile; corolla white, strap-shaped. **Disc florets** bisexual, fertile; corolla yellow, cylindric, 5-toothed. **Anthers** oblong, bases faintly sagittate, with suborbicular apical appendages. **Style** linear; branches of ray florets linear-lanceolate, of disc florets linear-lanceolate with small subulate terminal appendage, papillose on outer faces. **Cypselas** of ray florets obconical or obpyramidal, usually dorsiventrally compressed, enclosed by group of connate involucral bracts and palea; of disc florets obconical and obpyramidal or subterete, 4- or 5-angled. **Pappus** 0 or of linear or narrowly ovate, fimbriate, lacinate or aristate scales. x = 8 (9) (aneuploids, high polyploidy).

Species 13, North, Central and South America; **Galinsoga ciliata* (Raf.) S.F.Blake and *G. parviflora* Cav., introduced weeds in sthn Afr., both widespread.

*Gamochaeta Wedd. 8992060

(Gnaphalieae)

Weddell: 151 (1856); Anderberg: 155 (1991a); Anderberg: 357 (1994).

Gnaphalium L., in part, excl. type; Hilliard: 17 (1983).

Annual or perennial herbs. **Leaves** alternate, sessile, tomentose (hair type B), eglandular, margin flat, entire. **Capitula** disciform, small, inconspicuous, in head-like clusters or in ± elongated spikes. **Involucral bracts** papery, brownish, transparent; stereome undivided. **Receptacle** flat, epaleate. **Female florets** purple, filiform, pistillate, outnumbering disc florets. **Disc florets** bisexual; corolla purple, corolla lobes erect. **Anthers** ecalcarate, caudate with short tails; apical appendage flat, as wide as thecae; endothecial tissue polarised. **Style** bifid; style branches truncate with obtuse sweeping hairs apically; stigmatic surface separated. **Cypselas** small, oblong, with globose, myxogenic twin hairs; epidermis smooth. **Pappus** of barbellate, capillary bristles in 1 row, deciduous as unit, basally connate; apical cells not clavate. x = 10 (1 report, polyploidy).

Species 52, mainly South America, but also in other parts of the world; 5 naturalised in sthn Afr., widespread but absent from Namibia, Botswana and Northern Cape.

Garuleum Cass. 9426000

(Calenduleae)

Cassini: 172 (1819d); Harvey: 92 (1865); Norlindh: 33 (1943); Nordenstam: 375 (1994).

Perennial herbs, shrublets or shrubs, sometimes viscid, scabrid, or pilose. **Leaves** alternate, pinnatifid or toothed, sometimes pungent, sessile. **Capitula** radiate, solitary or corymbose, terminal, pedunculate. **Involucre** hemispherical-campanulate with imbricate bracts in 2 or 3 rows, ovate to linear, usually ciliate, sometimes reflexed and sometimes pungent. **Receptacle** convex, epaleate. **Ray florets** female, fertile; corolla blue, purple, mauve, white or yellow; tube with linear or oblong, 3-toothed lamina up to 3 × its length. **Style** linear, with linear, subacute branches. **Ray cypselas** triquetrous or somewhat compressed with entire or crenate angles, glabrous. **Pappus** 0. **Disc florets** bisexual or functionally male; corolla yellow; tube subcampanulate above, with 5 lanceolate lobes, sometimes hairy on back. **Anthers** ecalcarate, faintly eared at base; with ovate, apical appendage; endothecial tissue polarised. **Style** terete or linear, deeply bifurcate with linear lobes, covered with acute papillae (hairs) to well below point of bifurcation. **Disc cypselas** (develop in 1 species only) obovate or obcordate in outline, flattened, marginally winged with thickened rim, glabrous. **Pappus** 0.

Species 8, endemic to sthn Afr., widespread but absent from Botswana, Northern Province, North-West and Swaziland.

Gazania Gaertn. 9434000

(Arctoteae)

Gaertner: 451 (1791); Harvey: 471 (1865); Oliver & Hiern: 427 (1877); Phillips: 845 (1951); Roessler: 365 (1959); Hilliard: 543 (1977); Bremer: 261 (1994).

Perennial or rarely annual herbs, usually tufted from base, with milky latex. **Leaves** alternate sometimes rosulate, rarely with distinct petiole, entire to pinnately lobed, usually white-woolly on lower surface. **Capitula** radiate, few- to many-flowered, solitary, pedunculate. **Involucre** urceolate or campanulate; bracts in many rows, connate below to form cup and intrusive at base. **Receptacle** somewhat convex or conical, epaleate. **Ray florets** in 1 row, neuter; corolla yellow, golden or reddish, often with greenish or blackish spot at base, strap-shaped, tube flatttened, with ± oblong-elliptic, 3- or 4-toothed lamina, 2–3-times longer than tube; staminodes sometimes present. **Disc florets** bisexual, fertile or inner sterile; corolla concolorous with ray florets, tubular, widened above, deeply 5-lobed. **Anthers** with bases sagittate, shortly mucronate-acuminate **Style** terete, thickened above, with ± linear-lanceolate branches; styles of inner, sterile florets usually undivided. **Cypselas** obovoid-obconical, with rows of swollen cells, sericeous. **Pappus** of many, delicate, slender scales, sometimes difficult to distinguish from cypsela hairs. x = 5, 6, 7 (polyploidy).

Species 17, Africa; mainly in Namibia and South Africa with *Gazania krebsiana* Less. subsp. *serrulata* (DC.) Roessler extending to Angola and Tanzania, and *G. rigens* (L.) Gaertn. var. *uniflora* (L.f.) Roessler also occurring in Mozambique.

Geigeria Griess. 9090000

(Inuleae)

Griesselich: 411 (1830); Bentham: 337 (1873a); Oliver & Hiern: 367 (1877); Harvey: 124 (1865); Phillips: 810 (1951); Merxmüller: 251 (1953); Merxmüller: 74 (1967a); Hilliard: 283 (1977); Wild: 53 (1982); Anderberg: 286 (1994).

Diplostemma Hochst. & Steud. ex DC.: 75 (1838b). *Araschcoolia* Sch.Bip. ex Benth.: 337 (1873a). *Thysanurus* O.Hoffm.: 127 (1889b).

Perennial herbs, rosulate-acaulescent or variously branched, subshrubs or small shrubs. **Stems** erect or prostrate, glabrous or variously hairy, often glandular-punctate, winged or not. **Leaves** alternate, sessile, generally linear to lanceolate, entire or denticulate, usually glandular-punctate. **Capitula** radiate, few- to several-flowered, sessile, solitary or few, in terminal or axillary clusters. **Involucre** ovoid or globose; bracts in many rows, outer bracts usually with foliaceous appendages. **Receptacle** convex to conical, epaleate but with many bristles. **Ray florets** female, marginal; corolla yellow, tube 3- or 4-toothed or -lobed, oblong or linear-oblong; lamina longer than tube; ovary oblong; style terete, with linear,

obtuse branches. **Disc florets** bisexual, fertile; corolla tube slightly narrowed upwards, with linear-lanceolate lobes ± half as long as tube. **Anther** bases sagittate; with lanceolate, apical appendage. **Style** terete, slightly swollen at base; branches linear, acute. **Cypselas** ellipsoid or turbinate, villous. **Pappus** usually of 10 broad scales with alternate ones sometimes awned. $x = 10$ (1 report).

Species 27, mostly in the southern part of Africa; 21 in sthn Afr., widespread, absent from the Western Cape.

Gerbera L. 9528000

(Mutisieae)

Linnaeus: 247 (1758) name conserved: Oliver & Hiern: 445 (1877); Phillips: 851 (1951); Wild: 202 (1972); Hilliard: 586 (1977); Hansen: 8 (1985); Bremer: 100 (1994).

Perennial herbs, acaulescent and scapigerous, often with woolly crown. **Leaves** radical, entire, serrulate, dentate or sinuate-pinnatifid, pilose or tomentose or glabrescent. **Capitula** radiate, solitary on long scapes; scapes 1-headed, many-flowered, bracteate or ebracteate. **Involucre** turbinate to broadly campanulate; bracts in many rows, outer shorter than inner, obtuse. **Receptacle** flat, epaleate. **Ray florets** in 1 or 2 rows, usually female; corolla white, yellow, pink or red, bilabiate, outer lip strap-shaped or shortly elliptic, (2)3-denticulate, inner lip of 2 small, linear lobes. **Disc florets** bisexual, fertile or inner functionally male, of same colour as ray florets, also bilabiate; outer lip ± elliptic, 3-toothed or occasionally 3-lobed; inner lip of (1)2 or 3 linear or oblong lobes, usually reflexed. **Anthers** with bases sagittate, tailed, tails entire or ciliate; apical appendage lanceolate. **Style** terete, with shortly and broadly lanceolate branches, tips rounded or subacute with short, pollen-sweeping hairs outside. **Cypselas** narrowly flask-shaped, attenuated at apex or sometimes prolonged into beak, ribbed, sparsely puberulous. **Pappus** of many scabrid bristles. $x = 12, 23, 25$ (polyploidy).

Species ± 30, tropical and sthn Afr., Madagascar, Asia; 13 in sthn Afr., widespread but absent from Namibia and Botswana.

Gibbaria Cass. 9427010

(Calenduleae)

Cassini: 139 (1817c); Norlindh: 358 (1943); Nordenstam: 375 (1994).

Under *Osteospermum* by Harvey: 433 (1865).

Shrubs or shrublets. **Leaves** alternate, sessile, scabrid, linear to lanceolate and elliptic, entire or remotely toothed. **Capitula** radiate, shortly pedunculate, terminal, solitary, several- to many-flowered. **Involucre** campanulate; bracts in 2 or 3 rows, free, lanceolate, setose or pilose. **Receptacle** flat or convex, epaleate. **Ray florets** female, fertile; corolla yellow or orange on both sides or white above; tube oblique on ovary, funnel-shaped, with somewhat oblong-elliptic lamina 4–8 × its length. **Staminodes** sometimes present. **Style** terete with linear, obtuse branches. **Cypselas** glabrous, kidney-shaped, convex and transversely rugose on convex side, keeled on reverse side, with ventral cavity. **Pappus** 0. **Disc florets** functionally male; corolla tube widened above, with 5 ovate lobes. **Anthers** ecalcarate, caudate; with ovate, apical appendage; endothecial tissue polarised. **Style** linear, convex, faintly 2-lobed at apex, with apical ring of hairs. **Pappus** 0. $x = 10$ (1 report).

Species 2, endemic to sthn Afr.: *Gibbaria ilicifolia* (L.) Norl. and *G. scabra* (Thunb.) Norl., Western and Eastern Cape.

Gnaphalium L. 8992000

(Gnaphalieae)

Linnaeus: 850 (1753); Harvey: 260 (1865); Hilliard: 267 (1981a); Hilliard: 17 (1983); Anderberg: 167 (1991a); Anderberg: 358 (1994).

Amphidoxa DC.: 246 (1838a). *Demidium* DC.: 246 (1838a)

Annual or perennial herbs, rarely frutescent, whitish woolly. **Leaves** alternate, usually sessile, sometimes amplexicaul, tomentose (hair type B), eglandular; margin flat, entire. **Capitula** disciform, few together, rarely solitary, terminal or racemosely arranged, sometimes surrounded by whorl of leaves. **Involucral** bracts in few rows, light brown, buff, creamy or white; stereome undivided. **Receptacle** flat, nearly smooth or honeycombed, epaleate. **Marginal florets** female, filiform, purple, outnumbering disc florets. **Disc florets** bisexual; corolla purple, narrowly tubular, lobes erect, all with hairs on back. **Anthers** ecalcarate, caudate with short tails; apical appendage flat, as wide as thecae; endothecial tissue polarised. **Style** bifid; style branches truncate and penicillate with obtuse sweeping hairs apically; stigmatic surface separated. **Cypselas** small, oblong, glabrous or sparsely hairy with short, clavate, not myxogenic, twin hairs; epidermis with imbricate papillae. **Pappus** dimorphic, of free, scabrid, capillary bristles in 1 row, basally with patent cilia; apical cells subclavate in disc florets, acute in female florets. $x = 7$ (8, 9, 10, 13) (aneuploids, high polyploidy, B-chromosomes).

Species ± 80, cosmopolitan; 14 in sthn Afr., widespread but absent from Swaziland.

Gorteria L. 9433000

(Arctoteae)

Linnaeus: 1229 (1759); Harvey: 469 (1865); Phillips: 844 (1951); Roessler: 319 (1959); Bremer: 262 (1994).

Annual herbs, sometimes with wiry branches from base. **Leaves** alternate, sometimes radical, sessile, linear to lanceolate, entire or lobed, woolly on lower surface. **Capitula** radiate, several-flowered, solitary, terminal or axillary, subsessile. **Involucre** ovoid; bracts connate into cup towards base, pungent, ciliate, enclosing fruit after anthesis. **Receptacle** basin-shaped, nude, honeycombed, with margins of pits produced. **Ray florets** neuter, arising on side of receptacle; corolla yellow or orange, sometimes with dark basal spot and dark dorsal stripe, with tube absent; lamina ± elliptic above and narrowed into a long claw, 2- or 3-toothed. **Disc florets** bisexual, fertile or central ones sterile; corolla yellow or orange; tube slightly widened above, with 5 linear or lanceolate lobes. **Anthers** shortly sagittate at base; with ovate, apical appendage. **Style** linear, subglobose at base with lanceolate or linear-lanceolate branches; those of innermost florets undivided. **Cypselas** obovoid, apically sericeous. **Pappus** of few narrow setae or ring of minute, hyaline scales or long-ciliate cup, or crown. **Seeds** germinating within capitula.

Species 3, endemic to sthn Afr., occurring S Namibia, Northern Cape (Richtersveld, Namaqualand) and ± along the west and southern coastal region of the Western Cape to Humansdorp in the Eastern Cape.

Grangea Adans. 8865000

(Astereae)

Adanson: 121 (1763); Oliver & Hiern: 304 (1877); Merxmüller: 87 (1967a); Hilliard: 57 (1977); Fayed: 450 (1979); Bremer: 400 (1994).

Annual or perennial, erect or decumbent herbs, ± hairy, branching from base. **Leaves** alternate, sessile, with subauriculate bases, pinnatifid, oblong-obovate to obovate to spathulate in outline, hairy on both sides, lobes

entire or dentate. **Capitula** disciform, ± globose, single in leaf axils or 2–6 terminal, subcorymbosely arranged, on leafless or bracteate peduncles. **Involucre** campanulate or cup-shaped; bracts in ± 3 rows, subequal, with membranous, transparent ciliate margins. **Receptacle** convex to conical, epaleate. **Marginal florets** female, fertile, in 2 or 3, rarely many rows; corolla yellow, tubular, 2–4-dentate, laxly glandular. **Disc florets** many, bisexual, fertile, as long as or longer than outer florets; corolla yellow, lower part tubular becoming campanulate upwards, with 4 or 5 triangular lobes, laxly glandular. **Anthers** ecalcarate and ecaudate, apex with triangular obtuse appendages. **Style** slightly longer than corolla, with 2 short branches; appendages triangular papillose. **Cypselas** small, obovate or elliptic, slightly compressed, with 2 (rarely 4) marginal nerves, upper part often narrowed, loosely hairy. **Pappus** of few, basally connate, scaly bristles, or a corona or rarely 0. $x = 9$ (8).

Species 10, Africa, Madagascar and Asia; 2 in sthn Afr.: *Grangea anthemoides* O.Hoffm., *G. maderaspatana* (L.) Poir., subtropical flats of Namibia and N KwaZulu-Natal.

*Guizotia Cass. 9222000

(Heliantheae)

Cassini: 237 (1829a); Oliver & Hiern: 384 (1877); Wild: 11 (1967); Hansen: 139 (1976); Baagøe: 1 (1974); Karis & Ryding: 610 (1994).

Annual herbs. **Leaves** simple, lower opposite, uppermost alternate, sessile. **Capitula** radiate, solitary and terminal on branches or in cymes. **Involucre** with bracts in 2 rows; bracts dimorphic; outer bracts unequal, large, foliaceous, ciliate; inner bracts smaller. **Receptacle** with ± cucullate paleae. **Ray florets** in 1 row, female; corolla golden yellow, minutely 3-lobed. **Disc florets** bisexual, fertile; corolla yellow, cylindric, narrowed below, with reflexed pubescence at base, 5-lobed. **Anthers** obtuse or minutely sagittate at base; with apical appendage. **Cypselas** obovate, oblanceolate or obconical; ray cypselas triquetrous; disc cypselas 4-angled. **Pappus** 0. $x = 5$ (7, 8—1 report each) (aneuploids, high polyploidy, B-chromosomes).

Species ± 6, tropical Africa; **Guizotia abyssinica* (L.f.) Cass. occurs sporadically in Gauteng and Mpumalanga.

Gymnodiscus Less. 9418000

(Senecioneae)

Lessing: 95 (1831); Harvey: 345 (1865); Bremer: 502 (1994).

Annual herbs, delicate, glabrous. **Leaves** radical, rosulate, sessile, obovate to linear, entire or bluntly lobed, succulent; cauline leaves few, often amplexicaul. **Capitula** radiate, few-flowered, corymbosely arranged on long, almost leafless scapes. **Involucre** ecalyculate, campanulate; bracts in 1 row, free or connate at base, obovate to lanceolate. **Receptacle** convex, epaleate. **Ray florets** female; corolla yellow; tube with linear or elliptic lamina 2.5 × its length. **Disc florets** functionally male; corolla yellow; tube funnel-shaped or campanulate from cylindric base, with 5 lanceolate lobes. **Anthers** oblong, ecalcarate and ecaudate; with oblong, apical appendage; endothecial tissue radial. **Style** linear, with linear, obtuse branches, truncate, with conical appendage, or undivided. **Cypselas** obovoid, smooth, glabrous. **Pappus** 0 in disc florets; of many fine, scabrid bristles, persistent or caducous in marginal florets. $x = 9$.

Species 2, endemic to sthn Afr.: *Gymnodiscus capillaris* (L.f.) DC. and *G. linearifolia* DC., Namaqualand (Northern Cape) and Western Cape.

Gymnopentzia Benth. 9364000

(Anthemideae)

Bentham: 537 (1873a); Hilliard & Burtt: 9 (1971); Hilliard: 362 (1977); Källersjö: 538 (1985); Bremer & Humphries: 95 (1993); Bremer: 448 (1994).

Shrubs, erect or decumbent. **Leaves** opposite, connate and sheathing at base, linear, bifurcate or undivided, glabrous or pilose. **Capitula** discoid, small, in dense terminal corymbs, several- to many-flowered. **Involucre** broadly campanulate; bracts in few rows, ciliate. **Receptacle** flat or slightly convex, epaleate or with occasional paleae. **Disc florets** bisexual, fertile; corolla yellow, tubular below, campanulate above, glandular, with 5 ovate lobes. **Anthers** ecalcarate and ecaudate; with oblong, apical appendage; endothecial tissue polarised. **Style** branches oblong, truncate, penicillate. **Cypselas** ± cylindric, 10-ribbed, long-papillose. **Pappus** 0.

Monotypic, endemic to sthn Afr.: *Gymnopentzia bifurcata* Benth., mountains of Mpumalanga, Free State, KwaZulu-Natal, Lesotho and Eastern Cape.

Gymnostephium Less. 8882000

(Astereae)

Lessing: 185 (1832); Harvey: 66 (1865); Bremer: 422 (1994); Nesom: 85 (1994).

Subshrubs or lignescent herbs, branched, with vestiture of stout, thick-based, usually spreading hairs. **Leaves** alternate, sessile, linear, entire, usually ciliate, sometimes glandular-hairy. **Capitula** radiate, many-flowered, usually solitary, on long peduncles, rarely corymbose. **Involucre** campanulate; bracts in 3 or 4 rows, linear, oblong or elliptic, 1-nerved, with broad scarious margins, usually ciliate, glabrous or scurfy on back. **Receptacle** somewhat concave, honeycombed, epaleate. **Ray florets** female; corolla white or blue, tube cylindric, with linear or oblong-linear, 2- or 3-fid lamina. **Style** terete, with flattened, lanceolate or linear branches. **Disc florets** functionally male, sterile; corolla yellow; tube cylindric, campanulate or widening gradually above. **Anthers** linear, ecalcarate and ecaudate; with ovate, membranous, apical appendage. **Cypselas** oblong-obovate, 2-nerved, strongly compressed, surface black at maturity and minutely 'pebbled', moderately to densely invested with short, white papillae, glabrous to glabrate. **Pappus** of ray florets 0 or of 1 or 2 barbellate or plumose caducous bristles in a single row; of disc florets of 2 or 3 barbellate or plumose caducous bristles.

Species 8, endemic to sthn Afr., Western Cape.

Haplocarpha Less. 9432030

(Arctoteae)

Lessing: 90 (1831); Oliver & Hiern: 427 (1877); Beauverd: 50 (1915); Lewin: 50 (1922); Phillips: 843 (1951); Hilliard: 537 (1977); Pope: 232 (1992); Bremer: 260 (1994).

Perennial, mat-forming, acaulescent herbs, woolly, with stout rootstocks. **Leaves** radical, sessile or narrowed into petiole, entire, toothed or pinnatifid, lower surface whitish-woolly. **Capitula** radiate, many-flowered, solitary, terminal, peduncled. **Involucre** campanulate; bracts in few to many rows, scarious-hyaline on margins. **Receptacle** flat or convex, epaleate. **Ray florets** female, fertile; corolla yellow, strap-shaped; tube pilose at base, with ± linear-oblong, 3-toothed lamina, 3–5 times longer than tube; staminodes sometimes present. **Disc florets** many, bisexual; corolla yellow, infundibuliform, deeply 5-lobed. **Anthers** sagittate at base. **Style** abruptly thickened below branches; branches connate or minutely

bifid. **Cypselas** turbinate, ribbed, glabrous, minutely pubescent or silky-villous, with basal coma of long or short hairs. **Pappus** in 2 to several rows occasionally reduced or 0; inner pappus of delicate, hyaline, lanceolate scales equalling corolla tube in length; outer pappus smaller. $x = 5, 6, 9$ (polyploidy).

Species 10, Africa; 5 in sthn Afr., widespread, absent from Namibia and Botswana.

*Hedypnois Mill. 9569000

(Lactuceae)
Miller: [606] (1754); Sell: 307 (1976); Bremer: 197 (1994).

Annual herbs with milky latex. **Leaves** rosulate, entire to pinnatifid. **Capitula** ligulate, on stout, rather long peduncles. **Involucre** with bracts in 2 distinct, unequal rows. **Florets** bisexual, fertile; corolla yellow, dorsally sometimes with reddish or greenish stripes. **Style** with branches long, sweeping hairs short. **Cypselas** narrowly terete and incurved, enclosed by persistent involucral bracts. **Pappus** dimorphic: in outer florets a small corona; in inner florets of few, coarse, basally flattened and scale-like, scabrid bristles. $x = 3, 4, 5, 6, 7, 8, 9, 11, 13$ (aneuploids, polyploidy, B-chromosomes).

Species 3, Macronesia to the Mediterranean; **Hedypnois cretica* (L.) Dum.Cours., an introduced species, occurs sporadically in the Western and Eastern Cape.

*Helianthus L. 9200000

(Heliantheae)
Linnaeus: 904 (1753); Linnaeus: 386 (1754); Wild: 57 (1967); Hilliard: 309 (1977); Karis & Ryding: 602 (1994).

Perennial or coarse annual herbs. **Leaves** with lower ones opposite, upper ones alternate, ovate to triangular, entire or toothed. **Capitula** radiate, or rarely discoid, usually medium to large, solitary, long-pedunculate. **Involucre** hemispherical; bracts in 2 to many rows, often herbaceous. **Receptacle** flat or convex, paleate; paleae enfolding disc florets. **Ray florets** neuter; corolla yellow, occasionally reddish, strap-shaped, conspicuous. **Disc florets** bisexual, fertile; corolla yellow or sometimes partly or wholly purple, narrowly tubular below, expanded above, 5-toothed. **Anthers** entire or minutely sagittate at base; with apical appendage. **Style** with branches narrowly oblong, tips acutely deltoid with long or short sweeping hairs on outer face. **Cypselas** obovate, ± compressed, often apically emarginate. **Pappus** of 2 deciduous awn-like scales. $x = 17$ (5, 7, 8, 9) (aneuploids, polyploidy).

Species 50, North America; 3 as occasional escapes in sthn Afr., recorded from Gauteng, Free State, KwaZulu-Natal and the Eastern Cape.

Helichrysopsis Kirp. 8992030

(Gnaphalieae)
Kirpicznikov: 32 (1950); Hilliard & Burtt: 207 (1981); Hilliard: 47 (1983); Anderberg: 153 (1991a); Anderberg: 358 (1994).

Perennial herbs, stems much branched, spreading, ashy grey, closely leafy. **Leaves** alternate, sessile, linear, margins entire, strongly revolute, white-cottony (hair type B), contrasting strongly with silky grey upper leaf surface and midrib below, giving striped effect to leaves. **Capitula** disciform, narrowly campanulate, few clustered at branchlet tips. **Involucral bracts** in ± 4 rows, outer short, pellucid, palest brown; inner with tips opaque milk-white, exceeding flowers; stereome undivided. **Receptacle** honeycombed, flat, epaleate. **Flowers** yellow, ± 45–65, 30–50 female, corolla filiform; 12 or 13 bisexual, corolla cylindric, all lobes glandular-hairy on backs. **Anthers** ecalcarate, caudate, tails exceeding filament collar; with small obtuse apical appendage; endothecial tissue polarised. **Style** branches truncate and penicillate with obtuse sweeping hairs apically. **Cypselas** oblong, small, with minute 2-celled globular hairs without swelling cushion, myxogenic. **Pappus** bristles many, tips plumose, shaft nude, 2 or 3 bristles fused together near base and then, a little lower, these compound bristles fused into smooth ring.

Monotypic: *Helichrysopsis septentrionale* (Vatke) Hilliard, KwaZulu-Natal; also coastal Mozambique.

Helichrysum Mill. 9006000

(Gnaphalieae)
Miller: [462] (1754); Persoon: 414 (1807) name conserved; Hilliard: 61 (1983), Anderberg: 141 (1991a), Anderberg: 358 (1994).

Achyrocline (Less.) DC., Hilliard & Burtt: 201 (1981); Hilliard: 59 (1983); Mesfin Tadesse & Reilly: 379 (1995). *Leontonyx* Cass.: 466 (1822).

Annual or perennial herbs or shrublets, generally erect, sometimes prostrate, usually woolly or cobwebby, often glandular, rarely glabrous. **Leaves** alternate, straight, variously shaped, sessile or petiolate, often hairy, pilose to velutinous, margins entire, flat or sometimes revolute. **Capitula** disciform or discoid; cylindric, turbinate, campanulate, subglobose or depressed-globose, in terminal, loose, flat-topped corymbs or solitary. **Involucral bracts** in few to many rows; stereome usually fenestrated (divided); white, yellow, straw-coloured, brown, pink, purple, or red, sometimes a combination of colours; glabrous or hairy. **Receptacle** smooth, honeycombed or fimbrilliferous, flat, epaleate, rarely paleate. **Marginal florets** female, fewer or sometimes more than central florets; corolla often narrowly tubular, sometimes with well-developed lamina, rarely filiform, yellow. **Central florets** bisexual; corolla funnel-shaped or tubular and then ± campanulate above, lobes 5, hairs always present on backs of lobes, yellow. **Anthers** ecalcarate, caudate; with lanceolate apical appendages; endothecial tissue polarised. **Style** branches truncate, penicillate; stigmatic areas separated. **Cypselas** sparsely hairy with short, clavate, myxogenic hairs or with long nonmyxogenic hairs or glabrous; epidermis smooth or often papillose. **Pappus** of barbellate or subplumose bristles, generally in 1 row; bristles basally with or without patent cilia, apical cells clavate or not. $x = 7$ (4, 5, 6, 8, 13) (aneuploids, high polyploidy).

Species ± 600, largely Africa and Madagascar, also Europe, Asia and Australia; 244 in sthn Afr., widely distributed.

Hertia Less. 9377000

(Senecioneae)
Lessing: 94 (1831); Kuntze: 344 (1891); Phillips: 831 (1951); Merxmüller: 99 (1967a); Bremer: 503 (1994); Herman: 192 (1998b).

Doria Less., Harvey: 320 (1865).

Shrublets or shrubs. **Leaves** alternate, entire to serrate, sometimes decurrent, fleshy, glabrous. **Capitula** radiate or disciform, several-flowered, paniculate-corymbose or solitary, pedunculate to sessile. **Involucre** ecalyculate, campanulate to tubular; bracts in 1 row, usually connate below. **Receptacle** flat, epaleate. **Marginal** and **ray florets** female, fertile; corolla yellow, shorter than ovary, faintly toothed or with short lamina or with linear-oblong, 3-toothed lamina ± as long as tube. **Disc florets** functionally male; corolla yellow, tubular, widened above, ribbed, glabrous, with 5 ovate lobes. **Anthers** ecalcarate and ecaudate or faintly sagittate at base; with ovate, apical appendage; endothecial tissue radial. **Style**

terete, divided, with oblong-linear, obtuse or truncate branches. **Cypselas** ellipsoid-oblong, mostly densely pubescent. **Pappus** of many delicate bristles. $x = 10$.

Species ± 10, Africa and Southwest Asia; 5 in sthn Afr., widespread but absent from Botswana, Northern Province, Gauteng, Mpumalanga, Swaziland and KwaZulu-Natal.

Heterolepis Cass. 9057000

(Arctoteae)

Cassini: 26 (1820b); Harvey: 469 (1865); Druce: 628 (1917); Bremer: 257 (1994).

Minurothamnus DC.: 286 (1838b); Harvey: 124 (1865); Merxmüller: 39 (1950).

Shrublets; young branches cobwebby. **Leaves** alternate, linear to linear-oblong, margins entire or remotely dentate, usually revolute, mucronate, usually tomentose on lower surface. **Capitula** radiate, relatively large, solitary, terminal, on long or short, glandular peduncles. **Involucre** broadly campanulate; bracts in 1–3 rows; outermost sometimes herbaceous, papillose; inner oblong to linear, ciliate towards apex, with membranous margins. **Receptacle** epaleate, honeycombed (areolate). **Ray florets** female, fertile; corolla yellow; tube shorter than minutely 3-toothed, oblong-linear lamina, generally with staminodes, with filiform lobe ventrally in sinus of tube. **Disc florets** bisexual, fertile; corolla yellow; tube widening above, with 5 linear lobes. **Anthers** calcarate and caudate; with oblong, apical appendage; endothecial tissue polarised. **Style** slender with rather short style branches, apical portion not or only slightly thickened and with short hairs mainly at border to shaft. **Cypselas** oblong-obovoid, densely sericeous. **Pappus** of stout, subulate, bristle-like marginally barbellate scales in 2 rows. $x = 10$.

Species 3, endemic to sthn Afr., Western Cape.

Heteromma Benth. 8931000

(Astereae)

Bentham: 286 (1873a); Hilliard & Burtt: 364 (1973); Hilliard: 100 (1977); Bremer: 422 (1994).

Chrysocoma subgenus *Heteropsis* Harv.: 95 (1865). *Pentheriella* O.Hoffm. & Muschl.: 316 (1910).

Perennial herbs up to 1 m tall. **Leaves** alternate, sometimes radical, simple, broadly linear or pinnatisect, sessile or petiolate, decurrent. **Capitula** discoid, in panicled corymbs, several-flowered. **Involucre** campanulate; bracts in 2 or 3 rows, inner ones obovate to broadly elliptic, usually membranous. **Receptacle** flat, honeycombed, epaleate. **Florets** bisexual; corolla yellow; tube narrowly cylindric below, becoming campanulate above, 5-lobed. **Anthers** ecalcarate and ecaudate; with lanceolate, apical appendage. **Style** branches oblong, truncate and penicillate with deltoid appendage, with conspicuous sweeping hairs. **Cypselas** elliptic to obovate in outline, somewhat oblique, slightly compressed, usually 3-ribbed, pubescent. **Pappus** in 2 rows, of many fine scabrid bristles, caducous.

Species 3, endemic to sthn Afr., Free State, KwaZulu-Natal, Lesotho and Eastern Cape.

Heterorhachis Sch.Bip. ex Walp. 9438020

(Arctoteae)

Walpers: 278 (1846–1847); Harvey: 505 (1865) as *Berkheya palmata* (Thunb.) Willd.; Roessler: 312 (1959); Bremer: 262 (1994).

Shrubs or shrublets, rigid, coarse, woolly or flocculent. **Leaves** alternate, dense, pinnatifid, cobwebby beneath, becoming glabrous and glossy above, lobes pungent, with revolute margins. **Capitula** radiate, in terminal racemose clusters. **Involucre** with bracts basally somewhat connate, in 3 rows, with basal ones spine-toothed, middle ones longest, entire, lanceolate-acuminate. **Receptacle** conspicuously honeycombed; outer cavities thick-walled, inner walls membranous. **Ray florets** sterile, usually with rudimentary stamens; corolla yellow, lamina 3- or 4-dentate, minutely glandular-pubescent. **Disc florets** bisexual, fertile; corolla yellow, minutely glandular-pubescent. **Cypselas** obconical, thinly and very shortly pubescent or nearly glabrous. **Pappus** of scales ± in 2 rows, lanceolate, plumose-fimbriate, outer ones the shorter.

Monotypic: *Heterorhachis aculeata* (Burm.f.) Roessler is endemic to the Northern and Western Cape.

Hilliardia B.Nord. 9339020

(Anthemideae)

Nordenstam: 147 (1987); Bremer & Humphries: 157 (1993); Bremer: 474 (1994).

Scrambling shrubs. **Leaves** alternate, flat, herbaceous, pinnatilobate. **Capitula** radiate, pedunculate, solitary or laxly corymbose. **Involucral bracts** 8–11, imbricate, rounded-oblong, with subscarious hyaline margins and obtuse-rounded hyaline tip. **Receptacle** hemispherical or conical, glabrous, epaleate. **Ray florets** 8–13, female, fertile, strap-shaped; lamina oblanceolate-elliptic-obovate, white, with several branching veins, minutely papillate on upper surface, apically bifid, with short tube split adaxially to base. **Disc florets** many, bisexual; corolla tubular, 4-lobed. **Anthers** ecalcarate and ecaudate; apically with flat obtuse-truncate appendage. **Style** branches apically truncate, inside with discrete stigmatic areas. **Cypselas** elliptic-oblong, glabrous, adaxially slightly flattened and 3-ribbed, wall very thin, translucent and showing brownish black, rounded and very thick-walled testa epidermis cells. **Pappus** 0. $x = 10$ (1 report).

Monotypic, endemic to sthn Afr.: *Hilliardia zuurbergensis* (Oliv.) B.Nord., KwaZulu-Natal and Eastern Cape.

Hippia L. 9357000

(Anthemideae)

Linnaeus: 158 (1771); Harvey: 170 (1865); Hutchinson: 178 (1918); Bremer & Humphries: 160 (1993); Bremer: 474 (1994).

Shrublets or subshrubs, aromatic. **Leaves** alternate, pinnatisect, lobed, dentate or rarely entire. **Capitula** disciform, several-flowered, small, corymbose, occasionally solitary. **Receptacle** convex or conical, epaleate. **Involucre** campanulate; bracts in 3 or 4 rows, often glandular, sometimes ciliate and pilose on back. **Marginal florets** female, fertile, corolla tube short or conical, minutely 2–4-lobed; without lamina. **Disc florets** functionally male; corolla tube cylindric or funnel-shaped below and campanulate above, sometimes narrowly winged, glandular, with 5 ovate lobes; sometimes irregular. **Anthers** linear-oblong, ecalcarate and ecaudate; with oblong or linear-oblong, apical appendage. **Style** linear or terete, sometimes swollen at base, undivided, disciform and glandular at base. **Cypselas** dorsiventrally flattened, generally laterally winged. **Pappus** 0.

Species 8; endemic to sthn Afr., Western and Eastern Cape.

Hirpicium Cass. 9435000

(Arctoteae)

Cassini: 27 (1820b); Harvey: 485 (1865); Phillips: 845 (1951); Roessler: 333 (1959); Roessler: 86 (1975); Bremer: 262 (1994).

Berkheyopsis O.Hoffm.: 311 (1892).

Annual or perennial herbs, subshrubs or shrubs. **Leaves** alternate, sometimes fascicled, ericoid or lanceolate,

sometimes scabrid and pungent and whitish-woolly beneath. **Capitula** radiate, many-flowered, solitary, terminal, pedunculate or subsessile. **Involucre** campanulate; bracts connate into cup-like base, sometimes setose, with lobes sometimes partially reflexed. **Receptacle** conical, honeycombed. **Ray florets** neuter; corolla yellow, strap-shaped; tube flattened with lamina linear, 3-toothed; staminodes sometimes present. **Disc florets** bisexual, fertile; corolla yellow, tubular, slightly widened above, with 5 linear lobes, setose on back. **Anthers** minutely sagittate. **Style** terete, thickened above, with linear branches. **Cypselas** obconical, ± ribbed, pilose. **Pappus** generally of 2 distinct rows, each of 10 broad scales, with inner row of short scales and outer row of slender, membranous scales or of scales divided into linear segments ± as long as corolla tube. $x = 5$.

Species 12, southern and tropical Africa; 8 in sthn Afr., widespread.

Hoplophyllum DC. 8749000

(Eremothamneae)

Candolle: 73 (1836a); Harvey: 54 (1865); Phillips: 776 (1951); Bremer: 70 (1994); Karis: 193 (1992).

Spiny shrubs or subshrubs. **Leaves** alternate, linear, pungent. **Capitula** discoid; 4–6-flowered, sessile, solitary or in small clusters, axillary or terminal. **Involucre** narrowly campanulate; bracts in ± 7 rows, with outer smallest, broadly elliptic, spinous-pointed, glabrous. **Receptacle** flat, fimbriate. **Corolla** yellow; tube subcylindric; lobes 5, linear, glandular on back. **Anthers** linear, tailed; with small, ovate, membranous, apical appendage. **Style** branches filiform, setose. **Cypselas** oblong, ribbed, densely villous. **Pappus** of many long, scabrid bristles. $x = 9$.

Species 2, endemic in sthn Afr.: *Hoplophyllum ferox* Sond., known from the Western Cape, and *H. spinosum* DC., occurring in Northern and Western Cape.

Hydroidea P.O.Karis 9043020

(Gnaphalieae)

Karis: 29 (1990); Anderberg: 74 (1991a); Anderberg: 331 (1994).

Compact, dense, much or sparingly branched shrublet with axillary brachyblasts. **Leaves** in fascicles, involute ericoid with a skin-like indumentum beneath, occasionally with a few longer hairs, older leaves glabrous, acute to subacute, mucronate. **Capitula** discoid, solitary, 50–140-flowered. **Involucral bracts** in 8–11 rows, white; stereome undivided. **Receptacle** broadly conical, epaleate. **Florets** perfect. **Corolla** narrowly cylindrical, slightly widened above, glabrous. **Cypselas** with wholly papillose, large narrowly oblong epicarp cells; endocarp of the persistent, enlarged, in transverse section equally long testa epidermis cells with brown inversely U-shaped wall thickenings and narrowly oblong from above. **Pappus** bristles barbellate, shaft apically widened with free clavate cells with very thick light-refractive walls.

Monotypic: *Hydroidea elsiae* (Hilliard) Karis, endemic to Western Cape.

Hymenolepis Cass. 9327000

(Anthemideae)

Cassini: 138 (1817c); Bremer & Källersjö: 517 (1985); Källersjö: 534 (1985); Bremer & Humphries: 95 (1993); Bremer: 448 (1994).

Oligodora DC.: 282 (1838a). *Phaeocephalus* S.Moore: 158 (1900a).

Glabrous or pubescent shrubs; indumentum of stellate hairs. **Leaves** alternate, entire or lobed. **Capitula** discoid, with 6–10 florets, slender, in dense corymbs. **Involucre** narrowly ellipsoid-cylindrical to obconical. **Receptacle** flat, generally with paleae, rarely epaleate. **Corolla** gradually expanded, funnel-shaped above, 5-lobed, with distinct nervation, glandular all over with short-stalked biseriate glands. **Anthers** ecalcarate and ecaudate; endothecial tissue polarised. **Styles** sometimes with secretory cavities. **Cypselas** ellipsoid-obovoid to terete, glabrous, with 5–10 ribs. **Pappus** of basally united, fimbriate scales.

Species 7; endemic to sthn Afr., Western and Eastern Cape.

Hypericophyllum Steetz 9262000

(Helenieae)

Steetz: 498 (1864); Pope: 104 (1975); Karis & Ryding: 539 (1994).

Perennial herbs, pilose. **Leaves** opposite, shortly petiolate or sessile, blade elliptic to broadly elliptic or oblanceolate, entire to undulate margin, glabrous or pubescent. **Capitula** discoid, with many florets, solitary at ends of branches; peduncles long, usually thickened towards apex. **Involucre** broadly turbinate-campanulate; bracts in 3–5 rows; outer row ± broadly ovate, ± striate; inner row longer and narrower. **Receptacle** convex, epaleate. **Florets** bisexual. **Corolla** orange or reddish orange; tube widening gradually from base, deeply 5-lobed at apex. **Anthers** with base obtuse; appendage narrowly ovate, exserted. **Style** glabrous; branches obtuse or truncate, papillate outside. **Cypselas** narrowly obpyramidal to narrowly turbinate, longitudinally ribbed, sometimes 4- or 5-angled, glabrous, hirsute or strigose. **Pappus** of many setae, in 1 row, terete, uncinate or sometimes with few straight setae, usually with narrow membranous, ± fimbriate lateral wings in lower third.

Species 7, tropical Africa; 1 in sthn Afr.: *Hypericophyllum elatum* (O.Hoffm.) N.E.Br., Northern Province.

*__Hypochaeris__ L. 9572000

(Lactuceae)

Linnaeus: 810 (1753); Linnaeus: 352 (1754); Phillips: 852 (1951); Henderson & Anderson: 378 (1966); Hilliard: 599 (1977); Pope: 192 (1992); Bremer: 198 (1994).

Annual or perennial, acaulescent herbs with milky latex; with deep taproot; stems solitary or few, often branched. **Leaves** mostly radical, entire, toothed or pinnatifid. **Capitula** ligulate, solitary or several in sparingly branched, corymbose panicles. **Involucre** oblong-cylindrical or campanulate; bracts in several rows. **Receptacle** paleate; paleae linear, acuminate. **Florets** bisexual; corolla yellow or white, strap-shaped. **Anthers** with base sagittate, auricles mucronate-acuminate. **Style** branches long, obtuse, sweeping hairs short. **Cypselas** spindle-shaped, at least inner ones beaked, tuberculate, ribbed. **Pappus** of plumose bristles, in 1 or 2 rows. $x = 4, 5$ (3, 6, 7, 8, 11) (high polyploidy, B-chromosomes).

Species ± 50, Europe, Asia, North Africa, South America; 4 in sthn Afr., not known from Namibia and Botswana.

Ifloga Cass. 8967000

(Gnaphalieae)

Cassini: 142 (1819c); Hilliard: 296 (1981b); Anderberg: 153 (1991a); Anderberg: 359 (1994).

Comptonanthus B.Nord.: 54 (1964).

Annual herbs with ericoid habit. **Leaves** alternate, sessile, often adaxially concave, tomentose on adaxial surface only (hair type B), eglandular; margin involute, entire. **Capitula** disciform, few together along axis. **Involucral bracts** papery, brownish, transparent, glabrous;

stereome divided. **Receptacle** flat, epaleate. **Marginal florets** female, purple, filiform, pistillate, more than disc florets. **Disc florets** bisexual or rarely functionally male; corolla yellow, tube cylindric, lobes erect. **Anthers** ecalcarate, shortly tailed at base; apical appendage flat, as wide as thecae; endothecial tissue radial. **Style** bifid; style branches truncate with obtuse sweeping hairs apically; stigmatic surfaces separated. **Cypselas** small, oblong, with globose, myxogenic twin hairs; epidermis smooth. **Pappus**: 1 row of free, apically plumose, capillary bristles, basally with patent cilia. $x = 7$.

Species 6, mostly Africa, north to the Middle East, spreading to Canary Islands; 4 in sthn Afr., widespread but absent from Botswana, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Inezia E.Phillips 9337010

(Anthemideae)

Phillips: 297 (1932); Brusse: 27 (1989); Bremer & Humphries: 146 (1993); Bremer: 471 (1994).

Perennial herbs, with erect stems from woody rootstock. **Leaves** alternate, entire or pinnatisect, glandular-punctate, pilose. **Capitula** radiate, many-flowered, solitary, terminal, pedunculate. **Involucre** campanulate; bracts in 3 or 4 rows, ± linear, pilose; inner bracts with membranous tip. **Receptacle** conical, epaleate. **Ray florets** female, fertile or sterile, yellow or white; corolla tube short or 0, ciliate and glandular on margin, with obovate, 2- or 3-toothed lamina, 3 to 4 times longer than tube. **Disc florets** bisexual, fertile, yellow; corolla tube somewhat compressed, winged, glandular on margins, 4-lobed, with 2 lateral lobes somewhat cucullate, dorsal and ventral lobes ovate. **Anthers** ecalcarate and ecaudate, with ovate, apical appendage. **Style** terete, somewhat swollen at base, with oblong, truncate branches; cells of stylopodium thick-walled. **Cypselas** oblong, 4-angled, glandular. **Pappus** of minute scales or 0. $x = 10$.

Species 2, endemic to sthn Afr.: *Inezia integrifolia* (Klatt) E.Phillips and *I. speciosa* Brusse, Northern Province, Mpumalanga and Swaziland.

Inula L. 9061000

(Inuleae)

Linnaeus: 881 (1753); Anderberg: 97 (1991b); Anderberg: 287 (1994).

Annual or perennial herbs. **Leaves** alternate, generally sessile, margins dentate or denticulate, hairy and glandular. **Capitula** radiate, disciform or discoid, few together, pedunculate. **Involucre** campanulate; bracts in several rows, lanceolate, outer ones glandular. **Receptacle** honeycombed, epaleate. **Ray florets** female, usually fertile; corolla yellow, strap-shaped, tube cylindric, sometimes ± as long as 3-toothed lamina, sometimes miniradiate or tubular. **Disc florets** bisexual, fertile; corolla yellow; tube slightly widening upwards; lobes 5, ovate. **Anthers** ecalcarate, caudate, with branched tails; with lanceolate, apical appendage; endothecial tissue radial. **Style** with acute sweeping hairs not reaching furcation. **Cypselas** ellipsoid or ± cylindrical, ribbed. **Pappus** of barbellate bristles in 1 row (rarely several rows). $x = 8$ (5, 6, 9) (aneuploids, high polyploidy, B-chromosomes).

Species ± 100, Europe, Africa, Asia; 2 in sthn Afr.: *Inula glomerata* Oliv. & Hiern and *I. paniculata* (Klatt) Burtt Davy, Northern Province and Mpumalanga.

Inulanthera Källersjö 9326010

(Anthemideae)

Källersjö: 539 (1985); Bremer & Humphries: 108 (1993); Bremer: 455 (1994).

Glabrous or pubescent shrubs; indumentum of simple hairs; secretory cavities completely absent from all parts. **Leaves** alternate, entire, toothed or lobed, dotted with immersed glands. **Capitula** discoid, in corymbs. **Involucre** subglobose. **Receptacle** flat, generally with paleae, rarely epaleate. **Corolla** glandular, with narrow tube and distinct, partly enervate 5-lobed limb. **Anthers** ecalcarate and caudate with distinct tails; endothecial tissue polarised. **Cypselas** obovoid with slightly curved base, and with (8–)10 rounded ribs, sometimes with minute papillae, occasionally with small, almost sessile glands in 2 rows. **Pappus** of small, entire or toothed scales; 1 scale terminating each rib.

Species 10, sthn Afr., Angola, Zimbabwe and Madagascar; 7 in sthn Afr., Northern Province, Mpumalanga, Swaziland, Free State, KwaZulu-Natal and Eastern Cape.

Kleinia Mill. 9411050

(Senecioneae)

Miller: [729] (1754); Harvey: 315 (1865); Merxmüller: 104 (1967a); Jeffrey: 923, 935 (1986); Halliday: 22, t. 3878, 42, t. 3882, 70, t. 3888, 128, t. 3900 (1988); Bremer: 504 (1994).

Senecio L. in part, Phillips: 833 (1951). *Notonia* DC.: 518 (1833). *Notoniopsis* B.Nord.: 69 (1978).

Succulent perennial herbs or shrubs. **Leaves** alternate, entire or serrate-lacerate, succulent or reduced and stem then succulent. **Capitula** discoid, few or many, solitary or corymbose. **Involucre** mostly calyculate; bracts in 1 row. **Receptacle** flat, epaleate. **Disc florets** bisexual, yellow, orange or red, tubular, 5-toothed. **Anthers** ecalcarate and ecaudate; endothecial tissue radial. **Style** branches with conical to somewhat elongated, terminal appendages. **Cypselas** oblong, ribbed. **Pappus** of many fine bristles. $x = 10$ (9—1 report) (aneuploids).

Species ± 40, mainly in tropical Africa, also in the Middle East, India, and Sri Lanka; 5 in sthn Afr., widespread.

Lachnospermum Willd. 9045000

(Gnaphalieae)

Willdenow: 1787 (1803); Harvey: 272 (1865); Pillans: 87 (1954); Hilliard & Burtt: 218 (1981); Anderberg: 74 (1991a); Anderberg: 331 (1994).

Carpholoma D.Don: 555 (1826). *Erythropogon* DC.: 254 (1838a). *Tulocliuia* Rafin.: 119 (1838).

Shrublets, slightly greyish-woolly. **Leaves** alternate, ericoid, somewhat twisted, in fascicles, involute, adaxially tomentose. **Capitula** discoid, 16–45-flowered with florets bisexual and fertile, solitary at apices of branches or 2 or 3 together and corymbose. **Involucre** ellipsoid to campanulate, bracts in ± 10 rows, lanceolate, tips acute or obtuse, usually reddish, woolly on backs; stereome undivided. **Receptacle** flat, epaleate or with a few scattered paleae between outer florets; paleae ± as long as corolla, sometimes sparsely ciliate. **Ray florets** 0. **Disc florets** sometimes widened above, with 5 oblong lobes, lobes hairy on outer side. **Anthers** tailed, with a lanceolate, apical appendage. **Style** terete, somewhat swollen at base, sometimes seated on annular disc, with linear, truncate branches. **Cypselas** ± terete, 4- or 5-angled, hairy on ribs, hairs long and unicellular, sometimes also multicellular, gland-tipped hairs; annulus well-developed. **Pappus** of shortly barbellate bristles as long as corolla and sometimes overtopping.

Species 3, endemic to Western Cape.

*Lactuca L. 9596000

(Lactuceae)

Linnaeus: 795 (1753); Linnaeus: 348 (1754); Oliver & Hiern: 450 (1877); Phillips: 854 (1951); Hilliard: 629 (1977); Pope: 196 (1992); Bremer: 184 (1994).

Annual, biennial or perennial, acaulescent or caulescent herbs with milky latex. **Leaves** alternate or radical; cau-

line leaves often auriculate-amplexicaul, entire, coarsely toothed or pinnatifid, glabrous. **Capitula** ligulate, solitary to corymbose or panicled. **Involucres** cylindric; bracts in several rows, elongating in fruiting stage. **Receptacle** flat, epaleate, alveolate. **Florets** ligulate, bisexual, fertile; corolla yellow, whitish purple or blue, strap-shaped, tube cylindric, with tuft of hairs below lamina; lamina shortly 3–5-lobed. **Anthers** linear, sagittate at base, auricles acute or shortly setaceous-acuminate; with lanceolate apical appendage. **Style** linear, sometimes terete above, pubescent on upper portion; branches linear, subobtuse, sweeping hairs long. **Cypselas** flattened, elliptic-oblong to obovate, ribbed, glabrous or scabrid-hispid, generally with distinct slender to filiform beak. **Pappus** of many fine, smooth or scabrid bristles. $x = 9$ (6, 8, 17) (polyploidy, B-chromosomes).

Species ± 100, cosmopolitan, especially in north temperate regions; 5 in sthn Afr., widespread.

Laggera Sch.Bip. ex Benth. 8940000

(Plucheeae)

Bentham: 290 (1873a); Merxmüller: 107 (1967a); Anderberg: 161 (1991c); Anderberg: 300 (1994).

Herbs, aromatic; stem with resin ducts. **Leaves** alternate, dentate, decurrent, hairy. **Capitula** disciform, terminal, few to many together, often in large, loose synflorescence; flowers mauve, pink or yellow. **Receptacle** flat, epaleate. **Involucral bracts** narrow, often squarrose. **Marginal florets** female; corolla filiform, 3-lobed. **Disc florets** bisexual, 4- or 5-lobed. **Anthers** ecaudate, calcarate; endothecial tissue radial. **Style** bifid; style branches with obtuse sweeping hairs reaching below the furcation. **Cypselas** distinct, stout, ellipsoid, without resin ducts, with straight hairs. **Pappus** of free, barbellate, capillary bristles in 1 row; each bristle with adpressed teeth. $x = 5$ (9) (polyploidy, B-chromosomes—1 report).

Species 17; tropical Africa, Arabian Peninsula, Asia; 2 in sthn Afr.: *Laggera crispata* (Vahl) Hepper & Wood and *L. decurrens* (Vahl) Hepper & Wood, widespread but absent from Western Cape.

Lamprocephalus B.Nord. 9411080

(Senecioneae)

Nordenstam: 323 (1975); Bremer: 505 (1994).

Shrublets, glabrous except for loose cobwebby tomentum in leaf axils and on adaxial sides of young leaves. **Leaves** alternate, sessile, simple, linear, base half-clasping, subcarnose or coriaceous, mucronate. **Capitula** discoid, terminal, solitary, ± 15–30-flowered; peduncle long. **Involucre** ecalyculate, cupuliform to narrowly campanulate; involucral bracts 11–13, in 1 row, equal, free from base, linear-lanceolate. **Receptacle** flat, epaleate. **Disc florets** bisexual, fertile; corolla tubular, probably red with yellowish base, glabrous; lobes narrowly triangular, thickish, with involute margins and subcucullate tips. **Anthers** ecalcarate and ecaudate or minutely sagittate, with flat, acute, narrowly triangular appendage; endothecial cells with thickenings on longitudinal and transverse walls. **Style** terete, basally swollen; style branches stout with continuous stigmatic areas, apically with oblong-triangular, obtuse-subacute, minutely papillate appendage. **Cypselas** narrowly oblong, obscurely 5-angular, brown, eventually black, covered with small, whitish, mucilaginous, papilliform hairs. **Pappus** bristles copious, in many rows, persistent, laxly and minutely serrulate, glossy white.

Monotypic, endemic to sthn Afr.: *Lamprocephalus montanus* B.Nord., Western Cape.

Langebergia Anderb. 8995010

(Gnaphalieae)

Anderberg: 93 (1991a); Nordenstam: 406 (1996).

Petalacte D.Don section *Amphilasia* DC.; Harvey: 288 (1865).

Shrubs. **Leaves** alternate, sessile, greyish tomentose (hair type B), eglandular, margin flat, entire. **Capitula** disciform, in terminal flat-topped corymbs. **Involucral bracts** papery, white, opaque; stereome undivided. **Receptacle** flat, epaleate. **Female florets** purple, pistillate, filiform, fewer than disc florets. **Disc florets** bisexual or functionally male; corolla purple, lobes erect. **Anthers** ecalcarate, caudate with short tails; apical appendage flat, as wide as thecae; endothecial tissue polarised. **Style** bifid; style branches truncate with obtuse sweeping hairs apically; stigmatic surfaces separated. **Cypselas** ellipsoid, with short, clavate, nonmyxogenic twin hairs; epidermis smooth. **Pappus** of free, barbellate, capillary bristles in 1 row, basally with patent cilia; apical cells clavate, white, opaque.

Monotypic, endemic to sthn Afr.: *Langebergia canescens* (DC.) Anderb., Western Cape.

Lasiopogon Cass. 8987000

(Gnaphalieae)

Cassini: 75 (1818); Harvey: 264 (1865); Nordenstam: 60 (1964); Hilliard: 5 (1983); Anderberg: 155 (1991a); Anderberg: 359 (1994).

Annual herbs, small, prostrate and woolly. **Leaves** alternate, sessile, small, oblong to spathulate, obtuse, base narrowed, margins flat, entire, loosely enveloped in wool (hair type B), eglandular. **Capitula** disciform, campanulate, closely surrounded by leaves, massed in glomerules at branchlet tips; flowers whitish, often tipped reddish. **Involucral bracts** in 2 or 3 rows; apex obtuse to truncate, often emarginate, whitish to straw-coloured; stereome divided. **Receptacle** shortly honeycombed or shallowly tuberculate, epaleate. **Marginal florets** female, narrowly tubular or filiform, fewer than, more than or equalling disc florets. **Disc florets** bisexual; corolla tubular below, campanulate above, with 5 deltoid lobes; all lobes glandular-hairy on backs. **Anthers** caudate, ecalcarate, with small, obtuse apical appendage; endothecial tissue polarised. **Style** bifid; style branches truncate and penicillate, obtuse sweeping hairs scarcely extending down backs of branches. **Cypselas** oblong, usually with minute globular duplex hairs, or ellipsoidal unicellular; all myxogenic. **Pappus** bristles in 1 row, either wholly plumose or with clavate cells at tip and shaft wholly or partly plumose, subplumose, barbellate or nude, when not plumose, base with patent cilia, or bristles expanded in lowest quarter and fused at base. $x = 7$.

Species 8, mainly Africa, 1 also Spain to India; all 8 in sthn Afr., Namibia, Free State, Northern, Western and Eastern Cape.

Lasiospermum Lag. 9321000

(Anthemideae)

Lagasca: 31 (1816); Harvey: 153 (1865); Müller: 124 (1988); Bremer & Humphries: 94 (1993); Bremer: 451 (1994).

Annual or perennial herbs, sometimes decumbent, rooting at nodes. **Leaves** alternate, long pilose to glabrous, pinnatisect to bipinnatisect, rarely entire. **Capitula** radiate or discoid, pedunculate, solitary or paniculate, terminal. **Involucral bracts** in 2–4 rows, narrowly oblong to elliptic to almost quadrate, with membranous margin and apex, long pilose or felted to glabrous. **Receptacle** flat or convex, paleate; paleae membranous. **Ray florets** when present, few, female; corolla white or reddish; tube

sometimes flattened, with short or long lamina. **Disc florets** numerous, corolla sometimes reddish; tube campanulate above, with 5 ovate lobes. **Anthers** ecalcarate and ecaudate; with lanceolate apical appendage; endothecial tissue polarised. **Style** terete, discoid at base, with linear, truncate branches. **Cypselas** oblong-ovate, slightly flattened, smooth, dark yellow-brown, copiously woolly. **Pappus** 0. $x = 9, 10$.

Species 4, Egypt and sthn Afr.; 4 in sthn Afr., Namibia, North-West, Gauteng, Free State, Lesotho, Northern, Western and Eastern Cape.

Launaea Cass. 9593000

(Lactuceae)

Cassini: 321 (1822); Harvey: 527 (1865) under *Microrhynchus*; Oliver & Hiern: 460 (1877); Hilliard: 619 (1977); Pope: 214 (1992); Bremer: 188 (1994).

Annual, biennial or perennial herbs, glabrous, with milky latex. **Stems** erect or prostrate, simple or branched. **Leaves** mostly in rosettes, sinuate, coarsely toothed or pinnatifid. **Capitula** ligulate, few- to several-flowered, pedunculate or occasionally sessile, solitary or in lax, irregular corymbs, or clustered. **Involucres** campanulate or cylindrical; bracts in 2 to several rows, becoming ± swollen and corky towards base, innermost subequal, usually exceeding outer. **Receptacle** epaleate. **Florets** bisexual, fertile; corolla yellow, strap-shaped; tube slender, cylindric; ligule short, 4- or 5-toothed. **Anthers** sagittate at base, auricles acute or shortly setaceous-acuminate; with lanceolate, apical appendage. **Style** linear, terete, and pubescent above, with linear, obtuse or subobtuse branches, sweeping hairs long. **Cypselas** usually ellipsoid-fusiform or terete, often somewhat compressed, ribbed, sometimes apically attenuate or beaked, rugose or verrucose, rough or smooth. **Pappus** of bristles in many rows, or of bristles intermixed with many down-like hairs. $x = 9$ (4, 6, 7, 8, 13) (polyploidy, B-chromosomes).

Species ± 30, Canary Islands, Mediterranean region, East Asia, Africa and Madagascar; 4 in sthn Afr., widespread.

Lepidostephium Oliv. 9340000

(Gnaphalieae)

Oliver: 22, t. 1030 (1868); Kroner: 102 (1980); Anderberg: 49 (1991a); Anderberg: 324 (1994).

Perennial herbs, unbranched. **Leaves** radical and cauline, alternate, sessile, lanceolate to linear, margin revolute, denticulate or entire, glandular-hairy and hairy (hair type B). **Capitula** radiate, many-flowered, pedunculate, solitary or in loose corymbs. **Involucre** campanulate; bracts in 6 rows, lanceolate; stereome undivided. **Receptacle** flat, epaleate. **Ray florets** female, violet; corolla tube sparsely glandular, with linear, 3-toothed lamina 3–4 times as long as tube. **Staminodes** often present. **Disc florets** bisexual, fertile; corolla yellow; tube funnel-shaped, narrowly campanulate above, with 5 ovate, retrofract lobes. **Anthers** ecalcarate, caudate; apical appendage flat; endothecial tissue polarised. **Style** bifid, style branches obtuse, dorsally with obtuse sweeping hairs not reaching furcation; stigmatic surfaces basally separated but apically converging. **Cypselas** sparsely hairy with elongated twin hairs and glandular hairs. **Pappus** of free, barbellate, capillary bristles (sometimes of different length) in several rows or of scales.

Species 2, endemic to sthn Afr.: *Lepidostephium asteroides* (Bolus & Schltr.) Kroner and *L. denticulatum* Oliv., KwaZulu-Natal and Eastern Cape.

*Leucanthemum Mill. 9341080

(Anthemideae)

Miller: [769] (1754); Heywood: 175 (1976); Hilliard: 348 (1977); Bremer & Humphries: 141 (1993); Bremer: 468 (1994).

Perennial herbs with red-tipped roots. **Leaves** alternate, serrate or pinnatifid. **Capitula** radiate, solitary, pedunculate. **Involucre** hemispherical or campanulate. **Receptacle** convex or sometimes conical, epaleate. **Ray florets** female, fertile; lamina white. **Disc florets** bisexual, fertile; corolla yellow, 5-lobed; tube basally swollen and spongy in fruit, especially abaxially. **Anthers** ecalcarate and ecaudate; with ovate apical appendage. **Style** branches narrowly oblong, truncate, penicillate. **Cypselas** ± 10-ribbed with vallecular lacunae and vallecular secretory canals as well as vascular strands between ribs, with myxogenic cells along ribs. **Pappus** a corona or an adaxial auricle, sometimes 0. $x = 9$ (aneuploids, high polyploidy, B-chromosomes).

Species ± 33, throughout Europe, 1 species in North Africa, Morocco, Algeria and Tunisia; 1 naturalised as weed in sthn Afr.: **Leucanthemum vulgare* Lam., Mpumalanga, KwaZulu-Natal and Eastern Cape.

Leucoptera B.Nord. 9341020

(Anthemideae)

Nordenstam: 140 (1976); Bremer & Humphries: 157 (1993); Bremer: 475 (1994).

Erect or decumbent glabrous shrublets. **Leaves** alternate or opposite, filiform-linear or oblanceolate, entire or lobed, terete or flattened, somewhat fleshy. **Capitula** radiate, solitary, terminal, pedunculate. **Involucre** broadly campanulate-hemispherical; involucral bracts imbricate, broad, ovate-oblong-obovate with very obtuse or rounded tips, herbaceous, with membranous margins. **Receptacle** convex, epaleate. **Ray florets** female, fertile, usually ± 8, sometimes up to 13, white, often becoming pink-reddish and revolute; tube somewhat compressed, glandular, lamina with smooth surface, apically 3-toothed or subentire. **Style** branches oblong, truncate or somewhat emarginate. **Disc florets** regular, yellow; tube broadly cylindrical, glandular, limb campanulate, 5-lobed. **Anthers** ecalcarate and ecaudate; apical appendage ± ovate, obtuse; endothecial tissue polarised; filament collar subcylindrical with subequal cells. **Style** branches oblong, truncate; style base partly immersed in broad and distinct nectary. **Cypselas** dorsiventrally strongly compressed, laterally winged, white, adaxial side smooth; abaxial side with longitudinal myxogenic striae apically ending in fringe of fused projections; lateral wings scarious, white, opaque. **Pappus** of 3 adaxial, white, scarious scales. $x = 9$ (1 report).

Species 3, endemic to sthn Afr., Northern Cape (Namaqualand) and Western Cape.

Leysera L. 9052000

(Gnaphalieae)

Linnaeus: 1249 (1763); Harvey: 293 (1865); Bremer: 369 (1978); Anderberg: 67 (1991a); Anderberg: 332 (1994).

Shrublets or somewhat woody annuals, greyish-woolly to almost glabrous. **Leaves** alternate, slender, usually mucronate. **Capitula** radiate, many-flowered, solitary, on long peduncles or sometimes corymbose. **Involucre** campanulate; bracts in 4–7 rows, ± oblong, sometimes with dark margins, usually chartaceous and glandular. **Receptacle** nude or sometimes fimbriate. **Ray florets** female, cylindric, with minutely 3-toothed lamina ± as long as tube; ovary linear, glabrous or pilose. **Style** slender with linear, obtuse branches. **Pappus** of narrow,

membranous paleae. **Disc florets** bisexual, fertile, rarely some sterile, corolla tube glandular, with 5 lanceolate lobes. **Anthers** tailed, with an oblong, apical appendage. **Ovary** linear. **Style** linear, with linear, truncate branches, penicillate at apex. **Pappus** double, of membranous paleae and 4 or 5 plumose bristles ± as long as corolla. $x = 7, 8, 17$ (polyploidy).

Species 3, mainly in sthn Afr., 1 in North Africa, Arabian Peninsula and the Middle East; *Leysera gnaphalodes* (L.) L. and *L. tenella* DC., Namibia, Free State, Northern, Western and Eastern Cape.

Lidbeckia P.J.Bergius 9337000

(Anthemideae)

Bergius: 306, t. 5 (1767); Harvey: 154 (1865); Bremer & Humphries: 146 (1993); Bremer: 471 (1994).

Subshrubs, pilose. **Leaves** alternate, sessile or shortly petiolate, pinnately or digitately lobed, glandular-punctate, pilose or glabrous. **Capitula** radiate, many-flowered, solitary, on short or long, pilose or glabrous peduncles. **Involucre** campanulate; bracts in 3 rows, lanceolate, sometimes ciliate, densely villous or glabrous. **Receptacle** convex, epaleate, pilose. **Ray florets** female, sterile or neuter; corolla white, sometimes pilose; tube compressed, with oblong-linear, 2-toothed lamina 3–4 times longer than tube. **Disc florets** bisexual, fertile; corolla tube somewhat compressed, sometimes pilose, with 4 ovate lobes. **Anthers** ecalcarate and ecaudate; with oblong, apical appendage. **Style** terete, with somewhat thickened base and with linear, truncate branches; stylopodium large and persistent in fruit, with thin-walled cells. **Cypselas** ellipsoid, 3–8-ribbed, glandular. **Pappus** 0.

Species 2, endemic to sthn Afr.: *Lidbeckia pectinata* P.J.Bergius and *L. quinqueloba* (L.f.) Cass., both Western Cape.

Litogyne Harv. 8953010

(Plucheeae)

Harvey: 48 (1865); Anderberg: 168 (1991c); Anderberg: 300 (1994).

Epaltes Cass., in part, as to *E. gariepina*, Merxmüller: 57 (1967a); Hilliard: 119 (1977).

Subshrubs. **Leaves** alternate, entire, dentate or rarely sublyrate, decurrent, hairy. **Capitula** disciform, few together in terminal corymbose clusters or solitary; flowers mauve. **Involucre** ovoid-campanulate or hemispherical; bracts in many rows. **Receptacle** epaleate, dome-shaped and centrally depressed with marginal ridge. **Marginal florets** female, in many rows, situated on vertical outer face of marginal receptacle ridge; corolla filiform, 3-lobed. **Disc florets** functionally male, tubular, widening upwards, 3–5(6)-lobed, situated in central depression of receptacle. **Anthers** calcarate and caudate; cells of filament collar flattened; endothecial tissue radial. **Style** undivided; with obtuse sweeping hairs distally. **Cypselas** distinct, stout, subterete, 5–10-ribbed, hairy with straight hairs; without resin ducts. **Pappus** 0.

Monotypic: *Litogyne gariepina* (DC.) Anderb.; Africa, widespread in sthn Afr., but absent from Western and Eastern Cape.

Lopholaena DC. 9401000

(Senecioneae)

Candolle: 335 (1838a); Harvey: 315 (1865); Phillips & Smith: 221 (1934); Hilliard: 365 (1977); Bremer: 505 (1994).

Perennial herbs, shrublets or shrubs. **Leaves** alternate, sessile or subsessile, linear to suborbicular, entire to serrate, often amplexicaul and decurrent, fleshy. **Capitula** discoid, solitary, clustered or paniculate-corymbose, few- to many-flowered. **Involucre** ecalyculate, narrowly campanulate; bracts few to many, in 1 row, connate, at length free to base, sometimes keeled on back or more rarely with wide crest or wing, glabrous or rarely hairy. **Receptacle** flat, honeycombed, margins of alveolae slightly raised; epaleate. **Florets** bisexual, innermost sometimes functionally male; corolla white, pink or purplish; tube becoming campanulate above, articulate ± in middle of cylindric base, with 5 ± deltoid lobes. **Anthers** ecalcarate and ecaudate; with ovate to ovate-oblong appendage; endothecial tissue radial. **Style** terete; branches linear-obtuse, with long, filiform, papillose appendages. **Cypselas** ellipsoid-oblong, obscurely ribbed, glabrous or pubescent. **Pappus** of many fine bristles.

Species ± 20, tropical and sthn Afr.; 8 in sthn Afr., summer-rainfall parts but absent from Botswana and Free State.

Macowania Oliv. 9053000

(Gnaphalieae)

Oliver: 49, t. 1062 (1870); Smith: 348 (1927); Phillips: 802 (1951); Henderson: 116 (1961); Hilliard & Burtt: 260 (1976); Anderberg: 51 (1991a); Anderberg: 325 (1994).

Homochaete Benth.: 9, t. 1110 (1876).

Erect or dwarf shrubs, somewhat ericoid, dense or lax, often glandular. **Leaves** alternate, crowded, linear or linear-lanceolate, sessile, apex mucronate or with curved mucro, with revolute or thickened margins, glandular-hairy or woolly (hair type B). **Capitula** radiate, solitary, rarely clustered, terminal, sessile or pedunculate. **Involucre** campanulate or turbinate; bracts in 5–7 rows, glandular or hairy on back; stereome undivided. **Receptacle** flat, smooth or sometimes honeycombed, epaleate. **Ray florets** female, in 1 row, deep yellow, fertile; corolla tubular below, with narrowly elliptic 3-toothed lamina. **Style** branches linear, obtuse at apex; stigmatic papillae confined to marginal bands on inner faces and confluent at branch tips. **Disc florets** bisexual, fertile or rarely functionally male; corolla deep yellow, glandular-hairy, cylindric below, abruptly campanulate or more gradually widened above, 5-lobed. **Anthers** ecalcarate, caudate; with deltoid or oblong-obtuse apical appendage; endothecial tissue polarised. **Style** branches (when fertile) oblong, slightly branched at obtuse tips, minute pollen-sweeping papillae on outer faces; stigmatic bands marginal on inner surfaces, not meeting at tip. **Cypselas** cylindric or fusiform, 10–15-ribbed, glabrous or hairy. **Pappus** if present, of acute scabrid bristles, caducous or persistent.

Species 12, Arabian Peninsula and Ethiopia; 10 in sthn Afr., Northern Province, Gauteng, Mpumalanga, KwaZulu-Natal and Eastern Cape.

Mairia Nees 8883000

(Astereae)

Nees: 247 (1832); Harvey: 64 (1865) as *Mairea*; Bremer: 425 (1994); Nesom: 90 (1994).

Perennial herbs with vestiture of flexuous, thin-based hairs. **Leaves** in basal rosette, thick, broadly obovate, crenate or entire. **Capitula** radiate, solitary, terminal, on long, bracteate peduncles, rarely corymbose. **Involucre** campanulate; bracts in 3–5 rows. **Receptacle** flat, honeycombed, sometimes with rims of pits slightly produced, epaleate. **Ray florets** female, fertile; with staminodia; corolla white, pink or purple; tube cylindric, with 3-toothed, elliptic or spathulate lamina. **Style** terete, sometimes undivided; branches linear, obtuse. **Disc florets** bisexual, fertile; corolla yellow; tube cylindric below, tubular or gradually expanding above and 5-lobed. **Anthers** linear, ecalcarate and ecaudate; with lanceolate

or ovate, apical appendage. **Style** terete or linear, with linear or lanceolate branches. **Cypselas** narrowly oblong to oblong-oblanceolate, (2 or 3)4–6-nerved, flattened but plump, glandular and often densely strigose-sericeous, surface tan at maturity. **Pappus** persistent, 1 or 2 rows of plumose bristles, or inner row of bristles and outer row of scales.

Species 3, endemic to sthn Afr., Western Cape.

*Mantisalca Cass. 9476010

(Cardueae)
Cassini: 142 (1818); Dostál: 254 (1976); Bremer: 153 (1994).

Annual or perennial herbs, unarmed. **Leaves** alternate, dentate-pinnatifid. **Capitula** discoid or disciform, pedunculate, solitary. **Involucre** urceolate, much shorter than florets; bracts appressed, coriaceous; appendage a short, erect to deflexed, deciduous spine. **Marginal florets** neuter; with staminodes; corolla purple, rarely white, longer than bisexual central florets. **Disc florets** bisexual, fertile; corolla purple, rarely white. **Anthers** caudate at base. **Cypselas** obovoid, many-ribbed and transversely rugulose between ribs, glabrous with apical rim, lateral detachment area large and surrounded by whitish, swollen margin, with elaiosome. **Pappus** double, outer of linear-subulate, persistent scales; inner generally a single, abaxial scale. $x = 11$.

Species 4, Mediterranean region, North Africa; 1 an introduced weed in sthn Afr.: **Mantisalca salmantica* (L.) Briq. & Cavill., Northern and Eastern Cape.

Marasmodes DC. 9370000

(Anthemideae)
Candolle: 136 (1838a); Harvey: 175 (1865); Hutchinson: 171 (1916a); Bremer & Humphries: 152 (1993); Bremer: 475 (1994).

Shrubs. **Leaves** alternate, sometimes clustered, entire or occasionally lobed, linear, ± ericoid, glandular-punctate, glabrous. **Capitula** discoid, few-flowered, sessile, closely aggregated at stem tips, rarely solitary. **Involucre** subcampanulate or spindle-shaped; bracts in 6 or 7 rows, ovate, oblong or lanceolate, sometimes inner or all with membranous tip. **Receptacle** flat, epaleate. **Disc florets** bisexual; corolla tube glandular, swollen and with thick vascular strands, ± campanulate above, with 5 ovate lobes. **Anthers** short and comparatively wide, ecalcarate and ecaudate; with linear or lanceolate, apical appendage. **Style** terete, discoid at base, with linear, truncate branches. **Cypselas** 5-ribbed, glandular, with myxogenic cells mainly abaxially; ribs with thick vascular strands. **Pappus** of 7–10 oblong, flat, whitish, adaxially longer scales.

Species 4, endemic to sthn Afr., Western Cape.

*Melanthera Rohr 9204000

(Heliantheae)
Rohr: 213 (1792); Phillips: 816 (1951); Wild: 3 (1965); Hilliard: 311 (1977); Karis & Ryding: 595 (1994).

Annual or perennial herbs, sometimes scandent. **Leaves** opposite, sessile or petiolate, usually scabrid or hairy, margins toothed, rarely 3-lobed. **Capitula** discoid or radiate, many-flowered, solitary or in lax corymbs. **Involucre** hemispherical; bracts in 1–3 rows, inner enfolding ray florets. **Receptacle** convex or conical, paleate; paleae oblong to obovate, boat-shaped, conduplicate and enclosing disc florets. **Ray florets** female, fertile or sterile; corolla yellow, strap-shaped, lamina 2- or 3-toothed, longer than tube; ovary keeled on face or with narrow, marginal wings. **Disc florets** bisexual, fertile; corolla yellow; tube slightly widened upwards and abruptly contracted at base, 5-toothed. **Anthers** obtuse or shortly sagittate at base; with ovate, apical appendage. **Style** swollen at base, with linear, apiculate, glandular-pilose branches. **Cypselas** obovoid, 3- or 4-angled, laterally compressed, apically usually truncate or concave. **Pappus** of caducous awns or bristles. $x = 5$ (8—1 report) (polyploidy).

Species 20, SE United States, Mexico, Central America, West Indies, tropical Africa; 4 naturalised in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Metalasia R.Br. 9043000

(Gnaphalieae)
Brown: 124 (1817); Harvey: 265 (1865); Pillans: 47 (1954); Hilliard & Burtt: 218 (1981); Karis: 1 (1989); Anderberg: 73 (1991a); Anderberg: 332 (1994).

Endoleuca Cass.: 47 (1819e).

Shrublets with greyish-woolly branches. **Leaves** alternate, often of 2 sizes, sessile, ericoid, often pungent, usually twisted, with margins often incurved. **Capitula** discoid, 3–8(–13)-flowered, crowded at ends of branchlets, sessile or subumbellate, rarely solitary; florets bisexual, fertile or some sterile. **Involucral bracts** with undivided stereome, narrowly campanulate or cylindric; bracts in 4–6 rows, outer bracts oblong, usually acuminate, woolly on back, innermost bracts linear, with large, white or coloured appendage at apex. **Receptacle** epaleate. **Ray florets** 0. **Disc florets** cylindric, becoming subcampanulate upwards, thick-textured, often reddish on upper part with 5 small, deltoid, whitish, glabrous lobes. **Anthers** tailed at base, with a lanceolate, apical appendage. **Style** linear, swollen at base, branches truncate or slightly rounded, sweeping hairs extending briefly down backs of branches, stigmatic areas separated, sometimes joined at tip. **Cypselas** oblong or elliptic, ribbed or angled, often asymmetrical, rarely somewhat winged, tapered at both ends, glabrous or papillate; annulus 0. **Pappus** of many scabrid bristles in 1 row, tips flattened and ± clavate, as long as corolla. $x = 7$.

Species 52, 47 species endemic to the Western Cape; *Metalasia muricata* (L.) D.Don and *M. trivialis* Karis in Western and Eastern Cape; *M. aurea* D.Don and *M. massonii* S.Moore in Eastern Cape; *M. densa* (Lam.) Karis, widespread in Northern Province, Gauteng, Mpumalanga, Free State, KwaZulu-Natal, Lesotho, Western and Eastern Cape.

Microglossa DC. 8921000

(Astereae)
Candolle: 320 (1836a); Grau: 399 (1976); Hilliard: 78 (1977); Bremer: 425 (1994).

Nidorella Cass. in part, Harvey: 87 (1865).

Shrubs, often scandent or twining. **Leaves** alternate, entire or toothed, petiolate or subsessile, lanceolate or deltoid, glabrous to thinly hairy, sometimes glandular. **Capitula** radiate, corymbose-paniculate, terminal; peduncles sometimes bracteate. **Involucre** campanulate; bracts in 3 or 4 rows. **Receptacle** flat, epaleate, honeycombed, with rim of pits slightly or distinctly produced. **Ray florets** female; corolla blue or white; tube cylindric, extending into 3-fid lamina. **Disc florets** bisexual and fertile or functionally male; corolla yellow, tubular below, widening above, 3–5-lobed. **Anthers** ecalcarate and ecaudate; with lanceolate, apical appendage. **Style** branches of ray florets linear; of disc florets oblong, tips deltoid, minutely papillose outside and with few sweeping hairs. **Cypselas** elliptic or obovate, somewhat compressed, ribbed, glabrous or thinly pubescent. **Pap-**

pus of caducous scabrid bristles in 1 row. $x = 9$ (7, 10) (polyploidy).

Species ± 10: tropical and sthn Afr., Madagascar and Asia; 2 in sthn Afr.: *Microglossa caffrorum* (Less.) Grau and *M. mespilifolia* (Less.) B.L.Robinson, KwaZulu-Natal and Eastern Cape.

Mikania Willd. 8818000

(Eupatorieae)

Willdenow: 1742 (1803); Harvey: 58 (1865); Merxmüller: 111 (1967a); Hilliard: 54 (1977); Holmes: 213 (1982); King & Robinson: 419 (1987); Bremer *et al.*: 647 (1994).

Herbs or suffrutescent, twining or scrambling perennials. **Leaves** opposite, subsessile or petiolate, frequently cordate or sagittate at base. **Capitula** discoid, 4-flowered, in spikes, racemes or corymbs and often panicled. **Involucre** cylindric; bracts 4 or 5, in 1 row, linear or linear-lanceolate, 3-nerved, sometimes glandular-hairy. **Receptacle** small, naked. **Corolla** white; tube cylindric below, sometimes dilated at base; lobes 5, short, ovate. **Anthers** linear, obtuse at base; with ovate, membranous, apical appendage. **Style** with branches elongate, clavellate or filiform. **Cypselas** pentagonal, prismatic or tapering downward. **Pappus** of many scabrid bristles. $x = 9$ (7, 10, 17, 19) (aneuploids, high polyploidy, B-chromosomes).

Species ± 430, pantropical; 3 in sthn Afr., occurring in N Namibia, Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Mikaniopsis Milne-Redh. 9411100

(Senecioneae)

Milne-Redhead: 27 (1956); Jeffrey: 878 (1986); Bremer: 505 (1994).

Senecio L. in part, Hilliard: 499 (1977).

Scandent, twining, perennial herbs or subshrubs. **Leaves** alternate, deltoid-ovate in outline, 3–5-angled or shallowly lobed, thick-textured, palmately veined, base broadly cuneate to subtruncate; petioles basally thickened and climbing, exauriculate. **Capitula** disciform, paniculate-corymbose. **Involucre** calyculate, narrowly campanulate; bracts 5–7. **Receptacle** flat, epaleate. **Marginal florets** female, similar to disc florets. **Disc florets** bisexual, fertile; corolla creamy white or pale yellow; tube cylindrical; limb campanulate, 5-lobed. **Anthers** ecalcarate, caudate; endothecial tissue radial. **Style** branches truncate, penicillate, tipped with short cone. **Cypselas** oblong, ribbed, glabrous. **Pappus** of many fine bristles. $x = 10$ (polyploidy—1 report).

Species ± 15, tropical Africa, 1 in sthn Afr.: *Mikaniopsis cissampelina* (DC.) C.Jeffrey, Northern Province, Mpumalanga, KwaZulu-Natal and Eastern Cape.

***Montanoa** La Llave & Lex. 9170000

(Heliantheae)

La Llave & Lexarza: 11 (1825); Wild: 57 (1967); Hilliard: 305 (1977); Funk: 1 (1982); Karis & Ryding: 583 (1994).

Shrubs. **Leaves** opposite, petiolate, broadly ovate, palmately lobed, finely toothed, softly pubescent. **Capitula** radiate, in corymbose panicles. **Involucre** hemispherical; bracts in 1–3 rows. **Receptacle** convex or conical; paleae conduplicate, becoming very large and papery after anthesis. **Ray florets** neuter; corolla strap-shaped, white. **Disc florets** bisexual, fertile; corolla yellow, tubular below, campanulate above, 5-lobed. **Anthers** obtuse at base, apical appendage narrowly deltoid. **Style** branches oblong, apices deltoid, papillae present on outside. **Cypselas** obpyramidal or obovoid, ± 4-angled, apically with ring-shaped collar. **Pappus** 0. $x = 19$ (aneuploids).

Species 25, in Mexico, Central America, northern part of South America; a species from Mexico: **Montanoa hibiscifolia* Benth. has become naturalised, mainly in the coastal areas of KwaZulu-Natal and at Port St Johns (Eastern Cape).

Myxopappus Källersjö 9366030

(Anthemideae)

Källersjö: 314 (1988); Bremer & Humphries: 155 (1993); Bremer: 476 (1994).

Pentzia Thunb.: 145 (1800), in part excluding type.

Pubescent annual herbs. **Leaves** alternate, variously pinnatisect. **Capitula** discoid, solitary, pedunculate. **Involucre** hemispherical; bracts in 3–5 rows, very narrow and acute, without scarious margins, often with central resin canal. **Receptacle** convex or conical, epaleate. **Disc florets** bisexual; corolla generally 5- but occasionally 4-lobed; tube almost cylindrical; limb urceolate and partly enervate. **Anthers** ecalcarate and ecaudate. **Style** branches with resin ducts. **Cypselas** white when mature, with 2 lateral and 1 adaxial rib, myxogenic on ribs and abaxial surface, and with short-stalked glands in grooves between ribs; pericarp containing large number of druses, several cell-layers thick in ribs, but abaxially thin. **Pappus** an entire corona, covered with myxogenic cells.

Species 2, endemic to sthn Afr.: *Myxopappus acutilobus* (DC.) Källersjö and *M. hereroensis* (O.Hoffm.) Källersjö, Namibia and Namaqualand (Northern Cape).

Nestlera Spreng. 9048000

(Gnaphalieae)

Sprengel: 568 (1818); Harvey: 295 (1865); Anderberg & Bremer: 1061 (1991); Anderberg: 332 (1994).

Relhania L'Hér. in part, Bremer: 1 (1976a).

Subshrubs or shrubs, rarely annual, sometimes prostrate, dichotomously branched; often with thick tap-root. **Leaves** alternate or opposite. **Capitula** radiate, few- to several-flowered, solitary, terminal, or sessile in forks of branches, rarely subumbellate, sometimes shortly pedunculate. **Involucre** cylindric to ellipsoid; bracts in 4–11 rows, sometimes with a membranous appendage. **Receptacle** nude, or sometimes honeycombed and sometimes with rims of pits produced. **Ray florets** female; corolla tube cylindric, with somewhat elliptic, 3-toothed lamina; ovary ± oblong, sometimes hairy. **Style** slender, with linear, obtuse branches. **Pappus** a crown of short setae. **Disc florets** bisexual, sterile or fertile; corolla tube widened above, with 4 or 5 lanceolate lobes. **Anthers** tailed or rarely eared, with a lanceolate, rarely oblong, bifid, apical appendage. **Ovary** linear or oblong. **Style** slender, with linear, truncate, penicillate branches, undivided in sterile florets. **Pappus** a crown of short, unequal paleae, rarely with 2 barbellate bristles as long as corolla tube.

Monotypic: *Nestlera biennis* (Jacq.) Spreng., endemic to Northern and Western Cape.

Nicolasia S.Moore 8951000

(Plucheeae)

Moore: 458 (1900b); Merxmüller: 1 (1954b); Merxmüller: 113 (1967a); Anderberg: 161 (1991c); Anderberg: 301 (1994).

Shrublets, subshrubs or annuals. **Leaves** alternate, narrow, entire to dentate, generally decurrent, sometimes strongly 1-nerved on lower surface and with thickened margins, sparsely hairy. **Capitula** disciform, pedunculate, solitary at ends of branches or few together. **Involucre** ovoid or campanulate; bracts in 5–7 rows, sometimes apiculate, glandular. **Receptacle** flat, epaleate.

Marginal florets female; corolla filiform, 3-lobed. **Disc florets** bisexual, tubular, 5-lobed. **Anthers** calcarate, ecaudate, cells of filament collar flattened; endothecial tissue radial. **Style** bifid; style branches with obtuse sweeping hairs reaching below the furcation. **Cypselas** stout, ellipsoid, with straight hairs. **Pappus** of few free, barbellate, capillary bristles in 1 row.

Species 7, Africa; 6 in sthn Afr., mainly northern areas of Namibia, Botswana, Northern Province and North-West.

Nidorella Cass. 8925000

(Astereae)

Cassini: 469 (1825a); Harvey: 86 (1865); Merxmüller: 117 (1967a); Wild: 209 (1969c); Wild: 62 (1975); Hilliard: 79 (1977); Bremer: 427 (1994).

Annual or perennial herbs, variably hairy. **Leaves** alternate, entire or variously lobed. **Capitula** disciform or inconspicuously radiate, small, in subglobose or cymose corymbs, terminal. **Involucre** hemispherical to campanulate; bracts in 1–3 rows, usually with membranous margins and glandular. **Receptacle** flat or convex, usually honeycombed with rim of pits sometimes produced, epaleate. **Ray florets** female, in few to many rows; corolla yellow; tube cylindric, puberulent, strap-shaped or sometimes shortly 3- or 4-(5)-lobed; lamina narrow or elliptic, entire or 2- or 3-toothed. **Style** filiform, with linear branches. **Disc florets** bisexual and usually fertile; corolla yellow; tube ± funnel-shaped, 5-lobed, puberulent. **Anthers** ecalcarate and ecaudate, with lanceolate, apical appendage. **Style** broadly triangular above, outer surfaces with triangular, coarsely papillose branches. **Cypselas** obovoid or ellipsoid, often somewhat compressed, pubescent and often glandular. **Pappus** of barbellate bristles in 1 row, not or scarcely accrescent when mature; florets readily visible among pappus. $x = 9$.

Species ± 13, mainly Africa, 1 in Madagascar; 11 in sthn Afr.; widespread.

Nolletia Cass. 8929000

(Astereae)

Cassini: 479 (1825a); Merxmüller: 118 (1967a); Hilliard: 96 (1977); Bremer: 427 (1994).

Leptothamnus DC.: 367 (1836a); Harvey: 111 (1865).

Shrubs or subshrubs. **Leaves** alternate, entire, linear or subulate, often rigidly ciliate. **Capitula** disciform, medium-sized or small, solitary or laxly corymbose, on long, terminal peduncles. **Involucre** campanulate; bracts in 3 rows, sometimes ribbed, with membranous margins. **Receptacle** flat, epaleate, sometimes honeycombed. **Marginal florets** female, in 1 row, filiform, minutely 2- or 3-toothed at apex, yellow. **Style** filiform, with linear branches. **Disc florets** bisexual, fertile or sterile, tubular below, somewhat campanulate above, 5-lobed, yellow. **Anthers** ecalcarate and ecaudate; with lanceolate, apical appendage. **Style** oblong, truncate, penicillate with deltoid apical appendage and conspicuous sweeping hairs. **Cypselas** compressed, obovate or linear-oblong, margined, pubescent. **Pappus** of scabrid bristles in 1 row. $x = 9$ (1 report).

Species ± 10, Africa; 8 in sthn Afr., widespread but absent from Western Cape.

Oedera L. 9322000

(Gnaphalieae)

Linnaeus: 291 (1771); Harvey: 134 (1865); Anderberg: 68 (1991a); Anderberg: 332 (1994).

Eroeda Levyns: 83 (1948).

Shrublets, rather rigid and somewhat ericoid. **Leaves** opposite, ternate or spirally imbricate, ovate to linear. **Capitula** radiate, few-flowered, in terminal sessile clusters within a common involucre. **Involucre** broadly campanulate; bracts in 3 or 4 rows, ovate, lanceolate, ciliate, sometimes glandular on margins, pubescent or scabrid on back. **Receptacle** paleate; paleae acuminate or obtuse, sometimes fimbriate or irregularly 2- or 3-toothed. **Ray florets** female, marginal, corolla tube somewhat compressed, with long linear, minutely toothed lamina, much longer or somewhat shorter than tube. **Style** linear, with linear, obtuse or truncate branches. **Pappus** a crown of short paleae. **Disc florets** bisexual, fertile or some sterile; corolla tube campanulate or abruptly widening above. **Anthers** linear, obtuse at base, with a lanceolate, apical appendage. **Ovary** linear, glabrous. **Style** terete, with linear, truncate branches. **Pappus** a crown of short paleae.

Species 18, endemic to Western and Eastern Cape.

Oldenburgia Less. 9500000

(Mutisieae)

Lessing: 252 (1830); Candolle: 12 (1838b); Harvey: 512 (1865); Marloth: 282 (1932); Phillips: 50 (1951); Bond: 493 (1987); Bremer: 103 (1994).

Low trees or dwarf shrubs with thick stems covered with remains of old leaf bases. **Leaves** alternate, rosulate at ends of branches, obovate or elliptic, convex above, apex obtuse or subacute, base cuneate but expanded at junction with stem, densely silky-woolly, margin subrevolute; young leaves densely tomentose with projecting and conspicuous veins. **Capitula** radiate, large, sessile or pedunculate. **Involucre** ovoid, globose-urceolate or cyathiform; bracts in 4–10 rows, outer shorter than inner. **Receptacle** flat, epaleate, alveolate. **Ray florets** female; corolla white, bilabiate, outer lip long, strap-shaped or tripartite, inner lip of 2 delicate, linear, curled lobes; tube cylindrical. **Anthers**: filaments filiform; stamens lanceolate, without apical appendages, bases sagittate, tailed. **Style** terete, with very short branches. **Disc florets** many, regular, tubular, deeply 5-lobed. **Stamens** as in ray florets but with lanceolate, sterile apices. **Gynoecium** as in ray florets. **Cypselas** fusiform, elliptic or linear, glabrous and ribbed or villous. **Pappus** of 11–30 plumose or barbellate bristles, often of unequal length. $x = 9$ (polyploidy).

Species 4, endemic to sthn Afr., southern parts of Western and Eastern Cape.

Oligocarpus Less. 9424000

(Calenduleae)

Lessing: 90 (1832); Nordenstam: 375 (1994).

Osteospermum sect. *Oligocarpus* (Less.) Norl.: 346 (1943). *Xenismia* DC.: 509 (1836a).

Annual, glandular-puberulous herbs. **Leaves** alternate, petiolate to sessile, oblong to oblong-lanceolate, entire or shallowly lobed or toothed. **Capitula** radiate, small, solitary. **Involucre** campanulate or hemispherical with subequal bracts ± in 1 row. **Ray florets** female, fertile; lamina short, yellow. **Style** shallowly bilobed with apical ring of hairs. **Cypselas** polymorphic, slightly curved and wingless, or straight and 3-winged, or rostrate and wingless, with or without apical cavity, smooth or rugose-aculeate. **Disc florets** functionally male, yellow. **Anthers** ecalcarate and caudate; endothecial tissue polarised. **Pappus** 0.

Monotypic, endemic to sthn Afr.: *Oligocarpus calendulaceus* (L.f.) Less., KwaZulu-Natal, Northern, Western and Eastern Cape.

Oligothrix DC. 9416000

(Senecioneae)

Candolle: 304 (1838a); Harvey: 306 (1865); Bremer: 506 (1994).

Annual herbs, small and delicate. **Leaves** alternate, sessile, linear to linear-spathulate, shortly amplexicaul, sometimes toothed. **Capitula** radiate, few-flowered, small, laxly corymbose. **Involucre** ecalyculate, campanulate; bracts in 1 row, lanceolate, connate below, glabrous. **Receptacle** flat, epaleate. **Ray florets** female; corolla white or yellow; tube with elliptic, 3-toothed lamina ± twice its length. **Disc florets** bisexual, fertile; corolla yellow; tube campanulate above, with 5 ovate, cucullate lobes. **Anthers** ecalcarate and ecaudate; with oblong, apical appendages; endothecial tissue radial. **Style** terete, somewhat swollen at base, with linear, truncate, penicillate branches. **Cypselas** ellipsoid, ribbed, sparsely pubescent. **Pappus** of few delicate, barbellate, caducous bristles.

Monotypic, endemic to sthn Afr.: *Oligothrix gracilis* DC., Western Cape, very rare.

Oncosiphon Källersjö 9366020

(Anthemideae)

Källersjö: 310 (1988); Bremer & Humphries: 152 (1993); Bremer: 476 (1994).

Matricaria L.: 891 (1753), in part excluding type. *Pentzia* Thunb.: 145 (1800), in part excluding type.

Glabrous or pubescent annual herbs. **Leaves** alternate, variously pinnatisect. **Capitula** radiate or discoid, solitary or in corymbs, pedunculate. **Involucre** subglobose; bracts in several rows, apically obtuse or acute, with scarious margins, with or without central resin canal. **Receptacle** flat, convex or conical-globose, epaleate. **Ray florets**, if present, female, fertile, strap-shaped; corolla white. **Disc florets** bisexual; corolla always 4-lobed; lobes often cucullate; tube conspicuously swollen and of thick and brittle texture; limb campanulate and partly enervate. **Anthers** ecalcarate and ecaudate. **Style** branches with or without central resin canal. **Cypselas** yellowish brown, ± terete but tapering at base, 4-ribbed, with abaxial entire or toothed rim, glandular between ribs especially on adaxial side; pericarp very thin; epicarpic cells ± sclerenchymatous, elongated with narrow lumina; testa epidermis cells with thick, sinuate walls. **Pappus** 0. $x = 9$ (aneuploids, B-chromosomes).

Species 8, endemic to sthn Afr., mainly Namibia, Northern and Western Cape, 1 species extending to North-West, Gauteng, Mpumalanga, Free State, Lesotho and Eastern Cape.

Ondetia Benth. 9089000

(Inuleae)

Bentham: t. 1112 (1876); Merxmüller: 120 (1967a); Anderberg: 90 (1991b); Anderberg: 288 (1994).

Perennial herbs. **Leaves** alternate, sessile, linear, decurrent. **Capitula** radiate, solitary, sessile on branchlets and overtopped by subtending leaves. **Involucre** campanulate; bracts in 7 rows, oblong, with wide, membranous margins and ovate, membranous apex ending in awn. **Receptacle** flat, paleate; paleae flattened. **Ray florets** female; corolla yellow, minutely 3-toothed. **Disc florets** bisexual, fertile; corolla yellow; tube somewhat narrowing upwards, deeply lobed. **Anthers** long-calcarate, shortly caudate; with lanceolate, apical appendage; endothecial tissue polarised. **Style** branches with acute sweeping hairs not reaching below furcation. **Cypselas** villous. **Pappus** of bristle-like scales.

Monotypic, endemic to sthn Afr.: *Ondetia linearis* Benth., Namibia.

Oreoleysera K.Bremer 9052010

(Gnaphalieae)

Bremer: 450 (1978); Anderberg & Bremer: 1069 (1991); Anderberg: 67 (1991a); Anderberg: 333 (1994).

Compact woody perennials, forming dense tufts. **Leaves** alternate, sessile, narrowly oblong, flattened, greyish tomentose on both surfaces, eglandular, margin entire. **Capitula** radiate, solitary, terminal on long leafless peduncles. **Involucral bracts** with lanceolate laminas. **Receptacle** flat, epaleate. **Ray florets** female, in one row, fewer than disc florets, yellow with purple bands dorsally; cypselas and pappus as in disc florets. **Disc florets** perfect, yellow, glandular-hairy. **Anthers** ecalcarate with short tails; apical appendage acute; endothecial tissue polarised. **Style** branches truncate with obtuse sweeping hairs apically. **Cypselas** rod-like with 5 vascular bundles, moderately hairy with elongated twin hairs. **Pappus** of free, barbellate, capillary bristles in one row with an outer row of very narrow scales.

Monotypic: *Oreoleysera montana* (Bolus) K.Bremer, endemic to Western Cape.

Osmitopsis Cass. emended K.Bremer 9098000

(Anthemideae)

Cassini: 154 (1817d); Harvey: 305 (1865); Phillips: 811 (1951); Bremer: 22 (1972); Bremer: 471 (1994).

Osmites L.: 24 (1760). *Bellidiastrum* Less.: 383 (1832).

Subshrubs or shrublets, sometimes tomentose, aromatic, camphor-scented. **Leaves** usually alternate, sessile, narrow, sometimes reflexed, sometimes toothed or rigidly ciliate. **Capitula** radiate, few- to many-flowered, solitary, terminal or few in corymb. **Involucre** campanulate; bracts in 2–4 rows, imbricate, subequal, laterally and apically purplish, usually fimbriate, serrate, dentate or entire. **Receptacle** flat to conical, paleate; paleae as long as disc florets and somewhat enclosing them, linear to lanceolate, sometimes fimbriate, membranous. **Ray florets** neuter or female, fertile or sterile; corolla white, with ± cylindrical widening tube; lamina entire or bifid, longer than tube. **Disc florets** bisexual, sometimes sterile; corolla yellow, tubular, gradually widening upwards, lobes 5, ovate-triangular, thickened at apex. **Anthers** linear with sterile, flat, ovate to oblong, rounded to truncate, apical appendage; tails flat, subulate, ± connate in pairs. **Style** terete, bifid, with swollen base; branches semiterete, linear to oblong, penicillate; stylopodium present or 0. **Cypselas** glabrous, dotted all over with resin grains, brown, oblong to elliptic to obovate, somewhat 3- or 4-edged. **Pappus**, if present, crown-like, light brown, of scarious, subulate to triangular scales.

Species 9, endemic to sthn Afr, occurring in Eastern and Western Cape.

Osteospermum L. 9427000

(Calenduleae)

Linnaeus: 923 (1753); Harvey: 433 (1865); Norlindh: 98 (1943); Norlindh: 148 (1954); Norlindh: 387 (1960); Nordenstam: 375 (1994).

Annual or perennial herbs, shrublets or shrubs. **Leaves** alternate, rarely opposite, entire or variously divided to pinnatipartite. **Capitula** radiate, pedunculate, usually terminal and solitary, several- to many-flowered. **Involucre** campanulate, subhemispherical or turbinate; bracts in 1–4 rows, free. **Receptacle** flat or slightly convex, epaleate. **Ray florets** female, fertile; corolla yellow or orange yellow; tube short, with ± oblong, 3-toothed lamina up to 6 times its length. **Staminodes** sometimes present. **Style** linear, with linear, obtuse branches. **Ray cypselas** straight or somewhat curved, triquetrous, 3-

winged or terete, smooth or ribbed or tuberculate or with various processes, with or without apical cavities. **Pappus** 0. **Disc florets** functionally male; corolla yellow; tube widening above, with 5 lanceolate lobes. **Anthers** ecalcarate, shortly tailed; with ovate, apical appendage; endothecial tissue polarised. **Style** terete or linear, minutely bifid with apical ring of hairs. **Pappus** 0. $x = 8, 9, 10$ (polyploidy).

Species ± 45, south and tropical Africa, St Helena, Somalia and SW Arabian Peninsula; 35 in sthn Afr., widespread.

Othonna L. 9420000

(Senecioneae)

Linnaeus: 924 (1753); Harvey: 327 (1865); Hilliard: 513 (1977); Bremer: 506 (1994).

Shrubs, subshrubs or perennial herbs, sometimes succulent, with thickened rootstock, usually glabrous. **Leaves** alternate, sometimes radical, sessile or petiolate, varying from linear to orbicular, entire to serrate-dentate or pinnatifid. **Capitula** radiate, disciform or discoid; many-flowered, solitary to corymbose or paniculate, terminal or axillary, on short or long peduncles. **Involucre** ecalyculate, campanulate; bracts in 1 row, connate below, sometimes with membranous margin, glabrous. **Receptacle** flat or convex, epaleate. **Marginal florets** female or bisexual, fertile; corolla yellow, white, purple or pink; tube with obovate-elliptic to linear, blunt or 2- or 3-toothed lamina up to 4 times its length, sometimes short and truncate. **Disc florets** functionally male; corolla yellow or whitish, tubular below, widened above, sometimes very short, with 5 ovate lobes. **Anthers** ecalcarate and ecaudate or minutely sagittate at base; with ovate apical appendage; endothecial tissue radial. **Style** of female flowers linear, with linear, obtuse branches, subacute; of fully fertile bisexual flowers truncate and penicillate with small cone-shaped apical appendage; of functionally male flowers undivided, penicillate, tipped with conical or globose appendage. **Cypselas** mostly ellipsoid, glabrous or pubescent, ribbed. **Pappus** of many persistent, rarely caducous, scabrid bristles. $x = 10$ (polyploidy, B-chromosomes).

Species ± 120, Africa, mainly sthn Afr.; Namibia, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

Oxylaena Benth. ex Anderb. 9049010

(Gnaphalieae)

Bentham: 9 (1876); Anderberg: 53 (1991a); Anderberg: 325 (1994).

Shrubs. **Leaves** alternate, sessile, long, deflexed, narrowly linear, straight, mucronate, glandular-hairy, margin slightly revolute, entire. **Capitula** radiate, solitary. **Involucral bracts** cartilaginous, in a few rows; stereome undivided. **Receptacle** flat, epaleate. **Ray florets** female, in 1 row, fewer than disc florets; corolla ?white. **Disc florets** functionally male; corolla yellow, with glandular hairs, lobes erect. **Anthers** ecalcarate, shortly caudate; apical appendage ovate, concave, as wide as thecae; endothecial tissue polarised. **Style branches** obtuse with obtuse sweeping hairs, not reaching the furcation; stigmatic surface basally separated but apically converging(?). **Cypselas** with ± 5 vascular bundles, glabrous; epidermis smooth. **Pappus** 0.

Monotypic: *Oxylaena acicularis* (Benth.) Anderb.; endemic to sthn Afr., Western Cape, rare.

*__Parthenium__ L. 9138000

(Heliantheae)

Linnaeus: 988 (1753); Linnaeus: 426 (1754); Wild: 8 (1967); Hilliard: 294 (1977); Karis & Ryding: 622 (1994).

Annual herbs. **Stem** simple below, branching above into large open panicle. **Leaves** alternate, sessile, simple, elliptic or ovate in outline, deeply bipinnatisect, margins entire. **Capitula** radiate, small, in terminal panicles. **Involucre** campanulate or hemisherical; bracts in 2 or 3 rows, imbricate, outer somewhat smaller than inner. **Receptacle** convex, paleate. **Ray florets** female, fertile; small; corolla white, suborbicular. **Style** bifid; branches linear-lanceolate, obtuse. **Cypselas** compressed, keeled, crowned with persistent corolla, surrounded by inner involucral bract and 2 lateral, concave, receptacular paleae; pappus of 2 recurved awns, forming apparent margin to cypselas, but free from them, hidden by the 2 receptacular paleae to which they are attached at base. **Disc florets** bisexual, functionally male; small; corolla white, funnel-shaped, 5-toothed. **Anthers** with apical appendage, obtuse at base. **Style** undivided. **Ovary** of disc florets abortive. $x = 9, 17$ (6, 8, 29) (aneuploids, high polyploidy, B-chromosomes).

Species 16, North and Central America, northern South America, West Indies; **Parthenium hysterophorus* L., a widespread weed, is naturalised in parts of sthn Afr.: Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Pechuel-Loeschea O.Hoffm. 8943000

(Inuleae)

Hoffmann: 274 (1889a); Merxmüller: 135 (1967a); Anderberg: 106 (1991b); Anderberg: 289 (1994).

Pluchea Cass. in part, Brown: 117 (1909); Phillips: 788 (1951); Wild: 132 (1969a).

Shrubs up to 2 m high, thinly greyish tomentose. **Leaves** alternate, lanceolate, sessile, entire, not decurrent, sericeous. **Capitula** disciform, in loose corymbs. **Involucre** narrowly cyathiform; involucral bracts in several rows. **Receptacle** epaleate. **Marginal florets** female, in 1 row, filiform, purple. **Disc florets** bisexual, purple, lobes short, smooth; epidermis cells without needle-like crystals. **Anthers** minutely calcarate and caudate with branched tails; endothecial tissue polarised; cells of filament collar longer than wide. **Style** with acute sweeping hairs, not reaching furcation, without star-shaped crystals. **Cypselas** ellipsoid, hairy; epidermis without crystals. **Pappus** in 1 row of basally connate, barbellate, capillary bristles.

Monotypic, endemic to sthn Afr.: *Pechuel-Loeschea leubnitziae* (Kuntze) O.Hoffm., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland and Northern Cape.

Pegolettia Cass. 9073000

(Inuleae)

Cassini: 230 (1825b); Harvey: 122 (1865); Anderberg: 158 (1986); Anderberg: 107 (1991b); Anderberg: 289 (1994).

Shrubs, shrublets, annual or perennial herbs. **Leaves** alternate, sessile, filiform, lanceolate, oblong or spathulate in outline, entire, serrate or dentate to pinnatifid, with conspicuous short glands, in some species with glandular hairs and/or bristly hairs. **Capitula** discoid, solitary to laxly corymbose, pedunculate, terminal. **Involucre** narrowly to broadly cyathiform; bracts in 3 or 4 rows, lanceolate to narrowly oblong or narrowly obovate, dorsally glandular and marginally ciliate. **Receptacle** flat, epaleate. **Disc florets** bisexual; corolla yellow or occasionally purplish or turning purplish with age; tube gradually attenuating towards base, basally widened into ring-shaped foot, widening upwards, glandular, 5-lobed, lobes triangular. **Anthers** minutely calcarate, caudate, with branched tails; with lanceolate, apical appendage; endothecial tissue polarised. **Style** bifid; style branches linear to spathulate; with acute sweeping hairs not reaching furcation. **Cypselas** terete to somewhat flattened, cylindrical, ribbed, glandular-hairy.

Pappus of barbellate or plumose bristles in 1 or several rows and outer row of entire or incised to almost bristle-like scales. $x = 10$ (1 report).

Species 9, Africa and Middle East; 9 in sthn Afr., widespread but absent from North-West.

*Pentanema Cass. 9061060

(Inuleae)
Cassini: 74 (1818); Rechinger: 96 (1980); Anderberg: 100 (1991b); Anderberg: 289 (1994).

Vicoa Cass.: 418 (1829b); Bentham: 334 (1873a); Oliver & Hiern: 361 (1877).

Annual herbs. **Leaves** alternate, oblong to lanceolate, entire or toothed, often villose. **Capitula** radiate, pedunculate, solitary. **Involucral bracts** in many rows, narrow, imbricate, ± scarious, finely pointed. **Receptacle** epaleate. **Ray florets** female; corolla yellow, strap-shaped, 3-toothed. **Disc florets** bisexual; corolla yellow, tubular, 5-toothed. **Anthers** ecalcarate, caudate, with branched tails; endothecial tissue radial. **Style** with acute sweeping hairs, not reaching furcation. **Cypselas** ellipsoid. **Pappus** of barbellate bristles in 1 row. $x = 9$ (10, 17—1 report) (polyploidy).

Species ± 18, Asia, India, Afghanistan, Pakistan, Africa; 1 naturalised in sthn Afr.: **Pentanema indicum* (L.) Y.Ling, North-West.

Pentatrichia Klatt 9061010

(Gnaphalieae)
Klatt: 436, t. 10 (1895); Merxmüller: 138 (1967a); Anderberg: 43 (1991a); Anderberg: 325 (1994).

Shrubs, glandular pilose on young parts. **Leaves** alternate, petiolate or sessile, digitately lobed, cordate at base, pubescent when young. **Capitula** discoid or radiate, solitary, pedunculate, sometimes 2 together or corymbose. **Involucre** campanulate; bracts in 7 rows, linear, acute, scarious, glabrous; stereome undivided. **Receptacle** flat, honeycombed, epaleate. **Ray florets**, when present, female, whitish or yellow, pistillate, in 1 row; staminodia 0. **Disc florets** bisexual, fertile; corolla yellow, tube cylindric, glabrous, with 5 small, lanceolate lobes; lobes strongly retrofracted. **Anthers** ecalcarate, caudate; with lanceolate, apical appendage; endothecial tissue polarised. **Style** bifid; style branches obtuse with obtuse sweeping hairs not reaching furcation; stigmatic surface basally separated but apically confluent. **Cypselas** sparsely hairy with elongated twin hairs and glandular hairs. **Pappus** of few, free, barbellate bristles in 1 row and outer row of short, triangular scales.

Species 4, endemic to sthn Afr.; Namibia, Mpumalanga, Northern and Western Cape.

Pentzia Thunb. 9366000

(Anthemideae)
Thunberg: 145 (1800); Harvey: 171 (1865); Hutchinson: 241 (1916b); Hilliard & Burtt: 328 (1973); Källersjö: 302 (1988); Bremer & Humphries: 151 (1993); Bremer: 477 (1994).

Shrubs or shrublets, cano-pubescent, glandular or glabrous. **Leaves** mostly alternate, rarely opposite, variously pinnatisect, occasionally entire or apically dentate, ± ericoid. **Capitula** discoid, solitary or corymbose, pedunculate, several-flowered. **Involucre** globose; bracts in 3–5 rows, obtuse and with scarious margin. **Receptacle** flat, convex or hemispherical to conical, epaleate. **Disc florets** bisexual, fertile; corolla glandular; tube generally swollen, cylindrical, limb cyathiform-campanulate, with 5 ovate lobes. **Anthers** ecalcarate and ecaudate; with ovate to linear, apical appendage. **Style** terete, sometimes swollen at base; with linear, truncate branches. **Cypselas** yellowish brown, 5-ribbed, ± terete, often with large 2-celled glands and with myxogenic cells abaxially and on ribs. **Pappus** an adaxial auricle, or an oblique adaxially longer cup or of free adaxially whitish scales, sometimes 0. $x = 6, 7, 8$.

Species 23, Africa; 21 in sthn Afr., widespread but absent from Mpumalanga, Swaziland and KwaZulu-Natal.

Perdicium L. 9528020

(Mutisieae)
Linnaeus: 22 (1760); Harvey: 523 (1865); Bremer: 104 (1994).

Perennial herbs, acaulescent. **Leaves** radical, incised along margin, glabrous or woolly. **Capitula** disciform, solitary, on short scapes ± equalling leaves. **Involucre** with scales imbricate, lanceolate. **Marginal florets** female, in 1 row; corolla white, bilabiate, outer lip 3-toothed, inner shorter, bipartite. **Disc florets** bisexual; corolla bilabiate, of same colour as marginal florets. **Anthers** tailed. **Style** shortly 2-lobed; branches scarcely divergent, semiterete, obtuse, pubescent. **Cypselas** ovate-oblong, rostrate. **Pappus** of scabrous bristles in many rows, falling with epigynous disc or annulus.

Species 2, endemic in sthn Afr.: *Perdicium capense* L. and *P. leiocarpa* DC., Western Cape, from the Clanwilliam area to Worcester.

Petalacte D.Don 8995000

(Gnaphalieae)
Don: 552 (1826); Harvey: 288 (1865); Lundgren: 119 (1974); Anderberg: 92 (1991a); Anderberg: 339 (1994).

Perennial herbs or shrublets. **Leaves** alternate, sessile, narrowly obovate-spathulate, narrowly elliptic or narrowly panduriform, margins entire, flat or revolute, densely tomentose to woolly (hair type B). **Capitula** disciform, small, aggregated into terminal cymes or corymbs, several-flowered, pedunculate, densely woolly. **Involucre** ± obovoid; bracts in 4 rows, imbricate, stipitate, woolly, inner large, ovate, petaloid, white; stereome undivided. **Receptacle** flat, paleate; paleae linear, ± as long as florets, outermost resembling involucral bracts. **Marginal florets** female, few, filiform or narrowly tubular, minutely 5-toothed and glandular at apex. **Disc florets** functionally male, outnumbering female florets; corolla tubular, narrowly campanulate above, 5-lobed and glandular at apex. **Anthers** ecalcarate, caudate; with oblong-lanceolate, terminal appendage; endothecial tissue polarised. **Style** in female flowers bifid; branches flattened, linear, obtuse-truncate and with obtuse sweeping hairs apically. **Cypselas** narrowly elliptic, brownish, glabrous or with elongated, nonmyxogenic twin hairs, often subtended by short, scarious, apically laciniate scale. **Pappus** in male flowers of 10–15 bristles in 1 row, as long as to slightly longer than corolla tube, sparsely barbellate to nude below and subplumose at apex, free below; in female flowers more poorly developed.

Monotypic, endemic to sthn Afr.: *Petalacte coronata* (L.) D.Don, Western Cape.

Phaenocoma D.Don 8997000

(Gnaphalieae)
Don: 554 (1826); Harvey: 287 (1865); Anonymous: 388 (1930); Anderberg: 70 (1991a); Anderberg: 333 (1994).

Elichrysum Willd.: 1905 (1803). *Xeranthemum* L.: 858 (1753).

Rigid, erect shrubs, main stem to 60 mm in diameter; branches rigid, upright, covered in brachyblasts borne at right angles to branches, decreasing in size from base of branch to tip, each brachyblast subtended by a narrow

dark brown bract. **Leaves** small, fleshy, knob-like, very densely spaced on branches and brachyblasts, imbricate, abaxial surface woolly-hairy, adaxial surface arachnoid. **Capitula** discoid, terminal, large, with 800–1000 florets. **Involucral bracts** 240–270, with three clearly distinguishable sections: *basal shaft* 6–11 mm long, narrowly transversely elliptic in cross section, strongly hygroscopic, margins with a single row of hairs and glands; *hinge* a dark brown band, up to 2 mm wide between shaft and lamina; *lamina* up to 22 mm long, with a silky sheen, deep pink fading to lighter shades with age; outermost bracts scale-like, with acuminate dark brown tips; innermost bracts with lamina longer and narrower. **Receptacle** conical, nude, honeycombed. **Female florets** discoid, ± 20 per capitulum, positioned at regular intervals between other florets in outermost row closest to involucre, narrowing towards tip to clasp style, with very small, erect, triangular lobes. **Style** bifid; style branches tapering to a narrow, rounded tip, base bulbous. **Cypsela** with long, white, silky hairs. **Pappus** of 100–150 plumose bristles, slightly fused at base, tips acute or rounded. **Male florets** discoid, majority of florets in capitula, progressively younger towards centre, ± same width from base to tip. **Anthers** with apical appendage truncate, basally long frilly-tailed. **Style** not bifid, with swollen cells along upper part of shaft, base bulbous. **Nectary** reduced or 0. **Cypsela** reduced and sterile, smooth, glossy. **Pappus** bristles 20–55, plumose, slightly fused at base, tips bulbously inflated.

Monotypic: *Phaenocoma prolifera* (L.) D.Don, endemic to Western Cape.

Phaneroglossa B.Nord. 9411040

(Senecioneae)

Nordenstam: 66 (1978); Bremer: 507 (1994).

Subshrubs. **Leaves** alternate, linear-lanceolate or oblanceolate, sessile with half-clasping base, coriaceous, with entire to denticulate and often somewhat revolute margins. **Capitula** radiate, solitary, on long peduncles. **Involucre** broadly cup-shaped, ecalyculate; involucral bracts ± 11–15, in 1 row, basally connate, lanceolate, coriaceous, with distinct subscarious margins. **Receptacle** flat and wide, glabrous, smooth, punctate, epaleate. **Ray florets** female, 5–8; tube cylindrical, with few to many gland-tipped hairs; lamina elliptic-oblong, apically trifid, white or cream-coloured. **Style** branches glabrous, apically tipped with conical obtuse appendage. **Cypselas** oblong, with 5 or 6 obliquely curved, wing-like ridges, dark brown to black, glabrous. **Pappus** bristles in many rows, white, barbellate, caducous. **Disc florets** bisexual, many; corolla tubular, apically 5-lobed; lobes ovate, apically papillate. **Anthers** ecalcarate, caudate, bases auriculate; apical appendage ovate, large; endothecial tissue radial. **Style** branches with continuous stigmatic surfaces, apically distinctly conical-convex, outside surface papillate towards apex. **Cypselas** narrowly oblong, with 5 obliquely curved, wing-like ridges, brown, densely hirsute on ridges with mucilaginous hairs. **Pappus** bristles in many rows, white, barbellate, persistent.

Monotypic, endemic to sthn Afr.: *Phaneroglossa bolusii* (Oliv.) B.Nord., Northern Cape (Namaqualand) and Western Cape.

Philyrophyllum O.Hoffm. 9083000

(Gnaphalieae)

Hoffmann: 206, 208 (1889b); Merxmüller: 146 (1967a); Anderberg: 43 (1991a); Anderberg: 326 (1994); Herman: 107 (1999a).

Perennial herbs, glandular. **Leaves** alternate, petiolate, triangular, glandular-hairy, margin dentate. **Capitula** radiate, small, in loose corymbs. **Involucre** campanulate; bracts in 4 rows, lanceolate, glandular; inner ciliate; stereome undivided. **Receptacle** flat, paleate; paleae linear, as long as disc florets, concave, ciliate. **Ray florets** female; corolla yellow, 3-toothed, in 1 row, fewer than disc florets. **Pappus** a crown of scales. **Disc florets** bisexual, fertile; corolla yellow; tube widening above, 5-lobed, lobes strongly retrofract. **Anthers** calcarate and caudate; apical appendage flat; endothecial tissue polarised. **Style** bifid; style branches obtuse with obtuse sweeping hairs dorsally, not reaching furcation; stigmatic surfaces basally separated but apically confluent. **Cypselas** sparsely hairy with elongated twin hairs and glandular hairs. **Pappus** of few, free, barbellate, caducous bristles in 1 row and small crown of scales.

Monotypic, south-tropical Africa; also Angola and Zimbabwe: *Philyrophyllum schinzii* O.Hoffm., Namibia, Botswana, Northern Province, North-West, Gauteng and Mpumalanga.

Phymaspermum Less. 9336000

(Anthemideae)

Lessing: 253 (1832); Harvey: 160 (1865); Källersjö: 535 (1985); Bremer & Humphries: 94 (1993); Bremer: 451 (1994).

Adenachaena DC.: 49 (1838a); Harvey: 160 (1865). *Brachymeris* DC.: 76 (1838a); Harvey: 163 (1865). *Iocaste* E.Mey. ex Harv.: 160 (1865).

Shrubs or subshrubs, glabrous or pubescent. **Leaves** alternate, small, linear or subterete, sometimes appressed, entire or lobed; often with secondary shoots in axils of primary leaves. **Capitula** radiate or rarely discoid, few-flowered, solitary at apex of branches or laxly corymbose, pedunculate or rarely sessile. **Involucre** campanulate to subglobose; bracts in 4 or 5 rows, sometimes with membranous tip, ciliate, glabrous, sometimes glandular on back. **Receptacle** flat or slightly convex, epaleate. **Ray florets** female, fertile; corolla white or yellow; tube with oblong or elliptic, minutely 3-toothed lamina, 3–4 times longer than tube, glandular. **Disc florets** bisexual, fertile; corolla tube short with distinct campanulate, partly enervate, 5-lobed limb. **Anthers** ecalcarate and ecaudate; with oblong or lanceolate, apical appendage. **Style** terete, sometimes swollen at base, with linear, truncate branches. **Cypselas** ellipsoid-obovoid to terete, with 10–18 rounded ribs, minutely papillose, apically with entire or toothed thickened rim, rarely developing into small crown. **Pappus** 0.

Species 19, Zimbabwe and sthn Afr.; widespread but absent from Botswana and Northern Cape.

***Picris** L. 9575000

(Lactuceae)

Linnaeus: 792 (1753); Linnaeus: 347 (1754); Oliver & Hiern: 447 (1877); Phillips: 853 (1951); Henderson & Anderson: 384 (1966); Hilliard: 604 (1977); Bremer: 199 (1994).

Annual or perennial herbs, roughly hairy, with milky latex. **Stems** erect, branched, ribbed, hispid. **Leaves** rosulate and alternate along stems, entire, coarsely toothed or pinnatifid. **Capitula** ligulate, solitary at ends of branches, rarely corymbose. **Involucre** ovoid-urceolate or campanulate; bracts in several rows, outer ones ovate, pungent, ciliate, inner ones broadly linear or lanceolate-linear, some with long spinous awn from back of apex, setose on back. **Receptacle** flat, honeycombed, epaleate. **Florets** (ligules) bisexual, fertile; corolla yellow, strap-shaped, tube linear, shorter than lamina, sparsely pilose above; lamina broadly linear, truncate, 4- or 5-toothed. **Anthers** linear, sagittate; with oblong appendage. **Style** linear, terete above, pubescent on terete portion; branches linear, obtuse, glabrous. **Cypselas** ellipsoid-fusiform or terete, sometimes attenuate

apically, ribbed, transversely rugose, glabrous. **Pappus** of plumose bristles, rarely reduced to short scales or a corona in outer florets. x = 4, 5 (polyploidy, B-chromosomes—1 report).

Species 45, Europe, Mediterranean region, Asia, mountains of Africa; **Picris echioides* L. is a widespread weed in sthn Afr. whereas **P. hierachioides* L. is known only from KwaZulu-Natal.

Planea P.O.Karis 9043030

(Gnaphalieae)

Karis: 32 (1990); Anderberg: 73 (1991a); Anderberg: 333 (1994).

Much-branched shrublets. **Leaves** in fascicles, involute ericoid, twisted at base, up to 5 mm long, puberulous or glabrous, acute, mucronate. **Capitula** discoid, 5-flowered, corymbose. **Involucral bracts** in 8–11 rows, stereome undivided, outermost bracts green, inner ones reddish above stereome, otherwise whitish to entirely white. **Florets** perfect; corolla narrowly cylindrical with 5 erect, narrowly triangular lobes. **Anthers** with long, acute, abaxially concave apical appendage narrowing at base and with margins of short dorsiventrally erect-spreading cells, tails long, much-branched. **Cypselas** (immature) ovoid, covered with twin-hairs; endocarp of ± 10 cell layer thick testa with a marked pallisade-like epidermis of in transverse-section narrowly oblong, semitransparent cells. **Pappus** bristles serrate, distinctly connate at base into an irregular ring, shaft apically barbellate with free or slightly fused, acute, not clavate cells.

Monotypic: *Planea schlechteri* (L.Bolus) P.O.Karis is endemic to Western Cape.

Platycarpha Less. 9441000

(Arctoteae)

Lessing: 688 (1831); Harvey: 54 (1865); Phillips: 848 (1951); Bremer: 257 (1994).

Perennial herbs, acaulescent, unbranched or with subterranean branches. **Leaves** in rosettes, entire to pinnately lobed, sometimes spinescent, pustulate on upper surface, tomentose beneath. **Capitula** discoid; crowded in large, sessile secondary head in centre of leaf rosette, each capitulum few-flowered. **Involucre** subglobose; bracts in few to many rows, stiff and pungent or herbaceous and woolly. **Receptacle** flat, paleate; paleae ± linear to filamentous. **Florets** bisexual, fertile; corolla purple; tube widened above, glandular-hairy, with 5 linear lobes usually thickened at apex. **Anthers** sagittate or tailed; with ovate to lanceolate, apical appendage. **Style** linear below, terete above with a swelling between; branches short, oblong. **Cypselas** oblong, faintly ribbed. **Pappus** of scales in 1 or 2 rows.

Species 3, endemic to sthn Afr., Namibia, Botswana, North-West, Gauteng, Free State, Northern, Western and Eastern Cape.

Plecostachys Hilliard & B.L.Burtt 8992040

(Gnaphalieae)

Hilliard & Burtt: 206 (1981); Hilliard: 49 (1983); Anderberg: 140 (1991a); Anderberg: 362 (1994).

Perennial herbs or subshrubs; stems long, slender, tangled, thinly white-tomentose, leafy. **Leaves** alternate, small, elliptic to suborbicular, apex obtuse or rounded, sessile or shortly petiolate, margins entire, flat or undulate, upper surface generally cobwebby (hair type B), glabrescent, lower white-tomentose. **Capitula** disciform, small, many in small compact corymbose clusters terminating branchlets. **Involucral bracts** in 3 or 4 rows, inner ± equalling or slightly exceeding florets, tips opaque white, obtuse, radiating; stereome undivided. **Receptacle** shortly honeycombed, flat, epaleate. **Florets** ± 10–40, female flowers 3–30, fewer to more than bisexual flowers, narrowly tubular or filiform; bisexual flowers tubular below, slightly expanded above with 5 deltoid lobes, glandular hairs on backs of all lobes; corolla yellow sometimes tipped pink or purple. **Anthers** ecalcarate, caudate, tails either shorter or slightly longer than filament collar; with small obtuse or subacute deltoid apical appendage; endothecial tissue polarised. **Style** branches truncate and penicillate, short obtuse sweeping hairs extending briefly down backs of branches. **Cypselas** small, oblong, wall flat, apparently without crystals, oblong duplex hairs with swelling cushion always present, myxogenic. **Pappus** bristles scabrid above, bases cohering by patent cilia, lightly fused as well in 1 species; cells with delicate wall thickenings.

Species 2, endemic to sthn Afr.: *Plecostachys polifolia* (Thunb.) Hilliard & B.L.Burtt and *P. serpyllifolia* (P.J.Bergius) Hilliard & B.L.Burtt, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Pleiotaxis Steetz 9499000

(Mutisieae)

Steetz: 499 (1864); Merxmüller: 148 (1967a); Wild: 194 (1972); Bremer: 104 (1994).

Perennial herbs or subshrubs, often with woody rootstock. **Leaves** alternate, usually toothed, frequently cobwebby or tomentose. **Capitula** discoid, terminal, solitary or in few- to many-headed racemes or panicles. **Involucre** ± campanulate or subcylindric; bracts in many rows, closely imbricate, ovate to oblong, obtuse. **Receptacle** epaleate. **Florets** bisexual; corolla white or bright dark red; tube slender below, dilated above, with 5 ± linear lobes. **Anthers** with elongate, ciliate or fimbriate tails. **Style** with branches long, subapically with short hairs, glabrous at tips. **Cypselas** slender, somewhat compressed or 4-angled, glabrous or pilose. **Pappus** of many scabrid bristles.

Species 26, tropical Africa; 2 in sthn Afr.: *Pleiotaxis antunesii* O.Hoffm. in the northern parts of Namibia and *P. eximia* O.Hoffm. in Botswana.

Pluchea Cass. 8941000

(Plucheeae)

Cassini: 31 (1817a); Wild: 132 (1969a); Hilliard: 116 (1977); Anderberg: 164 (1991c); Anderberg: 301 (1994).

Subshrubs or shrubs, rarely perennial herbs, hairy or sometimes glutinous. **Leaves** alternate, dentate to serrate or entire, sessile or subsessile, not decurrent. **Capitula** disciform, mostly in leafless, terminal, corymbose cymes, rarely few or solitary; flowers white, yellow or purplish. **Involucre** ovoid, broadly campanulate or subhemispherical; bracts in few to many rows. **Receptacle** concave or convex, sometimes honeycombed, epaleate. **Marginal florets** female, filiform, 3-lobed, in 1 to few rows. **Style** entire or almost undivided or sometimes divided; style branches with obtuse sweeping hairs reaching below the furcation. **Disc florets** functionally male; corolla tubular, widening upwards, glabrous, with 5 lobes, glandular on margins. **Anthers** calcarate and caudate; endothecial tissue radial. **Cypselas** cylindric, hairy, without resin ducts. **Pappus** of free, barbellate, capillary bristles in 1 row, each bristle with patent teeth. x = 10 (polyploidy).

Species ± 80, Asia, America, Africa and Australia; 4 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Poecilolepis Grau 8919020

(Astereae)

Grau: 243 (1977); Bremer: 430 (1994).

Annual or perennial herbs, prostrate to erect. **Leaves** alternate or opposite, entire, linear, somewhat succulent. **Capitula** radiate, solitary, pedunculate. **Involucral** bracts in 3 to many rows, imbricate. **Receptacle** paleate. **Ray florets** female, sterile, white. **Disc florets** bisexual, fertile, yellow. **Anthers** ecalcarate, bases auriculate (shortly caudate); with apical triangular appendages. **Style** branches with broadly triangular appendages and at base with long sweeping hairs. **Cypselas** obovoid, somewhat compressed, ± pubescent. **Pappus** of few, scabrid, caducous bristles in 1 row.

Species 2, endemic to sthn Afr.: *Poecilolepis ficoidea* (DC.) Grau and *P. maritima* (Bolus) Grau, Western and Eastern Cape.

Polyarrhena Cass. 8919010

(Astereae)

Cassini: 173 (1828); Grau: 347 (1970); Bremer: 430 (1994).

Shrublets, usually densely leafy. **Leaves** alternate, entire to slightly toothed, densely hairy to glabrous; hairs usually coarse, sometimes glandular. **Capitula** radiate, solitary, terminal, sessile or pedunculate, or lateral or sometimes clustered on branchlets. **Involucral bracts** in 3 rows, lanceolate, inner row the longest. **Receptacle** epaleate. **Ray florets** female, with upperside white and underside purplish pink, acute. **Stigma** shortly bilobed. **Disc florets** bisexual or more often male or mixed, yellow. **Anthers** ecalcarate and ecaudate; apical appendage ovate-lanceolate, flat. **Style** appendage triangular in fertile florets. **Cypselas** buff or greenish brown to yellow, obtuse, elliptic, with swollen margin, glabrous, with horny ring ± 1 mm deep at upper end. **Pappus** of slender, yellowish white, scabrid, caducous bristles in 1 row.

Species 4, endemic to sthn Afr., Western Cape. Formerly associated with *Aster*, *Felicia*, etc.

Printzia Cass. 9059000

(Gnaphalieae)

Cassini: 324 (1825a); Harvey: 513 (1865); Leins: 108 (1971); Hilliard & Burtt: 368 (1973); Kroner: 108 (1980); Anderberg: 49 (1991a); Anderberg: 326 (1994).

Bojeria DC.: 94 (1836a).

Shrubs, shrublets or perennial herbs. **Leaves** alternate, petiolate or sessile, sometimes leaf bases decurrent, sometimes auriculate, ovate, obovate, elliptic to linear or lanceolate, margin entire to dentate, tomentose or tomentose only beneath (hair type B). **Capitula** radiate or disciform, 1–3 together, sessile or shortly pedunculate on short, axillary branchlets. **Involucre** campanulate; bracts in 3–6 rows, lanceolate to linear, ciliate towards apex, woolly on back; stereome undivided. **Receptacle** slightly convex, honeycombed, epaleate. **Marginal florets** female, in 1 row, white, blue, purple or green; corolla sometimes shortly strap-shaped or filiform, with 3-toothed, oblong or oblong-elliptic lamina longer than tube; staminodes often present. **Style** 2-branched. **Disc florets** bisexual, fertile; corolla yellow, white or purple, rarely green; tube widened above, glabrous, with 5 linear or lanceolate lobes. **Anthers** ecalcarate or calcarate, caudate; apical appendage flat; endothecial tissue polarised. **Style** bifid; style branches obtuse, dorsally with short papillose, obtuse sweeping hairs not reaching furcation; stigmatic surface basally separated but apically converging. **Cypselas** brown, cylindrical, 9–11-ribbed, glandular-hairy and sparsely hairy with elongated twin hairs. **Pappus** persistent, of subbarbellate or subplumose bristles in 2 or 3 rows.

Species 6, endemic to sthn Afr., Mpumalanga, Free State, KwaZulu-Natal, Western and Eastern Cape.

Pseudoconyza Cuatrec. 8940010

(Plucheeae)

Cuatrecasas: 30 (1961); Anderberg: 160 (1991c); Anderberg: 302 (1994).

Herbs, aromatic; stem without resin ducts. **Leaves** alternate, dentate and sometimes basally shallowly lobed, slightly stem-clasping but not decurrent. **Capitula** disciform, terminal, solitary or few together; flowers mauve. **Receptacle** epaleate. **Marginal florets** female; corolla filliform, 3-lobed. **Disc florets** bisexual. **Anthers** calcarate and caudate; cells of filament collar flattened; endothecial tissue radial. **Style** bifid; style branches with obtuse sweeping hairs reaching below the furcation. **Cypselas** distinct, stout, ellipsoid, with straight hairs, without resin ducts. **Pappus** of free, barbellate, capillary bristles in 1 row; each bristle with adpressed teeth.

Monotypic: *Pseudoconyza viscosa* (Mill.) D'Arcy, Central America, Africa and Asia; Namibia, Botswana, Northern Province and Mpumalanga.

Pseudognaphalium Kirp. 8992050

(Gnaphalieae)

Kirpicznikov: 33 (1950); Hilliard & Burtt: 204 (1981); Hilliard: 53 (1983); Anderberg: 146 (1991a); Anderberg: 362 (1994).

Annual, biennial or perennial herbs. **Leaves** alternate, sessile, lanceolate, linear-lanceolate or oblanceolate, sometimes decurrent, margins entire, flat or undulate, both surfaces woolly, or glandular above, woolly below (hair type B). **Capitula** disciform, in small clusters corymbosely or cymosely arranged. **Involucral bracts** in 3 or 4 rows, inner ± equalling or slightly exceeding flowers, white to yellow, often buff or cream; stereome usually divided, rarely undivided (*P. oligandrum*). **Receptacle** smooth or honeycombed, epaleate. **Florets** few to many; female florets more than bisexual florets, corolla yellow, filiform or narrowly tubular; bisexual florets tubular, scarcely broadened above, yellow, 5-lobed; all florets glandular-hairy on backs of lobes. **Anthers** ecalcarate, caudate, tails slightly longer or shorter than filament collar; with small, obtuse or subacute apical appendage; endothecial tissue polarised. **Style** branches truncate and penicillate, with obtuse sweeping hairs. **Cypselas** oblong, either glabrous or with duplex myxogenic hairs; epidermal cells tabular, often imbricate. **Pappus** bristles scabrid, apical cells sometimes inflated, bases cohering by patent cilia. $x = 7$ (1 report).

Species ± 90, Africa, Asia, Europe and America; 3 in sthn Afr., widespread.

Psiadia Jacq. 8923000

(Astereae)

Jacquin: 13, t. 152 (1797); Cufodontis: 1084 (1966); Merxmüller: 150 (1967a); Wild: 23 (1975); Bremer: 430 (1994).

Shrubs, ± viscid at extremities. **Leaves** alternate, petiolate, linear to lanceolate, entire, serrulate or undulate. **Capitula** disciform or shortly radiate, in terminal corymbose cymes, pedunculate. **Involucre** subglobose or campanulate; bracts in 3–5 rows, imbricate. **Receptacle** flat, epaleate. **Ray florets** female, fertile, in several rows, with strap-shaped lamina, 2- or 3-toothed, pale yellow. **Style** branches slender. **Disc florets** male, yellow; corolla funnel-shaped, shortly 5-lobed. **Anthers** obtuse at base, but very shortly 2-dentate. **Cypselas** nar-

rowly turbinate, pubescent. **Pappus** of many barbellate bristles united at base, in 1 row. $x = 9$ (1 report).

Species ± 60, Africa, Madagascar and Asia; 1 in sthn Afr.: *Psiadia punctulata* (DC.) Oliv. & Hiern ex Vatke, Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga and Northern Cape.

Pteronia L. 8862000

(Astereae)

Linnaeus: 1176 (1763); Harvey: 95 (1865); Hutchinson & Phillips: 277 (1917); Bremer: 408 (1994).

Shrublets or shrubs, often viscid, rarely spiny, rarely with decumbent branches rooting at nodes. **Leaves** mostly opposite or alternate, sometimes fascicled, entire or ciliate-serrulate, sometimes coriaceous or succulent, woolly-tomentose, papillose or glabrous, rarely warted. **Capitula** discoid, solitary or corymbose, 1–many-flowered. **Involucre** campanulate to cylindric or ovoid; bracts in 4–10 rows, inner progressively longer, with membranous, glabrous or ciliate margins, sometimes acuminate or spine-tipped. **Receptacle** convex to concave, often honeycombed, margins setose or lacerate. **Florets** bisexual. **Corolla** yellow, rarely purple or greenish; tube usually widening above, often chartaceous; lobes 5, triangular, oblong-linear to obovate. **Anthers** linear, obtuse at base; usually with lanceolate, membranous, apical appendage. **Style** terete; branches usually lanceolate, flattened, with short or long appendages, apex hairy. **Cypselas** obovoid or turbinate or ± compressed, sometimes narrowed into short apical beak, glabrous to villous. **Pappus** usually in 2 rows, of scabrid, barbellate or subpilose bristles, often connate at base, mostly straw-coloured, rarely purple.

Species 70, mainly sthn Afr., Namibia, Botswana, Free State, Northern, Western and Eastern Cape; few extending into Zimbabwe and Australia.

Pulicaria Gaertn. 9078000

(Inuleae)

Gaertner: 461, t. 173 (1791); Harvey: 121 (1865); Hilliard: 281 (1977); Anderberg: 109 (1991b); Anderberg: 290 (1994).

Annual or perennial herbs, villous or subwoolly. **Leaves** alternate, sessile, often cordate-amplexicaul, entire, sinuate or serrate-dentate. **Capitula** radiate or disciform, solitary, often pedunculate, terminal. **Involucre** hemispherical; bracts in 4 or 5 rows, linear, glandular, hairy. **Receptacle** flat, honeycombed, epaleate. **Marginal florets** female; corolla yellow, strap-shaped, rarely filiform, 2- or 3-toothed. **Disc florets** bisexual, fertile; corolla yellow; tube slightly widened upwards, glabrous, 5-lobed. **Anther** bases sagittate, with branched tails, minutely calcarate; with lanceolate, apical appendage; endothecial tissue radial. **Style** branches with acute sweeping hairs, not reaching furcation. **Cypselas** semiterete, ribbed, glandular and hairy. **Pappus** double; outer row of short scales often connate into toothed crown; inner row of few, smooth, caducous bristles. $x = 9$ (6, 7, 10) (polyploidy, B-chromosomes—1 report).

Species 77, Europe, Africa and Asia; 1 in sthn Afr.: *Pulicaria scabra* (Thunb.) Druce, widespread but absent from Botswana and Northern Cape.

Relhania L'Hér. 9050000

(Gnaphalieae)

L'Héritier de Brutelle: 22, t. 29 (1788); Harvey: 298 (1865); Bremer 27 (1976a); Anderberg: 68 (1991a); Anderberg: 333 (1994).

Shrubs, or shrublets, rarely annuals. **Leaves** alternate, rarely opposite, sessile, needle-shaped to lanceolate, very rarely obovate, glandular. **Capitula** radiate, mainly solitary and sessile, rarely pedunculate or corymbose, few- to many-flowered. **Involucre** ellipsoid, ovoid or campanulate; bracts in ± 5 rows, ovate to linear, sometimes bilobed, sometimes with ovate, terminal appendage. **Receptacle** flat or somewhat conical, with linear to broad paleae as long as corolla. **Ray florets** female, yellow, marginal; corolla tube with minutely 3-toothed lamina shorter or longer than tube; ovary linear or oblong, sometimes ribbed. **Style** slender, with linear, obtuse branches. **Pappus** a cup- or crown-like structure or of separate, membranous paleae. **Disc florets** bisexual, fertile or sterile; corolla tube widening above, becoming campanulate; lobes short, ovate. **Anthers** sagittate or tailed at base; ovary linear, sometimes with 2 ciliate ribs, glabrous to pilose. **Style** linear, sometimes swollen at base, branches linear, truncate, rarely rounded. $x = 7$ (5).

Species 13 with 4 subspecies, endemic to sthn Afr., Free State, KwaZulu-Natal, Lesotho, Northern, Western and Eastern Cape.

Rennera Merxm. emended P.P.J.Herman 9366010

(Anthemideae)

Merxmüller: 335 (1957); Källersjö: 308 (1988); Bremer & Humphries: 152 (1993); Bremer: 477 (1994); Herman: 373 (1999b).

Perennial herbs or dwarf shrubs, erect to ascending, sometimes rooting at nodes, aromatic. **Leaves** alternate or opposite at base, sessile or petiolate, entire, pinnatifid or bipinnatifid, glabrous or sericeous. **Capitula** discoid, solitary or corymbose, pedunculate. **Involucre** hemispherical; bracts in 3(4) rows, few to many, inner row(s) smaller than outer 2, apically acute or obtuse to spathulate, with scarious margins or inner almost totally membranous, with central resin canal. **Receptacle** hemispherical, epaleate. **Disc florets** bisexual, fertile; corolla yellow, tube narrowly cylindrical and of thin texture; limb globose, partly enervate, 5-lobed; lobes often cucullate; glandular. **Anthers** shortly calcarate and ecaudate, apical appendage ovate. **Style** terete; furcate, branches truncate, penicillate, stigmatic surfaces in 2 separate lines; with resin ducts. **Cypselas** brownish, obovoid, ellipsoid or turbinate, ribbed or angled, sometimes with radiating arms, glandular, but without myxogenic cells, thick-walled and conspicuously tuberculate to rugose, apically sometimes with thick, spreading to revolute corona. **Pappus** 0.

Species 4, endemic to sthn Afr., Namibia, Botswana, North-West and Northern Cape.

Rhynchopsidium DC. 9050020

(Gnaphalieae)

Candolle: 283 (1836b); Bremer: 27 (1976a); Anderberg & Bremer: 1069 (1991); Anderberg: 334 (1994).

Rhynchocarpus Less., name illegitimate.

Annual herbs. **Leaves** alternate or sometimes opposite, straight, adaxially concave, tomentose, glandular-hairy; margin entire. **Capitula** radiate, solitary, sessile or pedunculate. **Involucral bracts** with lanceolate laminas. **Receptacle** flat to convex, paleate; paleae lanceolate with two lateral teeth. **Ray florets** female, yellow with purple bands dorsally, in one row, fewer than disc florets; cypselas and pappus as in disc florets. **Disc florets** bisexual, yellow, often with robust multicellular trichomes. **Anthers** ecalcarate, with short tails; endothecial tissue polarised; apical appendage acute. **Style** branches truncate with obtuse sweeping hairs apically. **Cypselas** narrowly elliptic with three vascular bundles, densely hairy with elongated, apically coiled twin hairs. **Pappus** a crown of ± free scales.

Species 2: *Rhynchopsidium pumilum* (L.f.) DC. and *R. sessiliflorum* (L.f.) DC., endemic to Northern and Western Cape.

Rosenia Thunb. emended K.Bremer 9051000

(Gnaphalieae)

Thunberg: 161 (1800); Lessing: 369 (1832); Candolle: 280 (1838a); Harvey: 294 (1865); Bentham: 327 (1873a); Hoffmann: 198 (1890); Bremer: 104 (1976b); Anderberg: 67 (1991a); Anderberg: 334 (1994).

Densely to moderately branched, compact to diffuse, sometimes spiny shrubs. **Stems** prostrate to erect, glabrous or laxly tomentose, leafy and with lateral brachyblasts with crowded leaves. **Leaves** decussate or sometimes alternate, laxly to densely set, semiamplexicaul, sessile, entire, midribbed, glabrous or tomentose, usually glandular with stalked glands. **Capitula** radiate, solitary, sessile, terminal on stems and brachyblasts, often in fork of two branches. **Involucral bracts** in 3–10 rows, imbricated, entire, basally firm, apically spreading and scarious and sometimes brown with pale margins, otherwise yellowish, glabrous or seldom dorsally tomentose, often glandular. **Receptacle** flat, paleate or epaleate, sometimes shortly squamose. **Ray florets** female, fertile, tube cylindrical-funnel-shaped, sometimes glandular, lamina spreading, elliptic, yellow and sometimes dorsally with a brownish purple stripe, usually 4-veined, apically minutely 3-lobed. **Style** terete, bifid; branches spreading-revolute, semiterete, linear, glabrous or minutely penicillate apically, obtuse; stylopodium 0 or indistinct. **Disc florets** bisexual; corolla yellow, 5-lobed; lobes spreading, ovate-triangular, marginally thickened, dorsally usually gland-dotted. **Style** terete, bifid; branches spreading-revolute, semiterete, narrowly oblong, apically penicillate and truncate; stylopodium ± distinct, conical-terete. **Anthers** linear, with a sterile, flat, ovate, apical appendage and sterile, subulate, entire or slightly branched tails; filaments filiform. **Cypselas** terete or angular, ± narrowly oblong, glabrous or pilose, always more densely pilose in ray florets. **Pappus** crown-like, scarious, of many ± connate scales, often also with 1–4 barbellate, apically slightly flattened bristles. $x = 7$ (1 report).

Species 4, Namibia, Botswana, North-West, Free State, Northern, Western and Eastern Cape.

Schistostephium Less. 9356000

(Anthemideae)

Lessing: 251 (1832); Harvey: 168 (1865); Hutchinson: 99 (1916c); Hilliard: 357 (1977); Bremer & Humphries: 160 (1993); Bremer: 477 (1994).

Peyrousea DC.: 76 (1838a); Bremer: 493 (1977).

Shrubs, subshrubs or perennial herbs, often aromatic, silky villous, pubescent or glabrate. **Leaves** alternate, pinnatisect, lobed, dentate or occasionally entire. **Capitula** disciform or discoid, in terminal corymbs, rarely solitary, on long peduncles. **Involucre** campanulate or subglobose; bracts in several rows. **Receptacle** convex or ovoid-conical, epaleate or rarely with few marginal paleae. **Marginal florets** female, fertile, generally stalked; corolla tubular, compressed, 3- or 4-toothed; or filiform, shorter than style, 2- or 3-fid; or scarcely developed. **Disc florets** bisexual, fertile, or inner functionally male; corolla tubular, somewhat compressed or bluntly 4-angled, sometimes dilated above, 4-toothed. **Anthers** ecalcarate and ecaudate, with suborbicular or ovate apical appendage. **Style** branches linear, truncate, minutely penicillate. **Cypselas** oblong-obovate, somewhat compressed or angled in female florets; in disc florets somewhat compressed, 3- or 4-angled, sometimes keeled or narrowly winged; glabrous or hairy, sometimes glandular. **Pappus** 0.

Species 12, south-tropical Africa; 9 in sthn Afr., Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Eastern Cape and eastern part of Western Cape.

***Schkuhria** Roth 9291000

(Helenieae)

Roth: 116 (1797); Heiser: 267 (1945); Phillips: 820 (1951); Hilliard: 326 (1977); Karis & Ryding: 540 (1994).

Annual herbs, much branched, usually sparsely glandular-pubescent. **Leaves** alternate or opposite below, sessile, dissected or rarely simple, segments narrow, margin entire. **Capitula** radiate or discoid, several-flowered, on long peduncles, terminal and axillary, often corymbosely arranged. **Involucre** turbinate or campanulate; bracts in 1–3 rows. **Receptacle** epaleate. **Ray florets**, when present, female, fertile; corolla yellow, strap-shaped. **Style** branches linear, obtuse. **Disc florets** bisexual, fertile; corolla yellow or tinged reddish, tubular below, campanulate above, 5-toothed. **Anthers** with bases and apical appendage both obtuse. **Style** branches linear, apex rotundate-truncate or shortly appendaged, papillose outside, at least near tips. **Cypselas** narrowly obpyramidal, usually 4-angled, glabrous or pubescent. **Pappus** of 8–10 scales, with prominent midrib sometimes excurrent as awn. $x = 10$ (8, 11, 12) (polyploidy, B-chromosomes—1 report).

Species 6, North and South America; 1 in sthn Afr.: **Schkuhria pinnata* (Lam.) Thell., naturalised and a widespread weed of disturbed areas.

Sclerocarpus Jacq. 9169000

(Heliantheae)

Jacquin: t. 176 (1782); Bentham: 364 (1873a); Oliver & Hiern: 374 (1877); Phillips: 814 (1951); Merxmüller: 161 (1967a); Wild: 37 (1967); Karis & Ryding: 604 (1994).

Annual herbs with branches striate and sparsely pilose. **Leaves** alternate, shortly petiolate, ovate or lanceolate, entire or remotely toothed, strigose beneath. **Capitula** radiate, solitary, peduncled, terminal. **Involucre** campanulate; bracts in 1 row, leafy. **Receptacle** small; paleae cymbiform, clasping florets, becoming contracted above cypsela into ± tubular neck. **Ray florets** neuter; corolla yellow; tube longer than lamina, sparsely glandular-hairy; lamina obovate, shortly bilobed. **Style** 0. **Disc florets** bisexual, fertile; corolla yellow, tubular, slightly widening upwards, 5-lobed; lobes small, linear, sparsely pilose on back. **Anthers** rounded or pointed at base, with linear appendage. **Cypselas** obovate, sometimes oblique above. **Pappus** annular or 0. $x = 6, 11$ (7, 9, 13) (polyploidy).

Species 8, in Central America, Mexico and Africa; 1 in sthn Afr.: *Sclerocarpus africanus* Jacq. ex Murr., northern parts of Namibia and Botswana.

Senecio L. 9411000

(Senecioneae)

Linnaeus: 866 (1753); Harvey: 346 (1865); Hilliard: 387 (1977); Bremer: 508 (1994).

Annual or perennial herbs, subshrubs, shrubs, small trees or vines, very variable in habit and foliage, sometimes succulent. **Leaves** generally alternate, sometimes radical. **Capitula** radiate or discoid, solitary or cymose to corymbose-paniculate. **Involucre** generally calyculate, cylindric, campanulate or hemispherical; bracts mostly in 1 row, rarely in 2, sometimes connate. **Receptacle** always epaleate, flat or somewhat convex. **Ray florets** female, fertile, mostly yellow, sometimes pink, purple, violet, rarely white. **Disc flowers** bisexual or sometimes functionally male; corolla tubular, funnel-shaped or abruptly campanulate above, 5-lobed, yellow, whitish or variously coloured. **Anthers** ecalcarate, ecaudate or sometimes caudate; apical appendage ovate-

lanceolate to oblong, flat; filament collar dilated; endothecial tissue radial. **Style** branches truncate to obtuse, with crown of hairs, without appendages, with discrete stigmatic lines. **Cypselas** ellipsoid-obovoid and ribbed, glabrous or pubescent, sometimes with myxogenic hairs. **Pappus** of many fine bristles, rarely 0. $x = 10$ (7, 9, 11, 12, 23) (aneuploids, high polyploidy, B-chromosomes).

Species ± 1250; cosmopolitan, mostly South America and Africa; ± 300 in sthn Afr., widespread, some weedy, some toxic.

*Sigesbeckia L. 9160000

(Heliantheae)

Linnaeus: 900 (1753); Linnaeus: 383 (1754); Harvey: 132 (1865); Oliver & Hiern: 371 (1877); Bentham: 354 (1873a); Phillips: 814 (1951); Wild: 36 (1967); Hilliard: 300 (1977); Karis & Ryding: 612 (1994).

Annual herbs; stems, leaves and peduncles softly pubescent. **Leaves** opposite, petiolate or subsessile, simple, ovate to lanceolate, margins irregularly toothed. **Capitula** radiate, few-flowered, in lax, leafy panicles. **Involucre** campanulate or hemispherical; bracts in 2 rows: outer bracts spreading or reflexed, spathulate, long, with stalked, viscid glands and multicellular hairs, inner bracts ± enclosing ray cypselas. **Receptacle** convex; paleae embracing disc florets. **Ray florets** female, fertile, small; corolla yellow, strap-shaped, minutely 2- or 3-lobed. **Style** branches short, linear, obtuse. **Disc florets** bisexual, fertile or inner functionally male; corolla yellow, tubular, 3–5-toothed. **Anthers** slightly eared at base, with small apical appendage. **Style** terete, slightly swollen at base; with oblong branches. **Cypselas** ovoid-oblong, often incurved. **Pappus** 0. $x = 10$ (aneuploids, high polyploidy).

Species 3, tropical Africa and Asia; 1 in sthn Afr.: **Sigesbeckia orientalis* L., mainly in eastern forest areas of KwaZulu-Natal and Eastern Cape.

*Silybum Adans. 9464000

(Cardueae)

Adanson: 116 (1763); Henderson & Anderson: 396 (1966); Hilliard: 579 (1977); Bremer: 148 (1994).

Annual or biennial herbs. **Leaves** rosulate to alternate, white-veined to variegated above, sinuate-lobate or pinnatifid, undulate, margins spiny. **Capitula** discoid, solitary, terminal, erect or drooping. **Involucre** broadly subglobose; bracts marginally spiny and spine-tipped. **Receptacle** flat, densely setose. **Florets** bisexual, fertile; corolla purple; tube slender below, abruptly expanded above, deeply 5-lobed. **Anthers** with very short tails; filaments connate into papillose tube. **Style** scarcely thickened below branches, there furnished with ring of short hairs; branches linear-lanceolate, flattened, connate, minutely papillose outside. **Cypselas** obovoid, somewhat compressed, glabrous, attachment scar ± horizontal, central. **Pappus** double: outer row of scabrid, deciduous bristles, basally connate in a ring, inner row of short hairs. $x = 17$ (7).

Species 2, Mediterranean region; **Silybum marianum* (L.) Gaertn. is an introduced weed occurring in Western and Eastern Cape.

Solanecio (Sch.Bip.) Walp. 9411110

(Senecioneae)

Walpers: 273 (1846); Jeffrey: 920, 936 (1986); Bremer: 509 (1994).

Crassocephalum Moench in part, Hilliard: 372 (1977).

Scandent shrubs or lianes, semisucculent. **Leaves** alternate, pinnatifid-lobed, petiolate, auriculate. **Capitula** discoid, few or many, paniculate-corymbose. **Involucre** calyculate; bracts ± 5. **Receptacle** epaleate. **Disc florets** bisexual, fertile; corolla yellow. **Anthers** ecalcarate and ecaudate; endothecial tissue radial. **Style** branches truncate, sometimes with central tuft of fused papillae. **Cypselas** oblong, ribbed, glabrous or pubescent. **Pappus** of many fine bristles.

Species 16, tropical Africa, Madagascar, Yemen; 1 in sthn Afr.: *Solanecio angulatus* (Vahl) C.Jeffrey, Northern Province and KwaZulu-Natal.

*Soliva Ruiz & Pav. 9352000

(Anthemideae)

Ruiz & Pavón: 113, t. 24 (1794); Tutin: 178 (1976); Bremer & Humphries: 159 (1993); Bremer: 477 (1994).

Annual herbs. **Leaves** alternate, pinnatisect. **Capitula** disciform, solitary, sessile, surrounded by leaves. **Involucral bracts** in 2 subequal rows. **Receptacle** convex or conical, epaleate. **Marginal florets** female, fertile, in several rows; tube and lamina 0. **Style** persistent and spinescent in fruit. **Disc florets** functionally male; corolla 3- or 4-lobed. **Anthers** ecalcarate and ecaudate. **Style** branches fused. **Cypselas** glabrous, dorsiventrally flattened, laterally winged; wings sometimes projected into apical teeth, sometimes transversely rugose to sulcate. **Pappus** 0.

Species 8, mainly South America but also North America and Australia; 1 naturalised as weed in sthn Afr.: **Soliva sessilis* Ruiz & Pav., KwaZulu-Natal, Western and Eastern Cape.

Sonchus L. 9595000

(Lactuceae)

Linnaeus: 793 (1753); Linnaeus: 347 (1754); Merxmüller: 3 (1967b); Boulos: 287 (1972); Hilliard: 621 (1977); Pope: 221 (1992); Bremer: 189 (1994).

Annual, biennial or perennial herbs, with milky latex. **Leaves** alternate or sometimes rosulate, often with cauline leaves stem-clasping, entire, dentate, pinnatifid or dissected. **Capitula** ligulate, sessile or peduncled, in irregular corymbose panicles or rarely solitary. **Involucre** ovoid or campanulate; bracts in several rows, ovate to linear, densely tomentose to glabrescent. **Receptacle** flat, honeycombed, epaleate. **Florets** (ligules) bisexual, fertile; corolla yellow, strap-shaped; tube longer than linear or elliptic, shortly 5-lobed lamina. **Anthers** sagittate at base, auricles shortly setaceous-acuminate; with a lanceolate, apical appendage. **Style** linear, becoming terete and pubescent above; branches medium to long, sweeping hairs small. **Cypselas** somewhat compressed, elliptic or oblong, ribbed, smooth or rugulose. **Pappus** in many rows, always dimorphic, of fine, down-like hairs intermixed with bristles. $x = 9$ (7, 8) (aneuploids, high polyploidy).

Species ± 60, Eurasia to tropical Africa; 11 in sthn Afr., widespread.

Sphaeranthus L. 8955000

(Plucheeae)

Linnaeus: 927 (1753); Harvey: 115 (1865); Ross-Craig: 1 (1954); Merxmüller: 174 (1967a); Hilliard: 120 (1977); Anderberg: 169 (1991c); Anderberg: 302 (1994).

Annual or rarely perennial herbs or suffruticose plants, aromatic. **Leaves** alternate, dentate, usually decurrent, narrow, hairy. **Capitula** disciform, small, congested in dense, globose or ovoid to broadly cylindrical, terminal secondary heads, pedunculate, occasionally sessile; flowers reddish or purple. **Involucre** ovoid or campanulate; bracts few. **Receptacle** flat, epaleate. **Marginal florets** female; corolla filiform, 3-dentate. **Disc florets** functionally male; corolla tubular, 4- or 5-lobed. **Anthers** calcarate and caudate; cells of filament collar

flattened; endothecial tissue radial. **Style** undivided, with obtuse sweeping hairs distally. **Cypselas** oblong, reduced, often hairy with uncinate or anchor-shaped hairs. **Pappus** 0. $x = 10$ (12, 13) (aneuploids, polyploidy, B-chromosomes).

Species ± 40, mostly Africa to India and Java; 7 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

*Sphagneticola O.Hoffm. 9192010

(Heliantheae)

Hoffmann: 36 (1900); Karis & Ryding: 599 (1994); Pruski: 411 (1996).

Thelechitonia Cuatrec.: 242 (1954). *Complya* Strother: 10 (1991).

Perennial herbs with stems erect to prostrate, often rooting at nodes. **Leaves** opposite or uppermost occasionally alternate, elliptic or oblong-obovate to obovate, entire, weakly lobed or 3-lobed, sometimes serrate-dentate. **Capitula** radiate, terminal or axillary, solitary, on long peduncles. **Involucre** campanulate; bracts in 2 or 3 rows, outer herbaceous, inner scarious. **Receptacle** flat to convex, scaly. **Ray florets** female, fertile; corolla yellow to orange-yellow. **Disc florets** bisexual, fertile; corolla yellow to orange-yellow. **Cypselas** irregularly warted, minutely puberulous in upper part, with short early-caducous aristae. **Pappus** cup-shaped and of 1 or 2 awns, or 0.

Species 4, tropical America; **Sphagneticola trilobata* (L.) Pruski, often cultivated as ground cover, is now spreading into the natural vegetation in KwaZulu-Natal.

Spilanthes Jacq. 9207000

(Heliantheae)

Jacquin: 8 (1760); Harvey: 133 (1865); Phillips: 817 (1951); Wild: 60 (1967); Hilliard: 313 (1977); Karis & Ryding: 587 (1994).

Annual, rarely perennial herbs, often prostrate and rooting at nodes, often in damp places. **Leaves** opposite, simple, ovate to linear, entire or sinuate, glabrous. **Capitula** radiate, many-flowered, usually on long peduncles, terminal or axillary. **Involucre** campanulate; bracts in 2 or 3 rows, outer membranous, shorter than receptacle. **Receptacle** convex, sometimes elongated, paleate; paleae boat-shaped, enclosing florets. **Ray florets** female, fertile; corolla yellow or white, strap-shaped; tube ± hairy, with elliptic, usually 2-lobed lamina somewhat longer than tube. **Disc florets** bisexual, fertile; corolla yellow, tubular below, expanded above, 4- or 5-toothed. **Anthers** with small, obtuse apical appendage, base obtuse or minutely sagittate. **Style** branches of ray florets linear, of disc florets oblong, truncate, minutely penicillate. **Cypselas** elliptic or obovate, 3- or 4-angled, ± compressed, margins hyaline or ciliate. **Pappus** 0 or of 2 or 3 bristles. $x = 13$ (6, 7, 9) (aneuploids, polyploidy).

Species 6, pantropical; 2 in sthn Afr.: **Spilanthes decumbens* (Sm.) A.H.Moore, an introduced weed, known from KwaZulu-Natal and Eastern Cape, and *S. mauritiana* (Pers.) DC., indigenous in the Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Steirodiscus Less. 9421010

(Senecioneae)

Lessing: 251 (1832); Bremer: 509 (1994).

Gamolepis Less.: 251 (1832); Phillips: 836 (1951). *Psilothonna* E.Mey. ex DC.: 40 (1838a); Phillips: 16 (1950).

Annual herbs, small, glabrous. **Leaves** alternate, linear, entire or pinnatisect, with linear lobes. **Capitula** radiate, pedunculate, many- or few-flowered, in lax corymbs or solitary. **Involucre** ecalyculate, campanulate, ovoid or subglobose; bracts ± connate. **Receptacle** convex to conical, epaleate. **Ray florets** female; corolla yellow; tube with ± oblong, obtuse or 3-toothed lamina 2–4 times as long as tube. **Disc florets** bisexual, fertile or functionally male; corolla yellow; tube becoming campanulate above, with 5 ovate or lanceolate lobes. **Anthers** ecalcarate and ecaudate; with linear or lanceolate, apical appendage; endothecial tissue radial. **Style** terete, with linear, truncate, penicillate branches. **Cypselas** obovoid or oblong, glabrous or sparsely pubescent. **Pappus** 0.

Species 6, endemic to sthn Afr., Northern and Western Cape.

Stilpnogyne DC. 9385000

(Senecioneae)

Candolle: 293 (1838a); Harvey: 306 (1865); Bremer: 509 (1994).

Annual herbs, delicate, glabrous. **Leaves** alternate, petiolate, ovate-cordate, dentate, auriculate. **Capitula** disciform, small, few-flowered, solitary or corymbose, pedunculate. **Involucre** ecalyculate, campanulate; bracts in 1 row, linear-lanceolate, with submembranous margins, basally connate, glabrous. **Receptacle** flat, epaleate. **Marginal florets** female; corolla 3-toothed. **Disc florets** bisexual, fertile; corolla yellowish; tube widened above, glabrous, with 5 lanceolate lobes. **Anthers** linear, ecalcarate and ecaudate; with lanceolate, apical appendage; endothecial tissue radial. **Style** terete in female florets, with downy, terete branches; in disc florets branches shorter and bearded at apex only. **Cypselas** compressed, obovate, sparsely pubescent. **Pappus** of many fine bristles; 0 in marginal florets.

Monotypic, endemic to sthn Afr.: *Stilpnogyne bellidioides* DC., Western Cape.

Stoebe L. 9037000

(Gnaphalieae)

Linnaeus: 831 (1753); Harvey: 279 (1865); Levyns: 1 (1937); Anderberg: 77 (1991a); Anderberg: 334 (1994).

Eremanthis Cass.: 64 (1827). *Perotriche* Cass.: 75 (1818). *Seriphium* Less.: 346 (1832).

Single or multi-stemmed, robust or weak shrubs or dwarf shrubs, up to 1.5 m tall, occasionally prostrate; branches densely or sparsely leafy, tomentose or glaucous. **Leaves** small, alternate, often ericoid and twisted, broadly cymbiform, linear or narrowly triangular, adaxial surface villous or tomentose, abaxial surface glabrous or covered in a matted layer of hairs, tips rounded mucronate or pungent, margins slightly or strongly involute. **Synflorescences** tight, globose or cylindrical, terminal heads, or an open or dense plumose arrangement of capitula. **Capitula** discoid, 1-flowered. **Involucral bracts** in a few rows, innermost dry and membranous, outermost shorter, often leafy. **Receptacle** stalk-like, epaleate. **Ray florets** 0. **Disc florets** bisexual, tubular, white, pink or wine-red, 5-lobed; lobes erect or spreading. **Anthers** apically acuminate, basally tailed. **Style** bifid, branches truncate, pencilled at tips. **Nectary** a small disk between style and cypsela or 0. **Cypselas** small, with or without a rim-like annulus, smooth or tomentose, trichomes short with tips rounded or longer, more flexible with tips acuminate. **Pappus** of 10–26 capillary bristles, plumose in upper part, fused in a ring at base, rarely free, 0 in *Stoebe montana* and *S. schultzii*. $x = 8$ (1 report).

Species 25, tropical and sthn Afr. and Madagascar; 20 in Northern, Western and Eastern Cape, *Stoebe plumosa* (L.) Thunb. widespread northwards to Namibia and Zimbabwe.

Stomatanthes R.M.King & H.Rob. 8816010

(Eupatorieae)

King & Robinson: 430 (1970); Bremer *et al.*: 664 (1994).

Perennial herbs or subshrubs. **Leaves** alternate, rarely subopposite; petioles short. **Capitula** discoid; 4 or 5 florets present in capitulum, in panicles or corymbs. **Involucre** with bracts in few rows, unequal to equal. **Receptacle** glabrous. **Corolla** white, funnel-shaped or tubular, sometimes glandular. **Anthers**: filaments thick. **Style**: branches densely hirsute, apex papillate. **Cypselas** 5- to 8-ribbed, usually setose and sometimes glandular; carpopodium generally conspicuous. **Pappus** of many scabrid bristles. $x = 10$ (1 report).

Species 15, Brazil, Uruguay, tropical Africa; 1 in sthn Afr.: *Stomatanthes africanus* (Oliv. & Hiern) R.M.King & H.Rob., North-West, Northern Province, Gauteng, Mpumalanga and Swaziland.

Syncarpha DC. 9000010

(Gnaphalieae)

Candolle: 205 (1810); Nordenstam: 2 (1989); Anderberg: 150 (1991a); Anderberg: 363 (1994).

Helipterum DC.: 211 (1838a) of other authors in part, name illegitimate; Harvey: 256 (1865).

Perennial herbs. **Leaves** alternate, sessile, tomentose to velutinous (hair type B), margins flat or slightly concave, entire. **Capitula** discoid, solitary or few together. **Involucre** campanulate or ellipsoid; involucral bracts in ± 9 rows, small to large, outer usually oblong, with glumaceous appendage, sometimes with reflexed, acuminate, scarious apex and often woolly on back; inner bracts with glumaceous, usually coloured appendage (yellow, pink, white or brown), opaque; stereome divided or undivided. **Receptacle** epaleate, but with prominent fimbrils. **Florets** bisexual; corolla yellow; tube broadened above, usually with scattered glands and with 5 linear to lanceolate lobes. **Anthers** ecalcarate, caudate; apical appendage concave, as wide as thecae; endothecial tissue polarised. **Style** bifid; style branches truncate with obtuse sweeping hairs apically. **Cypselas** oblong, with globose, myxogenic hairs, epidermis smooth. **Pappus** of basally connate, generally plumose bristles.

Species 25; endemic to sthn Afr., Western and Eastern Cape.

*Tagetes L. 9311000

(Helenieae)

Linnaeus: 887 (1753); Linnaeus: 378 (1754); Phillips: 820 (1951); Pope: 115 (1975); Hilliard: 328 (1977); Karis & Ryding: 547 (1994).

Annual herbs, usually erect, glabrous, strongly aromatic. **Stems** simple or diffusely branched. **Leaves** opposite or alternate, sessile, base expanded with several, narrow, linear segments, pinnate or rarely simple, lobes lanceolate to narrowly elliptic, margins sharply serrate. **Capitula** usually radiate, few-flowered, solitary on long peduncles or corymbosely arranged. **Involucre** cylindric; bracts usually in 1 row, outer ones minute, inner ones connate. **Receptacle** flat, epaleate. **Ray florets** female, fertile; corolla pale yellow to lemon-yellow, strap-shaped. **Style** branches linear-lanceolate. **Disc florets** bisexual, fertile; corolla yellow, tubular, expanded above, 5-fid. **Anthers** with bases obtuse; apical appendage lanceolate. **Style** branches narrowly oblong, truncate and penicillate or with deltoid appendage, papillose on outer faces. **Cypselas** linear, narrowed to base, compressed or angled. **Pappus** of few scales, sometimes awned. $x = 6$ (10, 11) (high polyploidy).

Species ± 50, North and South America; **Tagetes minuta* L., widespread weed throughout sthn Afr.

*Tanacetum L. 9341070

(Anthemideae)

Linnaeus: 1028 (1753); Heywood: 169 (1976); Bremer & Humphries: 100 (1993); Bremer: 454 (1994).

Perennial herbs. **Leaves** alternate, petiolate, pinnatifid to pinnatisect, glandular-punctate, densely silvery-sericeous. **Capitula** radiate, solitary. **Involucral bracts** in 3 rows, sometimes with dark brown margins. **Receptacle** flat or convex, epaleate. **Ray florets** female or neuter; lamina white. **Disc florets** bisexual, with yellow corolla, 5-lobed. **Anthers** ecalcarate and ecaudate. **Cypselas** oblong, 5–7-ribbed, often with sessile glands. **Pappus** an irregularly lobed corona. $x = 9$ (7, 8) (aneuploids, polyploidy, B-chromosomes).

Species ± 152, Europe, Asia and North Africa; 1 in sthn Afr.: **Tanacetum cinerariifolium* (Trevir.) Sch.Bip., widely cultivated.

*Taraxacum F.H.Wigg. 9592000

(Lactuceae)

Wiggers: 56 (1780); Harvey: 526 (1865); Hilliard: 608 (1977); Pope: 212 (1992); Bremer: 182 (1994).

Perennial herbs, acaulescent, scapigerous, with milky latex, with simple or branched taproots. **Leaves** rosulate, entire, sinuate, mostly runcinate-dentate to pinnatifid-pinnatisect. **Scapes** 1–many, simple, hollow. **Capitula** ligulate, solitary, terminal. **Involucre** campanulate or oblong; bracts in 2 rows, inner row erect, outer row shorter and spreading or recurved. **Receptacle** flat, epaleate, pitted. **Florets** bisexual, fertile; corolla yellow, rarely white, strap-shaped. **Anthers** sagittate at base; auricles shortly setaceous-acuminate. **Style** with branches long, slender; sweeping hairs long. **Cypselas** obovoid-fusiform, ribbed apically scabrid to transversely muricate, with distinct, long, slender beak. **Pappus** of many, long, unequal, scabrid-barbellate bristles. $x = 6$, 8 (4, 5, 7, 9, 10, 13, 17) (aneuploids, high polyploidy, B-chromosomes).

Species 60, north temperate regions and temperate South America; 15 in sthn Afr., not known from Namibia and Botswana.

Tarchonanthus L. 8937000

(Tarchonantheae)

Linnaeus: 842 (1753); Harvey: 117 (1865); Paiva: 355 (1972); Hilliard: 110 (1977); Pope: 9 (1992); Bremer: 105 (1994).

Trees or shrubs, dioecious, often aromatic. **Leaves** alternate, petiolate or subsessile, persistently tomentose or lanate beneath, entire to coarsely irregularly serrate or 3-lobed towards apex. **Synflorescences** in terminal or axillary panicles, the whole usually tomentose-lanate. **Capitula** discoid; florets yellowish. **Involucre** subcylindric, broadly campanulate or subglobose; bracts in 1 or 2 rows. **Receptacle** flat or somewhat convex, honeycombed, epaleate, usually with long, silky hairs. **Male capitula** with corolla tubular or funnel-shaped, villous or lanate outside, lobes 5, recurved; anthers calcarate and caudate, apical appendage long, flat; endothecial tissue polarised; style narrowly terete, simple or minutely bifid; ovary abortive; pappus 0. **Female capitula** with corolla shorter than ovary, villous or lanate outside, 4- or 5-lobed; style branches short, flat, ovate; cypselas ± flattened, obovoid or ellipsoid, densely lanate; pappus 0.

Species 2, Africa; 2 in sthn Afr.: *Tarchonanthus camphoratus* L. and *T. trilobus* DC., widespread.

Tenrhynea Hilliard & B.L.Burtt 8994000

(Gnaphalieae)

Hilliard & Burtt: 232 (1981); Hilliard: 57 (1983); Anderberg: 140 (1991a); Anderberg: 363 (1994).

Rhynea DC.: 154 (1838a), not of Scop.; Harvey: 204 (1865); Hilliard: 134 (1977); Hilliard & Burtt: 374 (1973); Hilliard & Burtt: 196 (1981).

Shrubby perennial; branches closely leafy. **Leaves** alternate, lanceolate, margins entire, sessile, bases decurrent in long narrow wings, green above drying grey, with thin skin-like indumentum, white-tomentose below (hair type B). **Capitula** disciform, cylindric, in small terminal clusters, often further aggregated into spreading corymbose panicle. **Involucral bracts** in several rows, imbricate, graded, inner ones with stereome undivided, tips shortly exceeding flowers, radiating, opaque milk-white or occasionally pink. **Receptacle** flat, paleate; paleae resembling inner involucral bracts. **Florets** 17–26, 3–11 female, corolla purple, narrowly tubular or filiform; 10–17 bisexual, outnumbering female flowers, corolla purple, tubular below, campanulate above, 5-lobed, all lobes with glandular hairs on backs. **Anthers** ecalcarate, caudate, tails shorter or longer than filament collar; with lanceolate apical appendage; endothecial tissue polarised. **Style** branches with slightly rounded tips, with short, obtuse, sweeping hairs extending briefly down backs. **Cypselas** oblong, with elongate duplex hairs with basal swelling cushion, myxogenic. **Pappus** bristles scabrid above, cilia ± fused, shaft scabridulous, base nude, not cohering, caducous.

Monotypic, endemic to sthn Afr.: *Tenrhynea phylicifolia* (DC.) Hilliard & B.L.Burtt, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Thaminophyllum Harv. 9338000

(Anthemideae)

Harvey: 155 (1865); Bond: 158 (1980); Bremer & Humphries: 146 (1993); Bremer: 471 (1994).

Shrublets with silky pubescence. **Leaves** alternate, entire, ericoid, sessile, aromatic. **Capitula** radiate, solitary or in leafy cymes towards ends of branches, 7–12-flowered. **Involucre** campanulate or ovoid; bracts in 2 or 3 rows, ciliate or fimbriate, pilose on back. **Receptacle** epaleate, pubescent or pilose, convex or conical. **Ray florets** 2–11, female, sterile, strap-shaped, white or pink; with cylindric tube and elliptic or obovate lamina, 2–3 times as long as tube. **Style** undivided. **Disc florets** bisexual, fertile, yellow; tube somewhat compressed, glandular, with 4 acute or rounded lobes. **Anthers** ecalcarate and ecaudate; with oblong, apical appendage. **Style** branches linear, truncate, bristle-tipped; stylopodium large and persistent in fruit. **Cypselas** oblong, 3- or 4-angled, glabrous, with large myxogenic cells in rounded, scattered groups; crowned with hardened conical or globose stylopodium. **Pappus** 0. $x = 10$.

Species 3, endemic to sthn Afr., Western Cape.

*__Tithonia__ Desf. ex Juss. 9196000

(Heliantheae)

Jussieu: 189 (1789); Phillips: 816 (1951); Wild: 55 (1967); Hilliard: 307 (1977); La Duke: 478 (1982); Karis & Ryding: 605 (1994).

Annual herbs. **Leaves** usually alternate, simple, entire or often deeply lobed. **Capitula** radiate, solitary or few together; on long peduncles, thickened towards apex. **Involucre** hemispherical or broadly campanulate; bracts in 2–5 rows. **Receptacle** convex, paleate; paleae rigid, usually lobed, acuminate to aristate, embracing disc florets. **Ray florets** neuter; corolla yellow or orange, strap-shaped; tube somewhat compressed, linear-oblong, much shorter than lamina; lamina long-lanceolate, minutely 2- or 3-lobed. **Disc florets** bisexual, fertile; corolla yellow, slender, 5-toothed. **Anthers** linear, obtuse or very shortly sagittate, with lanceolate appendages. **Style** terete, globose at base; branches narrowly oblong, gradually widening upward to acutely triangular tips, pubescent on outer faces. **Cypselas** linear-obovate, usually 4-angled. **Pappus** of connate scales, sometimes with 1 or 2 awns. $x = 17$ (5, 8, 11) (aneuploids, polyploidy, B-chromosomes).

Species 11, SW United States to Costa Rica; 2 in sthn Afr.: **Tithonia diversifolia* (Hemsl.) A.Gray, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, and **T. rotundifolia* (Mill.) Blake, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland and KwaZulu-Natal, introduced from America, now naturalised.

Tolpis Adans. 9561000

(Lactuceae)

Adanson: 112 (1763); Phillips: 852 (1951); Hilliard: 598 (1977); Bremer: 196 (1994).

Annual or perennial herbs, usually scapigerous, ± pubescent, with milky latex. **Leaves** radical or cauline and alternate, entire, dentate or pinnatifid. **Capitula** ligulate, many-flowered, in lax corymbose panicles, peduncles hollow. **Involucre** campanulate; with unequal bracts in 2 or 3 rows. **Receptacle** flat, epaleate, alveolate. **Florets** (ligules) bisexual, fertile; corolla strap-shaped, yellow or innermost purplish brown, pubescent outside, with tube and 5-toothed lamina. **Anthers** with base sagittate; apical appendages ovate. **Style** linear, setose above, with linear obtuse branches, sweeping hairs short. **Cypselas** obconic, closely ribbed, smooth, glabrous. **Pappus** in 2 rows, with setose bristles, persistent. $x = 9$.

Species 20, Macaronesia, Mediterranean region, northern and tropical Africa; 1 in sthn Afr.: *Tolpis capensis* (L.) Sch.Bip., widespread in South Africa and Swaziland.

*__Tragopogon__ L. 9579000

(Lactuceae)

Linnaeus: 789 (1753); Linnaeus: 346 (1754); Phillips: 853 (1951); Henderson & Anderson: 406 (1966); Hilliard: 606 (1977); Bremer: 201 (1994).

Biennial or perennial herbs with milky latex. **Leaves** alternate, amplexicaul, entire, grass-like, glabrous. **Capitula** ligulate; solitary, terminal, long-peduncled. **Involucre** cylindric or narrowly campanulate; bracts in 1 row, lanceolate-acuminate, basally somewhat connate. **Receptacle** slightly convex, shallowly honeycombed, epaleate. **Florets** (ligules) bisexual, fertile; corolla yellow, blue or purple, strap-shaped, tube linear, slightly shorter than lamina, pilose at junction of lamina and tube; lamina broadly linear, truncate, 5-toothed. **Anthers** with base sagittate, auricles acute or shortly setaceous-acuminate. **Style** linear, becoming terete above, glandular-pubescent on cylindric portion; branches filiform, glandular. **Cypselas** fusiform, with slender beak, strongly ribbed; ribs tuberculate, pilose at apex, otherwise glabrous. **Pappus** of many plumose and intertwined bristles, often scabrid-barbellate apically. $x = 6$ (7) (polyploidy, B-chromosomes).

Species 50, temperate Eurasia, Mediterranean region; 3 occur as weeds of cultivation, not known from Namibia and Botswana.

Trichogyne Less. 8967010

(Gnaphalieae)

Lessing: 231 (1831); Anderberg: 155 (1991a); Anderberg: 364 (1994).

Ifloga Cass. in part, Hilliard: 297 (1981b). *Petalactella* N.E.Br.: 100 (1894).

Ericoid perennial herbs, shrublets or shrubs, rarely annuals. **Leaves** alternate, sessile, often adaxially concave,

tomentose on adaxial surface only (hair type B), eglandular, margins involute, entire. **Capitula** disciform, few together along axis. **Involucral bracts** papery, brownish, transparent; at least inner bracts ± hairy on abaxial surface; stereome divided. **Receptacle** flat, epaleate. **Marginal florets** female, purple, filiform, more numerous than disc florets. **Disc florets** functionally male; corolla yellow, cylindric below, campanulate above, lobes erect. **Anthers** ecalcarate, with short tails; apical appendage flat, as wide as thecae; endothecial tissue polarised. **Style** undivided, with obtuse sweeping hairs distally. **Cypselas** small, oblong, glabrous or with short, clavate, nonmyxogenic twin hairs; epidermis smooth. **Pappus** of free, apically plumose, capillary bristles in 1 row, basally without patent cilia.

Species 9, endemic to sthn Afr., Namibia, Northern, Western and Eastern Cape, 1 extending to Free State and S Mpumalanga.

*Tridax L. 9245000

(Heliantheae)

Linnaeus: 900 (1753); Linnaeus: 382 (1754); Wild: 10 (1967); Hilliard: 321 (1977); Karis & Ryding: 609 (1994).

Annual or perennial herbs, usually hairy, prostrate or ascending. **Leaves** opposite, petiolate, toothed or pinnately cut with segments few, narrow. **Capitula** radiate; on long peduncles, solitary. **Involucre** campanulate; bracts in 2 or 3 rows. **Receptacle** flat or convex, paleate; paleae membranous, keeled but scarcely clasping disc florets, persistent. **Ray florets** female, fertile; corolla yellow or creamy, strap-shaped. **Disc florets** bisexual, fertile; corolla yellow or greenish, cylindric, 5-lobed or 5-toothed. **Anthers** with bases sagittate; apical appendages narrowly deltoid. **Style** branches of ray florets shortly linear-lanceolate; of disc florets much longer, acuminate with subulate appendage, hairy on outer faces. **Cypselas** obconical, villous. **Pappus** of many plumose bristles. $x = 9$ (3, 10) (polyploidy).

Species 30, Central and South America; **Tridax procumbens* L., a pantropical weed, is occasionally found in the Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Tripteris Less. 9428000

(Calenduleae)

Lessing: 95 (1831); Nordenstam: 376 (1994).

Osteospermum subgen. *Tripteris* (Less.) Norl.: 263 (1943); Norlindh: 393 (1960).

Annual or perennial herbs, subshrubs or shrubs. **Leaves** alternate or opposite, petiolate to sessile, entire or variously lobed, sometimes with auricles. **Capitula** radiate, corymbose or solitary. **Involucre** campanulate or turbinate; bracts imbricate or almost in 2 rows, seldom subequal and nearly in 1 row. **Ray florets** female, fertile; corolla yellow to orange. **Cypselas** 3-winged, with apical fenestrate airchamber, usually homomorphic, sometimes dimorphic with some wingless and rostrate. **Disc florets** functionally male. **Anthers** ecalcarate, caudate; endothecial tissue polarised. **Style** bifid with apical ring of hairs. **Pappus** 0. $x = 8$.

Species ± 22, south and tropical Africa north to Egypt, Arabian Peninsula and Jordan; 20 in sthn Afr., widespread but absent from Swaziland and KwaZulu-Natal.

Troglophyton Hilliard & B.L.Burtt 8992020

(Gnaphalieae)

Hilliard & Burtt: 208 (1981); Hilliard: 39 (1983); Anderberg: 168 (1991a); Anderberg: 364 (1994).

Delicate annual or short-lived perennial herbs well-branched from base; stems filiform, prostrate, diffuse or weakly erect, thinly white-woolly, distantly leafy. **Leaves** alternate, small, on filiform petioles; blade elliptic or ovate; margins flat, entire, both surfaces cobwebby or thinly woolly (hair type B), upper sometimes glabrescent. **Capitula** discoid or disciform, small, on filiform peduncles racemosely or subcorymbosely arranged, or rarely nearly sessile and crowded. **Involucral bracts** in 3(–5) rows, subequal, slightly exceeding flowers; stereome undivided or with 2 or 3 thin linear patches in upper part, lower part canaliculate, embracing adjacent flower; lamina delicate, pellucid, sometimes purplish above stereome, tip subopaque or opaque white, obtuse to subacute, either radiating or whole involucre rotating at maturity. **Receptacle** shallowly tubercled, flat, epaleate. **Flowers** 8–30, yellow, sometimes tipped pink; female flowers (0)2–23, fewer than, or ± equalling, or 2 or 3(–7) × as many as bisexual florets, narrowly tubular or filiform; bisexual flowers narrowly infundibuliform or tubular below, narrowly campanulate above, with 5 deltoid lobes, glandular hairs with biseriate stalk and small globular 2-celled head on backs of all lobes. **Anthers** ecalcarate, caudate, tails shorter than, ± equalling, or slightly exceeding filament collar, with small obtuse apical appendage; endothecial tissue polarised. **Style** branches truncate and penicillate, with obtuse sweeping hairs apically. **Cypselas** oblong, wall with slightly raised cells, moderately imbricate or not, oblong duplex hairs with swelling cushion frequently present, apparently not always emitting mucilage (neither imbricate cells nor duplex hairs a specific character). **Pappus** bristles barbellate or subplumose above, these cilia ± clavate and with delicate wall thickenings, shaft markedly barbellate, bases cohering by patent cilia.

Species 6, endemic to sthn Afr., Namibia, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

*Urospermum Scop. 9573000

(Lactuceae)

Scopoli: 122 (1777); Phillips: 852 (1951); Hilliard: 603 (1977); Bremer: 199 (1994).

Annual or perennial, acaulescent or with distinct stem, with milky latex. **Stems** with scattered, setose hairs. **Leaves** rosulate or alternate along branched stems, entire, lyrate or toothed, setose. **Capitula** ligulate, many-flowered, solitary, terminal at ends of long peduncles. **Involucre** campanulate; bracts in 1 row, connate at base, elliptic-lanceolate, with long papillae on back. **Receptacle** flat, epaleate. **Florets** (ligules) bisexual, fertile; corolla pale yellow, strap-shaped; tube cylindric, longer than lamina with copious hairs at junction of lamina and tube; lamina broadly linear, truncate, 5-toothed. **Anthers** linear, sagittate, with ovate appendage. **Style** linear, terete above, pubescent on terete portion; branches long, obtuse, with very short pollen-sweeping hairs. **Cypselas** linear-oblong, subterete, usually curved, ribbed, beaked; beak basally swollen into bulbous, hollow part crowning the flattened, embryo-containing part of cypsela. **Pappus** of plumose, basally widened bristles. $x = 5, 7$ (4—1 report) (high polyploidy—1 report).

Species 2, Mediterranean region; **Urospermum picroides* (L.) Scop. ex F.W.Schmidt, a weed in S KwaZulu-Natal, Western and Eastern Cape.

Ursinia Gaertn. 9431000

(Anthemideae)

Gaertner: 462, t. 174 (1791); Harvey: 150 (1865); Prassler: 363 (1967); Bremer & Humphries: 93 (1993); Bremer: 451 (1994).

Sphenogyne R.Br.: 142 (1813); Harvey: 137 (1865). *Ursiniopsis* E.Phillips: 841 (1951).

Annual or perennial herbs or subshrubs. **Leaves** alternate, entire or serrate to pinnatisect. **Capitula** radiate,

rarely discoid, many-flowered, pedunculate, solitary or laxly corymbose. **Involucre** campanulate; bracts in 5–7 rows, free; outer usually with brown margin; inner or all with membranous margin, glabrous. **Receptacle** flat or convex, honeycombed, paleate; paleae as long as and enveloping disc florets, sometimes narrow with apical limb. **Ray florets** neuter, rarely female, fertile or sterile; corolla yellow, orange, white or rarely reddish, dorsally sometimes coppery; tube with ± linear-oblong, rounded or 2- or 3-toothed lamina 2.5–10 × longer than tube. **Disc florets** bisexual, fertile, central florets female and sterile; corolla yellow, purplish or coppery; tube cylindric or funnel-shaped, with 5 lanceolate, sometimes appendaged lobes, sometimes with marginal glands. **Anthers** ecalcarate and ecaudate; with ovate, apical appendage; endothecial tissue polarised. **Style** terete, with linear, penicillate branches, papillose at apex. **Cypselas** 5-ribbed, glabrous or with basal tuft of long hairs, glandular, erect or curved. **Pappus** in 1 row, of 5–10 obovate or rounded, hyaline, sometimes fimbriate scales, which envelop one another; or in 2 rows, of 5 outer scales and 5 inner bristles; occasionally 0. $x = 8$ (5, 7).

Species ± 39, sthn Afr. and Ethiopia; widespread but mostly Northern Cape (Namaqualand), Western and Eastern Cape.

Vellereophyton Hilliard & B.L.Burtt 8992010

(Gnaphalieae)

Hilliard & Burtt: 210 (1981); Hilliard: 31 (1983); Anderberg: 168 (1991a); Anderberg: 364 (1994).

Grey- or white-woolly annual or perennial herbs; stems few to many from crown, prostrate, ascending or erect, simple or branched, leafy. **Leaves** alternate, small to medium-sized, oblanceolate or spathulate, apex subacute or obtuse, base much narrowed, petiole-like, margins flat, entire, both surfaces thinly or thickly grey- or white-woolly (hair type B), eglandular. **Capitula** disciform, or discoid in 1 species, very small, few or many in woolly glomerules subcorymbosely arranged at branchlet tips. **Involucral bracts** in (2)3–5 rows, backs woolly, inner bracts subequal, ± equalling or exceeding flowers; stereome divided in upper half, lower part concave, embracing adjacent flower, lamina thin, pellucid, sometimes purplish above stereome, tip opaque white, obtuse or rounded, radiating. **Receptacle** nearly smooth, epaleate. **Florets** 10–40, yellow, often tipped red; female flowers (0)1–30, either fewer than, ± equalling, or up to 10 times as many as bisexual florets, narrowly tubular or filiform; bisexual florets tubular, scarcely widened above with 5 deltoid lobes markedly mamillate on outer surface except in 1 species, glandular hairs with biseriate stalk and small 2-celled globular head on backs of all lobes. **Anthers** ecalcarate, caudate, tails ± equalling or exceeding filament collar; with small obtuse apical appendage; endothecial tissue polarised. **Style** branches truncate and penicillate, with obtuse sweeping hairs. **Cypselas** oblong, wall smooth or nearly so or cells imbricate, oblong duplex hairs with swelling cushion frequently present, often myxogenic. **Pappus** bristles subplumose in upper part with clavate hairs, delicate patent cilia at base, cohering or not.

Species 7, endemic to sthn Afr., Northern, Western and Eastern Cape. One species naturalised in Australia and New Zealand.

*__Verbesina__ L. 9218000

(Heliantheae)

Linnaeus: 901(1753); Phillips: 817 (1951); Wild: 61 (1967); Karis & Ryding: 599 (1994).

Annual herbs, with ribbed and pilose branches. **Leaves** alternate, ovate, deeply toothed, pubescent on upper surface, densely albo-tomentose beneath. **Capitula** radiate; many-flowered, peduncled, terminal and axillary, corymbose. **Involucre** campanulate; bracts in 2 rows, lanceolate, strigose on back, herbaceous. **Receptacle** flat, paleate; paleae as long as ovary, lanceolate in profile, boat-shaped, acuminate, keeled, ciliate on keel, pilose above. **Ray florets** sterile or rarely neuter; corolla yellow; tube very much shorter than lamina, pilose; lamina broadly linear, obtuse. **Disc florets** bisexual, fertile; corolla yellow; tube pilose below, widened above; lobes 5, ovate, glandular on face. **Anthers** linear, faintly eared at base, with lanceolate apical appendage. **Style** terete, globose at base; branches linear, contracted at apex into linear, glandular appendage. **Cypselas** oblong, obovate or triquetrous, laterally compressed. **Pappus** of 2 awns. $x = 17$ (7, 8, 9, 10) (aneuploids, polyploidy, B-chromosomes).

Species ± 300, North, Central and South America; 2 occur in various parts of sthn Afr. as introduced weeds: **Verbesina encelioides* (Cav.) Benth. & Hook. var. *encelioides*, Namibia, Botswana, North-West, Northern Province, Free State, Northern Cape, and **V. encelioides* (Cav.) Benth. & Hook. var. *exauriculata* C.B.Rob. & Greenm., Eastern Cape.

Vernonia Schreb. 8751000

(Vernonieae)

Schreber: 541 (1791); Harvey: 48 (1865); Hilliard: 25 (1977); Pope: 57 (1992); Bremer: 227 (1994).

Annual or perennial herbs, often suffrutescent with annual stems from woody rootstocks, or small to large shrubs, woody scramblers or rarely small trees. **Leaves** alternate, rarely opposite, sometimes radical, sessile or petiolate, linear to ovate, entire or lobed, penninerved, often glandular. **Capitula** discoid, 1–many-flowered, capitula usually arranged in corymbiform cymes, sometimes scorpioidly cymose, or in various axillary or terminal clusters, spicate, paniculate or solitary and terminal. **Involucre** cyathiform-campanulate, obconic, cylindric or hemispheric; bracts free, in 2–many rows, loosely or appressed imbricate; apices acute, obtuse or rounded, often mucronate or aristate. **Receptacle** flat or convex, plane or alveolate; alveolae sometimes fimbriate; epaleate. **Florets** normally bisexual and fertile; corolla creamy white, various shades of purple or blue; cylindric to narrowly infundibuliform or slender-tubular below and abruptly widened cylindric above; regularly 5-lobed. **Anthers** calcarate, ecaudate or shortly caudate; with linear or lanceolate apical appendage. **Style** branches long-tapering-subterete with stigmatic papillae on inner surface towards base, pilose or shortly hirsute outside, usually with sweeping hairs. **Cypselas** subterete to ± laterally compressed, obpyramidal and 4- or 5-sided, oblong-obovoid, turbinate or subfusiform, 2–20-ribbed, sometimes smooth, sparsely to densely glandular, variously hairy or glabrous, with or without distinct basal callus. **Pappus** usually in 2 rows with outer row of short scales or setae, sometimes caducous; inner whorl of long, barbellate or subplumose, sometimes caducous, whitish purple or green setae, more rarely outer pappus 0. $x = 9, 10, 17$ (8, 11, 12, 19) (aneuploids, polyploidy, B-chromosomes).

Species over 1000, fairly cosmopolitan; 40 in sthn Afr., widespread but absent from Western Cape.

*__Xanthium__ L. 9148000

(Heliantheae)

Linnaeus: 987 (1753); Linnaeus: 424 (1754); Oliver & Hiern: 371 (1877); Phillips: 813 (1951); Wild: 3 (1967); Hilliard: 297 (1977); Henderson *et al.*: 110 (1987); Karis & Ryding 623 (1994).

Coarse, annual herbs, monoecious. **Leaves** alternate, petiolate, simple, deltoid or narrowly rhomboidal, mar-

gin variously toothed or lobed. **Capitula** and **florets** unisexual. **Male capitula** globose, many-flowered; involucre short, bracts few, narrow, in 1 or 2 rows; receptacle hemispherical, paleate; corolla tubular, 5-toothed; anthers with small apical appendage, base obtuse; filaments connate; ovary abortive; style undivided. **Female capitula** ovoid, 2-flowered; involucre completely enveloping 2 female flowers, 2-locular within, apex 1- or 2-beaked; corolla 0; style branches long, linear, acute, tips exserted on inner face of each terminal beak near its base; cypselas obovoid or oblong, solitary in each involucral chamber; involucre enlarging, hardening, with prominent hooked spines, shed as 2-celled unit. **Pappus** 0. $x = 9$ (5, 17) (high polyploidy—1 report).

Species 3, widespread weeds in warm parts of the world; 2 in sthn Afr., both from tropical America: **Xanthium spinosum* L., widespread but absent from Namibia and Western Cape and **X. strumarium* L., troublesome weed, absent from Namibia, Botswana, Northern Province and Northern Cape.

*Youngia Cass. 9605010

(Lactuceae)

Cassini: 88 (1831); Hilliard: 635 (1977); Bremer: 183 (1994).

Annual or perennial herbs with milky latex. **Leaves** radical or alternate, entire, coarsely toothed or pinnatifid. **Capitula** ligulate, corymbose or rarely racemose. **Involucre** narrowly campanulate or subcylindric; bracts in 2 unequal rows, outer few and short, inner lanceolate. **Receptacle** epaleate. **Florets** strap-shaped; corolla yellow. **Anthers** sagittate at base, acute or shortly setaceous-acuminate. **Style** branches long, slender, sweeping hairs present. **Cypselas** narrowly oblong-terete to fusiform, apically slightly attenuate, somewhat compressed, many-ribbed, usually with 5 main ribs, glabrous. **Pappus** of scabrid-barbellate bristles. $x = 5, 8$ (4, 6, 9) (polyploidy).

Species ± 30, Asia; **Youngia japonica* (L.) DC., introduced, has become a weed on the coast and in the midlands of KwaZulu-Natal.

*Zinnia L. 9155000

(Heliantheae)

Linnaeus: 1189 (1759) name conserved; Phillips: 813 (1951); Torres: 4 (1963); Wild: 54 (1967); Hilliard: 299 (1977); Karis & Ryding: 588 (1994).

Annual or perennial herbs, sometimes shrubby. **Leaves** opposite, sessile or shortly petiolate, simple, bases connate and sheathing stem, margins entire, roughly hairy. **Capitula** radiate, large, solitary, terminal on long, hollow peduncle swollen below capitulum. **Involucre** narrowly or broadly campanulate or subcylindric; bracts in 3 to many rows, oblong or obovate, imbricate, apices rounded with darker or discoloured summit band at or near apex. **Receptacle** conical to concave, with paleae conduplicate, embracing disc florets. **Ray florets** female, fertile; corolla strap-shaped, discolorous, outer surface greyish white, inner surface reddish or brownish red, drying purplish, persistent. **Cypselas** 3-angled or dorsiventrally compressed. **Pappus** 0. **Disc florets** bisexual, fertile; corolla brownish yellow, tubular, 5-toothed. **Anthers** with small apical appendage, base obtuse. **Style** branches long, linear, obtuse or subtruncate. **Cypselas** obovate, 3-angled or compressed. **Pappus** of 1 or 2 awns. $x = 10, 11, 12$ (7, 9, 13) (aneuploids, polyploidy, B-chromosomes).

Species 22, America, Peru, Mexico; 1 in sthn Afr.: **Zinnia peruviana* (L.) L., a widespread weed, absent from Western Cape.

Zyrphelis Cass. 8882010

(Astereae)

Cassini: 420 (1829b); Nesom: 91 (1994).

Elphegea subg. *Zyrphelis* (Cass.) Less.: 183 (1832). *Mairia* sect. *Zyrphelis* (Cass.) DC.: 218 (1836a). *Mairea* sect. *Zyrphelis* (Cass.) Harv.: 64 (1865). *Mairea* sect. *Homochroma* (DC.) Harv.: 64 (1865).

Subshrubs or basally lignescent herbs with vestiture of stout, thick-based, usually spreading hairs, sometimes also lightly tomentose; stems prominently branching. **Leaves** alternate, linear or spathulate, entire, almost all cauline or less commonly basally disposed. **Capitula** radiate, terminal, solitary, rarely corymbosely arranged, 3–12(–18) mm wide. **Involucral bracts** with broad, scarious margins, strongly concave. **Receptacle** epaleate. **Ray florets** female, strap-shaped, fertile; corolla white, blue or yellow. **Disc florets** functionally male, sterile (but fertile in *Z. perezioides*), tubular, 5-toothed; corolla yellow. **Cypselas** oblong-obovate, 2-nerved, strongly flattened, moderately to densely strigose-sericeous with filiform hairs or glabrous. **Pappus** of caducous, plumose bristles, in a single row.

Species 10, subtropical Africa; 9 in sthn Afr., Western Cape.

Avicenniaceae

(Asteridae—Lamiales)

Compiled by E. Retief

Shrubs or small trees of the mangrove zone; pneumatophores present; nodes swollen. **Leaves** opposite, simple, lanceolate to elliptic, sessile, entire, coriaceous, petiolate; stipules 0. **Flowers** bisexual, regular, small, in contracted or capitate cymes; bracts and bracteoles present. **Calyx** deeply 5-lobed; lobes ovate. **Corolla** 4- or 5-lobed, somewhat fleshy, yellow; tube funnel-shaped or campanulate; lobes longer than tube, ovate, glandular-pubescent on outer surface. **Stamens** 4, arising in throat of corolla, included; anthers ovate, with parallel thecae. **Ovary** superior, 2-carpellate, imperfectly 4-locular, with free-central, ± 4-winged placenta and a single pendent, orthotropous ovule in each locule; densely hirsute; style shorter than ovary, fleshy, conical, bilobed. **Fruit** a broadly ellipsoid, compressed capsule, opening by 2 (or 4) thick valves. **Seed** usually solitary by abortion and germinating before fruit drops; endosperm fleshy.

Monotypic family; *Avicennia*, with 14 species, occurs in the tropics and subtropics of both the Old and New World, being one of the major constituents of almost all coastal mangrove lagoons; sthn Afr.: genus 1, species 1.

Endlicher: 314 (1841); Moldenke: 149 (1973).

The family Avicenniaceae has often been included in the Verbenaceae as a monotypic subfamily but is treated here as a segregated family on morphological grounds.

Avicennia L. 7205000

Linnaeus: 110 (1753); Baker: 331 (1900); Pearson: 225 (1912); Moldenke: 149 (1973); Moldenke & Moldenke: 126 (1983); Duke: 302 (1991); Verdcourt: 144 (1992).

Description as for family.

Species ± 14, mangroves, fairly cosmopolitan in warm estuarine waters; 1 in sthn Afr.: *Avicennia marina* (Forssk.) Vierh., along the coast of KwaZulu-Natal to Gonubie (Eastern Cape).

Balanitaceae

(Rosidae—Sapindales)

Compiled by R.H. Archer

Shrubs or trees, with simple or forked spines. **Leaves** alternate, 2-foliolate; leaflets obovate, elliptic or ovate-elliptic, entire; stipules 0. **Flowers** bisexual, regular, in axillary cymes. **Calyx**: sepals 5, free, somewhat leathery, villous on outer surface, tomentose within, 4 inner ones with membranous margins. **Petals** 5, free, somewhat fleshy, imbricate. **Disc** thick, 10-furrowed or 5-lobed. **Stamens** 10, inserted at base of disc; filaments free; anthers 2-thecous, opening by longitudinal slits. **Ovary** superior but partly immersed in disc, 5-locular, globose, with an apical pendulous ovule in each locule, villous; style short, terete or 5-grooved; stigmas 1–5, simple. **Fruit** a fleshy drupe, 1-seeded by abortion. **Seeds** with thick, oily cotyledons; endosperm 0. $x = 9$ (8) (polyploidy).

Genus 1, species ± 20, mostly in Africa, few in Malaysia; sthn Afr.: species 4.

Balanites Delile 3980000

Delile: 221 (1813) name conserved; Launert: 221 (1963).

Description as for family.

Species ± 20; 4 in sthn Afr., Namibia, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Balanophoraceae

(Rosidae—Santalales)

Compiled by M. Jordaan

Herbaceous, fleshy, perennial root-parasites, without chlorophyll and roots, arising from variously shaped underground tubers, forming contact to host root and producing 1 or more unbranched inflorescence-bearing stems with or without leaves in lower part, upper part bearing scale-like leaves; plants monoecious or dioecious. **Leaves** spirally arranged or distichous, decussate or verticillate, scale-like, coloured, sometimes much reduced. **Inflorescences** many-flowered, much branched or simple, spadix-like; bracts scaly, ± transformed and reduced, triangular or peltate or reduced to a clavate structure, caducous or persistent. **Flowers** unisexual, rarely bisexual. **Male flowers** with a perianth of 3–9 tepals; stamens 2 or 3(4), free or confluent into a synandrium, opposite perianth segments; anthers dehiscing longitudinally or by apical pores. **Female flowers** with 3 or 0 perianth segments; ovary ± inferior, 3- or 4-merous, with 1 pendulous ovule (represented by an embryo sac without nucellus or integuments) in each locule; placentas and carpels often not recognisable; style 1, columnar or much reduced; stigma inconspicuous or ± capitellate. **Fruit** small, a 1-seeded achene. **Seed** with large-celled granular endosperm.

Genera 18, species ± 43, widely distributed in the tropics and subtropics of both hemispheres; in Africa 6 genera and 6 species: sthn Afr.: genera 2, species 2.

Richard: 404, 429 (1822) as Balanophoreae; Harvey: 572 (1862); Eichler: 117 (1873); Hooker: 232 (1880); Engler: 243 (1889); Hemsley: 434 (1911); Marloth: 170 (1913); Harms: 296 (1935); Hansen: 359 (1986).

Key to genera

Inflorescence simple, spadix-like, bearing male flowers above and female flowers below; stamens 2; style present; plants monoecious, usually parasitic on roots of Proteaceae ..... **Mystropetalon**

Inflorescence much branched, bearing unisexual flowers only; stamens 3(4); style 0; plants dioecious, usually parasitic on roots of *Acacia* and *Ekebergia* species ..... **Sarcophyte**

Mystropetalon Harv. 2155000

Harvey: 418 (1838); Griffith: 336 (1845); Hooker: 31 (1856); Harvey: 573 (1862); Eichler: 124 (1873); Hooker: 234 (1880); Engler: 252 (1889); Marloth: 171 (1913); Harms: 312 (1935); Visser: 44 (1981); Hansen: 370 (1986).

Reddish to yellowish white parasites, usually on roots of Proteaceae; monoecious. **Leaves** scale-like, fleshy or sometimes linear. **Inflorescence** a dense, often clavate spike, resembling a fungus, with female flowers below and male flowers above, rarely flowers all female, subtended by 1 coloured bract and 2 bracteoles. **Male flowers**: perianth with 3 segments, 2-lipped; lower lip of 1 lobe; upper lip of 2 lobes; stamens 2, arising on upper perianth segments; anthers 2-thecous, dehiscing longitudinally. **Female flowers** ripening before male, seated on a globular, fleshy receptacle; perianth segments 3, valvate, urceolate or tubular; staminodes 2, small or 0; ovary 3-merous, embedded in and fused to perianth tube, 1- or 3-locular, with 3 pendulous ovules; style columnar; stigma discoid or 3-lobed. **Fruit** a pseudonut, almost spherical, inserted on enlarged receptacle. **Seed** solitary.

Monotypic, Western Cape, almost exclusively southwest of Breede River.

Sarcophyte Sparrm. 2158000

Sparrman: 300, t. 7 (1776); Griffith: 338 (1845); Hooker: 29, t. 1/C (1856); Harvey: 573 (1862); Eichler: 126 (1873); Hooker: 234 (1880); Engler: 252 (1889); Hemsley: 435 (1911); Harms: 314 (1935); Hansen: 364 (1986); Hansen: 1 (1993).

Reddish, fleshy parasites; tuber subspheroidal, furrowed; dioecious. **Leaves** many, spirally arranged, scale-like, coloured. **Inflorescences** fleshy, paniculately branched, each branch subtended by a bract slightly smaller than leaves. **Male plants**: inflorescence branches with many shortly pedicellate flowers in groups of 2 or 3 on short secondary branches; male flowers: 3(4)-merous; tepals valvate; stamens with well developed filaments, inserted at base of perianth segments; anthers many-thecous, opening by apical pores. **Female plants**: inflorescence branches with 5–12 subglobular, almost sessile, spadix-like clusters of ± 200 flowers completely sunk in a common receptacle; perianth segments 0; ovary 3(4)-merous, fused together, each 1-locular or at length 3-locular through intrusion of placentas, with 1–3 pendulous ovules; stigma discoid, sessile, peltate on a much reduced style, almost covering surface of receptacle. **Fruit** a syncarp, individual fruits of each head developing into a globose pseudoberry. **Seed** solitary.

Monotypic with 2 subspecies, confined to tropical east and sthn Afr.; 1 in sthn Afr.: *Sarcophyte sanguinea* Sparrm. subsp. *sanguinea* occurs in southernmost Mozambique and eastern sthn Afr., Northern Province, Mpumalanga, KwaZulu-Natal and Eastern Cape.

Balsaminaceae

(Rosidae—Geraniales)

Compiled by R.H. Archer

Soft, subsucculent, glabrous herbs; stems ± translucent, rarely woody at base; usually in damp, shady places. **Leaves** opposite or alternate, rarely whorled or radical, simple, entire or variously toothed, usually petiolate; stipules 0. **Flowers** bisexual, very irregular, resupinate, attractive, 1–many, on axillary peduncles, sometimes paniculate, sometimes peduncles clustered. **Sepals** 3(–5), free, imbricate, 2 laterals flat, usually green, the lowermost petaloid, usually coloured, produced into a hollow spur or sac. **Petals** 5, usually ± connate, anterior one largest, laterals 2-lobed. **Stamens** 5; filaments free and linear below, broadened above and connate; anthers 2-thecous, large, elliptic, cohering to form a cap over ovary. **Ovary** superior, 5-locular, with few to many ovules in each locule on axile placentas; style absent; stigma simple, sessile, 5-toothed or -lobed. **Fruit** an explosively dehiscent loculicidal capsule, opening elastically into 5 twisted valves from placentiferous axis. **Seeds** smooth or tubercled, glabrous or hairy; embryo straight; endosperm 0. $x = 7, 8, 10$ (3, 5, 6, 9, 13) (polyploidy, B-chromosomes).

Genera 2, species ± 850, cosmopolitan in tropical and subtropical climates; sthn Afr.: genus 1, species 4.

Grey-Wilson: 1 (1980).

Impatiens L. 4856000

Linnaeus: 937 (1753); Sonder: 312 (1860); Launert: 162 (1963); Grey-Wilson: 1 (1980).

Description as for family.

Species ± 850, mainly northern hemisphere, tropical Africa, tropical Asia to North America; 4 in moist eastern parts of sthn Afr.

Basellaceae

(Caryophyllidae—Caryophyllales)

Compiled by M. Jordaan

Subsucculent perennial herbs with slender to fairly robust twining stems, usually glabrous, decumbent to procumbent, often renewed from tubers or thickened, ± woody stem bases; roots fibrous or often ± thickened; plant mucilaginous, lacking anomalous secondary growth and anthocyanins. **Leaves** alternate, simple, lanceolate to broadly elliptic, cordate or obovate, entire, with ± thin margin, usually petiolate, somewhat fleshy; stipules 0. **Inflorescences** axillary or terminal bracteate spikes, racemes or panicles, indeterminate or pseudodeterminate; bracts small, thin, deciduous or persistent, lanceolate to triangular, subtending a pedicel or sessile flower; bracteoles 2–4, frequently subtending flower. **Flowers** bisexual, rarely functionally unisexual, regular, small. **Sepals** 2, coloured, free to base or partly connate. **Petals** 5, membranous or fleshy, with short tube and persistent, imbricate lobes. **Stamens** 5, epipetalous, connate at base and adnate to corolla lobes; anthers included or exserted, dorsifixed or basifixed, 2-thecous, extrorsely dehiscent by longitudinal slits, whitish, yellowish, reddish, or violet. **Ovary** superior, 3-carpellate, 1-locular; ovule solitary, basal, bitegmic, amphitropous to campylotropous; style 1, 3-partite ± to middle or almost to base, sometimes persistent; stigmas linear to capitate. **Fruit** a thin-walled nutlet, globose to ± obliquely pyriform, smooth to ribbed, surrounded by persistent perianth. **Seed** nearly spherical, with membranous testa; embryo ring-like to spirally twisted.

Genera 4, species ± 20, mainly in tropical and subtropical South America but also in Africa and Asia; sthn Afr.: genera 2 (1 exotic), species 2.

Moquin-Tandon: 10 (1840); Hooker: 43 (1880); Volkens: 124 (1893); Franz: 1 (1908); Ulbrich: 263 (1934); Sperling & Bittrich: 143 (1993).

Key to genera

Flowers pedicelled; plants often with axillary aerial tubers; fruit ± 1 mm in diameter, without swollen receptacle ..... ***Anredera**

Flowers sessile; plants without aerial tubers; fruit 2–3 mm in diameter, on a swollen, coloured receptacle ..... **Basella**

***Anredera** Juss. 2428000

Jussieu: 84 (1789); Hooker: 78 (1880); Volkens: 128 (1893); Ulbrich: 271 (1934); Bogle: 590 (1969); Sperling & Bittrich: 146 (1993); Eriksson: 67 (1996).

Boussingaultia Kunth: 194. t. 645 (1825). *Tandonia* Moq.: 226 (1849).

Twining or scrambling, herbaceous subsucculent vines; roots often thickened; stems smooth, glabrous, producing axillary, subterranean to aerial tubers up to 25 mm thick. **Leaves** slightly fleshy, often tinged with red, shortly to distinctly petiolate. **Inflorescences** axillary or terminal panicles or racemes, with many small, pedicellate flowers in axils of small bracts; bracteoles subtending flower distinctly developed, persistent or deciduous, ± thin, triangular to broadly ovate, free or sometimes connate at base, ± entire. **Flowers** bisexual or functionally unisexual, chasmogamous, fragrant. **Sepals** ± adnate to floral cup, sometimes ± strongly keeled, slightly shorter than petals, patent to erect, rhombic or rounded ovate to elliptic, free, adnate to petals at base. **Petals** with 1–3 ± distinct veins, patent to erect, small, thin to fleshy, connate only at base, spreading at maturity, white or yellowish to reddish. **Stamens** free to base or shortly connate, opposite and inserted on petal bases; filaments filiform or subulate, recurved in bud; anthers oblong, versatile. **Ovary** globose to pyriform; ovule 1, subsessile; style 1, 3-partite up to about middle, with clavate to capitate stigmas. **Fruit** a nutlet, smooth, partly or com-

pletely enclosed by persistent dry perianth. **Seed** erect, lenticular, with crustaceous seedcoat; embryo semi-annular. $x = 12$ (1 report).

Species 10–15, from S Florida and Texas to Argentina, the majority of species occurring in northern South America; cultivated as ornamentals and 1 naturalised in sthn Afr.: **Anredera cordifolia* (Ten.) Steenis, locally a noxious invader.

Basella L. 2424000

Linnaeus: 272 (1753); Linnaeus: 133 (1754); Lamarck: 381 (1783); Jussieu: 84 (1789); Hooker: 76 (1880); Volkens: 126 (1893); Franz: 25 (1908); Baker & Clarke: 94 (1909) (under Chenopodiaceae); Ulbrich: 266 (1934); Verdcourt: 498 (1964); Verdcourt: 1 (1968); Stannard: 161 (1988); Sperling & Bittrich: 145 (1993); Eriksson: 59 (1996).

Twining vines to procumbent perennial herbs; stem glabrous or young stem puberulous. **Leaves** ovate, somewhat fleshy. **Inflorescence** an axillary, pedunculate panicle of spikes; bracteoles 2, subtending flower, minute or distinctly developed, persistent, thin, ovate to triangular, free, entire to erose at margin, obtuse to acute at apex. **Flowers** bisexual, sessile, partly sunken into rachis. **Sepals** shorter than petals or equally long, patent to erect, ovate to elliptic, greenish white. **Petals** connate only at base, green or yellow-green. **Stamens**: filaments connate at base; anthers with thecae free at apex. **Ovary** globose to pyriform, free; ovule on a short basal stalk; style 3-partite ± to base; stigmas linear. **Fruit** a nutlet, smooth and often shiny, with 6 longitudinal ribs, on a swollen, fleshy, reddish to purplish receptacle. **Seed** erect, subglobose; embryo spirally twisted. $x = 11$ (aneuploids).

Species ± 5; 1 species: *Basella alba* L. (= *Basella rubra* L.) widespread in Africa and Asia and elsewhere cultivated for its edible leaves and locally naturalised in tropical and subtropical areas worldwide; 3 endemic to Madagascar; 1 endemic to eastern Africa and sthn Afr.: *Basella paniculata* Volkens, KwaZulu-Natal.

This generic treatment is based largely on *Basella paniculata*, which differs markedly from other species of the genus and is perhaps better placed in a genus of its own (Eriksson 1996).

Begoniaceae

(Dilleniidae—Violales)

Compiled by C.L. Bredenkamp

Monoecious herbs or undershrubs, mostly fleshy, generally erect, sometimes creeping or climbing by means of adventitious roots, or acaulescent with a rhizome or tuber. **Leaves** alternate, rarely subradical, petiolate, generally asymmetrical, digitately nerved, margins entire, toothed, lobed or dissected; stipules 2, conspicuous, persistent or caducous. **Inflorescences** axillary, cymose, bracteate. **Flowers** regular or irregular, unisexual, showy. **Male flowers**: tepals usually 2 or 4, rarely many or 0, petaloid; stamens many, filaments free or connate; anthers 2-thecous, dehiscing laterally; ovary rudimentary or 0. **Female flowers**: tepals 5 or 6, sometimes 4, petaloid; staminodes 0 or rarely represented by glands; ovary inferior or rarely half-inferior, usually 3-, rarely 2- or 5-locular, usually 3-winged or angled; ovules many on projecting, simple or lobed axile placentas; styles (2)3(–5), free or connate at base, 2-fid, stigmas entire or branched, often twisted, papillose. **Fruit** usually a capsule, 3-winged or 3-angled, rarely terete or 4-angled. **Seeds** many, minute; testa reticulate; endosperm 0; embryo straight. $x = 14$ (11, 12, 13, 15, 19) (high polyploidy).

Genera 5, species ± 900, mostly in *Begonia*; mainly warm, wet parts of America and Asia, relatively few in Africa; only *Begonia* with 6(5) species in sthn Afr.

Sonder: 480 (1862); Candolle: 266 (1864); Hilliard: 136 (1976).

Begonia L. 5397000

Linnaeus: 1056 (1753); Linnaeus: 475 (1754); Sonder: 480 (1862); Candolle: 266 (1864); Hilliard: 136 (1976); De Lange & Bouman: 1 (1992).

Description as for family.

Species ± 900 species described, mainly tropical America and Asia; 6 or perhaps only 5 native in sthn Afr.

Bignoniaceae

(Asteridae—Scrophulariales)

Compiled by S.J. Smithies

Trees, shrubs, some scrambling, or climbers, rarely spiny, with several types of glands but not mucilaginous. **Leaves** opposite or sometimes whorled, at times solitary or fascicled on dwarf shoots, usually compound, with articulated leaflets, sometimes simple, terminal leaflet sometimes a tendril; stipules 0, but sometimes with pseudostipules (modified external scales of axillary bud). **Flowers** bisexual, ± irregular, often large and brightly coloured, in terminal or lateral panicles or racemes that sometimes terminate in cymose branching, or sometimes borne on old wood. **Calyx** gamosepalous, shortly (2–4)5(6)-lobed or -toothed or spathaceous, shorter than corolla tube. **Corolla** gamopetalous, 5(6 or 7)-lobed; often bilabiate with posterior lip usually bilobed, anterior lip trilobed; rarely regular; limb usually imbricate, shorter than tube; tube conspicuous, tubular to campanulate or funnel-shaped, often pilose inside around base of stamens. **Stamens** usually 4, didynamous, sometimes with a posterior staminode, or 5 and equal, arising in corolla tube, usually ± at rim of narrow basal part, alternating with corolla lobes; filaments filiform or flattened, slightly thickened and often dilated and/or hairy at base; anthers bithecate, attached at apex, with parallel, divergent or divaricate thecae, dehiscing longitudinally, introrse. **Nectary/disc** usually present, hypogynous, symmetric, annular or cupular. **Ovary** superior, syncarpous, bicarpellate, usually bilocular and not divided at this stage by a false septum, with placentation axile, or rarely unilocular with parietal placentation; ovules many, anatropous, erect, in 2–several rows per locule; style simple, filiform or somewhat stout; stigma of 2 flattened, ovate or oblong lobes. **Fruit** typically a bivalved, loculicidal or septicidal capsule, with valves splitting perpendicularly or parallel to septum respectively, or rarely a fleshy and indehiscent berry. **Seeds** usually flat, with a broad, hyaline wing, rarely wingless; endosperm 0.

Genera ± 109, species ± 750, cosmopolitan but mostly tropical, especially South America; sthn Afr.: genera 8 (2 naturalised), species 13, widespread with exception of Lesotho; many exotic ornamentals including **Jacaranda*, *Tecoma*, **Dolichandrone*, **Macfadyena* and **Spathodia*.

Sprague: 447 (1904); Merxmüller & Schreiber: 1 (1967); Gentry: 1 (1977); Palgrave: 827 (1977); Van Steenis: 114 (1977); Goldblatt & Gentry: 475 (1979); Gentry: 1 (1980); Diniz: 61 (1988); Gentry: 1 (1992); Diniz: 11 (1993); Mabberley: 87 (1997); Van Wyk & Van Wyk: 21, 414 (1997).

Key to genera

1a Ovary unilocular; fruit indehiscent, fleshy and fibrous within; seeds not winged ..... **Kigelia**
1b Ovary bilocular; fruit capsular; seeds winged:
2a Capsule slightly compressed, covered with prickly warts ..... **Catophractes**
2b Capsule compressed, smooth:
3a Calyx spathe-like, split down posterior side ..... **Markhamia**
3b Calyx 5-toothed or -lobed:
4a Capsule suborbicular; leaves bipinnate ..... ***Jacaranda**
4b Capsule linear, linear-oblong or oblong to elliptic; leaves simple, bifoliolate or pinnate:
5a Lianas; leaves often with a terminal trifid tendril ..... ***Macfadyena**
5b Trees, shrubs, or subshrubs; leaves without tendrils:
6a Stamens 5; ovules in 2 rows in each locule; fruit beaked ..... **Rhigozum**
6b Stamens 4, staminode 0 or 1; ovules in 2–8 rows in each locule; fruit not beaked:
7a Corolla tube curved, narrowly funnel-shaped; stamens exserted ..... (=*Tecomaria*) **Tecoma** in part
7b Corolla tube cylindrical below, campanulate above; stamens included:
8a Calyx inflated; scrambling shrub or subshrub; flowers pink ..... **Podranea**
8b Calyx not inflated; if shrub then not scrambling; flowers yellow ..... ***Tecoma stans**

Catophractes D.Don 7723000

Don: 4 (1839); Sprague: 453 (1904); Verdoorn: t. 1060 (1949); Merxmüller & Schreiber: 2 (1967); Palgrave: 830 (1977); Diniz: 70 (1988).

Shrubs or small trees, rigid and spiny, much branched from base; branches divaricate, densely stellate-pubescent, but glabrescent, sometimes spine-tipped or reduced to spines. **Leaves** simple, opposite, often fascicled, petiolate, densely stellate-pubescent, irregularly toothed to crenate. **Flowers** 1 or more, usually 2, terminal or axillary, ± dense in uppermost part of branches, sessile. **Calyx** ribbed, tube shortly split down one side; lobes 5(6), filiform, pubescent like leaves. **Corolla** subbilabiate, 5(6 or 7)-lobed, white, pale green, cream or pink; tube long-cylindrical, becoming funnel-shaped above, many-ribbed, glabrous outside, pilose in lower half; lobes suborbicular, spreading to reflexed. **Stamens** as many as corolla lobes, arising below middle of corolla tube, slightly exserted; filaments terete, adnate to tube for ± two-thirds of their length; anthers bluntly apiculate, with thecae connate in upper part, free and parallel to slightly diverging below. **Nectary** thick, shallowly cupular, somewhat crenate. **Ovary** subglobose, scabrous, bilocular; ovules few in 2 rows per locule; style filiform, exserted; stigma of 2 elliptic-oblong lobes. **Fruit** an elliptic, beaked capsule, slightly compressed parallel to septum; walls thick, woody; valves boat-shaped, with short, prickly warts. **Seeds** disc-like, with ± surrounding, papery wing.

Monotypic: *Catophractes alexandri* D.Don, subtropical and sthn Afr.: Namibia, Botswana, and adjacent parts of South Africa, from ± Messina (Northern Province) to Gordonia (Northern Cape); also in Angola and Zimbabwe; often associated with limestone.

*Jacaranda Juss. 7725000

Jussieu: 138 (1789); Don: t. 631 (1822); Gentry: 72 (1977); Gentry & Morawetz in Gentry: 51 (1992); Henderson: 88 (1995).

Deciduous or semideciduous, medium to large trees; branchlets terete. **Leaves** bipinnate, opposite, pinna rachis subwinged; leaflets many, narrowly elliptic, sessile. **Flowers** pedicellate, in an open, terminal panicle. **Calyx**

reduced, 5-denticulate, broadly campanulate, subpuberulous. **Corolla** tubular-campanulate above a slightly narrowed, curved tube, mauvish blue, rarely white, pubescent outside; tube white, partly pubescent inside; limb slightly bilabiate; lobes 5, rounded, ± equal, spreading. **Stamens** 4, didynamous, arising ± at top of narrow part of corolla tube, included; filaments pubescent below middle; anthers glabrous, unithecate as second theca reduced to minute appendage; staminode 1, exceeding stamens, glandular-pubescent at middle and apex. **Nectary** short, pulvinate. **Ovary** flattened-cylindrical, bilocular, with 2 axile, vertical, placental ridges per locule, glabrous; ovules 6–8-seriate in each locule; style filiform, included, tapering slightly into bilobed stigma. **Fruit** a woody capsule, broadly oval to suborbicular, apex often a little emarginate, base truncate to subcordate, strongly compressed perpendicularly to the septum, dehiscing parallel to the plane of compression; valves glabrous, smooth, margins not or slightly undulate. **Seeds** thin, with wing ± surrounding and clearly demarcated from seed body, hyaline-membranous with brownish streaks. $x = 9$ (polyploidy).

Species ± 49 species, neotropical; 1 in sthn Afr.: **Jacaranda mimosifolia* D.Don, from northwest Argentina to Bolivia, widely cultivated as an ornamental tree, naturalised in warmer parts extending from Soutpansberg (Northern Province) to Grahamstown (Eastern Cape), also in Swaziland. It is a proposed declared invader.

Kigelia DC. 7761000

Candolle: 135 (1838); Sprague: 454 (1904); Sprague: 533 (1906); Phillips: t. 573 (1935) as *K. pinnata*; Merxmüller & Schreiber: 2 (1967); Palgrave: 833 (1977); Diniz: 83 (1988).

Medium to large trees of varying habit, usually with a rounded crown; branches often stout, spreading. **Leaves** imparipinnate, opposite or ternate, petiolate; leaflets large, elliptic; foliar morphology very variable. **Flowers** large, pedicellate, in pendulous, long-peduncled, lax panicles; pollinated by bats. **Calyx** 2–5-lobed, leathery; tube campanulate to almost tubular, 5-ribbed; lobes sometimes apiculate. **Corolla**: tube slightly curved, cylindrical below, widely campanulate above, leathery, glabrous; limb bilabiate; upper lip short, erect; lower lip longer, deflexed; lobes 5, ± obovate; yellowish at first, then reddish to purplish. **Stamens** 4, didynamous, arising at top of the cylindrical part of corolla tube, subexserted; filaments thick, linear, leathery, pilose at base; anther thecae separating and sometimes with an apical, fleshy, bilobed appendage; staminode 1. **Nectary** annular, thick, 5-lobed, leathery, tomentose. **Ovary** terete, unilocular; placentas 2, parietal and much intruded; ovules many in many rows; style subterete, subexserted; stigma of two elliptic lobes. **Fruit** large, sausage-shaped, pendulous, hard-walled, indehiscent; pulp fibrous. **Seeds** many, thick, wingless, with coriaceous testa intruded between cotyledons. $x = 10$ (21) (aneuploids).

Monotypic: *Kigelia africana* (Lam.) Benth.; mainly tropical Africa; also in sthn Afr.: Namibia, Botswana, South Africa, from ± Messina (Northern Province), through lowveld (Mpumalanga) to KwaZulu-Natal, possibly as far south as Durban; also in Swaziland.

***Macfadyena** A.DC. 7706000

Candolle: 179 (1845); Bailey & Bailey: 692 (1977); Gentry: 85 (1977); Henderson: 96 (1995).

Doxantha Miers: 189 (1863).

Perennial lianas; roots usually with conspicuously swollen tubers; stems irregularly striate, lenticellate, branchlets terete, often rooting at nodes, attached to support by adventitious rootlets. **Leaves** with 2 lanceolate to broadly ovate leaflets, often with a terminal trifid, hooked tendril; opposite, petiolate; pseudostipules small, ± ovate. **Flowers** large, pedicellate, in an axillary panicle, usually reduced to 1 or 3 flowers but rarely up to 15; peduncles short, branches ± glabrous. **Calyx** membranous, cupular, subtruncate with sinuous margin, glabrous to slightly lepidote. **Corolla** tubular-campanulate, yellow; tube glabrous outside, glabrous or partly puberulous or pubescent inside; limb oblique; lobes obovate, shorter than tube. **Stamens** 4(5), didynamous, included, arising at top of narrow part of corolla tube; anthers glabrous, thecae straight, divaricate; staminode 1(0). **Ovary** linear, minutely lepidote to subpuberulous, bilocular; ovules in 4 rows per locule but may appear as 2 in cross sections. **Nectary** annular. **Fruit** a long, narrow, linear capsule, tapering at ends, compressed, leathery; valves parallel to septum; dehiscence septicidal. **Seeds** membranous, with 2 wings not sharply demarcated from seed body, blunt-ended, mostly brown and irregularly hyaline at apex.

Species 3 or 4, centred in tropical America; 1 exotic in sthn Afr., **Macfadyena unguis-cati* (L.) A.Gentry, a widespread garden escape but naturalised in Levubu, Magoebaskloof and Duiwelskloof (Northern Province), Sabi and possibly Nelspruit (Mpumalanga), and Durban and Pietermaritzburg areas (KwaZulu-Natal).

Markhamia Seem. ex Baill. 7744000

Baillon: 47 (1888) ('1891'); Merxmüller & Schreiber: 3 (1967); Palgrave: 830 (1977); Ross: t. 1757 (1977); Diniz: 72 (1988).

Trees or shrubs; young branches minutely lepidote, sometimes with conspicuous lenticels, or velvety tomentose but soon glabrescent. **Leaves** imparipinnate, opposite, petiolate; leaflets ovate or elliptic, sometimes acuminate; pseudostipules well developed, subcircular to reniform, or ovate to subulate-acuminate. **Flowers** in terminal or lateral axillary panicles or racemes, pedicellate. **Calyx** spathaceous, split down posterior side, boat-shaped, cuspidate or hooked at apex, ± coriaceous. **Corolla** ± bilabiate, yellow-greenish and maroon, or yellow with reddish striae; tube cylindrical or funnel-shaped at base, campanulate above; lobes 5, shorter than tube, obovate, glandular on inner face. **Stamens** 4, didynamous, included; filaments terete, sometimes glandular and thickened at base; anthers with thecae connate above, divergent below; staminode sometimes 1. **Nectary** annular or cupular, crenate. **Ovary** oblong, attenuate, bilocular; ovules many, in 4–6 rows per locule; style terete, included; stigma of two obovate lobes. **Fruit** a long, linear, ± straight to falciform capsule, glabrous or minutely tomentose; valves 2, flattened and dehiscing parallel to a false septum borne in middle of a very small true septum. **Seeds** subrectangular with 2 papery, subrectangular wings; testa somewhat coriaceous. $x = 10$ (polyploidy).

Species 10, mainly tropical Africa, also Asia; 2 in sthn Afr., Namibia, Botswana and in the far north of South Africa (Northern Province); also possibly further south in Kruger National Park (Mpumalanga).

Podranea Sprague 7716010

Sprague: 449 (1904); Verdoorn: t. 1347 (1961); Gentry: 122 (1977); Diniz: 79 (1988); Gentry: 111 (1992).

Scrambling shrubs or subshrubs, almost glabrous; branchlets terete to 4-angled, lenticelled. **Leaves** imparipinnately compound, without tendrils, opposite, petiolate; leaflets elliptic-ovate, entire or remotely toothed; pseudostipules 0. **Flowers** large, in terminal panicles. **Calyx** cupular-campanulate, evenly 5-lobed, inflated; tube ridged, glabrous; lobes almost as long as tube, ovate, apiculate, ciliate. **Corolla** somewhat bilabiate and vertically compressed, pink or lilac; tube campanulate above a short cylindrical base, glabrous outside, glandular within on lower part, with stalked hairs, pilose in throat; lobes obovate. **Stamens** 4, didynamous,

arising at top of narrow portion of corolla tube, included; filaments subterete, with stalked glands on basal part; anthers with 2 thecae connate only at apex, straight, divaricate when mature; staminode 1. **Nectary** thick, saucer-shaped, somewhat crenate. **Ovary** linear, ± cylindrical, tapering into style, glabrous, bilocular; ovules many, in 6–8 rows per locule; style semiterete, slightly exserted; stigma with two ± oval lobes. **Fruit** a long, narrow, linear, straight capsule, with acute apex, somewhat flattened, leathery, smooth, dehiscing perpendicularly to septum. **Seeds** with 2 ± rectangular wings; testa membranous.

Species 1 or 2, Africa; 1 in sthn Afr.: *Podranea ricasoliana* (Tanfani) Sprague, from Port St Johns (Eastern Cape); possibly conspecific with *P. brycei* (N.E.Br.) Sprague, from Zimbabwe, Malawi and Mozambique.

Rhigozum Burch. 7722000

Burchell: 299 (1822); Sprague: 450 (1904); Sprague: 530 (1906); Phillips: t. 381 (1930); Merxmüller & Schreiber: 4 (1967); Palgrave: 828 (1977); Diniz: 67 (1988).

Shrubs or small trees, typically much branched, sometimes trichotomously; branches rigid, sometimes spine-tipped. **Leaves** simple, trifoliolate or imparipinnate, solitary or fascicled on variously spaced, cushion-like, dwarf lateral branchlets. **Flowers** in fascicles on lateral cushions or solitary, shortly pedicellate. **Calyx** campanulate, 5-toothed, subglabrous to variously pubescent. **Corolla** 5-lobed, yellow, white or pink; tube ± cylindrical below, campanulate above, scantily pilose inside, at least on lower part of tube; lobes obovate, spreading. **Stamens** 5, arising near base of campanulate portion of corolla tube, slightly exserted; filaments terete, pilose at base; anthers oblong; thecae free at base only. **Nectary** thick, shallowly saucer-shaped, entire or lobed. **Ovary** ovoid, bilocular; ovules many, biseriate in each locule; style terete, slightly exserted; stigma of 2 ovate, somewhat fleshy lobes. **Fruit** an oblong to elliptic, shortly-beaked, compressed capsule, splitting perpendicularly to septum into 2 smooth valves. **Seeds** paper-winged.

Species 7, Africa and Madagascar; 5 in sthn Afr., widespread except for Lesotho, mainly in karroid areas from Botswana to near Grahamstown (Eastern Cape). *Rhigozum trichotomum* Burch. has become invasive in several areas due to veld mismanagement.

Tecoma Juss. 7733000

Jussieu: 139 (1789); Van Steenis: 134 (1977); Dos Santos & Miller: 356 (1992); Gentry: 273 (1992); Brummitt: 419 (1974); Brummitt: 421 (1992); Henderson: 149 (1995); Mabberley: 702 (1997).

Tecomaria (Endl.) Spach: 137 (1838): Sprague: 448 (1904); Phillips: t. 903 (1943); Gentry: 161 (1977); Diniz: 64 (1988); Diniz: 11 (1993); Van Wyk & Van Wyk: 416 (1997).

Shrubs, subshrubs, sometimes subscandent, or small trees; branches sometimes lepidote or lenticellate. **Leaves** simply imparipinnate, opposite, petiolate; leaflets ovate to elliptic, or lanceolate, terminal leaflets often acute or acuminate, sessile, crenate or serrate. **Flowers** pedicellate, in dense, terminal or subterminal racemes or racemose panicles; bracts ± linear or lanceolate. **Calyx** cupular or elongate-cupular, 5-dentate, ± puberulous or somewhat lepidote, ciliate. **Corolla** orange (natural) or scarlet, yellow or pink (cultivated), narrowly funnel-shaped and a little curved, or tubular-campanulate above a short, narrow base; tube glabrous outside, with some papillae or hairs within, mostly in lower part; limb bilabiate, all 5 lobes elliptic, obtuse. **Stamens** 4, didynamous, arising in lower part of corolla tube, sometimes adnate to beyond middle, exserted or included; filaments terete, with stalked glands on lower part; anthers linear-oblong, thecae connate in upper third and slightly divergent below or divaricate and not apically fused; staminode 0 or 1. **Nectary** cupular-pulvinate. **Ovary** oblong or narrowly cylindrical, bilocular; ovules many in 2 or 4 series per locule; style terete, exserted; stigma elliptic, bilobed. **Fruit** a capsule, linear-oblong and somewhat curved, or linear and straight, tapering at ends, compressed parallel to septum but dehiscing perpendicularly to it; valves smooth or wrinkle-ridged. **Seeds** thin with 2 hyaline, membranous wings, sharply demarcated from seed body and almost surrounding it. $x = 9$ (17) (aneuploids, polyploidy).

Species ± 13, 12 in Neotropics, 1 or 2 in Africa; 1 or 2 in sthn Afr.: *Tecoma capensis* (Thunb.) Lindl.; from Messina (Northern Province) to Barberton (Mpumalanga) and through KwaZulu-Natal to Uitenhage (Eastern Cape); also in Swaziland; widely cultivated as an ornamental. **Tecoma stans* (L.) Juss. ex Humb., Bonpl. & Kunth var. *stans*, an exotic, is becoming naturalised mainly in warmer areas and has been proposed as a declared invader.

Tecomaria (Endl.) Spach was reduced to synonymy under *Tecoma* by Van Steenis (1977), followed by Gentry (1992), contrary to his earlier view (Gentry 1977). The latter author maintained that the only character of potential generic significance is the manner in which the two thecae of the anthers diverge. As other bignoniaceous genera include a variety of thecae, Gentry opined that this difference does not seem to warrant generic separation. In addition, the two genera are interfertile and their wood anatomy is very similar (Dos Santos & Miller 1992). Brummitt (1992) and Mabberley (1997) use *Tecoma* but Diniz (1993) and Van Wyk & Van Wyk (1997) retain *Tecomaria*.

Bombacaceae

[under Malvaceae—Bombacoideae, fide Bayer *et al.* (1999)]

(Dilleniidae—Malvales)

Compiled by C.L. Bredenkamp

Trees with fibrous and fleshy trunks, sometimes attaining a very large girth. **Leaves** alternate, simple on seedlings, digitately 3–9-foliolate on more mature plants; leaflets entire; stipules present. **Flowers** ± regular, bisexual, usually solitary, large, pendulous; large bracts and bracteoles usually present. **Calyx** leathery, 5-segmented or -lobed, valvate in bud. **Petals** 5, adhering to base of staminal tube, large and crinkled. **Stamens** many, united into a tube below; anthers reniform, 1-thecous, opening by longitudinal slits; pollen smooth. **Ovary** superior, 5–10-locular, with many axile ovules in each locule; style simple; stigma 5–10-lobed. **Fruit** indehiscent, woody. **Seeds** many, embedded in dry, white pulp. $x = 8$ (high polyploidy).

Genera 30, species ± 250, tropical and subtropical regions of Africa and Madagascar to India, Australia and America; sthn Afr.: 1 genus, 1 species.

Wild: 511 (1961); Friedrich-Holzhammer: 1 (1969).

**Ceiba pentandra* (L.) Gaertn. (5026000), Kapok Tree, from which the Kapok fibre of commerce is derived, has been cultivated in subtropical areas and may occasionally be found as a stray in KwaZulu-Natal.

(See note on family circumscription under Malvaceae.)

Adansonia L. 5023000

Linnaeus: 1190 (1753); Wild: 512 (1961); Baum: 440 (1995).

Description as for family.

Species 8, in 3 sections, tropical Africa, Madagascar and Australia, but dispersed widely by humans; 1 in sthn Afr.: *Adansonia digitata* L., the Baobab, Namibia, Botswana, Northern Province, North-West and Mpumalanga, rarely south of the Soutpansberg, except in cultivation.

Boraginaceae

(Asteridae—Lamiales)

Compiled by E. Retief

Annual or perennial herbs, shrubs or trees, variably hairy, often strigose, trichomes often with conspicuous multicellular bases. **Leaves** alternate, sometimes opposite, subopposite or rosulate at base, simple, sessile or petiolate, usually entire; stipules 0. **Flowers** bisexual, regular or occasionally irregular, in terminal or axillary, bifurcate cymes or in raceme-like or panicled groups, inflorescence branches frequently scorpioid and spirally inrolled when young, uncoiling as flowers open; bracts leafy, small or 0. **Calyx** persistent, sometimes accrescent in fruit; tube campanulate or cylindric, sometimes very short; lobes usually 5, imbricate or open, rarely valvate. **Corolla** (2–)4–7-lobed, imbricate or contorted in bud; tube cylindric, ± funnel-shaped, campanulate or rotate, the tube very reduced; throat often with (faucal) scales, fornices, thickenings or folds between lobes. **Stamens** as many as and alternating with corolla lobes, epipetalous, exserted or included; filaments sometimes dilated at base, sometimes with a densely hairy scale or protuberance where arising on corolla; anthers 2-thecous, opening by longitudinal slits. **Disc** present or 0. **Ovary** superior, entire or deeply 4-lobed, 2-locular with 2 ovules in each or with 4, 1-ovuled locules due to development of false partitions; placentation at times appearing basal but actually axile; style terminal or gynobasic (arising from between ovary lobes), entire or 2–4-fid or twice 2-fid; stigmas various. **Fruit** usually a schizocarp of four 1-seeded nutlets (mericarps), or drupaceous with four 1-seeded stones, rarely a 1- or 2-seeded loculicidal capsule; gynobase (receptacle) conical or pyramidal or flat. **Seeds** erect, oblique or horizontal; endosperm 0 or scanty; embryo straight.

Genera ± 131, species ± 2500; widely distributed in mainly temperate and tropical regions of the Old and New World, with a major centre of diversity in the Mediterranean; sthn Afr.: genera 17 (4 exotic), species ± 105.

Jussieu: 128 (1789) as Borragineae; Candolle: 466 (1845) as Borragineae; Boissier: 123 (1879); Gürke: 71 (1897); Wright: 2 (1904); Lawrence: 684 (1951); Phillips: 625 (1951); Melchior: 431 (1964); Friedrich-Holzhammer: 1 (1967b); Riedl: 1 (1967); Taton: 1 (1971); Valentine & Chater: 83 (1972); Airy Shaw: 150 (1973); Mabberley: 74 (1989); Martins: 59 (1990); Al-Shehbaz: 1 (1991); Nowicke & Miller: 3 (1991); Verdcourt: 1 (1991); Zomlefer: 218 (1994); Riedl: 43 (1997).

Asperifoliaceae Rchb.: 118 (1828).

Classification of Boraginaceae

I. Subfamily WELLSTEDIOIDEAE: *Wellstedia*
II. Subfamily EHRETIOIDEAE: *Ehretia*
III. Subfamily CORDIOIDEAE: *Cordia*
IV. Subfamily HELIOTROPIOIDEAE: *Heliotropium*
V. Subfamily BORAGINOIDEAE
1. Tribe **Trichodesmeae**: *Trichodesma*
2. Tribe **Cynoglosseae**: *Afrotysonia*, *Cynoglossum*
3. Tribe **Eritrichieae**: **Amsinckia*, *Lappula*, **Rochelia*
4. Tribe **Myosotideae**: *Myosotis*
5. Tribe **Echieae**: *Echiostachys*, **Echium*, *Lobostemon*
6. Tribe **Lithospermeae**: **Buglossoides*, *Lithospermum*
7. Tribe **Boragineae**: *Anchusa*

Key to genera

1a Style terminal; fruit a capsule, drupaceous or breaking into 4 distinct 1-seeded nutlets (mericarps) or cohering in pairs; herbs, shrubs or trees:
2a Style undivided; flowers 5-merous; stigma usually ring-like below apex of style; fruit breaking into 4 distinct 1-seeded nutlets or cohering in pairs ..... **Heliotropium**
2b Style 2- or 4-fid; flowers 4- or 5-merous; stigma capitate or 0; fruit a capsule or drupaceous; perennial herbs, dwarf shrubs, shrubs, trees:
3a Flowers 4-merous; fruit a capsule; style 2-fid; perennial herbs becoming woody at stem bases ..... **Wellstedia**
3b Flowers 5-merous; fruit drupaceous; style 2- or 4-fid; perennial herbs, shrubs or trees:
4a Style 2-fid, the 2 branches each terminating in a capitate stigma; fruit a drupe, subglobose, with four 1-seeded stones ..... **Ehretia**
4b Style 4-fid, the 4 branches each terminating in an elongate or subcapitate stigma; fruit drupaceous with one stone, up to 4-locular but only one or two locules fertile ..... **Cordia**
1b Style gynobasic, fixed on a disc-like base between nutlets or apically on a conical or pyramidal gynobase (receptacle); fruit of 1 (*Trichodesma physaloides*) or 4 (rarely 2 or 3 by abortion) nutlets; annual or perennial herbs, occasionally shrubs:
5a Style on a conical or pyramidal gynobase (receptacle):
6a Calyx strongly accrescent in fruit; anthers with connectives prolonging into long, twisted appendages above thecae, androecium cone-like ..... **Trichodesma**
6b Calyx not or only slightly accrescent in fruit; anthers without prominent terminal appendages:
7a Stamens exserted, filaments long; corolla tube with small swellings at base ..... **Afrotysonia**
7b Stamens included, anthers subsessile; corolla tube without a swelling at base:
8a Nutlets 2, outer surface of nutlet with glochidia stellately arranged ..... ***Rochelia**
8b Nutlets 4:
9a Outer surface of nutlet verrucose ..... ***Amsinckia**
9b Outer surface of nutlet with glochidia (not stellately arranged):
10a Inflorescence ebracteate; nutlets attached to gynobase for the whole of their length ..... **Cynoglossum**
10b Inflorescence bracteate; nutlets attached to gynobase for only part of their length ..... **Lappula**
5b Style fixed basally on a disc-like gynobase (receptacle):
11a Corolla contorted in bud; anther connective prolonged into a small trulliform appendage ..... **Myosotis**
11b Corolla imbricate in bud; anther connective blunt, not prolonged:
12a Filaments with hairs, scales or protuberances present at base; corolla throat naked:
13a Ring, composed of a minute collar or 5–10 minute hairy lobules, present at base of corolla tube on inside; corolla irregular, bilabiate ..... ***Echium**
13b Hairs or scales present at base of filaments; corolla usually regular:
14a Filaments with hairs, sometimes tufted, at or near base ..... **Echiostachys**
14b Filaments with densely hairy scales, ridges or protuberances at base ..... **Lobostemon**
12b Filaments without hairs, scales or protuberances; corolla throat with vertical nectar guides, glandular appendages or scales:
15a Corolla throat bearing 5 well-developed, elongate, vertical nectar guides ..... ***Buglossoides**
15b Corolla throat without nectar guides, but with glandular appendages or scales:
16a Glandular appendages present in throat; nutlets without a collar-like ring around base ..... **Lithospermum**
16b Fornices present in throat; nutlets with a distinct, thickened, collar-like ring around base ..... **Anchusa**

Afrotysonia Rauschert 7072010

Rauschert: 558 (1982); Gürke: 98 (1897); Wright: 12 (1904); Mill: 467 (1986).

Tysonia Bolus: t. 1942 (1890) in part.

Perennial, erect herbs, pubescent; stems single, finely striate, terete. **Leaves** long-petiolate or sessile. **Flowers** in a branched panicle of 8–15-flowered helicoid cymes; pedicels ebracteolate, elongating considerably in fruit. **Calyx** divided nearly to base into 5 equal, lanceolate lobes; scarcely accrescent in fruit. **Corolla** white to dull yellow; tube campanulate or subrotate; faucal scales exserted from corolla throat, trapeziform, usually ob-

long-triangular; lobes 5, ovate, obtuse, sometimes rather fleshy. **Stamens** exserted; with filaments arising in middle of corolla tube, well below faucal scales; anthers oblong to ovoid. **Nectary scales** ± 10, situated at extreme base of corolla tube, each with 2 divergent horns. **Disc** thick, semiglobose. **Ovary** 4-lobed; gynobase conical; style gynobasic, filiform, subequalling stamens or slightly shorter; stigma small, capitate. **Fruit** of 1 or 4 nutlets; nutlets either depressed, wingless and densely glochidiate or strongly laterally compressed, lacking glochids but with broad, cartilaginous, ± undulate wing.

Species 3, Africa; 2 in sthn Afr.: *Afrotysonia africana* (Bolus) Rauschert and *A. glochidiata* (R.R.Mill) R.R.Mill, KwaZulu-Natal and Eastern Cape.

*Amsinckia Lehm. 7082000

Lehmann: 7 (1831); Candolle: 117 (1846); Bentham: 851 (1876); Gürke: 106 (1897); Brand: 204 (1921); Chater: 110 (1972); Al-Shehbaz: 98 (1991).

Annual herbs, often laxly decumbent, hispid or setose. **Leaves** alternate, usually lanceolate. **Flowers** in terminal, helicoid, usually ebracteate cymes. **Calyx** with 5 lanceolate lobes, some lobes sometimes connate; accrescent. **Corolla** yellow or orange, with a cylindrical tube, naked in throat, lobes 5, swollen at base, short-oblong. **Stamens** arising in upper part of corolla tube, included; anthers subsessile. **Ovary** 4-lobed, 4-locular, with a single ovule in each locule; gynobase pyramidal; ovules with a narrow, membranous, marginal rim; style gynobasic, almost as long as corolla tube, filiform; stigma capitate. **Fruit** of 4 nutlets; nutlets ovoid-trigonous, usually verrucose, attached to receptacle for only part of length; gynobase pyramidal. $x = 6, 17$ (8, 13, 29) (aneuploids, polyploidy).

Species ± 15, mainly in Central America; 2 introduced in sthn Afr.: **Amsinckia calycina* (Moris) Chater and **A. menziesii* (Lehm.) A.Nelson & J.F.Macbr., Northern, Western and Eastern Cape.

Anchusa L. 7093000

Linnaeus: 133 (1753); Linnaeus: 64 (1754); Candolle: 41 (1846); Bentham: 855 (1876); Gürke: 112 (1897); Wright: 16 (1904); Riedl: 232 (1967); Chater: 106 (1972).

Annual or perennial herbs, variously hairy. **Leaves** alternate, rosulate at base, sessile, linear or linear-lanceolate. **Flowers** in terminal, dichotomous cymes or simple, unilateral racemes at length loosely panicled; cymes scorpioid, bracteate. **Calyx** ± deeply 5-lobed; with campanulate tube; lobes linear, slightly enlarged in fruit. **Corolla** purple, blue or white; tube straight, cylindrical, short or of medium length; throat equal or slightly enlarged, with 5 ovate or oblong, papillose or hairy scales opposite lobes; lobes 5, imbricate, shorter than tube. **Stamens** arising in middle of corolla tube, included; filaments filiform; anthers linear, oblong, obtuse, longer than filaments. **Ovary** 4-lobed, 4-locular, with a single ovule in each locule; gynobase disc-like; style gynobasic, semiterete, as long as corolla tube; stigma capitate. **Fruit** of 4 nutlets; nutlets strongly convex on back, with marginal rim on face, rugose, a thickened collar-like ring present at base. $x = 6, 8$ (7, 11) (aneuploids, polyploidy, B-chromosomes).

Species ± 35, in Europe, North Africa and W Asia; 2 in sthn Afr.: **Anchusa azurea* Mill., introduced from Europe and *A. capensis* Thunb., indigenous in Namibia, Free State, Lesotho, Northern, Western and Eastern Cape.

*Buglossoides Moench 7109010

Moench: 418 (1794); Fernandes: 87 (1972); Al-Shehbaz: 129 (1991).

Annual or perennial herbs, rarely dwarf shrubs; usually hispidulous-strigillose; roots often purplish red. **Leaves** sessile or somewhat amplexicaul at base; lanceolate, linear-oblong, narrowly elliptic or oblanceolate. **Flowers** in terminal, scorpioid, bracteate cymes. **Calyx** divided almost to base into 5 narrow lobes, somewhat accrescent in fruit. **Corolla** white, blue or purple; tube infundibuliform or hypocrateriform; throat with 5 well-differentiated, longitudinal bands of hair and/or glands extending from base of corolla lobes downward to between tips of anthers; lobes 5, imbricate, rounded or truncate; annulus near base of corolla tube consisting of scale-like lobes or a narrow collar. **Stamens** included; filaments equal, shorter than anthers, arising below middle of tube; anthers oblong with a short apical appendage. **Ovary** 4-lobed, 4-locular; gynobase disc-like; style gynobasic, included, ± the same height as anthers; stigmas 2, subterminal. **Fruit** of 4 nutlets; nutlets erect to strongly divergent, ovoid to subpyriform, with a ± incurved or almost straight beak, rugose, tuberculate or smooth; attachment scar basal or nearly so, conspicuous. $x = 7$ (8) (polyploidy).

Species 15, in Europe and Asia; **Buglossoides arvensis* (L.) I.M.Johnst., naturalised in parts of sthn Afr., North-West, Gauteng, Free State, Lesotho, Northern and Eastern Cape.

Cordia L. 7038000

Linnaeus: 190 (1753); Linnaeus: 87 (1754); Candolle: 471 (1845); Bentham: 838 (1876); Boissier: 123 (1879); Gürke: 81 (1897); Wright: 4 (1904); Taton: 3 (1971); Warfa: 1 (1988); Martins: 60 (1990); Al-Shehbaz: 43 (1991); Miller: 8 (1991); Verdcourt: 3 (1991); Riedl: 68 (1997).

Trees or shrubs, variously hairy. **Leaves** alternate, rarely subopposite, petiolate, entire or coarsely toothed. **Flowers** usually yellow or white, bi- or unisexual, subsessile or pedicellate; borne in terminal or axillary dichotomous corymbs, panicles or subglobose clusters of cymes, the branches scorpioid, inflorescences ebracteate. **Calyx** tubular or campanulate; tube as long as corolla tube; lobes 3–5, shorter than tube, ovate; persistent, accrescent. **Corolla** white or yellow, with tube funnel- or salver-shaped; lobes 5, rarely 3–8, oblong, erect, spreading or reflexed, imbricate or somewhat contorted in bud. **Stamens** arising in mouth of corolla tube, included or exserted; filaments linear, glabrous or pubescent at base; anthers oblong. **Ovary** 4-locular with a thick, fleshy wall and a single, erect ovule in each locule; style terminal, 2-branched, with each branch 2-fid; stigmatic branches clavate or linear. **Fruit** a drupe, surrounded at base by a saucer-shaped calyx, with 1 stone, up to 4-locular but only 1 or 2 locules fertile. $x = 7, 8$ (6) (aneuploids, polyploidy).

Species 250–300, in tropical regions of both hemispheres, mainly America; 6 in sthn Afr., widespread except Northern and Western Cape.

Cynoglossum L. 7064000

Linnaeus: 134 (1753); Linnaeus: 65 (1754); Candolle: 146 (1846); Bentham: 848 (1876); Boissier: 263 (1879); Gürke: 98 (1897); Wright: 13 (1904); Brand: 114 (1921); Taton: 50 (1971); Martins: 102 (1990); Al-Shehbaz: 112 (1991); Nowicke & Miller: 25 (1991); Verdcourt: 102 (1991); Riedl: 79 (1997).

Paracynoglossum Popov: 717 (1953).

Perennial or biennial herbs, slightly branched, variably hairy. **Leaves** alternate; basal ones often long-petiolate, usually elliptic, cauline ones sessile, elliptic or lanceolate. **Flowers** in terminal or axillary, scorpioid cymes; cymes lengthen considerably in fruit, ebracteate; pedicellate or subsessile, bisexual. **Calyx** with a shallow tube; deeply 5-lobed, lobes ovate, elliptic or oblong, spreading or reflexed; not or slightly accrescent. **Corolla** white or blue; tube short, cylindrical or funnel-shaped,

with 5 crescent-shaped scales (fornices) in throat; lobes 5, spreading, ovate to broadly ovate, apices usually obtuse. **Stamens** included, arising at base of tube or just below scales, alternating with them; filaments very short; anthers ovate, elliptic to oblong, obtuse. **Ovary** 4-lobed, adhering to central stylar column only by part of internal face of each lobe; gynobase conical; style gynobasic, terete; stigma capitate. **Fruit** of 4 nutlets; nutlets depressed ovoid, densely covered with glochidia or smooth in part, glochidia often joined together to form a definite margin. $x = 6$ (high polyploidy).

Species ± 75, cosmopolitan in temperate and subtropical regions; 8 in sthn Afr., widespread, but absent from Namibia and Botswana.

Echiostachys Levyns 7117010

Levyns: 445 (1934); Phillips: 632 (1951).

Perennial herbs with somewhat woody rootstocks. **Leaves** linear-lanceolate, often tufted. **Flowers** in a dense pseudospike which is composed of many short cymes on a stout axis, occasionally interrupted at base, but rarely branched, elongating somewhat in fruit. **Calyx** of 5 free or nearly free sepals, conspicuously densely villous. **Corolla** white, pale blue or pink; with narrowly funnel-shaped tube and 5 obtuse, regular lobes. **Stamens** equal or subequal, arising in corolla tube, exserted; filaments with hairs at or near base, usually tufted. **Ovary** 4-lobed; gynobase disc-like; style simple, gynobasic; stigma small, obscurely 2-fid. **Fruit** of 4 nutlets; nutlets rugose-tuberculate or almost smooth.

Species 3, endemic in Western Cape.

*Echium L. 7118000

Linnaeus: 139 (1753); Linnaeus: 175 (1754); Candolle: 13 (1846); Bentham: 863 (1876); Boissier: 204 (1879); Gürke: 128 (1897); Wright: 43 (1904); Riedl: 213 (1967); Gibbs: 97 (1972); Al-Shehbaz: 137 (1991); Verdcourt: 81 (1991); Retief & Van Wyk: 167 (1998).

Annual, biennial or perennial herbs or shrubs, scabrid, hispid or canescent. **Leaves** alternate or whorled, sessile or petiolate, densely hairy. **Flowers** in unilateral, simple or forked scorpioid cymes; bracts small or foliaceous. **Calyx** divided into 5 short segments; usually accrescent. **Corolla** blue or purplish blue, bilabiate; tube broadly to narrowly funnel-shaped, straight, ± hairy outside, inside usually with a ring of 5–10 distinct scales or lobes or an undulate, entire, somewhat fleshy, collar-like membrane at base; throat ± oblique, open; with 5 short, obtuse lobes. **Stamens** sometimes unequal, 2 arising near base of corolla tube, 3 higher up, the longer ones exserted; filaments linear, glabrous or with a few, long hairs; anthers versatile. **Disc** present. **Ovary** 4-lobed, with a single ovule in each locule; gynobase disc-like; style gynobasic, exserted, linear, 2-fid; stigmas obtuse. **Fruit** of 4 nutlets; nutlets convex on one face, bluntly keeled on other, usually rugose. $x = 8$ (7, 6) (aneuploids, high polyploidy).

Species 60, mainly endemic in Madeira, the Azores and Canary Islands, but also in Africa and Asia; 2 naturalised in sthn Afr.: **Echium plantagineum* L. and **E. vulgare* L., Gauteng, Mpumalanga, Free State, KwaZulu-Natal, Lesotho, Western and Eastern Cape.

Ehretia P.Browne 7043000

Browne: 168 (1756); Linnaeus: 936 (1759); Candolle: 502 (1845); Bentham: 840 (1876); Boissier: 124 (1879); Gürke: 87 (1897); Wright: 4 (1904); Taton: 19 (1971); Martins: 75 (1990); Miller: 20 (1991); Verdcourt: 33 (1991); Riedl: 91 (1997).

Trees or shrubs, variously hairy. **Leaves** alternate or clustered on short side branches, sessile or shortly petiolate, obovate to orbicular, usually with entire margins; variously hairy or if surface glabrous then with hairs densely arranged along margin. **Flowers** white or blue to mauve, bisexual or polygamous, sessile or pedicellate in much branched, axillary or terminal cymose inflorescences, the individual cymules mostly scorpioid. **Calyx** with a shallow tube; lobes 5, lanceolate, hairy outside but glabrous inside. **Corolla** with tube very short or longer than lobes; lobes (4)5(–7), imbricate, oblong, spreading or reflexed. **Stamens**: filaments linear, arising in throat of corolla tube, usually exserted; anthers oblong, lobed at base. **Ovary** 2-locular, 2-ovuled or 4-locular with a single ovule at or above middle of each locule; style terminal, flattened, 2-fid with stigmas capitate. **Fruit** subglobose, drupaceous; with 4 1-seeded stones. $x = 13, 8$ (6, 10) (polyploidy).

Species ± 75, in the tropics of both Old and New World, particularly in Africa and Asia, a few in tropical America and West Indies; 3 in sthn Afr., widespread.

Heliotropium L. 7052000

Linnaeus: 140 (1753); Linnaeus: 63 (1754); Candolle: 532 (1845); Bentham: 843 (1876); Boissier: 125 (1879); Gürke: 90 (1897); Wright: 7 (1904); Friedrich-Holzhammer: 1 (1967a); Taton: 28 (1971); Martins: 83 (1990); Al-Shehbaz: 74 (1991); Nowicke & Miller: 29 (1991); Verdcourt: 50 (1991); Riedl: 99 (1997).

Annual or perennial herbs, sometimes subshrubs, rarely shrubs, usually hairy. **Leaves** alternate, rarely subopposite, sessile or petiolate, entire or denticulate. **Flowers** usually small, many, sessile, in unilateral, terminal or pseudoaxillary helicoid cymes with cymes simple or peduncle dichotomously branched to give a pair of cymes or flowers solitary at apices of leafy branches; bracts present or 0. **Calyx** with a short tube; 5-lobed, lobes lanceolate or linear. **Corolla** white, cream, yellow or orange yellow; tube usually cylindric, glabrous or hairy, throat often pubescent; lobes 5, variably shorter than tube, spreading. **Disc** present or 0. **Stamens** arising on corolla tube, included; filaments very short. **Ovary** completely or incompletely 4- or 5-locular with a single, pendulous ovule in each locule; gynobase flat; anthers elliptic-oblong or lanceolate, sometimes pubescent at apices; style terminal, undivided, included; stigma conical at apex, with a broad ring at base of cone. **Fruit** dry or somewhat fleshy, usually with 4 distinct 1-seeded nutlets, or nutlets cohering in pairs or reduced to 1 nutlet by abortion; nutlets with outer surface variable. $x = 13, 8$ (7) (aneuploids, high polyploidy).

Species ± 250, in tropical to warm, temperate regions, particularly in ± arid areas; 20 in sthn Afr., widespread but not recorded from Lesotho and Western Cape.

Lappula Moench 7073000

Moench: 416 (1794); Candolle: 135 (1846); Gürke: 106 (1897); Brand: 136 (1921); Riedl: 68 (1967); Al-Shehbaz: 108 (1991).

Echinospermum Sw. ex Lehm.: 113 (1818).

Annual herbs, rarely biennial. **Leaves** alternate, linear. **Flowers** in terminal, often dichotomously branched, helicoid cymes; small, sessile or pedicellate; pedicels bracteate or upper ones naked, sometimes thickened in fruit. **Calyx** very deeply 5-lobed, lobes linear; accrescent. **Corolla** blue or white; tube funnel- or salver-shaped with 5 scales in throat opposite lobes; lobes 5, oblong-elliptic. **Stamens** arising on corolla tube, included; anthers subsessile. **Ovary** shortly 4-lobed, with a single, laterally attached ovule in each locule; gynobase pyramidal; style gynobasic, short, terete; stigma capitate. **Fruit** of 4 nutlets; nutlets ovoid-trigonous to oblong, with 1 or 2 rows of cylindrical, conical or flattened glochidia, usually attached to receptacle for only

part of their length on the margin. $x = 12$ (11, 23) (aneuploids).

Species ± 50, mainly in temperate Europe and Asia, few in North America and Australia; 1 indigenous in sthn Afr.: *Lappula capensis* (DC.) Gürke, Western and Eastern Cape; **L. squarrosa* (L.) Dumort. subsp. *heteracantha* (Ledeb.) Chater naturalised in Gauteng, Free State, KwaZulu-Natal, Lesotho, and Eastern Cape.

Lithospermum L. 7109000

Linnaeus: 132 (1753); Linnaeus: 64 (1754); Candolle: 73 (1846); Bentham: 860 (1876); Boissier: 216 (1879); Gürke: 118 (1897); Wright: 20 (1904); Riedl: 148 (1967); Taton: 56 (1971); Martins: 108 (1990); Al-Shehbaz: 119 (1991); Verdcourt: 77 (1991).

Perennial, rarely annual or biennial, erect or spreading herbs, undershrubs or shrubs, roughly canescent or hispid. **Leaves** alternate, usually sessile, linear to lanceolate, entire. **Flowers** in leafy terminal or axillary, helicoid cymes. **Calyx** with shallow tube; 5-lobed to more than halfway, lobes linear to lanceolate, usually much shorter than corolla tube. **Corolla** yellow, orange or white; tube subcampanulate with 5 hairy cushions in throat opposite lobes or with 5 folds intruded from outer surface; lobes 5, shorter than tube, imbricate in bud, ovate, obovate or semicircular. **Stamens**: filaments arising near middle of corolla tube, included; anthers longer than filaments. **Disc** a ring of nectaries, lobes or small hairs. **Ovary** 4-lobed, 4-locular, with a solitary ovule in each locule; gynobase disc-like; style gynobasic, filiform, simple or slightly 2-fid, included or exserted; stigmas 2, terminal or situated just below 2-fid apex of style, usually globose. **Fruit** of 4 nutlets; nutlets white, shiny, bony, ovoid or ellipsoid, convex on back, keeled on face. $x = 7$ (8, 6) (aneuploids, high polyploidy).

Species ± 45, mainly in temperate regions of both hemispheres, particularly in Mexico and North America; 9 in sthn Afr, not recorded from Botswana and Western Cape.

Lobostemon Lehm. 7117000

Lehmann: 378 (1830); Candolle: 4 (1846); Bentham: 863 (1876); Gürke: 128 (1897); Wright: 25 (1904); Levyns: 393 (1934).

Subshrubs or shrubs, variably scabrid, hispid or villous, rarely almost glabrous. **Leaves** alternate, sessile, margins entire. **Flowers** in terminal or axillary scorpioid cymes, elongating in fruit, or in pseudospikes; usually with conspicuous bracts. **Calyx** with 5 sepals, divided to base or nearly so, rarely joined for part of their length, similar or dissimilar. **Corolla** blue, ageing pink, cylindric or funnel-shaped, naked in throat, densely hairy scales, ridges or protuberances present at bases of filaments; lobes 5, equal or 2 lobes larger than other 3, erect or spreading. **Stamens** exserted or included; filaments equal or unequal, glabrous; anthers subglobose, obtuse. **Disc** flat or convex. **Ovary** 4-lobed; gynobase disc-like; style simple, gynobasic, hairy or glabrous; stigma minutely bilobed. **Fruit** of 4 nutlets; nutlets ovoid-trigonous or acuminate, rugose-tuberculate to almost smooth. $x = 7$ (polyploidy).

Species 30, endemic in Northern, Western and Eastern Cape.

Myosotis L. 7100000

Linnaeus: 131 (1753); Linnaeus: 63 (1754); Candolle: 104 (1846); Bentham: 858 (1876); Boissier: 234 (1879); Gürke: 118 (1897); Wright: 18 (1904); Stroh: 317 (1942); Riedl: 255 (1967); Grau & Merxmüller: 111 (1972); Al-Shehbaz: 159 (1991); Verdcourt: 86 (1991).

Annual or perennial herbs, usually hairy. **Leaves** alternate, mostly oblong or lanceolate, entire; basal ones shortly petiolate, cauline ones sessile. **Flowers** in simple or dichotomously branched, terminal and axillary scorpioid cymes, cymes lengthening considerably in fruit; bisexual. **Calyx** with a very shallowly campanulate tube; 5-lobed to below middle, lobes linear-lanceolate to oblong; not or slightly enlarging in fruit. **Corolla** white or blue; tube cylindric or campanulate, usually with appendages in throat opposite lobes; 5-lobed to ± halfway. **Stamens** arising in corolla tube, included or exserted; filaments filiform; anthers linear, with connective prolonged into a small trulliform appendage. **Ovary** on disc; deeply 4-lobed with a solitary ovule in each locule; gynobase disc-like; style gynobasic, filiform; stigma obtuse. **Fruit** of 4 nutlets; nutlets erect, oblong-ovoid, glabrous, shiny, fixed by a small basal areole to gynobase. $x = 12$, 11 (8) (aneuploids, high polyploidy).

Species ± 100, cosmopolitan, mostly in the temperate regions of the Old World, particularly Europe and New Zealand but a few in Africa; 7 in South Africa, Lesotho and Swaziland.

***Rochelia** Rchb. 7124000

Reichenbach: 243 (1824); Candolle: 175 (1846); Bentham: 852 (1876); Boissier: 243 (1879); Gürke: 130 (1897); Riedl: 89 (1967); Ferguson: 110 (1972).

Annual, rarely perennial herbs, variously hairy. **Leaves** alternate, rosulate at base, elliptic to oblong. **Flowers** in bracteate, scorpioid cymes, forming lax terminal panicles. **Calyx** lobed to base; lobes 5, linear, accrescent. **Corolla** usually blue; tube cylindrical, usually with 5 scales or invaginations in throat; lobes 5, ovate. **Stamens** included, arising ± in middle of tube. **Ovary** 2-locular; gynobase pyramidal; style gynobasic, included; stigma capitate. **Fruit** of 2 nutlets; nutlets subpyriform, attached to receptacle for most of their length, glochidiate. $x = 10$, 11 (1 report each).

Species ± 20, in Eurasia: 1 in sthn Afr.: **Rochelia disperma* (L.f.) C.Koch from Spain, in Western Cape.

Trichodesma R.Br. 7056000

Brown: 496 (1810) name conserved; Lehmann: 192 (1818); Candolle: 171 (1846); Bentham: 845 (1876); Boissier: 280 (1879); Gürke: 99 (1897); Baker & Wright: 44 (1906); Brand: 19 (1921); Riedl: 219 (1967); Brummitt: 94 (1990); Nowicke & Miller: 24 (1991); Verdcourt: 91 (1991).

Borraginoides Boehm.: 18 (1760). *Pollichia* Medik.: 247 (1783). *Friedrichsthalia* Fenzl: 53 (1839). *Leiocarya* Hochst.: 30 (1844).

Erect, annual or perennial herbs, or subshrubs, variously hairy. **Leaves** with lower ones usually opposite or subopposite, upper ones usually alternate, sessile. **Flowers** pedicellate, in a bracteate, one-sided cyme or in a branching system of ebracteate, very lax cymes. **Calyx** deeply divided into 5 or 6 lobes; lobes ovate to lanceolate, with rounded to cordate bases, apices narrow to cuspidate, often winged; strongly accrescent in fruit. **Corolla** blue or white; tube campanulate to funnel-shaped, throat naked; lobes 5 or 6, ovate-acuminate or broadly triangular, often spreading or reflexed. **Stamens** arising on corolla tube, sessile or with very short, flattened filaments; anthers oblong or linear-lanceolate, with connectives prolonged above, the whole androecium converging above to form a cone with connective prolongations twisted together at apex, connectives with long, shaggy hairs on their dorsal surface. **Ovary** 4-lobed, 4-locular; gynobase pyramidal; style gynobasic or terminal, long and subulate; stigma small, subglobose. **Fruit** of 4 ovoid nutlets, smooth or variously ornamented, or of a single, sessile nutlet; nutlets enclosed in enlarged calyx. $x = 12$, 11.

Species ± 45, mainly in tropical and subtropical regions of Africa to Asia and Australia; 4 in sthn Afr., not recorded from Western Cape.

Wellstedia Balf.f. 7131000

Balfour: 407 (1884); Gürke: 131 (1897); Pilger: 558 (1912); Phillips: 633 (1951); Friedrich-Holzhammer: 121 (1967c) as Wellstediaceae; Hunt: t. 3665 (1969); Thulin & Johanssen: 80 (1996).

Dwarf shrubs, densely, silky hairy with appressed hairs. **Branches** decumbent or ascending. **Leaves** alternate, oblanceolate. **Flowers** in dense, scorpioid cymes or solitary, well-separated, on lax branches; small, regular. **Calyx** deeply 4-lobed. **Corolla** pink or white, with a short, campanulate, membranous, 8-nerved tube, slightly constricted at throat; lobes 4, ovate, ± as long as tube. **Stamens** arising in corolla throat, shorter than corolla lobes; filaments linear; anthers subglobose, ± as long as filaments, with 2 parallel thecae dehiscing introrsely. **Disc** none. **Ovary** bilocular, compressed, densely hairy, with a single ovule in each locule; style terminal, 2-fid at apex; stigmas small, globose. **Fruit** a capsule, loculicidally dehiscent. **Seeds** without endosperm.

Species 4, 3 in Somalia, Socotra and Ethiopia; 1 in sthn Afr.: *Wellstedia dinteri* Pilg., Namibia and northern Namaqualand (Northern Cape).

Brassicaceae (Cruciferae)

(Dilleniidae—Capparales)

Compiled by L.L. Dreyer & M. Jordaan

Annual, biennial or perennial herbs, suffrutices and shrubs, glabrous or hairy; hairs simple, medifixed, branched, stellate or glandular. **Leaves** mostly alternate, often crowded in a rosette in short-lived herbs, simple, trifoliolate or pinnate, entire or variously lobed or cut, often auriculate; stipules minute or 0. **Inflorescence** usually a terminal, usually bractless raceme, sometimes somewhat corymbose, occasionally a corymbose panicle, rarely intercalary or leaf-opposed, or flowers axillary, solitary. **Flowers** bisexual, usually regular. **Sepals** 4, free, in 2 pairs, equal or unequal, inner (lateral) pair often saccate or spurred at base. **Petals** 4(–0), free, entire, bilobed or fimbriate, usually clawed, sometimes with appendage at base. **Stamens** 6, lateral 2 shorter than median 4 arising in pairs, rarely only 2 or 4 or many; filaments with or without wings or appendages; anthers 2-thecous, opening by longitudinal slits. **Nectaries** at base of filaments variable in number and form. **Ovary** superior, sessile or stipitate, 2-celled or sometimes septum absent and then 1-celled; placentation parietal; ovules in (1)2 rows separated by the septum, generally pendulous, 1–many per locule; style simple, short or long; stigma capitate or bilobed. **Fruit** basically a capsule divided into 2 locules by the persistent septum (replum) to which seeds are attached; referred to as a silicula (short) or siliqua (long), frequently with seed-bearing beak, usually dehiscing by 2 valves falling to reveal septum, rarely indehiscent or transversely articulate; some fruit latiseptate (with a broad septum, because fruit are flattened parallel to the septum), or angustiseptate (with narrow septum because fruit are flattened at right angle to the septum). **Seeds** discoid to globose, often winged, seed coat often mucilaginous; embryo folded double with radicle lying against sides (accumbent) or backs of cotyledons (incumbent); cotyledons linear to circular, variously folded or rolled; endosperm 0 or little.

Genera 390, species ± 3000, cosmopolitan, but mostly in northern, temperate regions, especially the Mediterranean and Middle East; sthn Afr.: genera 34 (20 exotic), species 153 (37 exotic); many of economic importance.

Sonder: 19 (1860); Schulz: 227 (1936); Phillips: 347 (1951); Exell: 190 (1960); Schreiber: 48 (1966); Marais: 1 (1970); Jonsell: 1 (1982); Jonsell: 62 (1993).

Classification of Brassicaceae

[after Schulz (1936), Jonsell (1982) & Takhtajan (1997)]

Tribe **Chamireae** (Fruit a shortly stipitate siliqua; cotyledons persistent, leaf-like, folded longitudinally, with margins deeply folded in again; filaments not appendiculate; hairs absent): *Chamira*

Tribe **Heliophileae** (Fruit a siliqua; cotyledons twice transversely folded; filaments with appendages or papillate at base; hairs absent or simple): *Cycloptychis*, *Heliophila*, *Thlaspeocarpa*

Tribe **Brassiceae** (Fruit usually a siliqua with a distinct, few-seeded to seedless stylar beak, or transversely septate into an upper and lower segment; cotyledons longitudinally folded, spirally or incumbent or accumbent; filaments rarely with appendages; hairs simple or absent): **Brassica*, **Crambe*, **Diplotaxis*, **Eruca*, *Erucastrum*, **Hirschfeldia*,**Raphanus*, **Rapistrum*, **Sinapis*

Tribe **Sisymbrieae** (Fruit a siliqua, rarely a silicula; cotyledons incumbent; filaments linear, not appendiculate; hairs branched, forked or simple): **Arabidopsis*, **Descurainia*, *Sisymbrium*

Tribe **Arabideae** (Fruit a siliqua, very rarely a silicula; cotyledons accumbent, rarely incumbent; filaments linear, not appendiculate, sometimes flattened or thickened at base; hairs branched or simple): *Aplanodes*, **Barbarea*, *Cardamine*, *Rorippa*, **Turritis*

Tribe **Lepidieae** (Fruit a narrowly septate silicula, usually dehiscent; cotyledons incumbent or accumbent; filaments often appendiculate or widened; hairs branched or simple): *Brachycarpaea*, **Camelina*, **Capsella*, **Cardaria*, **Coronopus*, **Hymenolobus*, *Lepidium*, **Thlaspi*

Tribe **Hesperideae** (Fruit a broadly septate, flat or inflated silicula, rarely elongated into a siliqua; cotyledons accumbent; filaments linear or appendiculate; hairs mostly branched: stellate, forked, 2-fid or rarely simple): **Alyssum*, **Lobularia*, **Matthiola*

Tribe **Lunarieae** (Fruit a compressed silicula; cotyledons twice transversely folded; filaments not appendiculate; hairs absent): *Schlechteria*, *Silicularia*

Key to genera

1a Lowermost pair of 'leaves' opposite, sessile, amplexicaul, broader than long, upper leaves alternate or subopposite, petiolate, cordate at base; cotyledons very broad, folded longitudinally and their margins deeply folded in again ..... **Chamira**

1b Lower leaves alternate or opposite, but neither sessile, amplexicaul and broader than long, nor, if opposite, with petiolate, cordate upper leaves; cotyledons narrower, if longitudinally folded, not with margins deeply rolled in:

2a Inflorescences lateral, mostly opposite leaves ..... ***Coronopus**

2b Inflorescences terminal or in leaf axils:

3a Fruit transversely articulate with 2 or more segments which separate at maturity; lower segment indehiscent or whole fruit breaking into 1-seeded portions:

4a Upper segment of fruit cylindrical, oblong-ovoid or ± conical, sometimes constricted between seeds ..... ***Raphanus**

4b Upper segment of fruit globose or ovoid, sometimes beaked:

5a Upper segment not beaked, style absent; flowers white ..... ***Crambe**

5b Upper segment beaked, style persistent; flowers pale yellow, sometimes with red veins ..... ***Rapistrum**

3b Fruit not transversely articulate; siliquae or siliculae opening by valves or breaking into 1-seeded portions, or hard and indehiscent:
6a Fruit at least 4 times as long as broad (including length of style or beak):
7a Hairs simple or absent:
8a Upper stem leaves with clasping auricles:
9a Upper stem leaves not divided; stems round ..... *Brassica
9b Upper stem leaves divided; stems angled ..... *Barbarea
8b Upper stem leaves without clasping auricles:
10a Stem leaves pinnate, pinnatisect, trifoliolate or digitate:
11a Seeds in 2 rows, rarely irregularly in 1 row; flowers white or yellow; fruit subterete, valves with inconspicuous midrib ..... Rorippa
11b Seeds in 1 row; flowers white, mauve, lilac or purple:
12a Valves 1–3(–7)-nerved; leaves pinnately or sub-bipinnately partite ..... Heliophila
12b Valves apparently nerveless; leaves trifoliolate or pinnate with petiolulate leaflets or leaves pinnately lobed ..... Cardamine
10b Stem leaves simple, toothed or lobed to pinnatifid:
13a Petals white, blue, lilac, pink, mauve or purple ..... Heliophila
13b Petals yellow (sometimes white):
14a Seeds in 2 rows in each locule:
15a Beak large, flat, ensiform or lanceolate, never seed-bearing; valves hispid; flowers large, more than 15 mm long, yellow with dark veins ..... *Eruca
15b Style not beak-like, 1.5–2.5 mm long, narrowly cylindrical or ± obconical, sometimes seed-bearing; flowers small, less than 9 mm long, yellow, sometimes tinged with violet when fading ..... *Diplotaxis
14b Seeds in 1 row in each locule:
16a Valves of fruit 1-nerved:
17a Cotyledons incumbent or longitudinally folded around the incumbent radicle; style never beak-like and seed-bearing ..... Sisymbrium
17b Cotyledons always longitudinally folded around the incumbent radicle; style beak-like, often seed-bearing:
18a Fruit ± compressed or subterete, more than 2 mm wide; racemes ebracteate ..... *Brassica
18b Fruit ± quadrangular, less than 2 mm wide; racemes often bracteate, at least in lower part ..... Erucastrum
16b Valves of fruit 3- or more-nerved:
19a Fruit appressed, less than 1.5 mm in diam., valves 3-nerved, the nerves obscure in ripe fruit; seeds oblong to ovoid ..... *Hirschfeldia
19b Fruit spreading, more than 2.5 mm in diam., valves 3–5-nerved; seeds globose ..... *Sinapis
7b Hairs stellate, branched or a mixture of simple and branched hairs:
20a Plants glandular; petals longer than 10 mm; stigma deeply 2-lobed, lobes erect, each frequently with a dorsal swelling or horn ..... *Matthiola
20b Plants not glandular; petals shorter than 10 mm:
21a Stem leaves amplexicaul ..... *Turritis
21b Stem leaves not amplexicaul:
22a Upper stem leaves finely divided ..... *Descurainia
22b Upper stem leaves simple, entire or dentate:
23a Basal leaves in a rosette; stem leaves sessile; slender, small, annual or biennial herbs up to 300 mm tall ..... *Arabidopsis
23b Basal leaves not in a rosette; stem leaves petiolate; perennial herbs, up to 800 mm tall ..... Aplanodes
6b Fruit less than 3.5 times as long as broad:
24a Fruit angustiseptate (septum narrow because fruit is flattened at right angles to the septum):
25a Ovules 1–4; cotyledons narrow, linear:
26a Fruit indehiscent; stem leaves sagittate, amplexicaul; inflorescence a corymbose panicle ..... *Cardaria
26b Fruit breaking into two 1-seeded portions or valves falling away from the seeds; stem leaves not amplexicaul; inflorescences racemes:
27a Glabrous, perennial subshrubs, virgate, erect or procumbent; all leaves entire; flowers large, petals 8–20 mm long; valves of silicula papillose to rugose ..... Brachycarpaea
27b Glabrous herbs or shrublets; leaves variable; flowers small, petals 1–3 mm long; valves smooth ..... Lepidium
25b Ovules 6–24; cotyledons broad, elliptic to circular:
28a Upper stem leaves cuneate; plant glabrous or sparsely puberulous with simple hairs; fruit ellipsoid to obovoid, 2–3(5) mm long ..... *Hymenolobus
28b Upper stem leaves sagittate-amplexicaul; plants glabrous or with simple and branched hairs:
29a Fruit obovate-circular, 10–15 mm long, broadly winged all around, but wings broadest apically ..... *Thlaspi
29b Fruit obcordate-triangular, 6–9 mm long, 4–8 mm broad, emarginate, lateral margins almost straight ..... *Capsella
24b Fruit latiseptate (septum broad, fruit flattened parallel to the septum):
30a Plants with stellate, branched or medifixed hairs, sometimes mixed with simple hairs:
31a Stem leaves sagittate-amplexicaul ..... *Camelina

31b Stem leaves not sagittate-amplexicaul:
32a Plants with stellate hairs; flowers yellow; petals linear-oblong, broadly clawed, densely pubescent on back; each filament with wing-like appendage; sepals persistent whilst fruits mature ..... ***Alyssum**
32b Plants with medifixed hairs; flowers white or pinkish; petals with a circular blade, clawed, glabrous; filaments without appendages; sepals patent ..... ***Lobularia**
30b Plants with simple hairs or completely glabrous:
33a Annual or perennial herbs:
34a Fruit a siliqua, erect; seeds in 2 rows; valves with an indistinct midrib, appearing veinless..... **Rorippa**
34b Fruits subcircular, compressed, discoid, pendulous, 1-seeded; valves 1-nerved..... **Thlaspeocarpa**
33b Perennial woody shrublets, glabrous:
35a Petals mauve to purple; sepals 3-nerved; fruit dehiscent ..... **Cycloptychis**
35b Petals white or pale pink; fruit indehiscent:
36a Fruit erect, valves woody, margins thickened..... **Silicularia**
36b Fruit pendulous, compressed, valves membranous..... **Schlechteria**

*Alyssum L. 3006000

Linnaeus: 650 (1753); Linnaeus: 293 (1754); Sonder: 23 (1860); Schulz: 490 (1936); Phillips: 352 (1951); Ball: 297 (1964); Marais: 99 (1970).

Annual or perennial herbs or subshrubs; vegetative parts generally densely stellately hairy. **Leaves** simple, entire or dentate. **Inflorescence** dense, racemose or paniculate. **Sepals** erect-spreading, not saccate. **Petals** entire or emarginate, clawed, yellow. **Stamens** 6; all or only some filaments with appendages. **Nectaries** 4, on either side of each short filament, triangular or filiform. **Fruit** a circular, ovate or obovate silicula; valves flat or eventually inflated, faintly net-veined, glabrous or hairy. **Seeds** 2–16, flattened, mostly narrowly winged; cotyledons accumbent. $x = 8$ (aneuploids, high polyploidy).

Species ± 168, mostly Mediterranean, some in central Europe and Asia; 1 in sthn Afr.: **Alyssum minutum* Schltdl. ex DC., naturalised in Namaqualand and the Western Cape.

Aplanodes Marais 2875010

Marais: 111 (1966); Marais: 102 (1970).

Perennial herbs with irregularly branched hairs. **Leaves** ovate, petiolate, lower ones cordate at base or pinnatifid with short, spreading lobes. **Inflorescence** racemose, terminal. **Sepals** spreading, inner 2 slightly saccate. **Petals** obovate, clawed, slightly emarginate, white to purple. **Filaments** flattened or thickened at base. **Nectaries** present, lateral ones ring-shaped, closing around bases of short filaments, uniting into ring with ribbon-shaped median nectaries outside long filaments. **Ovary** sessile; ovules 6–18 per locule; stigma capitate, very shallowly 2-lobed. **Fruit** a linear siliqua; valves flat, 1-nerved, net-veined, acute. **Seeds** in 1 row, broadly oval, winged; cotyledons accumbent.

Species 2, restricted to sthn Afr.: *Aplanodes doidgeana* Marais, KwaZulu-Natal; and *A. sisymbrioides* (Schltr.) Marais, Lesotho and Eastern Cape.

*Arabidopsis Heynh. 2999000

Heynhold: 538 (1842) name conserved; Schulz: 640 (1936); Phillips: 352 (1951); Ball: 267 (1964a); Marais: 117 (1970); Jonsell: 43 (1982); O'Kane & Al-Shehbaz: 323 (1997).

Cardaminopsis (C.A.Mcy.) Hayek: 477 (1908).

Slender, annual or biennial herbs, with simple and branched hairs; up to 300 mm tall. **Leaves** simple, entire or dentate. **Inflorescences** simple, terminal, sometimes bracteate racemes. **Sepals** erect, not or hardly saccate at base. **Petals** clawed, mostly white. **Stamens** 6 or 4; filaments without appendages. **Nectaries** united into a ring. **Ovary** narrowly cylindrical; ovules many; stigma almost sessile. **Fruit** a linear siliqua; valves thin, rounded on back, 1-nerved. **Seeds** ellipsoid, not mucilaginous, mostly in 1 row; cotyledons incumbent. $x = 2$ (polyploidy).

Species 13, Asia, Europe and North America; 1 in sthn Afr.: **Arabidopsis thaliana* (L.) Heynh., introduced to Northern, Western and Eastern Cape.

*Barbarea R.Br. 2961000

Brown: 109 (1812) name conserved; Sonder: 22 (1860); Schulz: 537 (1936); Adamson: 422 (1950); Phillips: 350 (1951); Ball: 281 (1964); Marais: 104 (1970); Jonsell: 51 (1982).

Biennial or perennial herbs with a taproot and angular stems, glabrous or sparsely set with simple hairs. **Leaves** in basal rosette, lyrate-pinnatifid, petiolate; stem leaves sessile, auriculate-amplexicaul. **Inflorescences** dense racemes. **Sepals** erect, spreading, inner two saccate. **Petals** clawed, yellow. **Stamens** 6; filaments without appendages. **Nectaries** 4, those at base of short filaments horseshoe-shaped, opening outwards, rarely divided into 2; glands between long filaments erect, ± conical. **Fruit** a linear, subterete-quadrangular siliqua; valves strongly 1-nerved, net-veined. **Seeds** in one row; cotyledons accumbent. $x = 8$ (aneuploids).

Species 12, Europe, North America and N Asia; 1 in sthn Afr.: **Barbarea verna* (Mill.) Aschers., introduced to Western Cape.

Brachycarpaea DC. 2877000

Candolle: 247 (1821a); Candolle: 698 (1821b); Candolle: 235 (1824); Sonder: 33 (1860); Schulz: 406 (1936); Adamson: 419 (1950); Phillips: 347 (1951); Compton: 149 (1953); Marais: 82 (1970).

Glabrous, perennial subshrubs, erect and virgate or procumbent. **Leaves** linear to oblong, entire, sessile, acute. **Inflorescences** terminal, ebracteate racemes. **Sepals** erect, persistent, inner 2 saccate at base. **Petals** oblanceolate to obovate, clawed. **Stamens** 6; filaments without appendages; anthers apiculate. **Nectaries** small, 2 on either side of each short filament. **Ovary** subcircular in outline, compressed, sessile, 2-locular; ovules solitary, pendulous. **Fruit** an angustiseptate, didymous, indehiscent silicula, breaking into 1-seeded locules; valves ± spherical, keeled, hard, woody, papillose to rugose; style cylindrical, stout. **Seeds** with coiled cotyledons.

Species 1, sthn Afr.: *Brachycarpaea juncea* (P.J.Bergius) Marais, Western and Eastern Cape.

*Brassica L. 2949000

Linnaeus: 666 (1753); Linnaeus: 299 (1754); Schulz: 21(1919); Schulz: 321 (1936); Adamson: 409 (1950); Phillips: 350 (1951); Exell: 186 (1960); Heywood: 335 (1964); Marais: 5 (1970); Jonsell: 3 (1982); Jonsell: 64 (1993).

Annual, biennial or perennial herbs, glabrous or with simple hairs, frequently glaucous. **Leaves** with lower ones lyrate-pinnatifid or sometimes only dentate or sinu-

ate; upper leaves usually entire, often sessile and amplexicaul. **Inflorescences** terminal, ebracteate racemes. **Sepals** erect or spreading, inner somewhat saccate. **Petals** clawed, yellow, rarely white. **Stamens** 6; filaments without appendages. **Nectaries** 4; one ± kidney-shaped gland inside each short filament and an erect, ± conical or tongue-shaped gland in front of each pair of long filaments. **Fruit** a narrowly or broadly linear siliqua, terete or ± compressed; valves rather thick, rounded on back, 1-nerved; beak usually prominent, with 1–3 seeds. **Seeds** in one row, subglobose, reticulate; cotyledons emarginate, longitudinally folding around incumbent radicle. $x = 9, 10$ (7, 8, 11, 12, 17, 19) (polyploidy).

Species ± 40, mainly Eurasia; 5 in sthn Afr., introduced and widely naturalised.

*Camelina Crantz 2987000

Crantz: 17 (1762); Clapham, Tutin & Warburg: 184 (1952); Meikle: 315 (1964); Marais: 1 (1970); Jonsell: 68 (1982); Rich: 37 (1991).

Annual or biennial herbs with taproots and simple, branched or stellate hairs; stems erect, branched above. **Leaves**: basal ones sessile, simple; leaves on stems sagittate-amplexicaul; upper stem leaves smaller. **Inflorescences** terminal, crowded, ebracteate racemes. **Sepals** erect. **Petals** spathulate, yellow or whitish. **Stamens** 6, without appendages; anthers ovoid, obtuse, yellow. **Nectaries** at each side of bases of lateral stamens. **Ovary** pyriform, with very short gynophore; ovules 8–24; style distinct; stigma capitate. **Fruit** a dehiscent, obovoid or obovoid-pyriform silicula; valves convex or inflated, with a strong midrib vanishing above. **Seeds** many, ellipsoid, pale brown, biseriate; cotyledons incumbent. $x = 8$ (aneuploids, polyploidy).

Species ± 10, natives of central Europe, eastern Mediterranean and central Asia but widely spread by man. Cultivated for fibre, seeds for cagebirds and for seed oil (cameline oil). Weed in flax and grain fields in Europe; only twice recorded from South Africa in Gauteng.

*Capsella Medik. 2986000

Medikus: 85 (1792) name conserved; Sonder: 31 (1860); Schulz: 453 (1936); Adamson: 421 (1950); Phillips: 351 (1951); Exell: 192 (1960); Chater: 316 (1964); Marais: 97 (1970); Jonsell: 27 (1982).

Annual or biennial herbs with simple and branched hairs. **Leaves** basally pinnatipartite to entire; stem leaves sessile, amplexicaul. **Inflorescences** ebracteate racemes. **Sepals** spreading, not saccate. **Petals** 4 or 0, white, pink or yellowish, shortly clawed. **Stamens** 6; filaments without appendages; anthers ovoid, obtuse. **Nectaries** semicircular glands, one on either side of each short filament. **Ovary** dorsiventrally flattened, obovate, ovules 12–24 per locule. **Fruit** an angustiseptate, obcordate silicula; valves keeled, net-veined. **Seeds** ellipsoid, not winged; cotyledons incumbent. $x = 8$.

Species 5, eastern Mediterranean and W Asia; 1 in sthn Afr.: **Capsella bursa-pastoris* (L.) Medik., naturalised, widespread.

Cardamine L. 2966000

Linnaeus: 654 (1753); Linnaeus: 295 (1754); Sonder: 23 (1860); Schulz: 280 (1903); Schulz: 527 (1936); Adamson: 422 (1950); Phillips: 351 (1951); Exell: 189 (1960); Jones: 285 (1964); Marais: 100 (1970); Jonsell: 38 (1982); Hilliard & Burtt: 275 (1982); Marhold: 397 (1995).

Annual or perennial herbs, glabrous or with simple hairs. **Leaves** pinnate, trifoliolate or more rarely simple. **Inflorescences** terminal, ebracteate racemes. **Sepals** erect, spreading, not or hardly saccate. **Petals** obovate, rounded or emarginate, clawed, white, mauve, lilac or purple. **Stamens** 4 or 6; filaments without appendages. **Nectaries** at base of short filaments ring-shaped, closed or open on inner side; median nectaries small or absent. **Fruit** a linear or linear-lanceolate siliqua; valves flat; midrib immersed, obscure; valves opening suddenly and coiling spirally from base. **Seeds** flattened, broadly elliptic to oblong, in 1 row; cotyledons accumbent. $x = 8$ (aneuploids, high polyploidy).

Species 130, cosmopolitan; sthn Afr., 2 natural: *Cardamine africana* L. (widespread) and *C. trichocarpa* Hochst. ex A.Rich. (restricted to KwaZulu-Natal); 3 introduced and naturalised: **C. flexuosa* With. (KwaZulu-Natal), **C. hirsuta* L. (widespread) and **C. impatiens* L. (widespread).

*Cardaria Desv. 2883010

Desvaux: 163 (1814); Schulz: 415 (1936); Ball: 333 (1964); Marais: 96 (1970).

Perennial herbs with creeping rootstock; stems several, densely leafy; hairs simple. **Leaves** with lower ones petiolate, lobed; stem leaves sessile, sagittate, amplexicaul. **Inflorescence** an ebracteate, corymbose panicle. **Sepals** spreading, not saccate. **Petals** clawed, white. **Stamens** 6; filaments without appendages. **Nectaries** 6, 2 median glands triangular, lateral ones semicircular. **Ovary** with 2–4 ovules. **Fruit** a broadly ovate to obcordate silicula, indehiscent, 2(1)-seeded. **Seeds** ovoid or ellipsoid; cotyledons incumbent. $x = 8$ (aneuploids, polyploidy).

Species 1, Mediterranean; 1 in sthn Afr.: **Cardaria draba* (L.) Desv., naturalised.

Chamira Thunb. 2880000

Thunberg: 48 (1782); Sonder: 32 (1860); Schulz: 319 (1936); Adamson: 408 (1950); Phillips: 348 (1951); Marais: 5 (1970).

Annual herbs, succulent, glabrous; cotyledons persistent, leaf-like, green, sessile. **Leaves** petiolate, cordate at base. **Inflorescences** ebracteate racemes. **Sepals**: lateral ones spurred. **Petals** narrowly obovate, long-clawed, white. **Stamens** 6; filaments without appendages. **Nectaries** present, lateral ones large, ± tongue-shaped. **Ovary** shortly stipitate, 2-locular with 2–4 ovules in each locule. **Fruit** a broadly lanceolate or oblanceolate, shortly stipitate siliqua; valves membranous, weakly veined. **Seeds** ± ovoid but flattened at hilum end, papillate; cotyledons very broad, folded longitudinally, with margins deeply folded in again.

Monotypic: *Chamira circaeoides* (L.f.) A.Zahlbr., endemic to Western Cape.

*Coronopus Zinn 2884000

Zinn: 325 (1757) name conserved; Schulz: 410 (1936); Adamson: 420 (1950); Phillips: 348 (1951); Exell: 193 (1960); Ball: 333 (1964); Schreiber: 48 (1966); Marais: 94 (1970); Jonsell: 23 (1982).

Senebiera DC.: 140 (1799); Sonder: 27 (1860).

Annual, biennial or perennial herbs with a taproot, glabrous or with simple hairs; stems leafy. **Leaves** pinnatifid or entire. **Inflorescences**: lateral racemes becoming overtopped by lateral growth, mostly opposite leaves. **Sepals** spreading, not saccate. **Petals** 4 or 0, white, yellowish or purplish. **Stamens** 2, 4 or 6; filaments without appendages. **Nectaries** 6, small, 2 median, 4 lateral. **Ovary** flat; ovules 2 per locule; style short or rudimentary. **Fruit** an angustiseptate silicula, reniform or with 2 globose halves, dorsally compressed, indehiscent or breaking into 2 halves, 2-seeded. **Seeds** ovoid-ellipsoid; cotyledons incumbent. $x = 8$ (polyploidy).

Species 10, Mediterranean, southeast Africa and South America, but now almost cosmopolitan; 3 in sthn Afr., naturalised, widespread.

*Crambe L. 2958000

Linnaeus: 671 (1753); Linnaeus: 301 (1754); Schulz: 228 (1919); Ball: 344 (1964); Marais: 15 (1970); Jonsell: 15 (1982).

Annual or perennial herbs or suffrutices, glabrous or with simple hairs. **Leaves** with lower ones pinnatisect, rarely entire; upper leaves small, linear. **Inflorescence** branched, racemose. **Sepals** erect, spreading, inner two slightly saccate. **Petals** shortly clawed or cuneate, white or pale yellow. **Stamens** 6; long filaments 4, usually with tooth-like appendages. **Nectaries** with lateral ones semilunar; median ones ± conical. **Fruit** a transversely articulate silicula on gynophore; lower segment short, sterile, stalk-like; upper segment ovoid to globose, hard, indehiscent, 1-seeded; stigma sessile. **Seeds** faintly sculptured or smooth, spheroid; cotyledons folded around incumbent radicle. $x = 10$ (polyploidy).

Species 20, W Asia, central Europe, the Mediterranean region, northern tropical Africa; 1 in sthn Afr.: **Crambe hispanica* L. introduced and restricted to KwaZulu-Natal.

Cycloptychis E.Mey. ex Sond. 2878000

Sonder: 34 (1860); Schulz: 400 (1936); Phillips: 347 (1951); Marais: 80 (1970).

Glabrous, virgate, woody shrubs or shrublets. **Leaves** linear, oblong to oblanceolate, entire. **Inflorescences** terminal, lax racemes. **Sepals** erect, 3-nerved, inner 2 saccate or not. **Petals** oblanceolate-spatulate, long-clawed, pale mauve to purple. **Stamens**: filaments subulate; anthers minutely apiculate. **Nectaries** 2, 1 outside each short filament. **Ovary** elliptic, oval or oblong, compressed, 2-locular; ovules solitary; style short or long, stout; stigma small. **Fruit** an elliptical to subcircular, beaked silicula; valves falling away enclosing seeds, or seeds falling free; valves weakly or strongly keeled and ridged. **Seeds** compressed and winged or shaped like a button mushroom; cotyledons twice transversely folded.

Species 2: *Cycloptychis virgata* (Thunb.) E.Mey. ex Sond. and *C. marlothii* O.E.Schulz, endemic to Western Cape.

*Descurainia Webb & Berthel. 2997000

Webb & Berthelot: 72 (1836); Schulz: 649 (1936); Ball: 266 (1964); Marais: 117 (1970).

Mostly annual, branched herbs, with branched, stellate, glandular or simple hairs. **Leaves** 2- or 3-pinnatisect. **Inflorescences** racemose, many-flowered, ebracteate. **Flowers** small, inconspicuous. **Sepals** erect, not saccate. **Petals** yellowish, usually smaller than sepals. **Stamens** 6; filaments without appendages. **Nectaries** narrow, lateral ones horseshoe-shaped, united with median ones. **Fruit** a short, linear siliqua; valves rounded, 1-nerved, net-veined; style very short; stigma capitate. **Seeds** elliptic or oblong, in 1 or 2 rows, small; cotyledons incumbent. $x = 7$ (aneuploids, polyploidy).

Species ± 55, mostly North America, some from South America, Europe and Asia; 1 in sthn Afr.: **Descurainia sophia* (L.) Webb ex Prantl, naturalised in arid areas, only few times recorded in Gauteng, Northern and Eastern Cape.

*Diplotaxis DC. 2946000

Candolle: 628 (1821b); Candolle: 221 (1824); Schulz: 342 (1936); Phillips: 349 (1951); Heywood: 334 (1964); Marais: 12 (1970); Rich: 102 (1991); Jonsell: 64 (1993).

Annual or perennial herbs, sometimes woody at base, with simple hairs. **Leaves** petiolate; basally usually rosulate, pinnatisect or pinnatifid; stem leaves few, sessile, usually cuneate. **Inflorescences** terminal, many-flowered racemes. **Sepals** erect, spreading, equal or inner pair slightly saccate. **Petals** obovate, clawed, yellow. **Stamens** 6; filaments without appendages. **Nectaries** at base of long stamens shortly ligulate. **Fruit** a linear or linear-lanceolate siliqua, compressed, dehiscent with short, seedless beak; valves 1-nerved, flat; stigma shallowly 2-lobed. **Seeds** many, in 2 rows, ovoid; cotyledons longitudinally folded around incumbent radicle. $x = 7, 9, 10, 11, 13$ (polyploidy).

Species ± 27, Mediterranean and central Europe, some extending eastwards into India; 1 in sthn Afr.: **Diplotaxis muralis* (L.) DC., introduced and widely naturalised.

*Eruca Mill. 2944000

Miller: [472] (1754); Schulz: 344 (1936); Phillips: 349 (1951); Exell: 186 (1960); Tutin: 340 (1964); Marais: 12 (1970).

Annual or perennial herbs, with simple hairs. **Leaves** lyrate-pinnatifid. **Inflorescences** ebracteate racemes. **Flowers** large. **Sepals** erect, inner two slightly saccate. **Petals** obovate, long-clawed, whitish, yellow or lilac with dark veins. **Stamens** 6; filaments without appendages. **Nectaries** 6, small. **Fruit** a short, oblong or ellipsoid siliqua; valves 1-nerved; beak broad, flat, seedless. **Seeds** spherical or ovoid, in 2 rows; cotyledons folded longitudinally around incumbent radicle. $x = 11$.

Species 5, native to the Mediterranean region; 1 in sthn Afr.: **Eruca sativa* Mill., naturalised in the northern summer-rainfall regions.

Erucastrum (DC.) C.Presl 2947000

Candolle: 582, 598 (1821b) as *Brassica* L. sect. *Erucastrum* DC.; Presl: 92 (1826) as *Erucastrum*; Sonder: 31 (1860), under *Brassica*; Schulz: 88 (1919); Schulz: 331 (1936); Phillips: 350 (1951); Exell: 189 (1960); Tutin: 340 (1964); Marais: 7 (1970); Jonsell: 9 (1982); Jonsell: 64 (1993); López: 67 (1999).

Annual, biennial or perennial herbs with simple hairs. **Leaves** basally lyrate-pinnatifid; upper leaves usually sessile. **Inflorescences** often bracteate racemes. **Sepals** erect or spreading, inner two ± saccate. **Petals** clawed, yellow. **Stamens** 6; filaments without appendages. **Nectaries** semicircular or 2-lobed, median ones ± tongue-shaped. **Ovary** cylindrical; ovules 10–50; style short; stigma semiglobose to 2-fid. **Fruit** a siliqua, readily dehiscent, subterete, ± quadrangular, ± torulose; valves keeled, 1-nerved, reticulately veined; beak conical, 0–3-seeded. **Seeds** ovoid or oblong, in 1 row; cotyledons folded longitudinally around incumbent radicle. $x = 7, 8, 9$ (polyploidy).

Species ± 18, central and southern Europe, Africa, Arabian Peninsula; 3 in sthn Afr., widespread.

Heliophila L. 2875000

Linnaeus: 926 (1763); Sonder: 35 (1860); Schulz: 31 (1931); Schreiber 48: 4 (1966); Marais: 17 (1970).

Carponema (DC.) Eckl. & Zeyh.: 8 (1834–1835); Sonder: 35 (1860); Adamson: 418 (1950); Phillips: 347 (1951); Marais: 17 (1970).

Annual or perennial herbs or shrubs, rarely scandent or climbing, glabrous or with simple hairs. **Leaves** narrow or broad, simple, entire or variously dentate or lobed or pinnately or sub-bipinnately partite; stipules 0 or 2, minute. **Inflorescence** usually racemose, sometimes flowers axillary or few together on short side branches, or intercalary; pedicels sometimes subtended by 2 minute bracts. **Sepals** caducous or subpersistent, outer 2 often cucullate, sometimes horned or thickened at apex, inner 2 saccate at base or not. **Petals** lanceolate to subcircular, generally clawed, with (0)1(2) appendages at base, or papillate, white, blue, lilac, mauve, purple or pink. **Stamens** 6; none, all, or only 2 short filaments with appendages or papillate at base. **Nectaries** 2, semicircular, horseshoe-shaped or biprismatic, outside lateral (short)

filaments. **Fruit** a siliqua, dehiscent, short or long, linear to obovate-circular, with straight margins or deeply constricted between seeds, terete or dorsally compressed, latiseptate, sessile or stipitate; valves flat or bulged by seeds, 1–7-nerved, glabrous or hairy, smooth, papillate or somewhat warted; style short or long, slender or stout, much swollen in fruit. **Seeds** generally in 1 row, few to many, flattened, ovoid or globose, immarginate or winged, smooth or papillose; cotyledons twice transversely folded. $x = 10$.

Species 75, endemic to sthn Afr., mostly from winter-rainfall areas of Northern, Western and Eastern Cape, but a few widely distributed.

*Hirschfeldia Moench 2947010

Moench: 264 (1794); Schulz: 339 (1936); Tutin: 342 (1964); Marais: 11 (1970).

Annual or biennial herbs; stems leafy, with simple hairs. **Leaves** usually lyrate-pinnatifid. **Inflorescences** terminal, ebracteate racemes. **Sepals** erect, spreading, inner two slightly saccate. **Petals** small, obovate, clawed, yellow or white. **Stamens** 6; filaments without appendages. **Nectaries** 6, small. **Fruit** a short, appressed siliqua; valves 3-nerved when young, nerves obscured when ripe; beak thick, 1- or 2-seeded. **Seeds** in 1 row, ovoid, brown; cotyledons folded longitudinally around incumbent radicle. $x = 7$.

Species 2, Mediterranean and Socotra; 1 in sthn Afr.: **Hirschfeldia incana* (L.) Lagr.-Foss., introduced and recorded as rare escape in Western Cape.

*Hymenolobus Nutt. 2985000

Nuttall: 117 (1838); Schulz: 457 (1936); Heywood: 317 (1964); Marais: 98 (1970).

Small, annual herbs, with simple hairs. **Leaves** pinnatifid, upper ones entire. **Inflorescences** many-flowered, ebracteate racemes. **Sepals** spreading, not saccate. **Petals** spatulate, clawed, white. **Stamens** 4 or 6; filaments simple. **Nectaries** 4, small. **Fruit** an angustiseptate silicula, ellipsoid to oblong-ovoid. **Seeds** 3–10 per locule, ovoid, small; cotyledons incumbent. $x = 6$.

Species 5, Europe, Mediterranean region, central Asia, Australia, North America, Chile; 1 in sthn Afr.: **Hymenolobus procumbens* (L.) Nutt. ex Schinz & Thell., introduced and recorded as rare escape in Western Cape.

Lepidium L. 2883000

Linnaeus: 643 (1753); Linnaeus: 291 (1754); Sonder: 28 (1860); Schulz: 407 (1936); Adamson: 419 (1950); Phillips: 348 (1951); Exell: 190 (1960); De Carvalho e Vasconcellos: 330 (1964); Schreiber: 48 (1966); Marais: 83 (1970); Jonsell: 20 (1975); Jonsell: 17 (1982).

Annual, biennial or perennial herbs or shrublets, glabrous or pubescent, with simple hairs. **Leaves** variable, simple to 1–4-pinnatipartite, sessile or petiolate, cuneate or amplexicaul, margins entire to serrate-dentate or lobate; basal leaves usually rosulate and differing in shape from cauline leaves. **Inflorescences** terminal or axillary racemes, corymbose at first, contracting or elongating in fruit, dense or lax. **Flowers** minute; pedicels appressed or wide-spreading. **Sepals** equal, not saccate at base, deciduous or persistent. **Petals** present or 0, often much reduced. **Stamens** 2–6; filaments long; anthers exserted. **Nectaries** tuberculate or elongate, filiform. **Fruit** a silicula, dehiscent, dorsally compressed, oblong, ovate, obovate, elliptical, obcordate or subcircular, angustiseptate, 2-valved, emarginate at apex and style included in sinus, or not (or hardly) emarginate with style exserted; valves boat-shaped, keeled or winged, falling away empty and seeds falling free. **Seeds** 1(2) per locule, pendulous, finely reticulate, mucilaginous, elliptic to obovate, sometimes narrowly winged; cotyledons incumbent, sometimes oblique, entire or tripartite. $x = 4, 8$ (aneuploids, high polyploidy).

Species ± 150, cosmopolitan in temperate and subtropical regions of the world; 17 (2 introduced) in sthn Afr., widespread.

*Lobularia Desv. 3013000

Desvaux: 162 (1814); Schulz: 494 (1936); Ball: 307 (1964); Marais: 99 (1970).

Under *Alyssum* L.; Sonder: 24 (1860); Adamson: 421 (1950).

Annual to perennial herbs, with appressed, medifixed hairs. **Leaves** narrow, entire. **Inflorescences** terminal racemes, dense in flower, elongate in fruit. **Sepals** spreading, not saccate at base. **Petals** clawed, entire, white or pinkish. **Stamens** 6; filaments without appendages. **Ovary** with 2–10 ovules. **Fruit** a circular or ovate, compressed silicula; valves flat or ± inflated, faintly reticulately veined. **Seeds** compressed, narrowly winged; cotyledons accumbent. $x = 6$ (aneuploids, polyploidy).

Species 5, Cape Verde, Canary Islands and Mediterranean region; 1 in sthn Afr.: **Lobularia maritima* (L.) Desv., an escape in Western Cape.

*Matthiola R.Br. 3042000

Brown: 119 (1812) name conserved; Sonder: 20 (1860); Schulz: 562 (1936); Adamson: 424 (1950); Phillips: 353 (1951); Ball: 279 (1964a); Schreiber: 48 (1966); Marais: 109 (1970); Jonsell: 62 (1982); Jonsell: 72 (1993).

Annual herbs or perennial shrublets, grey-tomentose with branched and sometimes glandular hairs. **Leaves** entire, sinuate-dentate or pinnatifid. **Inflorescences** terminal, lax racemes. **Sepals** erect, 2 inner ones saccate at base. **Petals** long-clawed, pink-purple, white or brownish yellow. **Stamens** 6; long filaments sometimes dilated, without appendages. **Nectaries** 4, semicircular, one on either side of each short filament. **Fruit** a siliqua on short, stout pedicels, linear, terete; valves 1-nerved, hairy; style very short or absent; stigma 2-lobed, lobes erect, each with dorsal swelling or horn. **Seeds** in one row, compressed, often winged; cotyledons accumbent. $x = 6, 7$ (aneuploids).

Species 55, Macaronesia, western Europe, Mediterranean; 3 in sthn Afr., recorded in the drier parts as introduced species and garden escapes: Namibia, North-West, Free State, Lesotho, Northern, Western and Eastern Cape.

*Raphanus L. 2950000

Linnaeus: 669 (1753); Linnaeus: 300 (1754); Schulz: 194 (1919); Phillips: 350 (1951); Exell: 193 (1960); Chater: 345 (1964); Marais: 14 (1970); Jonsell: 11 (1982).

Annual, biennial or short-lived perennial herbs, with simple hairs. **Leaves** basally lyrate-pinnatifid; upper leaves small. **Inflorescences** terminal, ebracteate racemes. **Sepals** erect, inner two saccate. **Petals** long-clawed, white, purple or yellow, generally dark-veined. **Stamens** 6; filaments without appendages. **Nectaries** 6; 2 median glands tongue-shaped; 4 lateral glands small. **Fruit** a transversely articulate siliqua; lower segment small, sterile, stalk-like; upper segment terete, straight-sided or moniliform, ribbed, indehiscent, breaking into 1-seeded portions or not; beak thin, seedless. **Seeds** ovoid, brown; cotyledons folded longitudinally around incumbent radicle. $x = 9$.

Species ± 8, western and central Europe; 2 in sthn Afr.: **Raphanus raphanistrum* L. and **R. sativus* L., naturalised, widespread.

*Rapistrum Crantz 2956000

Crantz: 105 (1769); De Carvalho e Vasconcellos: 343 (1964); Marais: 16 (1970).

Annual or perennial herbs; stems hispid with simple hairs. **Leaves** pinnatisect or pinnatifid. **Inflorescences**

terminal, ebracteate racemes. **Sepals** erect-spreading, inner 2 saccate. **Petals** shortly clawed, yellow. **Stamens** 6; filaments without appendages. **Nectaries** 6; median 2 tongue-shaped; lateral 4 small, flat. **Fruit** a transversely articulate siliqua; valvar portion 0–2-seeded, cylindrical, ellipsoid, or obconical; stylar portion ovoid to globose, wider than the lower portion, 1-seeded, indehiscent; beak conical or filiform. **Seeds** ovoid, smooth; cotyledons longitudinally folded around incumbent radicle. x = 8 (aneuploids).

Species 3, central Europe, Mediterranean region and W Asia; 1 in sthn Afr.: **Rapistrum rugosum* (L.) All., naturalised in North-West, KwaZulu-Natal, Northern, Western and Eastern Cape.

Rorippa Scop. 2965000

Scopoli: 520 (1760); Schulz: 522 (1936); Exell: 182 (1960); Valentine: 283 (1964); Schreiber: 48 (1966); Marais: 105 (1970); Jonsell: 52 (1982).

Nasturtium R.Br.: 109 (1812); Sonder: 21 (1860); Adamson: 422 (1950); Phillips: 351 (1951).

Annual to perennial herbs, glabrous or with simple hairs. **Leaves** entire, simple or pinnate. **Inflorescences** terminal or axillary, ebracteate racemes. **Sepals** spreading, not or hardly saccate at base. **Petals** white or yellow. **Stamens** normally 6; filaments without appendages. **Nectaries** ± surrounding lateral filament-bases, usually also extending outside median ones or lacking. **Fruit** a siliqua or a silicula; valves rounded on back, midrib inconspicuous or absent; stigma 2-lobed. **Seeds** ± in 2 rows, ellipsoid to spheroid, yellow to dark brown, wingless; cotyledons accumbent. x = 8 (aneuploids, polyploidy).

Species ± 80; fairly cosmopolitan, chiefly in temperate regions; 5 in sthn Afr., widespread.

Schlechteria Bolus 3008000

Bolus: 455 (1898); Schulz: 484 (1936); Phillips: 353 (1951); Compton: 152 (1953); Marais: 77 (1970).

Glabrous, much-branched, woody shrublets. **Leaves** linear, alternate, sessile. **Inflorescences** racemose, terminal or intercalary. **Sepals** oblong, membranous, outer 2 cucullate, inner two ± saccate. **Petals** oblanceolate to obovate, rounded, clawed. **Stamens** 6; filaments without appendages. **Nectaries** 2, large, ± horseshoe-shaped, 1 around outside of each short filament. **Ovary** elliptical, margined, compressed; 2-locular with 1 or 2 pendulous ovules per locule; stigma very shallowly 2-lobed, subsessile. **Fruit** an oval, elliptical or ± obovate silicula, often oblique, compressed, discoid, margined or narrowly winged, pendulous, indehiscent, generally 1(2 or 3)-seeded; valves membranous, 1-nerved, reticulately veined. **Seeds** oval or broadly oblong, compressed; cotyledons twice transversely folded.

Species 1: *Schlechteria capensis* Bolus, endemic to mountains of Western Cape near Clanwilliam.

Silicularia Compton 2878010

Compton: 147 (1953); Marais: 81 (1970).

Glabrous, slender, many-stemmed, virgate shrublets. **Leaves** linear or linear-oblanceolate, acute. **Inflorescences** terminal, many-flowered racemes. **Sepals** erect, weakly 3-nerved, inner 2 saccate. **Petals** obovate, rounded, cuneate. **Stamens** 6; filaments subulate, without appendages. **Nectaries** 2, horseshoe-shaped, 1 at base of each short filament. **Ovary** ± elliptic, sessile, compressed, imperfectly 2-locular; septum incomplete, 2-ovulate; style short or long. **Fruit** a subcircular to circular-elliptic or ovate-elliptic silicula, compressed, indehiscent, 1-seeded, 1-locular, but with marginal remains of septum, margin thickened; valves with indistinct midrib and radiating ridges; style persistent, short, stout. **Seeds** subcircular, compressed; cotyledons twice transversely folded.

Species 1: *Silicularia polygaloides* (Schltr.) Marais, endemic to Western Cape, known from mountains near Ceres.

***Sinapis** L. 2945000

Linnaeus: 668 (1753); Linnaeus: 299 (1754); Sonder: 32 (1860); Schulz: 335 (1936); Exell: 188 (1960); Chater: 339 (1964); Marais: 10 (1970).

Annual, rarely perennial, branched herbs, with simple hairs. **Leaves** simple, pinnatifid or pinnatisect. **Inflorescences** ebracteate racemes. **Sepals** spreading, not saccate. **Petals** shortly clawed, yellow. **Stamens** 6; filaments without appendages. **Nectaries** at base of long filaments, tongue-shaped, lateral ones reniform. **Fruit** a linear siliqua, 3–5-nerved, 0–9-seeded, sometimes flattened; valves convex; beak long. **Seeds** globose, in 1 row; cotyledons folded longitudinally around incumbent radicle. x = 6, 7 (polyploidy).

Species ± 10, Mediterranean region but some now widespread in other parts of Europe; 2 in sthn Afr.: **Sinapis arvensis* L., recorded in Mpumalanga, Gauteng, Free State, KwaZulu-Natal, and **S. alba* L. in the Eastern Cape as weeds of cultivation.

Sisymbrium L. 2917000

Linnaeus: 657 (1753); Linnaeus: 296 (1754); Sonder: 24 (1860); Schulz: 46 (1924); Adamson: 423 (1950); Phillips: 349 (1951); Exell: 118 (1960); Ball: 264 (1964); Schreiber: 48 (1966); Marais: 110 (1970); Jonsell: 62 (1982); Jonsell: 73 (1993).

Annual or biennial herbs or perennial suffrutices, with simple or branched hairs. **Leaves** entire, lobed, pinnatifid or pinnatisect. **Inflorescences** terminal, ebracteate racemes. **Sepals** spreading, not or slightly saccate at base. **Petals** clawed, generally yellow. **Stamens** 6; filaments without appendages. **Nectaries**: lateral ones ring-shaped, joining median ribbon-like glands. **Fruit** a linear, subterete siliqua; valves convex, 1–3-nerved, glabrous or hairy. **Seeds** in 1 or 2 rows, ± oblong; cotyledons incumbent or cotyledons longitudinally folded around radicle. x = 7 (aneuploids, high polyploidy).

Species 80, Eurasia, Mediterranean, Africa, South America; 6 indigenous and 2 naturalised in sthn Afr., widespread.

Thlaspeocarpa C.A.Sm. 2879000

Smith: 155 (1931); Schulz: 401 (1936); Phillips: 348 (1951); Compton: 153 (1953); Marais: 77 (1970).

Palmstruckia Sond.: 35 (1860); Marloth: 242 (1913).

Annual herbs. **Leaves** pectinately 3–9-lobed, rarely entire. **Inflorescences** terminal, ebracteate racemes. **Sepals** spreading, inner 2 slightly saccate. **Petals** obovate-cuneate, hardly clawed. **Stamens** 6, each of 2 short filaments with small appendage. **Nectaries** 2, large, biprismatic, one outside each short filament. **Ovary** elliptical, compressed, 2-locular, 1 locule usually sterile, other with 1 pendulous ovule, rarely 1 ovule in each cell; stigma capitate, subsessile. **Fruit** a subcircular silicula, compressed, discoid, pendulous, 1-seeded, apparently indehiscent; septum disappearing, fruit apparently 1-celled; valves 1-nerved. **Seeds** circular, broadly winged; cotyledons twice transversely folded.

Species 2, Africa; 2 in sthn Afr.: *Thlaspeocarpa capensis* (Sond.) C.A.Sm., endemic to Western Cape (Calvinia, Sutherland and Worcester districts) and *T. namaquensis* Marais, endemic to Namaqualand.

***Thlaspi** L. 2903000

Linnaeus: 645 (1753); Linnaeus: 292 (1754); Schulz: 444 (1936); Clapham: 318 (1964); Marais: 97 (1970); Jonsell: 27 (1982).

Annual or perennial herbs, usually glabrous; stems leafy. **Leaves** simple, mostly amplexicaul. **Inflorescences**

simple, ebracteate racemes. **Sepals** spreading, not saccate. **Petals** clawed, white, pink or mauve. **Stamens** 6; filaments without appendages. **Nectaries** 4, semilunar, one on either side of each short filament. **Ovary** with 2–16 ovules. **Fruit** an angustiseptate, oblong to circular or obovate silicula, usually deeply emarginate; valves keeled, generally winged. **Seeds** ellipsoid; cotyledon accumbent. $x = 7$ (aneuploids, high polyploidy).

Species 60, widespread in temperate regions of the northern hemisphere; 1 in sthn Afr.: **Thlaspi arvense* L., introduced, recorded only in the Eastern Cape.

*Turritis L. 3000000

Linnaeus: 666 (1753); Linnaeus: 298 (1754); Sonder: 22 (1860); Schulz: 548 (1936); Phillips: 352 (1951); Marais: 104 (1970); Jonsell: 48 (1982).

Tall, erect, leafy, biennial herbs with a taproot and sparsely branched to unbranched stems, with simple and branched hairs in basal part. **Leaves** densely arranged on stems, amplexicaul, entire, glabrous. **Inflorescences** terminal, elongate racemes. **Sepals** spreading, not saccate at base. **Petals** white or yellowish. **Stamens** 6; filaments without appendages. **Nectaries**: lateral ones ring-shaped, joined with ribbon-like, median glands. **Fruit** a linear, subterete or ± 4-angled siliqua; valves convex, 1-nerved. **Seeds** many in 1 or 2 rows, ovoid to angular; cotyledons accumbent. $x = 6, 8$ (polyploidy).

Species 3, Europe, W Asia and Africa; 1 in sthn Afr.: **Turritis glabra* L., introduced, recorded in Northern Province, Mpumalanga, KwaZulu-Natal, Lesotho and Eastern Cape.

Bruniaceae

(Rosidae—Bruniales)

Compiled by A.V. Hall

Shrubs, spreading to erect, rarely small trees; often with coppice shoots sprouting from underground lignotubers after fires. **Leaves** usually small, spirally imbricate, linear to very broadly ovate, often keeled, sometimes petiolate, usually minutely stipulate, leaves in bud always uniquely with a fleshy terminal colleter, later shrinking to a dark apiculus or lost. **Flowers** bisexual, usually regular, small, from occasionally solitary and sometimes in stipitate spikelets, to spikes, panicles or dense capitula with a ± clavate receptacle; bracts 1–several per flower, if 1, then usually 2 bracteoles; floral receptacle bearing flower parts often ribbed, sometimes warty or wrinkled. **Calyx**: sepals 5, free or connate at base or vestigial, segments imbricate to well separated. **Corolla**: petals 5, rarely lightly adnate to connate with filaments to form a weak tube from below to up to most of filament length; often crested next to ovary; white to cream, sometimes mauve, purple or scarlet. **Stamens** 5, free, or adnate to connate as noted above; filaments linear; anthers 2-thecous with thecae sometimes partly free and ± divergent, opening by longitudinal slits. **Nectary** uncommon, a fleshy ring on top of ovary. **Ovary** usually half to fully inferior, rarely superior, sometimes with floral receptacle extended above to form a cup-shaped hypanthium; with 1–3(4 or 5) locules usually lateral to the flower stem plane, rarely oblique to dorsiventral; septa (wall(s) between locules) often incomplete; ovules 1–16 per locule, pendulous, sometimes sterile as dark flakes in spongy tissue filling the locule; placentas distal to rarely parietal or free-central from below; styles free to adnate or connate and distally divergent; stigmas minute. **Fruit** indehiscent to dehiscent with 2–4 valves. **Seeds** fleshy, testa thin.

Genera 9, species 57, endemic, Western Cape to KwaZulu-Natal, concentrated in the SW Western Cape.

Sonder: 309 (1862); Marloth: 35 (1925); Niedenzu & Harms: 288 (1930); Pillans: 121 (1947); Dahlgren: 21 (1988); Goldblatt & Manning (in prep.).

Classification of Bruniaceae

The subdivision into tribes proposed by Marloth (1925) and Niedenzu & Harms (1930) is not meaningful. Based on morphology, anatomy and chemotaxonomic data (G. Scott, pers. comm.) the genera are sequenced below by decreasing average apomorphy, constrained by the clustering:

Thamnea (3284000), *Audouinia* (3283000), *Berzelia* (3294000), *Brunia* (3292000), *Linconia* (3287000), *Pseudobaeckea* (3291000), *Staavia* (3290000), *Lonchostoma* (3286000), *Raspalia* (3288000).

Key to genera

1a Flowers ± 30–400 in each dense, generally spherical capitulum; stamens much exserted and very prominent at anthesis:
- 2a Leaves petiolate, soft-textured and easily bent at base; flowers with 1 or 2 styles ..... **Berzelia**
- 2b Leaves sessile, hard-textured and inflexible at base; flowers with 2 styles (includes *Nebelia*) ..... **Brunia**

1b Flowers usually not in dense, generally spherical capitula, or if rather dense then some 20 or less per capitulum; stamens mostly included, not prominent at anthesis:
- 3a Anther with a pale, apical, sterile lobe, thecae divergent by ± 30–45°; petals stiffly erect ..... **Linconia**
- 3b Apical lobe absent; thecae scarcely divergent; petals pliant and often spreading:
  - 4a Each flower in a spikelet solitary and terminal in an involucre of bracts at the end of a short stipe; spikelets on a peduncle 4–150 mm long; old stipes persistent (includes *Tittmannia*) ..... **Audouinia**
  - 4b Flowers, if solitary, then lacking a persistent stipe on a peduncle:
    - 5a Flowers in a spike; petals and filaments connate into a tube at least a quarter of length of corolla; ovary locules dorsiventral to oblique to the bract stem plane ..... **Lonchostoma**
    - 5b Flowers solitary, or in capitula or panicles; tube sometimes formed by light adnation of corolla and filaments; ovary locules collateral:
      - 6a Each flower solitary and terminal on a branch with ± 6–30 bracts; bracteoles absent; petals clawed ..... **Thamnea**
      - 6b Flowers grouped in panicles or capitula; bracteoles present; petals not clawed:
        - 7a Flowers in racemose or cymose panicles; leaves of a plant often prominently varying in size; sepals without apiculi ..... **Pseudobaeckea**
        - 7b Flowers in dense capitula; leaves of a plant with limited variation in size; sepals usually with a dark apiculus:
          - 8a Petioles absent to vestigial; leaves abaxially generally smoothly rounded; capitula usually lacking cream-white radiating bracts (includes *Mniothamnea*) ..... **Raspalia**
          - 8b Petioles slender; leaves abaxially deeply keeled; capitula with cream-white radiating bracts ..... **Staavia**

Audouinia Brongn. 3283000

Brongniart: 384 (1826); Sonder: 323 (1862); Pillans: 127 (1947).

Tittmannia Brongn.: 385 (1826) name conserved, not of Rchb.: Sonder: 312 (1862); Niedenzu & Harms: 298 (1930).

Low shrubs, sprawling to erect, often with coppice shoots sprouting from lignotubers after fires. **Leaves** ovate to narrowly lanceolate, longer in coppice shoots, sessile; leaf margins ciliate to lanate; minute stipules seldom visible; bud leaf colleter soon shrivelling to a black cone or lost. **Flowers** each in a spikelet, solitary and terminal in an involucre of 5–12 bracts at end of a short stipe, spikelets on an elongate peduncle, old stipes persistent; ciliate bracts with a prominent midrib and often several parallel veins, bases of two lowest bracts forming an inverted shallow bowl around narrowed tip of stipe; floral receptacle often with fleshy warts or transverse wrinkles and a rib below each sepal. **Calyx**:

sepals free, narrowly ovate to triangular, whitish to bright red; sepal midrib prominent, often with parallel lateral veins. **Corolla** white to bright red; petals free, clawed, glabrous, often with small crests next to ovary. **Stamens** free; anther thecae either united or partly free; pollen grains tricolporate. **Nectary** and scent either 0 or not recorded. **Ovary** inferior to half-inferior; locules 2 (also 3 and very rarely 4 or 5), wall between locules sometimes incomplete; ovules 1 or 2 per locule, or 0, pendulous, or ovules sterile as dark flakes in spongy tissue filling locule; styles terete or distally furrowed, rarely partly to fully free, erect or apically diverging. **Fruit** little known, at least sometimes indehiscent. **Seed** apparently germinating through fruit wall. $x = 11$.

Species 5, Western Cape, concentrated in the southwest.

Berzelia Brongn. 3294000

Brongniart: 370, t. 35 fig. 1 (1826); Sonder: 310 (1862); Pillans: 186 (1947).

Erect shrubs to rarely small trees, some with coppice shoots sprouting from lignotubers. **Leaves** linear or seldom broadly ovate; petiolate, soft-textured and easily bent at base; dark stipules present; bud leaf colleter a papilla becoming an apiculus, then shrivelling to a black cone or lost. **Flowers** borne in dense, spherical to very rarely elongate capitula with a narrowly elliptic to broadly clavate receptacle; flowers in each capitulum 80–130; capitula usually in a corymbose panicle; involucral bracts usually ovate to elliptic, mostly with adnate stipules; floral bracts narrowly elliptic to spathulate, usually without stipules; bracteoles 2; floral receptacle with rounded to angular ribs passing down from the sepals. **Calyx**: sepals free, often linear, sometimes broadly oblong, with a dark apiculus. **Corolla** white to pale cream or bright red, regular or irregular in lower flowers; petals oblong to narrowly lanceolate or clawed, basally with an adaxial crest; petal margins often with flaps partly enclosing the filaments and lightly adnate to them, forming a tube. **Stamens**: immature filaments often arched; anther thecae united or partly free and slightly to strongly divergent; pollen grains tricolporate. **Nectary** apparently 0; nectar rarely present at base of flower; scent usually 0, rarely faint or coffee-like or fishy. **Ovary** half- to three-quarters-inferior, locules 1 or 2, locules 2 in some peloric flowers, wall between locules often incomplete; ovule 1, rarely 0 or 2 per locule, or ovules sterile as dark flakes in spongy tissue filling locule; styles terete, when 2 then often divergent, stigmas terminal. **Fruit** comprising expanded ovary wall and attached persistent flower parts, mostly indehiscent, where not so, valves 2–4 and spreading. **Seeds** usually ellipsoid. $x = 10$ (aneuploids, high polyploidy).

Species 8, Western to Eastern Cape, mainly in the southwestern mountains and flats.

Brunia Lam. 3292000

Lamarck: 474 (1785); Sonder: 313 (1862) in part; Pillans: 178 (1947).

Nebelia Neck. ex Sweet: 116 (1830).

Erect or spreading shrubs to small trees, some sprouting from an underground lignotuber. **Leaves** lanceolate to oblanceolate or ovate; sessile, hard-textured and inflexible at base; stipules mostly absent; bud leaf colleter a papilla, darkening and shrinking to a narrow deltoid lamina or minute cone, later persistent or lost. **Flowers** borne in very dense spherical capitula with a clavate to globose receptacle; flowers in each capitulum 30–400; bracts closely appressed, spathulate to narrowly lanceolate or deltoid; bracteoles two, connate with the very short pedicel; floral receptacle with or without ribs. **Calyx**: sepals free, regular to sometimes irregular, linear to oblanceolate, with a dark apiculus. **Corolla** white to cream, usually regular, occasionally irregular near base of capitulum; petals very narrowly obovate to oblanceolate, lightly adnate to filaments forming a weak tube; each petal with two adaxial crests in tube, or if one, then diverging into 2 lobes. **Stamens** erect or some recurved by ± 90° near apex; anther thecae united or partly free and slightly divergent; pollen grains with 4–8 colpi. **Nectary** 0; scent seldom recorded, where known sweetish or cabbage-like. **Ovary** half- to fully inferior; locules 2, 1–3 ovules in each, sometimes with one locule barren; ovules often sterile as dark flakes in spongy tissue filling locule; styles slightly to nearly fully adnate, sometimes divergent. **Fruit** with persistent flower parts, indehiscent or a 4-valved capsule. **Seeds** ellipsoid to oblong. $x = 10$.

Species 7, mountains, mainly in the SW Western Cape, extending to the Cockscomb (SW Eastern Cape).

Linconia L. 3287000

Linnaeus: 216 (1771); Sonder: 317 (1862); Pillans: 130 (1947).

Erect shrubs sprouting from an underground lignotuber, distal branching sparse and clustered at nodal zones on stem. **Leaves** linear to narrowly elliptic; petiole appressed to stem; dark stipules present, later lost; bud leaf colleter later a conical, acuminate apiculus shrivelling to a minute black spot. **Flowers** in spikelets, each flower terminal within an involucre of bracts on a vestigial to minute stipe subtended by a leaf-like bract, spikelets arranged along peduncles; stipes persisting up to most or all of a year; involucre of 4 bracts distal on stipe, opposite and decussate, closely appressed, broadly ovate; floral receptacle ribbed or wrinkled. **Calyx** forming a vestigial collar, slightly lobed. **Corolla** white; petals free, elliptic to narrowly ovate, stiffly erect with crests lying against ovary. **Stamens** free from corolla; filaments erect, with an adaxial basal ridge lying partly over top of ovary; anthers with a pale, apical, sterile lobe, thecae prominently divergent; pollen tricolporate. **Nectary** and flower scent either 0 or unknown. **Ovary** half- to nearly fully inferior; locules 2, lateral, each with a single ovule, wall between locules well developed; styles free, divergent, stigmas terminal. **Fruit** unknown.

Species 2, Western Cape, rare in mountains from Ceres to Kogelberg, to Swellendam, extending to Humansdorp (SW Eastern Cape).

Lonchostoma Wikstr. 3286000

Wikström: 350, t. 10 (1818); Sonder: 316 (1862); Pillans: 133 (1947).

Erect to slightly spreading shrubs, some with coppice shoots sprouting from lignotubers after fires; sparse branching mainly from nodal zones. **Leaves** narrowly elliptic to elliptic or obovate, sessile and generally glabrous, margins flat to strongly incurved; stipules 0; bud leaf colleter erect to distally curved, shrivelling to a minute black apiculus, or lost. **Flowers** in a racemose spike; bracts appressed, elliptic to obovate or clawed, channelled; bracteoles present; floral receptacle minute. **Calyx** tubular below; segments subulate to broadly ovate. **Corolla** white to pink or purple; petal bases connate with stamens to form a tube; free parts of petals obovate, or narrowly so, or elliptic, spreading, glabrous, lacking crests next to ovary. **Stamens** arising from top of corolla tube; anther thecae partly free; pollen grains with 5–10 colpi. **Nectary** 0; scent not recorded. **Ovary** fully superior to two-thirds inferior; locules 2, placed dorsiventrally to obliquely to bract stem plane, sometimes with an interlocular passage; placentas, when parietal, T-

shaped, when axile then with 1 or 2 placental ridges in each locule, bearing 2–16 ovules; style distally branched. **Fruit** not recorded. $x = 11$ (1 report, polyploidy).

Species 5, Western Cape, rare in mountains from Cederberg southwards.

Pseudobaeckea Nied. 3291000

Niedenzu: 136 (1891); Pillans: 169 (1947).

Spreading, medium to tall shrubs, some with coppice shoots sprouting from underground lignotubers after fires. **Leaves** ovate to linear, with a short petiole; often with prominent variation in length on a plant; stipules absent; bud leaf colleter brown, acute to acuminate, later shrinking to a minute black semicone or ridge. **Flowers** in racemose or cymose panicles; floral receptacle trigonous to obconic, slightly to densely warty. **Calyx**: tube minute; segments broadly ovate to oblong, papery, lacking a dark tip. **Corolla** pale cream; petals free to lightly adnate to filaments, obovate to elliptic, with fleshy crests on adaxial surfaces of petal bases. **Stamens** with a basal fleshy crest; anther thecae partly free; pollen with 4 or 5 colpi. **Nectary** 0 to present as a pale ring around top of ovary, either low and fleshy or erect and laminate; scent not recorded. **Ovary** almost to fully inferior; locules 1 or 2, if 2 then wall between locules complete to partly so; ovules 1 or 2 per locule; styles 1 or 2, if 2, then lightly connate, then branching, with branches divergent; if style single then erect to curved. **Fruit** mostly unknown, globose, with or without warts. **Seeds** unknown. $x = 11$ (1 report).

Species 3, Western Cape, mainly in southwest, extending to Uitenhage (S Eastern Cape).

Raspalia Brongn. 3288000

Brongniart: 377, t. 37 fig. 1 (1826) under *Berardia* Brongn.; Sonder: 318 (1862) in part; Pillans: 147 (1947).

Mniothamnea (Oliv.) Nied.: 136 (1891); Niedenzu & Harms: 302 (1930).

Shrubs erect to sprawling, seldom with coppice shoots sprouting from lignotubers. **Leaves** linear to broadly ovate, abaxially smoothly rounded, petiole 0 to vestigial; stipules 0; bud leaf colleter papilloid to deltoid, eroding to a minute black patch, rarely retained intact. **Flowers** solitary or in terminal, usually semiglobose capitula; bracts closely appressed to rarely spreading, ovate to elliptic, with a black apiculus, midrib not visible; bracteoles 2, rarely 1 or absent, lanceolate to spathulate or obovate; floral receptacle obconic to rarely oblong, sometimes with slight ribs passing up to sepals. **Calyx**: tube minute; segments deltoid to ovate, midrib scarcely visible, usually with a dark apiculus. **Corolla** white to magenta, free from filaments, obovate to oblong or elliptic; a crest partly covering edge of ovary. **Stamens** free from petals; filaments often incurved; anther thecae usually partly free, rarely fused or divergent; pollen with 3–6 colpi. **Nectary** a pale fleshy ring around top edge of ovary; scent known in one of the species: sweet and musky. **Ovary** fully to half-inferior; locules usually 2, seldom 1, very rarely 3, wall between locules often incomplete at anthesis; ovules either 1 or 2 or 0 in one locule; styles adnate to connate below the erect or distally divergent branches. **Fruit**, where known, either indehiscent, with receptacle enlarged and persistent flower parts attached, or rarely dehiscing with capsule valves. **Seeds** ovoid, lacking an elaiosome. $x = 11$ (1 report).

Species 11, mainly SW Western Cape, to extremely rare in KwaZulu-Natal.

Staavia Dahl 3290000

Dahl: 15 (1787); Sonder: 321 (1862) in part; Pillans: 169 (1947).

Shrubs erect to sprawling or dwarf, rarely with coppice shoots sprouting from a lignotuber. **Leaves** narrowly ovate to linear, abaxially deeply and prominently keeled; with a slender petiole; dark stipules present, later lost; bud leaf colleter slender to conical, later shrinking or lost. **Flowers** in dense capitula; bracts forming a radiating involucre, linear to ovate, the outer leaf-like, green, the inner often cream-white; bracteoles filiform; floral receptacle slightly to closely ribbed. **Calyx** with a tube; segments narrowly deltoid, up to half darkened from apex. **Corolla** white to deep mauve-pink; petals free, elliptic to sometimes oblong, entire to undulate or toothed, fitting tightly together and crested to form a cup covering edge of ovary. **Stamens** free from corolla, usually with a swelling near base matching petal crests, erect to incurving; anther thecae adnate; pollen grains with 4 or 5 colpi. **Nectary** 0; scent mostly not recorded, in one species faintly sweet. **Ovary** inferior to almost so; locules 1 or 2, if 2 then wall between locules sometimes incomplete; ovules 1 or 2 per locule or rarely an ovule lacking in one locule; ovules pendulous, often with a prominent caruncular cap; styles often swollen below, two branches connate, or connate nearly to apex with branches divergent, stigmas terminal. **Fruit** a 2–4-valved capsule with remains of flower parts. **Seeds** dark, usually with a basal elaiosome. $x = 8, 11$ (1 report, aneuploids).

Species 9, Western Cape, mainly in the southwest.

Thamnea Sol. ex Brongn. 3284000

Brongniart: 386 (1826); Sonder: 324 (1862); Pillans: 143 (1947).

Shrubs, erect to sprawling, some with coppice shoots sprouting from lignotubers after fires. **Leaves** spiral to rarely opposite and decussate, generally minute, hard-textured and sessile, narrow, elliptic to ovate, glabrous to verruculose, margins and keel mostly narrowly hyaline or warty; stipules often present as minute dark papillae, later lost; bud leaf colleter a narrow papilla becoming a broadly triangular or semiconical apiculus, later shrinking to lost. **Flowers** solitary and terminal on a branch with an involucre of ± 6–30 bracts; bracteoles 0; floral receptacle finely ribbed, sometimes extended above to form a hypanthium. **Calyx**: sepals free, lanceolate to narrowly ovate. **Corolla** white to pink or basally purple; petals free, spreading, clawed, sometimes with crests next to ovary. **Stamens** free from corolla; anthers slender; pollen grains with 3–5 colpi. **Nectary** 0 to a thin to fleshy green collar; nectar and scent not recorded. **Ovary** superior to half-inferior, with 1 or 2 locules; ovules 4–8, pendulous; wall between locules often incomplete at anthesis with placenta basal, free-central, axile, or a reduced placenta in summit of ovary; style erect, stigma solitary, obtuse to capitate or truncate. **Fruit** ellipsoid to spheroidal or oblong.

Species 7, Western Cape, mainly in the Ceres region.

Buddlejaceae

(Asteridae—Gentianales)

Compiled by J.E. Victor

Shrubs, trees or suffrutices; pubescence often scaly or stellate. **Leaves** opposite or occasionally subopposite, alternate or ternate, simple, petiolate or sometimes connate at base; stipules present or represented by an interpetiolar ridge, sometimes obscure. **Inflorescence** of many-flowered, terminal or axillary, paniculate cymes, or corymbosely congested, sometimes contracted into pseudoheads or umbels, or in terminal racemes with 2-bracteate pedicels. **Flowers** regular, bisexual. **Calyx** 4-lobed. **Corolla** 4-lobed; tube short to long, campanulate to cylindric, sometimes bearded in the throat; lobes becoming recurved or reflexed in open flower. **Stamens** 4, arising on corolla tube at, in or near throat, included to long-exserted, free portion of filament short to long; anthers basifixed, with longitudinal slits. **Ovary** superior, 2-locular, pubescent; stigma terminal, sometimes decurrent; ovules several to many on thickened axile placentas, hemitropous. **Capsules** small, subcylindric, ovoid, obovoid or oblong, sometimes 2-lobed, septicidally dehiscent, the valves usually splitting at apex. **Seeds** with endosperm; embryo straight.

Genera 8, species 120, Africa, Mascarenes, Asia and America; sthn Afr.: genera 3, species ± 14.

Wilhelm: 90 (1910); Verdoorn: 150 (1963) under Loganiaceae; Roessler: 1 (1967); Leeuwenberg: 327 (1983) under Loganiaceae; Takhtajan: 452, 457 (1997).

The family was formerly included in the Loganiaceae.

Key to genera

1a Inflorescence cymose, paniculate; trees, shrubs, or stragglers:
  2a Leaves usually 3-nate, if opposite, then not densely scaly or tomentose beneath; calyx coriaceous, usually lined with appressed hairs; corolla circumscissile near base; anther thecae confluent ..... **Nuxia**
  2b Leaves opposite or subopposite, usually discolorous, with lower surface densely scaly or tomentose; calyx herbaceous, glabrous within; corolla not circumscissile; anther thecae distinct ..... **Buddleja**
1b Inflorescence racemose; suffrutices ..... **Gomphostigma**

Buddleja L. 6473000

Linnaeus: 112 (1753); Verdoorn: 159 (1963) as *Buddleia*; Leeuwenberg: 333 (1983).

Chilianthus Burch.: 94 (1822).

Shrubs, erect, bushy, scrambling or climbing, sometimes trees; pubescence often scaly or stellate. **Leaves** opposite or occasionally subopposite. **Inflorescence** of many-flowered, terminal and axillary, paniculate cymes, occasionally cymes congested into subglobose heads. **Calyx** pubescent without, glabrous within, persistent. **Corolla**: tube short to long, campanulate to cylindric, sometimes bearded in throat; lobes imbricate, becoming strongly recurved from above base. **Stamens** arising on corolla tube at or near throat, included to long-exserted; anther thecae distinct, ± parallel. **Ovary** pubescent. **Capsules** small, ovoid, obovoid or oblong, sometimes 2-lobed, shortly or long-exserted from persistent calyx. **Seeds** oblong, compressed. $x = 19$ (high polyploidy).

Species ± 100, Africa, Asia and America; 7 in sthn Afr., widespread.

Gomphostigma Turcz. 6470000

Turczaninow: 53 (1843); Verdoorn: 168 (1963); Leeuwenberg: 343 (1983).

Suffrutices, canescent, with mostly stellate scales. **Leaves** opposite, rarely ternate, sometimes appearing fascicled, connate at base or with a ridge between them. **Flowers** in terminal racemes; pedicels bibracteate. **Calyx** cuneate at base. **Corolla** tube not longer than calyx; lobes broad, recurved in open flower. **Stamens** arising in throat of corolla; free portion of filament shorter than anthers; anthers exserted or subexserted. **Capsule** subcylindric, 2-lobed, 2-valved, with valves splitting. **Seeds** many.

Species 2, Africa, both extending into sthn Afr.; *Gomphostigma virgatum* (L.f.) Baill. is a widespread rheophyte, *G. incomptum* (L.f.) N.E.Br. occurs in karroid areas of the Northern andWestern Cape.

Nuxia Comm. ex Lam. 6469000

Lamarck: 295 t. 71 (1791); Verdoorn: 150 (1963); Leeuwenberg: 349 (1983).

Lachnopylis Hochst.: 77 (1843); Phillips: 575 (1951).

Shrubs or trees with fibrous, stringy bark. **Leaves** ternate, sometimes opposite, rarely some leaves alternate, petiolate, glabrous, scaly or variously pubescent, sometimes glutinous; hairs simple, branched or gland-tipped, short or long, dense or sparse; margin entire or variously toothed or lobed, sometimes somewhat undulate. **Cymes** in terminal panicles or corymbosely congested, sometimes contracted into pseudoheads or umbels. **Calyx** tubular-campanulate; lobes erect; tube usually appressed-hairy within. **Corolla** with tube usually included in calyx, circumscissile near base and often bearded in throat; lobes usually reflexed over the erect calyx lobes. **Stamens** arising in or just below throat of corolla tube; anthers exserted, thecae confluent. **Ovary** 2-locular, narrowed into style; stigma terminal, usually exserted;

ovules many in each locule. **Capsule** small, slightly longer than to twice as long as persistent calyx, septicidally 2-valved, valves splitting at apex; placenta free. **Seeds** many.

Species ± 40, Africa, Madagascar and Mascarene Islands; 5 in sthn Afr., widespread.

Burseraceae

(Rosidae—Sapindales)

Compiled by R.H. Archer

Trees or many-stemmed shrubs, dioecious or polygamous, rarely monoecious; bark often peeling or flaking, with resin ducts, secreting an odoriferous resin. **Branchlets** often spine-tipped. **Leaves** alternate, simple, trifoliolate or imparipinnate; stipules 0. **Flowers** unisexual, rarely bisexual, regular, usually small, perigynous to hypogynous; in axillary simple or compound dichasial or paniculate cymes, or singly in clusters; male flowers usually larger than female flowers. **Calyx** infundibuliform, campanulate with 4 valvate, persistent lobes. **Petals** 4, free or united near base, usually yellow to green. **Disc** in perigynous flowers adnate to hypanthium, cylindrical; in hypogynous flowers not adnate to calyx or corolla, intrastaminal, cylindrical, usually with 4 large or with 4 large and 4 small lobes. **Stamens** 8(4), obdiplostemonous, 4 antesepalous stamens longer than other 4, arising on outside or on top of disc; anthers introrse, with longitudinal slits; staminodes present in female flowers. **Ovary** half-inferior or superior; rudimentary in male flowers; 2-locular; with 2 epitropous ovules per locule, pendulous on axile placenta; style short; stigma capitate, obscurely 2–4-lobed. **Fruit** an ovoid to subglobose drupe; in ripe fruit the thin exocarp and fleshy mesocarp splitting into 2 longitudinal valves to expose a crustaceous or bony endocarp (putamen), usually clasped by a red or yellowish pseudo-aril; pseudo-aril either cupular with short lobes or arms, or with 2–4 relatively long arms, or covering ± whole putamen without distinct arms; putamen usually enclosing 1 fertile locule and 1 much smaller abortive locule. **Seeds**: embryo straight, cotyledons much folded. $x = 13$ (polyploidy).

Genera 16, with ± 500 species distributed mainly in the tropics, but especially in Malaysia, Africa and South America; sthn Afr.: genus 1, species 31.

Wild: 263 (1963); Merxmüller: 1 (1968); Van der Walt: 53 (1973); Van der Walt: 195 (1975); Van der Walt: 5 (1986).

Commiphora Jacq. 4151000

Jacquin: 66 (1797) name conserved; Wild: 67 (1959); Wild: 263 (1963); Merxmüller: 1 (1968); Van der Walt: 53 (1973); Van der Walt: 5 (1986).

Balsamodendrum Kunth: 348 (1824); Sonder: 526 (1860).

Description as for family.

Species nearly 200, mostly in Africa, some in India and Arabian Peninsula; 31 in sthn Afr., widespread.

Buxaceae

(Dilleniidae—Buxales)

Compiled by R.H. Archer

Trees or shrubs, evergreen, monoecious. **Leaves** opposite, shortly petiolate, simple, entire; stipules 0. **Flowers** regular, unisexual, small, sessile or shortly pedicelled in compact, axillary racemes or cymes, with terminal flowers usually female and remainder male, rarely a few bisexual. **Perianth** (calyx) usually of 2 sepaloid whorls. **Male flowers**: perianth segments 4, sometimes 6, usually in 2 series, imbricate; stamens 4–6, rarely more, when 4 then opposite perianth segments, when 6 then 2 pairs opposite inner segments; filaments free, exserted; anthers 2-thecous, dorsifixed near base, opening lengthwise, often large; pistil absent or rudimentary. **Female flowers**: perianth segments 4–6; lobes imbricate, outer smaller; ovary superior, 3-locular, with 2 pendulous, anatropous ovules from outer angles in

each locule; styles 3, free, often diverging, thick, undivided. **Fruit** a somewhat woody loculicidal capsule with 3 horns (persistent styles). **Seeds** somewhat 3-angled, black, shiny; testa crustaceous; embryo straight; endosperm firm. $x = 14$ (polyploidy).

Genera 4, species 100, nearly cosmopolitan, but mainly northern hemisphere; sthn Afr.: genus 1, species 2.

Hutchinson: 105 (1967); Glen: 37 (1996).

Buxus L. 4533000

Linnaeus: 983 (1753); Hutchinson: 108 (1967); Friis: 293 (1989); Glen: 37 (1996).

Notobuxus Oliv.: t. 1400 (1882); Hutchinson: 375 (1915) as Euphorbiaceae; Phillips: 138 (1943).

Description as for family.

Species 80, mainly north temperate, 9 in Africa; 2 in sthn Afr., Northern Province, Gauteng, Mpumalanga, KwaZulu-Natal to Eastern Cape.

Cabombaceae

(Magnoliidae—Nymphaeales)

Compiled by R.P. Glen

Stoloniferous, perennial, aquatic herbs rooted in mud, submerged parts heavily covered with mucilaginous jelly, particularly younger parts. **Stem** rhizomatous with floating or creeping runners bearing leaves. **Leaves** alternate, long-petiolate, blades peltate, oval, floating, young leaves inrolled longitudinally, submerged; stipules 0. **Flowers** bisexual, regular, solitary in leaf axils, long-pedicellate. **Sepals** 3, free. **Petals** 3, free, linear, hypogynous, purple, reflexed at anthesis, becoming erect in fruit. **Stamens** 18–36; anthers extrorse, opening lengthwise. **Carpels** 4–18, free, oblong-ovate; style very short or absent; stigma attenuated, entire; ovules 2 per carpel, parietal, pendulous. **Fruiting carpels** indehiscent, beaked, 1 or 2 seeds. **Seeds** globular, smooth or partly and minutely papillate, operculate, without aril; endosperm scanty, perisperm copious. $x = 10$ (polyploidy).

Genera 2, species 8, tropical to warm-temperate areas of Old and New World; sthn Afr.: genus 1, species 1.

Cook: 60 (1990); Wild: 173 (1960); Zomlefer: 51 (1994).

Brasenia Schreb. 2510000

Schreber: 372 (1789); Wild: 173 (1960); Aston: 46 (1973); Cook: 60 (1990).

Description as for family.

Species 1: *Brasenia schreberi* J.F.Gmel., America, Australia and Africa; very common in the Okavango Swamps (Botswana), one record from Loskop Dam (Mpumalanga).

Cactaceae

(Caryophyllidae—Caryophyllales)

Compiled by H.F. Glen

Perennial plants with variously modified succulent stems, epiphytes, shrubs or trees, often spiny; spines, branches, flowers and often irritant hairs (glochids) arise from usually raised cushions or areoles which may represent axillary buds or condensed side branches. **Leaves** usually rudimentary. **Flowers** bisexual, regular, rarely irregular, usually showy, solitary or clustered, axillary. **Calyx** adnate to ovary and shortly tubular above; lobes often numerous, in several rows, scale-like, foliaceous, or petaloid. **Corolla** usually of many petals in several rows, free or connate into a short tube, the outer merging into sepals. **Stamens** usually numerous, in several rows, arising in calyx throat, sometimes adnate to base of petals; anthers 2-thecous. **Ovary** inferior, 1-locular, with many ovules on 3 or more parietal placentas; style terminal, simple, with as many stigmas as placentas. **Fruit** a berry, rarely dry, smooth or ± spiny. **Seeds** many, with smooth and shiny or tuberculate, often black testa.

Genera 100–150, species ± 2 000, mostly arid, tropical America; sthn Afr.: genera 7 (6 naturalised), species 19 (18 naturalised). Many species cultivated, often naturalised in hot dry regions worldwide; often troublesome invaders. Only *Rhipsalis* is considered an Old World genus and appears to be indigenous.

Harvey: 479 (1862); Britton & Rose (1919–23); Berger (1929); Backeberg (1958–62); Obermeyer: 144 (1976); IOS Working Party: 65 (1986); IOS Working Party: 85 (1990); Barthlott & Hunt: 161 (1993); Glen *et al.* (in prep.).

Key to genera

1a Stems divided into flattened joints (pads) ..... ***Opuntia**
1b Stems terete or winged, not flattened:
2a Stems 3-angled ..... ***Hylocereus**
2b Stems cylindrical:
3a Branches ± terete, without longitudinal ribs:
4a Branches tuberculate ..... ***Opuntia**
4b Branches smooth:
5a Pendulous herbs; paired hooked thorns absent; leaves absent; flowers solitary; fruit up to 10 mm in diameter ..... **Rhipsalis**
5b Erect shrubs; paired hooked thorns present on older parts of extension growths; leaves present; flowers in panicles; fruit ± 20 mm in diameter..... ***Pereskia**
3b Branches winged or with conspicuous longitudinal ribs:
6a Erect trees or shrubs:
7a Shrubs up to 1–2 m tall; mature spines brown; flowers white and pink ..... ***Echinopsis**
7b Trees up to 5 m tall; mature spines grey; flowers greenish and white ..... ***Cereus**
6b Climbing plants ..... ***Harrisia**

Miller: [308] (1754); Haworth: 178 (1812); Britton & Rose: 3 (1920); Berger: 107 (1929); Buxbaum: 410 (1968); IOS Working Party: 70 (1986); IOS Working Party: 90 (1990); Barthlott & Hunt: 180 (1993).

Piptanthocereus (A.Berger) Riccob.: 225 (1909).

Erect stem-succulent trees 2–7 m tall. **Trunk** branched at base. **Stems** cylindrical. **Branches** 6–8-winged, wings compressed when young, broader later, margins relatively straight or evenly spiral. **Areoles** with 3 central spines 10–20 mm long, yellow or brown when young, ageing grey, and 4–8 peripheral spines 4–6 mm long, yellow or brown when young, ageing grey. **Flowers** solitary. **Sepals** greenish, lorate, apices obtuse. **Petals** white, lorate, apices obtuse. **Stamens** many, oblique in mature flower. **Ovary** dark green; stigma lobes 16–20. **Fruit** (ripe) red, ellipsoid, skin smooth, pulp white. **Seeds** black. $x = 11$ (aneuploids, polyploidy).

Species ± 40, Caribbean and South America; **Cereus jamacaru* DC. (locally often referred to as **C. peruvianus*) is naturalised in the bushveld areas of the Northern Province, Mpumalanga, Gauteng and North-West.

*Echinopsis Zucc. 5406010

Zuccarini: 675 (1837); IOS working party: 91 (1990); Barthlott & Hunt: 184 (1993).

Trichocereus (A.Berger) Riccob.: 236 (1909); Backeberg: 1095 (1959); Kiesling: 279 (1978).

Erect stem-succulent shrubs 1–2 m tall. **Stems** cylindrical. **Branches** 10–15-winged, glaucous, margins relatively straight or evenly spiral. **Areoles** ± 10 mm apart, with 1 central spine, yellow when young, ageing brown, and 8–10 peripheral spines 6–10 mm long, yellow when young, ageing brown. **Flowers** solitary, ± 20 mm long overall, mouth ± 15 mm in diameter. **Sepals** white. **Petals** pink or red. **Fruit** spherical to narrowly ovoid or oblong, fleshy to dry. **Seeds** dull black, more or less warty. $x = 11$.

Species ± 60, South America; **Echinopsis spachianus* (Lem.) Friedrich & Rowley, is invasive in Eastern Cape.

*Harrisia Britton 5401010

Britton 35: 561 (1908); Britton & Rose 2: 147 (1920); Obermeyer: 145 (1976); IOS Working Party: 69 (1986); IOS Working Party: 89 (1990); Barthlott & Hunt: 178 (1993).

Eriocereus Riccob.: 238 (1909).

Climbing stem-succulent shrubs over 2 m tall. **Stems** cylindrical. **Branches** 4- or 5-winged, ribs broad, margin relatively straight or evenly spiral; young joints glaucous, becoming green. **Areoles** 30–35 mm apart, with 1 brown central spine 20–30 mm long, and 5–7 peripheral spines; glochidia absent. **Flowers** solitary. **Sepals**: segments greenish, lorate, with margins and apices red. **Petals** white, pink or red, lorate. **Fruit** (ripe) red, round, skin scaly, pulp white. **Seeds** black. $x = 11$ (1 report).

Species ± 20, Caribbean and South America; **Harrisia martinii* (Labour.) Britton is naturalised in KwaZulu-Natal.

*Hylocereus (A.Berger) Britton & Rose 5401060

Britton & Rose: 428 (1909); Backeberg 2: 803 (1959); IOS Working Party: 69 (1986); IOS Working Party: 89 (1990); Barthlott & Hunt: 179 (1993).

Climbing stem-succulent shrubs. **Branches** 3-winged, ribs compressed, margin strongly undulate, becoming horny with age. **Areoles** up to 40 mm apart, with 1 central spine 2–4 mm long and up to 2 peripheral spines 2–4 mm long. **Flowers** solitary. **Sepals** lorate, greenish or yellowish, apices acuminate. **Petals** spathulate, green, apices acute. **Stamens** of mature flower roughly parallel to perianth. **Style** cream; stigma lobes ± 24. **Fruit** (ripe) red, oblong, scaly. **Seeds** black. $x = 11$.

Species ± 18, tropical America; **Hylocereus undatus* (Haw.) Britton & Rose, is recorded as invasive in KwaZulu-Natal and Eastern Cape.

*Opuntia Mill. 5417000

Miller: [974] (1754); Britton & Rose 1: 42 (1919); Berger: 48 (1929); Obermeyer: 149 (1976); IOS Working Party: 75 (1986); IOS Working Party: 88 (1990); Barthlott & Hunt: 172 (1993).

Cylindropuntia (Engelm.) F.Knuth: 117, 410 (1935). *Austrocylindropuntia* Backeb.: [21] (1938).

Erect or prostrate stem-succulent shrubs or trees. **Stems** divided into flattened, usually elliptic joints (pads), or stems terete, branches tuberculate. **Areoles** with up to 30 spines each; glochidia present. **Leaves** usually absent or inconspicuous and soon deciduous. **Flowers** solitary. **Petals** various. **Fruit** (ripe) purple, red or yellow, round, ellipsoid or ovoid, skin usually with glochidia, pulp greenish or red. **Seeds** whitish to mid-brown; hilum white. $x = 11$ (high polyploidy).

Species ± 240, North and South America; at least 14 species are naturalised in sthn Afr.; several are widespread throughout the region.

N.P. Taylor (personal communication) states 'On the basis of seed anatomical features (W. Stuppy, unpublished) and pollen morphology (Leuenberger 1976) I would recognise the following segregate genera from amongst those taxa introduced in South Africa: **Austrocylindropuntia* Backeb. (**O. cylindrica* and *subulata*); **Cylindropuntia* (En-

gelm.) F. Knuth (**O. rosea* and *imbricata*) and **Opuntia* in strict sense (all others). All the names are available either way.' It seems from Taylor's letter and the references he cites that all species of **Opuntia* with flat pads belong to the narrow interpretation of the genus, but species with cylindrical joints may belong to any of the three segregate genera. With the evidence available at the time of writing, there is no obvious way of distinguishing between these genera without seeds or pollen. Therefore, they are treated as one here, and a more definitive decision is deferred until the publication of the paper by Glen *et al.* (in prep.).

*Pereskia Mill. 5421000

Miller: [1026] (1754); Britton & Rose 1: 8 (1920); Berger: 41 (1929); Obermeyer: 156 (1976); IOS working party: 69 (1986); Leuenberger: 53 (1986); IOS Working Party: 88 (1990); Barthlott & Hunt: 171 (1993).

Climbing stem-succulent shrubs 2–10 m tall. **Branches** terete, green. **Areoles** with 1–3 charcoal-grey spines; paired hooked thorns present. **Leaves** oblong to ovate, up to 70 mm long. **Flowers** in panicles; bracts few, elongated, leaf-like. **Sepals** 4–7, greenish. **Petals** 7–12, white, apices obtuse. **Stamens** of mature flower oblique. **Ovary** dark green, surface with spines. **Fruit** (ripe) yellow, ± 20 mm in diameter, skin smooth. **Seeds** black. $x = 11$.

Species 20, Central and South America; **Pereskia aculeata* Mill., is a serious pest in coastal forest in KwaZulu-Natal.

Rhipsalis Gaertn. 5416000

Gaertner: 137, t. 28 (1788) name conserved; Harvey: 479 (1862); Britton & Rose 4: 219 (1923); Berger: 89 (1929); Obermeyer: 147 (1976); IOS Working Party: 70 (1986); IOS Working Party: 92 (1990); Barthlott & Hunt: 188 (1993); Barthlott & Taylor: 48 (1995); Smith & Steyn: 135 (1997).

Succulent, leafless shrublets or shrubs. **Branches** terete or leaf-like, often jointed, sometimes epiphytic. **Leaves** scale-like or 0. **Areoles** with 1 or 2 spines. **Flowers** solitary, usually lateral. **Calyx** not united above ovary; lobes 3–many, scale-like, greenish. **Petals** 6–10, oblong, spreading, green or white. **Stamens** many; filaments subequal, perpendicular to perianth; anthers short. **Ovary** smooth, usually glabrous; style divided into 2–many stigmas. **Fruit** a subglobose berry, crowned with persistent perianth, sometimes with a few spines, cream-coloured; flesh white. **Seeds** somewhat pear-shaped, dark brown to black. $x = 11$ (polyploidy).

Species ± 50, Africa, Asia, America; 1 in South Africa: *Rhipsalis baccifera* (J.S.Mill.) Stearn subsp. *mauritiana* (DC.) Barthlott; KwaZulu-Natal coast into Eastern Cape near Komga.

Callitrichaceae

(Asteridae—Lamiales)

Compiled by R.H. Archer

Small, delicate, often submerged aquatic or terrestrial herbs with limited vascular system; monoecious. **Leaves** opposite, small, entire; stipules 0. **Flowers** unisexual, small, axillary, solitary, rarely a male and female flower from the same leaf axil forming an apparently bisexual flower; bracts caducous; perianth absent. **Male flowers**: stamen 1: filament filiform, elongated or shorter than ovary; anther 2-thecous, opening by longitudinal slits joining at the top. **Female flowers**: ovary superior, 2(–4)-locular, (2–)4-furrowed and -lobed, sessile or shortly stalked, with a single, pendulous, axile, anatropous, unitegmic ovule in each locule; styles 2, longer or shorter than ovary, papillose on either side. **Fruit** leathery, compressed, indehiscent, with lobes dorsally margined or winged, 2(–4)-seeded. **Seeds** with oily endosperm. $x = 5$ (3, 4, 14, 19) (polyploidy).

Genus 1, species ± 25, cosmopolitan; 2 in sthn Afr.

Callitriche L. 4530000

Linnaeus: 969 (1753); Marloth: 141 (1925).

Description as for family.

Species ± 25, cosmopolitan; 2 in sthn Afr., Namibia, KwaZulu-Natal and Western Cape.

References

Campanulaceae

(Asteridae—Asterales)

Compiled by W.G. Welman

Herbs, undershrubs, or small shrubs, often with milky juice. **Leaves** alternate, rarely opposite or whorled, simple, entire, toothed, lobed or cut, rarely rudimentary; stipules 0. **Flowers** bisexual, regular, in cymes, racemes or panicles or axillary and solitary; bracts present or absent. **Calyx** (3 or 4)5(6–10)-lobed or -partite (calyx tube refers to portion above ovary); lobes equal or unequal, valvate. **Corolla** gamopetalous, 4- or 5-lobed; tube campanulate, cylindric, rarely funnel-shaped, arising at line where calyx becomes free from ovary. **Stamens** as many as corolla lobes and alternating with them, free from or arising in corolla tube; filaments free or connate into a tube, often dilated at base; anthers free but often connivent, 2-thecous, opening lengthwise. **Ovary** inferior, half-superior or rarely superior, (1)2–5(6–10)-locular, with axile placentas, rarely basal or apical, 2–few to many ovules in each locule; style simple, often hidden by connate to connivent stamens; stigmas as many as locules. **Fruit** a capsule or berry, often crowned with persistent calyx, variously dehiscent, rarely indehiscent. **Seeds** often small, smooth or reticulate-rugose.

Genera ± 35, species ± 700, cosmopolitan, especially in Mediterranean region and sthn Afr., relatively few in the African tropics; sthn Afr.: genera 12, species ± 260. Lobeliaceae (incl. Cyphiaceae) is sometimes classified under Campanulaceae in broad sense, which would then consist of three subfamilies, namely **Campanuloideae** (Flowers ± regular; anthers usually eventually free: all genera of Campanulaceae in strict sense, treated below); **Cyphioideae** (Flowers irregular; stamens sometimes united, anthers free: *Cyphia*); **Lobelioideae** (Flowers usually irregular; anthers connate: *Grammatotheca*, *Lobelia*, *Monopsis*, *Wimmerella* (=*Laurentia*)).

Sonder: 530 (1865) in broad sense, excluding Lobeliaceae and Goodeniaceae; Thulin: 87 (1983).

Key to genera

1a Leaves small, broadly ovate, hard, glabrous, densely imbricate, in 4 rows ..... **Rhigiophyllum**
1b Leaves not as above:
2a Stamens arising high in corolla tube; ovules rarely more than 6 ..... **Siphocodon**
2b Stamens free from corolla or arising on lower portion of tube:
3a Ovary 1-locular or incompletely 2-locular, with 4 basal ovules; stamens free; corolla with long slender tube ..... **Merciera**
3b Ovary 2–5(6–10)-locular; ovules many:
4a Capsule indehiscent, tardily opening by the irregular decomposition of the pericarp between the persistent lateral nerves; annuals ..... **Gunillaea**
4b Capsule dehiscent; annuals or perennials:
5a Capsule dehiscing septicidally by 3 longitudinal splits ..... **Namacodon**
5b Capsule dehiscing not as above:
6a Capsule bursting at apex or opening by a terminal pore or lid:
7a Ovary 2-locular; capsule cylindric or barrel-shaped, opening by a terminal pore or bursting irregularly; shrubs or shrublets:
8a Inflorescence 1–few-flowered, closely subtended by leaves ..... **Roella**
8b Inflorescence usually pedunculate; capsule elongate, at length splitting nearly to base into 5 segments.... ..... **Prismatocarpus**
7b Ovary 3(2)-locular; capsule campanulate, opening by terminal cap, walls breaking down in fruit; small prostrate perennial herbs, often mat-forming ..... **Craterocapsa**
6b Capsule opening regularly by terminal valves:
9a Corolla campanulate or funnel-shaped ..... **Wahlenbergia**
9b Corolla cylindric:
10a Ovary 2-locular, subglobose, hairy; stamens 5, free from corolla tube, included; stigma 2-lobed ... **Treichelia**
10b Ovary 3–5-locular:
11a Ovary 5-locular; stigma 5-lobed ..... **Microcodon**
11b Ovary 3(4)-locular; stigma club-shaped, with 3 glandular lobes ..... **Theilera**

Craterocapsa Hilliard & B.L.Burtt 8668010

Hilliard & Burtt: 314 (1973).

Perennial herbs, prostrate, often mat-forming. **Leaves** alternate, occasionally opposite. **Flowers** sessile or shortly pedicellate, usually solitary, occasionally a few from the axis of a leaf, terminal or pseudolateral. **Calyx**: tube free, short; lobes narrowly triangular or foliaceous. **Corolla** funnel-shaped, shortly 5-lobed. **Stamens** free; filaments dilated below. **Style** swollen at base or surrounded by a disc, (2)3-branched. **Ovary** entirely inferior, campanulate, (2)3-locular, with many ovules produced above middle of placenta, walls very delicate. **Fruit** a capsule often becoming 1-locular on maturity, dehiscing through an apical lid. **Seeds** ellipsoid, slightly angled.

Species 4, sthn Afr., with 1 extending into Zimbabwe; mainly on eastern high mountains, Northern Province, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Lesotho, Eastern Cape.

Gunillaea Thulin 8663020

Thulin: 166 (1974).

Annual herbs. **Leaves** alternate, sessile, flat. **Inflorescences** ± frondose monochasia. **Flowers** ± regular, bisexual, protandrous. **Calyx** lobes (3)4 or 5, accrescent. **Corolla** campanulate, epigynous, (3)4- or 5-lobed. **Stamens** (3)4 or 5, free; filament bases almost linear to broadly winged, ciliate or glabrous. **Ovary** inferior, 2-locular; ovules many; style shorter than corolla, 2-lobed, upper part with pollen-collecting hairs, lower part glabrous or hairy; 2 glands sometimes present at base of style lobes. **Capsule** thin-walled, indehiscent. **Seeds**

many; testa sulcate, often with hair-like projections. x = 9 (1 report).

Species 2, Africa and Madagascar; 1 species: *Gunillaea rhodesica* (Adamson) Thulin, N Namibia and Botswana.

Merciera A.DC. 8661000

Candolle: 369, t. 5 (1830); Adamson: 157 (1954).

Dwarf undershrubs or shrublets, glabrous or hairy. **Leaves** somewhat ericoid, dense, often fascicled, ciliate. **Flowers** solitary, axillary, shortly pedicellate or subsessile; bracts 2. **Calyx** much shorter than corolla, glabrous, 4- or 5-lobed; tube very short or shallowly campanulate; lobes lanceolate or oblong-lanceolate. **Corolla** 4- or 5-lobed; tube long, slender, gradually widening upwards; lobes sometimes unequal, shorter than tube, sometimes glandular on inner face. **Stamens** 4 or 5, free from corolla, included; filaments filiform, pilose ± in the middle; anthers 2-thecous, linear. **Ovary** inferior, turbinate or subglobose, 1-locular; or imperfectly 2-locular, with 4 erect ovules, pilose; style filamentous, exserted, swollen at base; stigma ellipsoid or clavate, of 2 fleshy, glandular or hairy lobes. **Fruit** a capsule, 1-seeded by abortion, crowned with persistent calyx.

Species 5, Western Cape.

Microcodon A.DC. 8677000

Candolle: 127, t. 19 (1830); Sonder: 564 (1865).

Herbs, usually small, somewhat wiry annuals. **Leaves** alternate or subopposite, linear. **Flowers** in terminal corymbs or heads. **Calyx** as long as or shorter than corolla tube, 5-partite; lobes linear, subulate, sometimes ciliate. **Corolla** 5-lobed, glabrous; tube cylindric; lobes ovate or oblong, shorter than tube. **Stamens** 5, arising at base of corolla tube, included; filaments linear, shorter than anthers, pilose; anthers linear. **Ovary** inferior or half-inferior, 5-locular, with many ovules in each locule, glabrous or hairy; style terete, included, sparsely hairy on lower portion; stigma 5-lobed. **Fruit** a capsule, loculicidally 5-valved.

Species 4; mainly Western but also Northern Cape.

Namacodon Thulin 8663010

Thulin: 173 (1974).

Erect shrublets, much branched from base. **Leaves** alternate, sessile, flat, lanceolate, margin slightly revolute. **Flowers** terminal, solitary; pedicel elongating in fruit, protandrous. **Calyx**: tube linear or tapering at each end, with 3 longitudinal furrows, glabrous; lobes 5, linear, acute, entire, glabrous. **Corolla** campanulate, epigynous, blue, lobes 5, united almost halfway. **Stamens** 5, free, filament bases ciliate-pubescent; anther connective with apical appendage. **Ovary** inferior, 3-locular, ovules many; style shorter than corolla, with pollen-collecting hairs, style lobes 3. **Capsule** elongated, cylindrical-fusiform, dehiscing septicidally by 3 longitudinal splits. **Seeds** many, broadly elliptic, strongly compressed, almost smooth, brown, glossy.

Species 1: *Namacodon schinzianum* (Markgr.) Thulin, mountains in central Namibia.

Prismatocarpus L'Hér. 8663000

L'Héritier de Brutelle: 1, t. 3 (1789); Adamson: 93 (1951).

Subshrubs, sometimes perennial herbs. **Leaves** alternate, often somewhat ericoid. **Flowers** solitary or glomerate at ends of branches or in dichotomous panicles. **Calyx** shorter to longer than corolla tube, 5-lobed or 5-partite, glabrous or hairy; lobes variable. **Corolla** 5-lobed, glabrous; tube campanulate or subcylindric, expanding above; lobes elliptic-lanceolate to obovate-oblong. **Stamens** 5, free from corolla, included or shortly exserted; filaments long, linear and pilose or short and dilated at base; anthers 2-thecous, linear. **Disc** glandular, swollen, or 0. **Ovary** cylindric, 2-locular, with many ovules in each locule, usually hairy; style linear or thick and terete, sometimes with 2 glands below stigma, included or exserted; stigma usually 2-lobed, rarely cylindric. **Fruit** a capsule, splitting from top to base into 5 segments. **Seeds** oblong, compressed, dotted.

Species 30, mostly Western Cape, also Northern and Eastern Cape.

Rhigiophyllum Hochst. 8664000

Hochstetter: 232 (1842); Sonder: 597 (1865).

Shrublets, rigid. **Leaves** small, broadly ovate, glabrous, densely imbricate in 4 rows, squarrose, entire. **Flowers** in terminal heads, intermixed with rigid, leaf-like bracts; bracteoles 2. **Calyx** much shorter than corolla tube, glabrous; tube shallowly basin-shaped; lobes lanceolate. **Corolla** 5-lobed, glabrous; tube long, cylindric; lobes lanceolate. **Stamens** 5, arising in corolla throat, scarcely exserted; filaments linear, shorter than anthers; anthers 2-thecous, linear. **Ovary** obconic, 3-locular, with several ovules in each locule on apical placentas; style slender, terete, exserted; stigma of 3 recurved, fleshy lobes. **Fruit** a capsule, dehiscing through a terminal lid, crowned with persistent style base.

Species 1: *Rhigiophyllum squarrosum* Hochst., Western Cape.

Roella L. 8662000

Linnaeus: 170 (1753); Adamson: 129 (1951).

Undershrubs, rarely herbs. **Leaves** somewhat ericoid, often recurved, sometimes those under flowers pinnately spinous-lobed. **Flowers** sessile, solitary or glomerate at ends of branches. **Calyx** longer than corolla tube, (4)5-lobed; tube shallowly saucer-shaped; lobes lanceolate-linear to ovate, entire or pectinate or ciliate in upper half. **Corolla** (4)5-lobed; tube usually campanulate; lobes elliptic or oblong. **Stamens** (4)5, free from corolla tube; included or subexserted; filaments expanded at base into an oblong or linear, ciliated, scale-like structure; anthers 2-thecous, free, linear or oblong-linear. **Disc** annular or swollen. **Ovary** 2-locular, with many ovules in each locule; style broadly linear or terete, sometimes hairy at base or glandular above, sometimes with 2 glands at base of stigma, included; stigma of 2 lobes either recurved, somewhat fleshy and often clavate, or oblong and glandular. **Fruit** a capsule, 2-locular, perforated by base of style and appearing as if covered by an apical lid, at length dehiscing by hole at apex, without valves. **Seeds** many, angled, scabrous, thick.

Species 25, mostly Western Cape, 1 in KwaZulu-Natal and Eastern Cape.

Siphocodon Turcz. 8667000

Turczaninow: 175 (1852); Sonder: 596 (1865).

Slender undershrubs with wiry branches. **Leaves** sparse, subulate, scale-like. **Flowers** in few-flowered racemes or racemose panicles. **Calyx** shorter than corolla tube, 5-lobed, glabrous; tube shallowly saucer-shaped; lobes lanceolate. **Corolla** 5-lobed, glabrous; tube cylindric; lobes oblong or ovate-lanceolate, shorter than tube. **Stamens** 5, arising high in corolla tube, included; filaments free, slightly shorter than anthers; anthers 2-thecous, oblong. **Ovary** inferior, 2- or 3-locular, 2, 4 or

5 ovules in each locule; style terete, gradually thinner upwards; stigma of 3 lanceolate, glandular lobes. **Fruit** a capsule, crowned with persistent calyx, opening transversely and lid falling with portion of calyx.

Species 2, Western Cape.

Theilera E.Phillips 8677010

Phillips: 368 (1932).

Shrublets with lax, slender branches. **Leaves** alternate, fascicled, linear, erect or recurved. **Flowers** axillary, solitary, sessile. **Calyx** much shorter than corolla tube, 5-partite, glabrous; lobes linear. **Corolla** 5-lobed, glabrous; tube cylindric; lobes oblong or ovate-oblong, shorter than tube. **Stamens** 5, free from corolla, included; filaments thread-like, longer than anthers, scantily pilose; anthers 2-thecous, linear. **Ovary** inferior, 3(4)-locular, with many ovules in each locule, on basal placentas; style terete, exserted, glabrous; stigma club-shaped, with 3 glandular lobes. **Fruit** a capsule opening by terminal valves.

Species 1: *Theilera guthriei* (L.Bolus) E.Phillips, Western and Eastern Cape.

Treichelia Vatke 8665000

Vatke: 700 (1874); Adamson: 745 (1950).

Leptocodon Sond.: 584 (1865) name illegitimate.

Dwarf, coarse, annual herbs. **Leaves** linear, with few remote teeth and with few rigid cilia at base. **Flowers** in dense, terminal subheads, intermixed with long, linear bracts. **Calyx** shorter than corolla tube, 5-lobed, hairy; tube subcampanulate. **Corolla** 5-lobed, glabrous; tube cylindric, globose at base; lobes lanceolate. **Stamens** 5, free from corolla tube, included; filaments short, linear, expanded and ciliate at base; anthers 2-thecous, linear. **Ovary** subglobose, 2-locular, with several ovules in each locule, hairy; style slender, terete, swollen into a large, subglobose, solid ball at base; stigma 2-lobed. **Fruit** a capsule, cylindric, several-seeded, covered by solid, conical base of style.

Species 1: *Treichelia longebracteata* (H.Buek) Vatke; Western Cape: Cape Peninsula.

Wahlenbergia Schrad. ex Roth 8668000

Schrader ex Roth: 399 (1821) name conserved; Sonder: 566 (1865); Von Brehmer: 9 (1915); Thulin: 1 (1975); Lammers: 333 (1995); Welman: 157 (1996).

Lightfootia L'Hér.: 4, t. 4 (1789) name illegitimate. *Cervicina* Delile: 7, t. 5, f. 2 (1813) name rejected. *Cephalostigma* A.DC.: 117 (1830).

Annual or perennial herbs, sometimes shrublets. **Leaves** alternate, rarely opposite. **Flowers** solitary, on axillary or terminal peduncles or sometimes panicled. **Calyx** usually shorter than corolla tube (3- or 4-)5-partite; segments usually linear or subulate. **Corolla** (3- or 4-)5-lobed to ± middle; tube funnel-shaped, or campanulate, sometimes widened at base; lobes variable in shape, usually shorter than tube. **Stamens** 5, free from corolla, included; filaments linear, sometimes pilose, often expanded at base and 2-lobed; anthers 2-thecous, linear, sometimes sagittate. **Ovary** subglobose, 2–5-locular, with many ovules in each locule, glabrous or hairy, sometimes glandular; style terete, included or exserted, sometimes with cone-shaped base; stigma of 2–5 glandular, usually recurved, lobes. **Fruit** a capsule, dehiscing loculicidally into as many valves as there are locules. $x = 9$ (8) (aneuploids, high polyploidy).

Species ± 200, mainly southern hemisphere; nearly 150 in sthn Afr.; all regions.

Canellaceae

(Magnoliidae—Magnoliales)

Compiled by C.L. Bredenkamp

Trees, evergreen, glabrous, often aromatic. **Leaves** alternate, simple, entire, gland-dotted, penninerved, dark green, shiny above; stipules 0. **Inflorescence** axillary with flowers solitary or in abbreviated 3-flowered cymes. **Flowers** regular, bisexual. **Sepals** 3, imbricate, persistent, suborbicular. **Petals** 10, free, in 2 whorls, the outer larger and thicker than inner, pellucid gland-dotted. **Stamens** 10, hypogynous; filaments united in a tube; anthers sessile on upper part of tube, about as long as tube, linear, with fleshy apical appendage and with longitudinal extrorse dehiscence. **Ovary** superior, 1-locular; ovules 10–30 in 1 or 2 rows on 5 parietal placentas; style ± enclosed in staminal tube, truncate at apex, bearing 5 oval stigmatic patches round the sides, thick; stigmas 2–5. **Fruit** a berry; pericarp coriaceous. **Seeds** 2–many, shining; endosperm oily and fleshy.

Genera 5, species ± 11 , tropical North and South America, east tropical Africa and Madagascar; sthn Afr.: genus 1, species 1.

Codd: 39 (1976).

Warburgia Engl. 5256000

Engler: 276 (1895) name conserved; Codd: 40 (1976).

Description as for family.

Species 3, Africa; 1 in sthn Afr.: *Warburgia salutaris* (G.Bertol.) Chiov., Northern Province, Mpumalanga, KwaZulu-Natal.

*Cannabaceae

(Dilleniidae—Urticales)

Compiled by M. Jordaan

Erect, tall, annual, aromatic herbs without latex, dioecious, rarely monoecious; most parts of plant with minute adpressed swollen-based glandular hairs. Male and female plants dimorphic: males taller and more slender with longer narrower leaflets, inflorescence sparsely leafy, plant dying soon after flowering; female shorter, more robust, inflorescence densely leafy, plant living several months after pollination. **Leaves** alternate (opposite at stem base), petiolate, palmately compound or lobed, leaflets uneven in size, serrate; stipules lateral, linear, acute, persistent. **Male inflorescences** axillary, much-branched, lax, cymose panicles, bristly-hairy, exceeding leaves but bearing few scattered leaves. **Male flowers** small, pedicellate, regular; perianth uniseriate, lobes 5, free, imbricate, greenish or whitish, boat-shaped, spreading or reflexed; stamens 5, opposite perianth lobes, erect in bud, pendulous at maturity, dehiscence longitudinal, basipetal; filaments short; pistillode 0. **Female inflorescences** axillary, short, compact, not exceeding leaves, few-flowered. **Female flowers** in pairs, each with stipule-like bract and small green organ ('bracteole' or 'calyx') completely enveloping ovary and loosely enclosing mature fruit, forming basally swollen tubular sheath acuminate at apex and covered with fine hairs and short-stalked or sessile resinous glands; perianth thin, undivided, tightly enveloping ovary and mature fruit (often reduced or absent in cultivated forms), marbled with light and dark areas; ovary superior, sessile, ± globose, 1-locular; ovule solitary, anatropous, bitegmic, crassinucellar and pendent from near apex of locule; style short; stigma branches 2, long, filiform, densely pubescent, caducous. **Fruit** a globular to ovoid achene tightly covered by thin crustaceous perianth, reticulate venation of surface beneath perianth visible. **Seed** 1; endosperm sparse, fleshy, oily; embryo strongly curved or coiled; cotyledons fleshy. $x = 10$ (polyploidy).

Genera 2, native to temperate parts of the northern hemisphere, Eurasia to SE Asia and North America; 1 genus with 1 species naturalised in Africa.

*Cannabis L. 1973000

Linnaeus: 1027 (1753); Linnaeus: 453 (1754); Adanson: 376 (1763); Lamarck: 694 (1785); Jussieu: 400 (1789); Candolle: 30 (1869); Baillon: 159 (1875); Bentham: 357 (1880); Engler: 96 (1888); Rendle: 16 (1916); Burtt Davy: 445 (1932); Tutin: 67 (1964); Hendrcrson & Anderson: 70 (1966); Miller: 185 (1970); Emboden: 304 (1974); Schultes *et al.*: 337 (1974); Small & Cronquist: 405 (1976); Anderson: 61 (1980); Wilmot-Dear: 10 (1991); Kubitzki: 205 (1993); Small: 381 (1997).

Description as for family.

Species 1: **Cannabis sativa* L. with 3 varieties, 'Dagga', probably originally from Asia and now widely cultivated and naturalised worldwide in warmer areas.

Due to its long association with man the genus shows considerable variation in growth form, achene size, and chemical content. This variation has led to various taxonomic interpretations. Emboden (1974) and Schultes *et al.* (1974) adduce good reasons for distinguishing three species. Small & Cronquist (1976) interpret *Cannabis* as a variable monotypic (**C. sativa* L.) genus with 4 infraspecific taxa. Anderson (1980) considers *Cannabis* as comprising 3 species. Wilmot-Dear (1991) considers *Cannabis* as comprising 1 very variable species with 3 infraspecific taxa.

Capparaceae

(Dilleniidae—Capparidales)

Compiled by L.L. Dreyer & M. Jordaan

Herbs, shrubs or trees, sometimes scandent. **Leaves** alternate, very rarely opposite, simple or 3–5-foliolate, sometimes crowded on abbreviated shoots, rarely underdeveloped or soon deciduous; stipules, when present, setaceous or spinescent. **Inflorescences** terminal or axillary, racemose, corymbose or paniculate, or flowers solitary and axillary, sometimes on abbreviated shoots or arising on old wood. **Flowers** bisexual, very rarely unisexual, regular or rarely irregular, usually 4-merous. **Receptacle** cupular, campanulate, infundibular or cylindrical; disc various or 0. **Sepals** 3 or 4(5). **Petals** (0–3)4(rarely more), free. **Stamens** 4–many, arising from base or high up on androphore (torus), sometimes accompanied by staminodes; filaments free, usually terete; anthers 2-thecous, opening by longitudinal slits, sometimes with small, apical appendage. **Ovary** superior, sessile or more usually supported on long or short gynophore, 1-locular, with 2 parietal placentas, sometimes 2-locular by division of placentas, or multilocular; ovules few to many, often in 2 rows; style 1, short or 0; stigma often sessile, capitate. **Fruit** a capsule or berry, usually stipitate. **Seeds** reniform or subglobose, without endosperm.

Genera 45, species 675, native to warm and tropical countries, often in arid regions; sthn Afr.: genera 8, species 45.

Sonder: 54 (1860); Gilg & Gilg-Benedict: 144 (1915); Pax & Hoffmann: 146 (1936); Wild: 194 (1960); Elffers *et al.*: 1 (1964); Roessler: 1 (1966); Killick: 118 (1970); Fici: 37 (1993); A.P.G.: 549 (1998) included in Brassicaceae.

Key to genera

1a Herbs; fruit a cylindrical, dehiscent capsule ..... **Cleome**
1b Woody plants; fruit a globose, ellipsoid, oblong or cylindrical, usually indehiscent berry:
2a Androphore elongated, longer than sepals:
3a Leaves 3-foliolate; upper and lower sepals not enclosing lateral ones; androphore with staminodes at its base; fruit globose ..... **Cladostemon**
3b Leaves simple; upper and lower sepals enclosing lateral ones; androphore with a conspicuous nectary at its base; fruit cylindrical ..... **Cadaba**
2b Androphore short, not as long as sepals:
4a Calyx rupturing transversely; fruit with 8–10 longitudinal ribs ..... **Thilachium**
4b Calyx not rupturing transversely; fruit without ribs:
5a Receptacle or calyx not tubular:
6a Branches with stipulate spines; sepals imbricate, orbicular, rarely ovate ..... **Capparis**
6b Branches without spines; sepals valvate, lanceolate ..... **Boscia**
5b Receptacle or calyx tubular:
7a Flowers in abbreviated racemes on old wood; calyx lobes not or scarcely spreading; androphore very short; disc absent ..... **Bachmannia**
7b Flowers solitary, fascicled or in terminal racemes or corymbs; sepals spreading; androphore about equalling the receptacle; disc present ..... **Maerua**

Bachmannia Pax 3097000

Pax: 177 (1897); Gilg: 204 (1902); Gilg & Gilg-Benedict: 175 (1915); Pax & Hoffmann: 171 (1936); Phillips: 355 (1951); Killick: 142 (1970).

Shrubs or small trees. **Leaves** alternate, digitately (1)3- or 4(5)-foliolate; leaflets elliptic or obovate, large, coriaceous. **Inflorescence** 2–6-flowered, abbreviated racemes on old wood. **Calyx**: tube campanulate, intruse at base; lobes 4 or 5, oblong, mucronate, veined; disc 0. **Petals** 0. **Stamens** 13–18, on a short androphore; filaments terete; anthers oblong. **Ovary** on a long, terete gynophore, ellipsoid, with ± 7 ovules; style 0; stigma capitate. **Fruit** subglobose.

Species 1, Mozambique and sthn Afr.: *Bachmannia woodii* (Oliv.) Gilg, KwaZulu-Natal and Eastern Cape.

Boscia Lam. 3106000

Lamarck: t. 395 (1793) name conserved; Sonder: 60 (1860) in part; Gilg & Gilg-Benedict: 203 (1915); Pax & Hoffmann: 188 (1936); Phillips: 356 (1951); Wild: 229 (1960); Elffers *et al.*: 50 (1964); Roessler: 2 (1966); Tölken: 59 (1969a); Tölken: 150 (1970); Fici: 44 (1993).

Trees or shrubs, with spreading branches often ending in spines, usually with a light yellowish or greyish bark. **Leaves** fascicled, alternate or irregularly spaced, simple, entire, coriaceous, petiolate. **Inflorescence** terminal or axillary, pedunculate or sessile racemes, panicles or corymbs, sometimes flowers fascicled; bracts setaceous or linear, entire, trifid, often caducous. **Sepals** 4, fleshy, scarcely fused at base with fleshy corona, valvate, yellowish green. **Petals** usually 0, rarely 1–4, spathulate. **Stamens** 5–22, hardly fused in an androphore. **Ovary** on a gynophore up to 8 mm long, ovoid, 1-locular, with (2)4–8 ovules on two parietal placentas. **Fruit** a berry with clusters of stone cells in exocarp. **Seeds** usually 1 or 2, usually with a pustulate or colliculate surface.

Species 37, throughout Africa and 1 species in Arabian Peninsula; 9 in sthn Afr., widespread.

Cadaba Forssk. 3109000

Forsskål: 67 (1775); Sonder: 59 (1860); Pax: 209 (1891); Gilg & Gilg-Benedict: 222 (1915); Phillips: 356 (1951); Roessler: 4 (1966); Marsh: 171 (1970); Fici: 46 (1993).

Schepperia Neck.: 67 (1790); Sonder: 59 (1860).

Shrubs, unarmed or branches becoming spine-tipped; branches sometimes subsucculent, leafless, scurfy. **Leaves** simple, solitary, alternate or fascicled, glabrous to farinose, with margins usually entire, sometimes rudimentary or undeveloped. **Flowers** solitary or fascicled in leaf axils or in terminal, leafless corymbs. **Sepals** 4, subequal or unequal in 2 series, upper and lower valvate and enclosing lateral sepals. **Petals** 0. **Stamens** usually 5–8(–13); androphore with basal, variously shaped, con-

spicuous nectary. **Ovary** on an elongated gynophore at least 4 mm long; cylindrical, 1-locular with many ovules attached on 2(–4) placentas; stigma capitate, sessile. **Fruit** indehiscent or tardily dehiscent, long-cylindrical. **Seeds** reniform; testa ridged or smooth, often embedded in scarlet matrix. $x = 8, 9$ (aneuploids, polyploidy).

Species 30, Old World tropics including Arabian Peninsula, India, Australia, Madagascar and islands of the Indian Ocean; 4 in sthn Afr., widespread.

Capparis L. 3101000

Linnaeus: 503 (1753); Linnaeus: 222 (1754); Sonder: 61 (1860) in part; Gilg & Gilg-Benedict: 184 (1915); Pax & Hoffmann: 172 (1936); Phillips: 355 (1951); Wild: 235 (1960); Elffers *et al.*: 58 (1964); Tölken: 63 (1969b); Tölken: 144 (1970); Wild & Gonçalves: 53 (1973); Fici: 52 (1993).

Scramblers or shrubs with long branches usually with a pair of stipular spines at base of leaf. **Leaves** alternate, simple, entire, petiolate. **Inflorescence** terminal or axillary, paniculate, racemose, corymbose or umbellate, rarely with single, axillary flowers; bracts usually 0. **Sepals** 4, broadly ovate to orbicular, often with outer and inner ones unequal in size, convex, imbricate, free or nearly so. **Petals** 4, oblong or obovate, not clawed, usually white or cream becoming brownish. **Stamens** 6–many, free. **Ovary** on a gynophore at least 5 mm long, ovoid to almost spherical, with 4–many ovules on 2–many placentas; stigma indistinct, rarely capitate, on a style usually less than 1 mm long. **Fruit** a berry, spherical to cylindrical. **Seeds** 1–many, embedded in a fleshy pulp; embryo convolute. $x = 6, 10$ (aneuploids).

Species ± 250, widespread in the tropical and subtropical areas of the world; 5 in sthn Afr., widespread.

Cladostemon A.Braun & Vatke 3099000

Braun & Vatke: 866 (1877); Pax & Gilg: 185 (1895); Gilg & Gilg-Benedict: 183 (1915); Pax & Hoffmann: 171 (1936); Wild: 211 (1960); Elffers *et al.*: 70 (1964); Killick: 140 (1970); Williams: t. 2079 (1992).

Shrubs or small trees, glabrous. **Leaves** alternate, 3-foliolate; petiolules articulated at base; stipules minute, inconspicuous. **Flowers** in lax corymbose racemes. **Sepals** 4, free; receptacle not developed into a disc. **Petals** 4, the 2 adaxial larger, unguiculate. **Stamens** 5–8; adaxial ones united in a much elongated androphore; abaxial ones (staminodes) shortly united at base and arising from base of androphore. **Ovary** on a gynophore attached to androphore, stout in fruit, ellipsoid, 2-locular with 2 multi-ovulate parietal placentas; stigma peltate. **Fruit** globose, large, with long stalk; pericarp coriaceous. **Seeds** many, subglobose; cotyledons large, fleshy, curved.

Species 1, Mozambique, Zimbabwe; 1 in sthn Afr.: *Cladostemon kirkii* (Oliv.) Pax & Gilg, Swaziland and KwaZulu-Natal.

Cleome L. 3082000

Linnaeus: 671 (1753); Linnaeus: 302 (1754); Sonder: 55 (1860); Gilg & Gilg-Benedict: 145 (1915); Roessler: 6 (1966); Codd & Kers: 119 (1970); Wild & Gonçalves: 12 (1973); Thulin & Kers: 53 (1993b).

Polanisia Raf.: 267 (1818); Sonder: 56 (1860). *Gynandropsis* DC.: 237 (1824); Sonder: 55 (1860); Oliver: 81 (1868); Pax & Gilg: 184 (1895); Wild: 205 (1960); Roessler: 12 (1966). *Tetratelia* Sond.: 58 (1860); Pax & Hoffmann: 219 (1936). *Dianthera* Klotzsch ex Sond.: 57 (1860).

Annual or perennial herbs, often somewhat woody at base; stems usually striate, glabrous to viscid, glandular-hispid and aromatic. **Leaves** alternate, simple or digitately 3–13-foliolate, petiolate; leaflets usually narrow and usually entire. **Inflorescence** a terminal raceme. **Flowers** usually irregular. **Sepals** 4, usually free or almost so, persistent or deciduous, usually narrow and often glandular-pubescent. **Petals** 4, sessile or clawed, equal or unequal, usually longer than sepals. **Stamens** 4–many, all fertile or some sterile, borne on a small torus or receptacle or on a long or short androgynophore; filaments equal or unequal, usually declinate; anthers 2-thecous, usually oblong or narrowly oblong, sometimes with a small, apical projection. **Ovary** sessile or with a short gynophore, with many ovules on 2 parietal placentas; style short or 0; stigma capitate or truncate. **Fruit** an oblong or linear capsule, often borne on an elongated gynophore, opening by 2 valves separating from seed-bearing placentas, terminating in persistent style; valves glabrous to glandular-pubescent, smooth or strongly longitudinally nerved. **Seeds** reniform to almost circular in outline, surface almost smooth or reticulate-foveolate to transversely rugose, glabrous or pubescent. $x = 10$ (aneuploids, high polyploidy).

Species ± 150, cosmopolitan in tropical and warmer regions of the world; 21 in sthn Afr., widespread.

Maerua Forssk. 3112000

Forsskål: 104 (1775); Gilg & Gilg-Benedict: 232 (1915); Pax & Hoffmann: 195 (1936); Phillips: 357 (1951); Wild: 216 (1960); Elffers *et al.*: 24 (1964); Roessler: 13 (1966); Killick: 39 (1969); Killick: 159 (1970); Thulin & Kers: 38 (1993a).

Niebuhria DC.: 243 (1824). *Courbonia* Brongn.: 901 (1860); Phillips: 356 (1951); Wild: 214 (1960).

Shrubs, trees, scramblers, or climbers, without spines, glabrous or pubescent. **Leaves** alternate or sometimes crowded on abbreviated shoots, simple or 3–5-foliolate, sessile or petioled, variously shaped, margins entire. **Inflorescence** axillary, solitary or fascicled or terminal racemes or corymbs. **Receptacle** cylindrical, infundibular or campanulate, inner margin often produced into a coronate, annular, lobed or toothed disc. **Sepals** 4. **Petals** 0–4, arising from mouth of receptacle between much larger sepals. **Stamens** many, borne on androphore (torus) equal or exceeding receptacle, exserted; anthers oblong, basifixed, with longitudinal dehiscence. **Ovary** cylindrical or ellipsoid, 1- or 2-locular, with 4–many ovules in 2 rows on 2 placentas; stigma sessile, capitate. **Fruit** globose, ovoid, ellipsoid, oblong-ellipsoid or cylindrical, sometimes moniliform. **Seeds** subglobose, sometimes angled, smooth or rugose. $x = 10$ (polyploidy).

Species ± 100, tropical Asia, India and Africa; 11 in sthn Afr., widespread.

Thilachium Lour. 3113000

Loureiro: 342 (1790); Pax & Hoffmann: 201 (1936); Wild: 213 (1960); Elffers *et al.*: 81 (1964); Killick: 175 (1970); Thulin: 53 (1993).

Shrubs, small trees or scramblers. **Leaves** alternate, simple or 3-foliolate, petiolate; stipules often caducous. **Flowers** in corymbose racemes, terminal or axillary. **Calyx** closed in bud, later rupturing transversely, 'cap' often remaining attached on one side. **Petals** 0. **Stamens** many, on a columnar androphore. **Ovary** on a well-developed gynophore, 1-locular, appearing multilocular owing to development of spurious dissepiments from 6–10 placentas, multiovulate; stigma sessile. **Fruit** ellipsoid or oblong, with 8–10 longitudinal ribs. **Seeds** many.

Species ± 10, East African coast and Madagascar; 1 in sthn Afr.: *Thilachium africanum* Lour., Mpumalanga, Swaziland and KwaZulu-Natal.

Caryophyllaceae

(Caryophyllidae—Caryophyllales)

Compiled by M. Jordaan

Annual or perennial herbs, or subshrubs, rarely shrubs; plants rarely monoecious, gynodioecious or dioecious; stems often swollen at nodes, often dichotomously branched. **Leaves** opposite, decussate or apparently whorled, very rarely alternate, simple, entire, often slightly connate at base, sometimes succulent; stipules, when present, scarious, sometimes connate at base. **Inflorescences** mostly dichasial, sometimes monochasial, rarely flowers solitary. **Flowers** bisexual or rarely unisexual, regular, hypogynous or perigynous, sometimes obdiplostemonous, commonly protandrous. **Sepals** (4)5, free or ± connate, imbricate, rarely valvate, sometimes subtended by bracts. **Petals** (0)(4)5, or rarely more, sometimes minute, free, entire, emarginate, bifid or lacerate, clawed or not; aestivation contorted or rarely imbricate. **Stamens** (1–4)5–10(11), in 1 or 2 whorls; filaments free or basally connate, or additionally connate with petals, then forming a tube which may be adnate to a gynophore; anthers 2-thecous, versatile, dehiscing longitudinally by means of slits; sometimes staminodes present. **Ovary** superior, sometimes half-inferior, 2–5-carpellate, 1-locular, occasionally incompletely 2–3-locular below middle; ovules 1 to many, bitegmic, hemitropous to campylotropous, rarely nearly anatropous, on a free-central placenta or basal when 1; styles free or connate at base; stigmas as many as carpels. **Fruit** either a capsule, splitting from apex with as many or twice as many valves or teeth as there are carpels, or a nutlet, sometimes enclosed in persistent calyx. **Seeds** small, globose to pyriform or reniform, usually with variously sculptured testa, rarely smooth; endosperm little or 0; embryo peripherally curved around starchy perisperm, sometimes ± straight, rarely spiral.

Genera ± 80, species ± 2200, mostly north, temperate and cold regions, with a centre in the Mediterranean and Irano-Turanean region; sthn Afr.: genera 22 (11 exotic), species 72 (18 exotic).

In agreement with Bittrich (1993) Illecebraceae is included in Caryophyllaceae.

Jussieu: 299 (1789) name conserved; Candolle: 351 (1824); Seringe: 351 (1824); Fenzl: 955 (1840); Bentham: 55 (1862a); Hooker: 12 (1880); Pax: 61 (1889); Lüders: 1 (1907); Pax & Hoffmann: 275 (1934); Chaudhri: 1 (1968); Friedrich: 763 (1979a); Friedrich: 749 (1979b); Bittrich: 206 (1993).

Classification of Caryophyllaceae (adapted from Mabberley 1997)

I. Subfamily PARONYCHIOIDEAE (Stipules present; petals 0 or small; sepals free; styles partly fused):
   1. Tribe **Polycarpeae** (Fruit a capsule; leaves opposite): *Drymaria*, *Krauseola*, *Polycarpaea*, *Polycarpon*, **Spergula*, *Spergularia*
   2. Tribe **Paronychieae** (Fruit a nutlet; leaves opposite): *Herniaria*, **Paronychia*, *Pollichia*
   3. Tribe **Corrigioleae** (Fruit a nutlet; leaves alternate): *Corrigiola*

   Note: tribes 2 and 3 are sometimes (also by Dyer 1975) placed in the family Illecebraceae.

II. Subfamily ALSINOIDEAE (Stipules 0; sepals free; styles ± free; fruit a capsule or rarely a nutlet: *Scleranthus*):
   1. Tribe **Alsineae** (Fruit a capsule; petals mostly 4 or 5, sometimes 0; styles usually 3–5): **Arenaria*, *Cerastium*, **Holosteum*, **Moenchia*, **Sagina*, **Stellaria*

2. Tribe **Scleranthеae** (Fruit a nutlet; petals 0; styles 2): **Scleranthus*

III. Subfamily CARYOPHYLLOIDEAE (Stipules 0; calyx tubular; styles ± free):

1. Tribe **Caryophylleae** (Styles 2; capsule opening by 4(–6) teeth): *Dianthus*, **Petrorhagia*, **Vaccaria*
2. Tribe **Sileneae** (Styles 3–5; capsule opening by as many or twice as many teeth as styles): **Agrostemma*, *Silene*

Key to genera

1a Leaves with stipules; petals 0 or small; styles at least partly fused:
2a Leaves alternate: **Corrigiola**
2b Leaves opposite:
3a Fruit a nutlet:
4a Infructescence succulent, berry-like, translucent white; leaves often in false whorls **Pollichia**
4b Infructescence not succulent; leaves opposite, upper ones sometimes alternate by reduction; stipules sometimes large:
5a Stipules conspicuous; sepals often hooded and with a dorsal, subapical awn ***Paronychia**
5b Stipules inconspicuous; sepals mostly planoconcave, not hooded or awned **Herniaria**
3b Fruit a capsule:
6a Leaves linear to filiform; plants often glandular-viscid:
7a Leaves pseudoverticillate; petals white; stipules 4 per node; styles 5(3) ***Spergula**
7b Leaves decussate; petals white or pink; stipules 2, connate and sheathing the node; styles 3(5) **Spergularia**
6b Leaves broader than above; plants usually not glandular-viscid:
8a Petals 2–4-lobed or partite; leaves ovate, 3–7-nerved from base **Drymaria**
8b Petals entire, emarginate or dentate; leaves rarely ovate, 1-nerved at base:
9a Sepals 9–13; petals 5–8; capsule 5-valved **Krauseola**
9b Sepals 5; petals 3; capsule 3-valved:
10a Sepals winged up back and sharply prominent in fruit **Polycarpon**
10b Sepals scarious, long-acuminate **Polycarpaea**

1b Leaves without stipules; petals often conspicuous, rarely 0 or minute (**Sagina*, **Scleranthus*); styles free:
11a Sepals free or only basally connate; petals and stamens basally free; petal venation mostly open or semiclosed; episepalous stamens often with a nectary gland at abaxial base:
12a Fruit a nutlet; perianth becoming crustaceous with age ***Scleranthus**
12b Fruit a capsule; perianth not becoming crustaceous with age:
13a Fruit splitting into as many valves as there are styles ***Sagina**
13b Fruit splitting into twice as many valves as there are styles:
14a Petals entire, emarginate or fimbriate, rarely 0:
15a Styles usually 2 ***Holosteum**
15b Styles usually 3 or 4:
16a Styles usually 3 ***Arenaria**
16b Styles usually 4 ***Moenchia**
14b Petals deeply 2-fid or bipartite:
17a Stamens 5; styles 3 or occasionally 2 ***Stellaria**
17b Stamens 10; styles 5 or occasionally 4 **Cerastium**
11b Sepals connate, often for most of their length; petals mostly clawed, petals and stamens basally ± connate, petal venation ± closed; abaxial base of episepalous stamens without nectary glands:
18a Calyx tube with 1–12 pairs of bracts at base:
19a Bracts green, much shorter than calyx **Dianthus**
19b Bracts membranous, as long as and clasping the calyx ***Petrorhagia**
18b Calyx tube without bracts at base:
20a Calyx tube 5-winged; styles 2 ***Vaccaria**
20b Calyx tube with 10, 20 or 30 ± prominent veins or ribs; styles 3 or 5:
21a Calyx lobes longer than petals ***Agrostemma**
21b Calyx lobes shorter than petals **Silene**

*Agrostemma L. 2488000

Linnaeus: 435 (1753); Linnaeus: 198 (1754); Jussieu: 302 (1789); Candolle: 386 (1824); Sonder: 129 (1860); Pax: 70 (1889); Burtt Davy: 150 (1926); Chater: 157 (1964a); Henderson & Anderson: 126 (1966); Zohary: 80 (1966); Friedrich: 1175 (1979a); Bittrich: 233 (1993); Greuter: 106 (1995).

Tall annual herbs, with erect, villous stems. **Leaves**: radical ones spatulate, cauline ones opposite and usually linear; stipules 0. **Inflorescences** terminal or axillary lax dichasia, or flowers usually solitary. **Flowers** bisexual, conspicuous, long-pedicelled, white, pink or purple. **Calyx** tube prominently 10-ribbed, with 5 narrow spreading teeth as long as or longer than tube, coriaceous, campanulate. **Petals** 5, often shorter than calyx; limb entire, gradually tapering into claw. **Stamens** 10, the 5 opposite the petals sometimes adnate to claw. **Disc** basin-shaped, lobed on margin. **Ovary** 1-locular, sometimes 3-locular towards base; ovules many on free-central placenta; styles (4)5, hairy, alternisepalous, long, linear, pubescent. **Fruit** a capsule (4)5-valved. **Seeds** many, reniform with hard, dark brown to black testa, tuberculate. $x = 12$ (polyploidy).

Species 2, native of Mediterranean and temperate Eurasia; noxious weeds of fields, now widely dispersed; **Agrostemma githago* L., introduced into sthn Afr., has become naturalised.

*Arenaria L. 2443000

Linnaeus: 423 (1753); Linnaeus: 193 (1754); Jussieu: 301 (1789); Candolle: 400 (1824); Pax: 84 (1889); Williams: 326 (1898); Pax & Hoffmann: 315 (1934); McNeill: 102 (1962); McNeill: 245 (1963); Chater & Halliday: 116 (1964); Meikle: 261 (1977); Bittrich: 225 (1993).

Annual, biennial or perennial herbs, usually less than 0.3 m tall, often tufted or cushion-like. **Leaves** small, variable in shape, with cauline ones opposite, petiolate or sessile; stipules 0. **Inflorescence** often a panicle or cyme, terminal or rarely axillary, sometimes flowers solitary; bracts herbaceous. **Flowers** bisexual, subperigynous. **Sepals** 5, very rarely 4, free. **Petals** 5, white, cream or pink, entire or emarginate, rarely 0. **Stamens** 5 or 10, arising on a glandular perigynous disc. **Ovary** 1-locular; ovules many on a free-central placenta; styles (2)3(–5), episepalous. **Fruit** a capsule, subglobose, oblong or pyriform, dehiscent, mostly by twice the number of teeth as styles present, by 2 or 3(–5) bifid valves. **Seeds** many, compressed, smooth or tuberculate. $x = 10, 11$ (7, 8, 9, 12, 13) (high polyploidy).

Species ± 150, mainly in northern temperate regions, also in the arctic, some species on the mountains of South America and Northeast Africa; 2 introduced into sthn Afr., infrequent.

Cerastium L. 2430000

Linnaeus: 437 (1753); Linnaeus: 199 (1754); Jussieu: 301 (1789); Candolle: 414 (1824); Sonder: 130 (1860); Pax: 80 (1889); Burtt Davy: 150 (1926); Möschl: 15 (1951); Wild: 346 (1961a); Jalas, Sell & Whitehead: 136 (1964); Henderson & Anderson: 128 (1966); Wild, Hooper & Diniz: 9 (1973); Friedrich: 902 (1979a); Bittrich: 226 (1993).

Annual or perennial herbs, with simple or dichotomously branched stems, usually glandular-hairy. **Leaves** small, opposite, sessile or subsessile, entire; stipules 0. **Inflorescences** terminal, dichotomous, often umbelliform, occasionally flowers solitary; bracts herbaceous or with membranous margins. **Flowers** bisexual, subperigynous. **Sepals** (4)5, free, with scarious-membranous margins. **Petals** (4)5, white, emarginate or bifid, rarely quite entire or deeply cut, sometimes 0. **Disc** of 5 honeyed glands. **Stamens** (8)10 or 5 or fewer. **Ovary** 1-locular; ovules many on free-central placenta; styles (3–)5(6). **Fruit** a cylindrical capsule, often incurved, membranous, dehiscing by twice as many teeth as styles present. **Seeds** many, reniform or subglobose, often tubercled; embryo almost annular. $x = 18$ (12, 13, 17, 19) (high polyploidy).

Species ± 100, with almost cosmopolitan distribution, but mainly in the north temperate regions of the Old World; many weeds; some species are cultivated as ornamentals; 5 in sthn Afr., North-West, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal, Free State, Lesotho, Western and Eastern Cape.

Corrigiola L. 2469000

Linnaeus: 271 (1753); Linnaeus: 132 (1754); Candolle: 366 (1828); Sonder: 132 (1860); Hooker: 17 (1880); Pax: 90 (1889); Baker & Wright: 12 (1909); Pax & Hoffmann: 298 (1934); Adamson: 396 (1950); Turrill: 13 (1956); Walters: 149 (1964b); Podlech: 1 (1966); Chaudhri: 34 (1968); Wild & Diniz: 3 (1973); Friedrich: 751 (1979b); Bittrich: 225 (1993).

Polygonifolia Adans.: 272 (1763).

Glabrous annual, biennial or perennial herbs with diffusely branched decumbent to prostrate stems, sometimes becoming woody at base. **Leaves** alternate, sessile to subsessile or rarely petiolate, spathulate or linear, glaucous; stipules scarious, auriculate. **Inflorescences** dense, terminal and lateral cymes or small clusters; bracts inconspicuous. **Flowers** bisexual, small, with slightly perigynous receptacles. **Sepals** 5, persistent, green with white scarious margins. **Petals** 5, membranous, white, shorter than or slightly exceeding sepals, oval. **Stamens** 5, with filaments short; anthers often dark brown. **Ovary** 1-locular; ovule solitary, basal on long funicle; style short or almost 0; stigmas 3, subsessile. **Fruit** a crustaceous, indehiscent, trigonous nutlet, enclosed by persistent calyx. **Seeds** globose-ovoid; embryo annular. $x = 9$ (8) (polyploidy).

Species 11; mainly in Europe, Africa and Chile, *Corrigiola litoralis* L. nearly cosmopolitan; the roots are used for medicinal purposes; 2 in sthn Afr., in all provinces and countries.

Dianthus L. 2502000

Linnaeus: 409 (1753); Linnaeus: 191 (1754); Jussieu: 302 (1789); Candolle: 355 (1824); Sonder: 122 (1860); Pax: 76 (1889); Williams: 346 (1893); Burtt Davy: 148 (1926); Pax & Hoffmann: 356 (1934); Hooper: 1 (1959); Tutin: 188 (1964); Podlech: 1 (1967); Wild, Hooper & Diniz: 16 (1973); Meikle: 214 (1977); Bittrich: 232 (1993).

Annual or short-lived perennial herbs or subshrubs, tufted, often somewhat woody towards base; stems mostly thickened at nodes. **Leaves** opposite, grass-like, connate basally and forming a sheath, frequently 5-nerved; stipules 0. **Inflorescences** terminal panicles of cymes, in heads or occasionally flowers solitary, often subtended by bracts. **Flowers** bisexual, rarely unisexual; anthophore often present. **Calyx** gamosepalous, surrounded at base by 2–many bracts, tubular, firm, finely striate, 5-toothed, with many parallel veins, without membranous commissures. **Petals** 5, white, pink or red, rarely yellow, limb entire, toothed or fimbriate, without coronal scales; claw long, with two longitudinal ridges. **Stamens** 10; filaments long, slender. **Ovary** 1-locular, on a short gynophore, with chartaceous cap; ovules many on free central placenta; styles 2, linear, longer than ovary. **Fruit** a capsule, ovoid to cylindric, opening by 4 valves. **Seeds** many, orbicular to ovoid in outline, ± compressed, with facial hilum, black; testa with raised polygonal sculpturing; embryo straight. $x = 15$ (high polyploidy).

Species ± 300, Europe, Asia, especially Mediterranean, Africa; 15 in sthn Afr., widely distributed. Some species are cultivated as ornamentals (e.g. **Dianthus caryophyllus* L. and **D. chinensis* L.).

Drymaria Willd. ex Schult. 2452000

Schultes: 406 (1819); Sonder: 135 (1860); Pax: 86 (1889); Pax & Hoffmann: 306 (1934); Turrill: 9 (1956); Duke: 173 (1961); Wild: 344 (1961a); Wild, Hooper & Diniz: 8 (1973); Bittrich: 220 (1993).

Annual herbs, dichotomously branched and diffuse, sometimes rooting at nodes. **Leaves** opposite or pseudoverticillate, flat, broad or narrow, sessile to long-petiolate; stipules small, mostly setaceous or composed of subulate segments, persistent or fugaceous. **Inflorescences** often terminal or axillary, few- to many-flowered dichasial cymes, or occasionally flowers solitary or clustered in leaf axils. **Flowers** bisexual, subperigynous or hypogynous. **Sepals** 5, free, herbaceous or with margins translucent. **Petals** 5, deeply bifid, white. **Stamens** 2–5; filaments flattened, slightly connate at base; anthers subglobose. **Ovary** superior, slightly stipitate; carpels mostly 3, 1-locular; ovules 2–many, campylotropous on free-central placenta; styles 1-, 2- to 4-fid to ± middle or to base. **Fruit** a capsule, ovoid to spheroid, (2)3-valved. **Seeds** 1–many, reniform-globose or compressed, usually tuberculate; embryo surrounding perisperm. $x = 12$ (polyploidy).

Species ± 48, mostly restricted to the New World from W United States to Patagonia (46), Galapagos Islands (1); *Drymaria cordata* (L.) Willd. ex Roem. & Schult., pantropical, also only species in sthn Afr., Mpumalanga, KwaZulu-Natal and Eastern Cape.

The position of the genus is dubious, even its placement in subfamily Paronychioideae, as it shows some alsinoid characters and the ontogeny of its stipules differs from that of other Paronychioideae.

Herniaria L. 2476000

Linnaeus: 218 (1753); Linnaeus: 103 (1754); Jussieu: 89 (1789); Candolle: 367 (1828); Sonder: 132 (1860); Hookcr: 16 (1880); Pax: 91 (1889); Williams: 556 (1896); Baker & Wright: 12 (1909); Hermann: 206 (1937); Brummitt & Heywood: 151 (1964); Podlech: 2 (1966); Chaudhri: 297 (1968); Friedrich: 755 (1979b); Bittrich: 223 (1993); Gilbert: 98 (1993).

Annual or, mostly perennial, small, compact herbs; stems often prostrate, much branched from base. **Leaves** mostly opposite and unequal, upper ones sometimes alternate (due to reduction of one of the leaves), small, entire, sessile or subsessile, obovate to narrowly elliptic; stipules minute, scarious, entire, sometimes with ciliate margin, 2 per pair of leaves. **Inflorescences** small cymose clusters, usually congested on short lateral branches; bracts and bracteoles small, stipule-like. **Flowers** bisexual or unisexual, ± perigynous, subsessile, small. **Sepals** (4)5(6), mostly plano-concave and connivent to erect. **Petals** (0)4 or 5, minute, subulate-filiform, alternating with sepals. **Stamens** (2)4 or 5, equal or unequal, with or without staminodes, alternating with petals; filaments filiform; anthers oblong or quadrangular and orange-yellow. **Ovary** subglobose or ovoid; ovule solitary, basal, amphitropous; style usually short and occasionally entirely suppressed, sometimes quite distinct and elongate; stigma notched or bifid, subsessile or on a short style. **Fruit** an ovoid to narrowly ellipsoid, membranous nutlet enclosed by persistent calyx, rupturing irregularly at base. **Seeds** globular to lenticular, smooth and shining, dark brown; embryo annular, surrounding endosperm. $x = 9$ (high polyploidy).

Species ± 47, a few widely distributed in Eurasia and North Africa, the rest narrow endemics in Canary Islands, (1 isolated sp. in Somalia); 5 in sthn Afr., mainly in Northern, Western and Eastern Cape, otherwise scattered, except Northern Province, Swaziland and only on borders of KwaZulu-Natal.

*Holosteum L. 2431000

Linnaeus: 88 (1753); Linnaeus: 39 (1754); Jussieu: 299 (1789); Pax: 80 (1889); Pax & Hoffmann: 318 (1934); Walters: 136 (1964a); Friedrich: 870 (1979a); Bittrich: 227 (1993).

Small annual herbs, often viscid-pubescent above, erect, simple or sparsely branched. **Leaves** entire, narrow, lower leaves ± rosulate, the rest opposite, sessile; stipules 0. **Inflorescence** an umbel-like terminal cyme. **Flowers** bisexual, with pedicels deflexed after flowering. **Sepals** 5, free, persistent. **Petals** 5, entire, toothed, or jagged, white. **Stamens** 3–5 or 8–10. **Ovary** cylindrical; ovules many; styles 3(4 or 5). **Fruit** a capsule, ovoid or cylindric, longer than sepals, with twice as many teeth as styles, dehiscent by 6(–10) short recurved teeth. **Seeds** many, asymmetrically reniform and laterally expanded, peltate, tuberculate; embryo horseshoe-shaped. $x = 10$.

Species ± 3, temperate Eurasia, 1 record from Ethiopia; 1 introduced to South and North America and sthn Afr.: **Holosteum umbellatum* L. subsp. *umbellatum*, recorded from near Sutherland in Western Cape.

Krauseola Pax & K.Hoffm. 2453010

Pax & Hoffmann: 308 (1934); Wild: 337 (1961a); Wild, Hooper & Diniz: 2 (1973); Bittrich: 222 (1993).

Pleiosepalum Moss: 65, t. 596 (1931).

Annual or perennial herbs, erect or diffuse, with a sparse indumentum of branched hairs. **Leaves** opposite or apparently whorled, subsessile, obovate to narrowly oblanceolate; stipules deltoid, scarious. **Inflorescences** lax or dense terminal or axillary cymes. **Flowers** bisexual; bracts oblong, with hyaline, ciliolate margins. **Sepals** 9–13, free, spirally arranged, imbricate, green with hyaline margins. **Petals** 5–8, hyaline-membranous, much shorter than sepals. **Stamens** 5–8, alternating with petals. **Ovary** with many ovules; style 1 with 5 stigmatic branches. **Fruit** a capsule, 5-valved, surrounded by persistent sepals. **Seeds** many, reniform, reddish brown; testa minutely reticulate. $x = 8$ (1 report).

Species 2, in tropical East Africa; 1 on sand dunes in Mozambique; 1 in *Acacia—Commiphora* scrub in North Kenya: *Krauseola mosambicina* (Moss) Pax & K.Hoffm., described from Mozambique and recorded in Zululand.

*Moenchia Ehrh. 2432000

Ehrhart: 177 (1788) name conserved; Pax: 81 (1889); Pax & Hoffmann: 322 (1934); Adamson: 393 (1950); Clapham: 145 (1964); Bittrich: 227 (1993).

Glabrous, glaucous, dwarf, erect annual herbs. **Leaves** narrow, sessile, opposite, linear to oblong-lanceolate; stipules 0. **Inflorescences** few-flowered lax cymes, or flowers sometimes solitary; bracts white-margined. **Flowers** bisexual, shortly perigynous, erect. **Sepals** 4(5), free, with broad membranous margins. **Petals** 4(5), entire or retuse, ± half as long as sepals, white. **Stamens** 4(5) or 8(10). **Ovary** ovoid; styles (3)4 or 5. **Fruit** an ovoid capsule, opening by 8 teeth at top. **Seeds** many, reniform, papillose. $x = 9, 19$ (polyploidy).

Species 3, West and Central Europe, Mediterranean; 1 introduced into sthn Afr.: **Moenchia erecta* (L.) Gaertn. & Scherb., Western Cape.

*Paronychia Mill. 2473000

Miller: [1019] (1754); Adanson: 272 (1763); Jussieu: 387 (1815); Willdenow: 517 (1819); Candolle: 370 (1828); Hooker: 15 (1880); Pax: 90 (1889); Baker & Wright: 11 (1909); Adamson: 397 (1950); Chater: 149 (1964c); Henderson & Anderson: 130 (1966); Chaudhri: 64 (1968); Bittrich: 223 (1993); Gilbert: 99 (1993).

Gymnocarpos Forssk.: 65 (1775).

Prostrate, mat-forming annual to perennial herbs, with a taproot. **Leaves** opposite and members of pair often unequal, sessile or subsessile, plane and entire; stipules and bracts ovate-lanceolate, white, often conspicuously silvery and shiny. **Inflorescences** axillary and terminal, ± head-like cymose clusters; flowers usually ± concealed by large, silvery-membranous bracts. **Flowers** bisexual, slightly or distinctly perigynous, small. **Sepals** 5, almost free, hooded and with a dorsal spreading awn near apex. **Petals** 0. **Stamens** 4 or 5; filaments filiform, inserted on perigynous ring; anthers dorsifixed, oblong. **Ovary** ovoid; ovule solitary, basal; styles 2, free or connate below; stigmas 2, elongate or clavate. **Fruit** a nutlet enclosed within persistent calyx, often irregularly rupturing at base; pericarp membranous. **Seeds** many, lenticular to globular, smooth, dark brown; embryo curved. $x = 7, 9$ (8) (high polyploidy).

Species ± 110; nearly cosmopolitan (except sthn Afr., SE Asia); with centres of distribution in the Mediterranean, in Turkey, in the SE United States and Peru/Bolivia; only 7 species penetrating into tropical Africa south to Chad, Ethiopia and Somalia; 1 South American species introduced into sthn Afr.: **Paronychia brasiliana* DC. var. *pubescens* Chaudhri, widespread, a troublesome weed in lawns, especially on golf courses.

*Petrorhagia (Ser.) Link 2497000

Link: 235 (1831); Ball & Heywood: 121 (1964); Friedrich: 978 (1979a); Bittrich: 232 (1993).

Gypsophila L. section *Petrorhagia* Ser.: 354 (1824) in part. *Kohlrauschia* in sense of Levyns: 132 (1966) in part. *Tunica* Mertens & Koch: 182 (1831); Bentham: 145 (1862b); Pax & Hoffmann: 355 (1934); Adamson: 400 (1950).

Erect annual or perennial slender herbs. **Leaves** narrow, grass-like, 1–5-nerved. **Inflorescences** terminal heads. **Flowers** bisexual, with large, membranous bracts, forming an epicalyx. **Calyx** cylindrical to campanulate,

5-toothed, 5–15-nerved, with scarious commissures. **Petals** 5, very shortly bifid, exceeding calyx, pink. **Stamens** 10; anthophore present or almost wanting. **Ovary** 4-locular at base, 1-celled above; styles 2, hairy. **Fruit** a capsule, oblong or ovoid, dehiscent by 4 apical teeth. **Seeds** many, compressed, peltate with a facial hilum; embryo straight. $x = 6, 13$ (aneuploids, polyploidy).

Species 28, Europe, from Mediterranean to Kashmir, and on Canary Islands; 1 introduced into sthn Afr.: **Petrorhagia prolifera* (L.) Ball & Heywood, naturalised in parts of southern Cape region.

Pollichia Aiton 2467000

Aiton: 5 (1789) name conserved; De Candolle: 377 (1828); Sonder: 133 (1860); Hooker: 14 (1880); Pax: 89 (1889); Lüders: 26 (1907); Baker & Wright: 10 (1909); Turrill: 11 (1956); Wild: 358 (1961b); Podlech: 2 (1966); Wild & Diniz: 2 (1973); Bittrich: 224 (1993); Gilbert: 96 (1993).

Scandent, pilose subshrubs, freely branched, with rather stiff branches. **Leaves** clustered at nodes to form false whorls, usually linear, sometimes lanceolate; stipules free, scarious. **Inflorescences** dense, subsessile, axillary cymes, surrounded by white, scarious bracts, and each flower subtended by a bracteole; after anthesis each cyme forms a fleshy (berry-like) infructescence due to swollen bracts and peduncles. **Flowers** bisexual, perigynous, sessile; receptacle cupuliform, as long as sepals. **Sepals** 5, free, small. **Petals** 5, minute, scale-like, white. **Stamens** 1 or 2, inserted on 5-lobed nectary disc. **Ovary** 1-locular; ovules 2, basal, on short funicles; style 1, filiform, persistent. **Fruit** 1-seeded, indehiscent, enclosed by persistent calyx and borne with several other fruits in milky white to reddish brown berry-like infructescence in which rachides and lower parts of bracts are enlarged and fleshy. **Seeds** 1 or 2, ± ovoid; embryo curved. $x = 9$ (1 report, polyploidy).

Monotypic: *Pollichia campestris* Aiton, from northern Arabian Peninsula and Ethiopia, through east tropical Africa to sthn Afr. (all countries and provinces except Western Cape).

Polycarpaea Lam. 2455000

Lamarck: 3, t. 25 ('*Polycarpea*') (1792) name conserved; Candolle: 373 (1828); Sonder: 133 (1860); Pax: 87 (1889); Burtt Davy: 152 (1926); Turrill: 5 (1956); Wild: 341 (1961a); Podlech: 2 (1967); Wild, Hooper & Diniz: 5 (1973); Friedrich: 772 (1979a); Bittrich: 221 (1993).

Annual or perennial herbs, rarely somewhat woody at base, erect, often much-branched, rarely diffuse, tomentum not glandular. **Leaves** opposite or apparently whorled, often clustered at nodes on sessile axillary shoots, linear or oblanceolate to ovate; stipules scarious. **Inflorescences** terminal, loose or compact cymes, bracteate; bracts sepal-like. **Flowers** bisexual; perianth and stamens hypogynous or somewhat perigynous. **Sepals** 5, free, scarious, not keeled, rarely herbaceous, often silvery, white or brown to purple. **Petals** 5, much shorter than sepals, entire, 2-toothed. **Stamens** (2–)5; 5 inner staminodes sometimes present. **Ovary** 1-locular; ovules few to many on a free central placenta; style 3-fid or capitate. **Fruit** a capsule, 3-valved. **Seeds** few to many, often lenticular, sometimes slightly tuberculate, tiny, translucent, brown. $x = 9$ (aneuploids, polyploidy).

Species ± 50, with tropical and subtropical distribution (chiefly palaeotropic); 2 recorded from sthn Afr., Namibia, Botswana, the northern provinces to Swaziland and KwaZulu-Natal; **Polycarpaea spirostylis* F.Muell. from Australia is a copper indicator.

Polycarpon L. 2453000

Linnaeus: 881 (1759); Jussieu: 299 (1789); Kunth: 40 (1823); Candolle: 376 (1828); Sonder: 133 (1860); Pax: 86 (1889); Burtt Davy: 152 (1926); Adamson: 396 (1950);Wild: 339 (1961a); Chatcr: 153 (1964d); Henderson & Anderson: 132 (1966); Podlech: 3 (1967); Wild, Hooper & Diniz: 3 (1973); Meikle: 277 (1977); Bittrich: 221 (1993).

Annual, biennial or perennial herbs, glabrous, diffusely or dichotomously branched; stems usually scabridulous. **Leaves** opposite or in whorls of 4, obovate to suborbicular, flat, sometimes fleshy, ± petiolate; stipules silvery-membranous, scarious. **Inflorescences** crowded, terminal or axillary, many-flowered cymes with scarious bracts. **Flowers** bisexual, subperigynous, small. **Sepals** 5, free, keeled or winged with scarious margin. **Petals** 5, small, entire, hyaline, shorter than sepals. **Stamens** 5, arising on a perigynous disc, episepalous; filaments shortly connate at base. **Ovary** 1-locular; ovules many on a free-central placenta; style connate below, 3-fid above. **Fruit** a capsule, dehiscent almost to base into 3 spirally twisting valves. **Seeds** many, ovoid or lenticular, sometimes postulate; embryo curved or nearly straight. $x = 7, 8, 9$ (high polyploidy).

Species ± 16, in Europe and the Mediterranean, 2 in S America; 2 in sthn Afr.: *Polycarpon prostratum* (Forssk.) Aschers. & Schweinf. and *P. tetraphyllum* (L.) L. cosmopolitan in warm and temperate situations, scattered in Namibia, Botswana, Mpumalanga, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

**Sagina* L. 2433000

Linnaeus: 128 (1753); Linnaeus: 62 (1754); Jussieu: 300 (1789); Candolle: 389 (1824); Pax: 81 (1889); Burtt Davy: 151 (1926); Pax & Hoffmann: 326 (1934); Adamson: 393 (1950); Clapham & Jardine: 146 (1964); Zohary: 121 (1966); Meikle: 273 (1977); Friedrich: 827 (1979a); Chorney: 227 (1986); Danin: 413 (1990); Bittrich: 228 (1993).

Dwarf annual or perennial herbs, often tufted, sometimes cushion-like, or procumbent. **Leaves** subulate to linear-lanceolate, connate at base into a membranous sheath; stipules 0. **Inflorescences** few-flowered axillary or terminal cymes or flowers solitary on slender pedicels. **Flowers** bisexual, small and relatively inconspicuous. **Sepals** 4 or 5(6), free, sometimes persistent, green. **Petals** usually 0 or minute. **Stamens** 4 or 5 or (8)10. **Ovary** 1-locular; ovules many on free-central placenta; styles 4 or 5, very short, alternating with sepals. **Fruit** a capsule, dehiscent to base into 4 or 5 valves. **Seeds** many, orbicular-reniform, minute, brownish, slightly granulated. $x = 11$ (6, 7, 8, 9, 10) (high polyploidy).

Species ± 30, northern temperate regions, arctic, mountains from South to East Africa, Himalayas, New Guinea, Andes, several species (Pearlworts) widespread as tiny weeds in lawn; 2 introduced into sthn Afr.: **Sagina apetala* Ard. and **S. maritima* G. Don, scattered in Western Cape and KwaZulu-Natal.

**Scleranthus* L. 2483000

Linnaeus: 406 (1753); Linnaeus: 190 (1754); Brown: 412 (1810); Candolle: 378 (1828); Hooker: 19 (1880); Pax: 92 (1889); Baker & Wright: 13 (1909); Pax & Hoffmann: 336 (1934); Adamson: 394 (1950); Sell: 148 (1964); Henderson & Anderson: 136 (1966); Meikle: 285 (1977); Friedrich: 941 (1979a); Bittrich: 229 (1993).

Erect or decumbent annual herbs, low, rigid, much, dichotomously branched; stems angled, with a single line of reversed hairs. **Leaves** opposite, subulate, pungent, expanding into membranous, connate bases; stipules 0. **Inflorescences** axillary or terminal, few-flowered cymes or flowers solitary; bracts leaf-like. **Flowers** bisexual, perigynous, sessile, very small, green. **Calyx**: tube campanulate, herbaceous when young, becoming crustaceous with age; lobes 5. **Petals** 0. **Stamens** 5, arising in throat of calyx tube; filaments subulate. **Ovary** ovoid, 1-locular; ovule 1(2), pendulous from a basal funicle; styles 2, free, filiform, erect. **Fruit** a nutlet enclosed by enlarged and indurated wall of perigynous zone and persistent, hardened calyx tube and crowned by persistent calyx lobes. **Seed** 1, subglobose to horseshoe-shaped, smooth; embryo curved, peripheral; endosperm abundant. $x = 11$ (12) (polyploidy).

Species ± 10, temperate Eurasia, Mediterranean, Ethiopia, Australasia, 1 naturalised species in sthn Afr.: **Scleranthus annuus* L., introduced from Europe, before the end of 19th century, KwaZulu-Natal, Northern, Western and Eastern Cape. It is a troublesome weed in wheat and lucerne lands and has been suspected of causing poisoning in sheep.

Silene L. 2490000

Linnaeus: 416 (1753); Linnaeus: 193 (1754); Jussicu: 302 (1789); Sonder: 125 (1860); Pax: 70 (1889); Burtt Davy: 149 (1926); Pax & Hoffmann: 343 (1934); Wild: 350 (1961a); Chater: 158 (1964); Henderson & Anderson: 138 (1966); Podlech: 4 (1967); Bittrich: 233 (1993).

Melandrium Mertens & Koch: 274 (1812); Adamson: 399 (1950).

Annual, biennial or perennial herbs, rarely geophytes or shrublets, sometimes caespitose; plants often monoecious or rarely gynodioecious or dioecious. **Leaves** opposite, entire, sometimes slightly connate at base; stipules 0. **Inflorescences** dichasial or monochasial, sometimes ± capitate, sometimes flowers solitary. **Flowers** bisexual or unisexual; anthophore present. **Calyx**: tube 10–30(–60)-nerved, sometimes strongly inflated, with 5 short lobes, often glandular. **Petals** 5, arising on margin of disc, with long claw and entire to deeply divided limb, often with 2 scales at base. **Stamens** 10, in male and bisexual flowers, sometimes abnormally reduced, arising on margin of disc, the 5 opposite petals sometimes attached to claw. **Disc** columnar, often pubescent. **Ovary** on long gynophore adnate to disc, usually 1-locular, sometimes 3-locular towards base; ovules many on free central placenta; styles (2–)5, usually 3, as long as or longer than ovary, often glandular. **Fruit** a capsule, opening usually by twice as many teeth as styles present. **Seeds** many, ± reniform, compressed, reticulate or tuberculate, sometimes with 2 wings; embryo ± annular. $x = 12$ (aneuploids, high polyploidy).

Species ± 700, in Eurasia (± 600 species), Africa (± 92 species), North America (± 50 species); ± 19 in sthn Afr., of which 3 are naturalised, widespread in all provinces and countries except Botswana.

*Spergula L. 2449000

Linnaeus: 440 (1753); Linnaeus: 199 (1754); Sonder: 135 (1860); Pax: 85 (1889); Burtt Davy: 151 (1926); Adamson: 394 (1950); Turrill: 11 (1956); Wild: 346 (1961a); Ratter: 154 (1964); Henderson & Anderson: 140 (1966); Podlech: 4 (1967); Friedrich: 775 (1979a); Bittrich: 220 (1993).

Annual, erect to suberect herbs, often glandular-viscid; with forked or fascicled branches. **Leaves** pseudoverticillate, linear to filiform, with abbreviated leaf buds in their axils and appearing whorled; stipules small, scarious, caducous, 4 per leaf pair. **Inflorescences** loose terminal dichasia; pedicels reflexed after flowering, erect in ripe fruit. **Flowers** bisexual, subperigynous. **Sepals** 5, free, herbaceous and often ± fleshy, with scarious margins. **Petals** 5, entire, white. **Stamens** 10, arising on a perigynous ring. **Ovary** 1-locular; ovules many; styles (3–)5, alternating with sepals. **Fruit** a capsule, ± globose, opening by 5 valves or teeth not separating completely. **Seeds** many, grey-black, compressed, biconvex, very narrowly winged; embryo annular. $x = 9$ (polyploidy).

Species 6; 5 in temperate Eurasia, chiefly in Europe and the Mediterranean; 1 in sthn Afr.: **Spergula arvensis* L., a cosmopolitan weed of waste places and cultivated lands, North-West, Gauteng, Mpumalanga, KwaZulu-Natal, Lesotho, Western and Eastern Cape.

Spergularia (Pers.) J.Presl & C.Presl 2450000

Presl & Presl: 94 (1819); Pax & Hoffmann: 312 (1934); Monnier & Ratter: 154 (1964); Adamson: 394 (1950); Meikle: 274 (1977); Friedrich: 782 (1979a); Bittrich: 220 (1993).

Arenaria section *Spergularia* Pers.: 504 (1805). *Lepigonum* Sond.: 134 (1860).

Annual, biennial or perennial herbs, sometimes woody at base, diffuse, often glandular-viscid; stems often decumbent or ascending, swollen at nodes, with forked or fascicled branches. **Leaves** opposite, sometimes ± fleshy, linear to filiform, with abbreviated leaf buds in their axils and appearing whorled; stipules scarious, connate in pairs and sheathing the node. **Inflorescences** cymose or pseudo-racemose. **Flowers** bisexual, rarely unisexual, subperigynous. **Sepals** 5, free, divided almost to base, obscurely nerved, with scarious margins. **Petals** 5, entire, rarely 0, white, pink or red. **Stamens** (2)5–10, unequal, arising on a perigynous ring; anthers medifixed, introrse. **Ovary** 1-locular; ovules many on free-central placenta; styles 3(–5), free or ± connate. **Fruit** a capsule, subglobose or ovoid-trigonous, dehiscent almost to base into 3(–5) valves or teeth. **Seeds** many, ovoid, pyriform or subtrigonous, often winged; testa smooth, rugose or variously tuberculate; embryo annular or hooked. $x = 9$ (aneuploids, high polyploidy).

Species ± 25, cosmopolitan, especially some halophytes with nearly worldwide distribution; 4 in sthn Afr., mainly in Cape region, but also scattered in Namibia, North-West, Free State and KwaZulu-Natal.

*Stellaria L. 2429000

Linnaeus: 421 (1753); Linnaeus: 193 (1754); Jussieu: 301 (1789); Sonder: 130 (1860); Pax: 79 (1889); Burtt Davy: 51 (1926); Pax & Hoffmann: 320 (1934); Turrill: 24 (1956); Wild: 349 (1961a); Chater & Heywood: 133 (1964); Henderson & Anderson: 142 (1966); Wild, Hooper & Diniz: 11 (1973); Friedrich: 883 (1979a); Bittrich: 227 (1993).

Slender annual or perennial herbs, often with fragile, sprawling stems, usually freely branched, sometimes rooting from nodes. **Leaves** opposite, sessile or petiolate, flat or very rarely subulate; stipules 0. **Inflorescences** axillary, lax dichasial cymes, rarely flowers solitary; bracts membranous or herbaceous. **Flowers** bisexual or rarely gynodioecious, hypogynous or subperigynous, small, honeyed. **Sepals** 5, rarely 4, free, with scarious margins, persistent. **Petals** (0)4–5, usually very deeply bifid, rarely 5–10-cleft, white. **Stamens** (3–)5(–10), ± perigynous, arising and dehiscing in 2 sets. **Disc** annular, elongating or of 5 interstaminal glands. **Ovary** 1-locular; ovules many on free-central placenta; styles (2)3(4 or 5), episepalous. **Fruit** a capsule, spherical or oblong, short, dehiscent by 6, rarely 4, 8 or 10 valves. **Seeds** many, rarely few or one, compressed, granulate, roundish-reniform; embryo annular. $x = 13$ (9, 10, 11, 12) (aneuploids, high polyploidy).

Species 150–200, mainly in Eurasia, with a centre of distribution in the mountains of East Central Asia, some species in afromontane Africa, some species with cosmopolitan distribution; 3 introduced into sthn Afr., widespread weeds of cultivation, Namibia, Botswana, Northern Province, North-West, Gauteng, Free State, KwaZulu-Natal, Lesotho, Western and Eastern Cape.

*Vaccaria Wolf 2501000

Wolf: iii (1776); Wolf: 234 (1781); Medikus: 96 (1789); Pax: 76 (1889); Burtt Davy: 149 (1926); Chater: 186 (1964b); Rauschert: 494 (1965); Henderson & Anderson: 134 (1966); Rauschert: 52 (1966); Zohary: 104 (1966); Friedrich: 977 (1979a); Léonard: 297 (1985); Rechinger: 337 (1988); Bittrich: 231 (1993).

Erect, glabrous annual herbs, dichotomously branched. **Leaves** opposite, ovate or lanceolate, glaucous, clasping at base; stipules 0. **Inflorescences** lax terminal dichasia. **Flowers** bisexual; antherophore present. **Calyx**: tube inflated below, whitish, prominently 5-ribbed, accrescent and becoming 5-winged in fruit, without scarious commissures; epicalyx 0. **Petals** 5, clawed; limb notched, exserted from calyx, pink or purple; coronal scales 0. **Stamens** 10, those opposite petals attached to claw; filaments slender. **Ovary** 2-locular below, 1-locular above; ovules many on free-central placenta; styles 2, linear, several times as long as ovary, glandular. **Fruit** a

capsule, oblong to globular, membranous, enclosed in persistent calyx tube, with papery exocarp, dehiscent by 4 teeth, endocarp membranous, dehiscing irregularly. **Seeds** many, reniform or subglobose, minutely tuberculate, black. $x = 10$ (aneuploids, polyploidy).

Species 1 or 4, central and eastern Europe, Mediterranean, temperate Asia; 1 introduced into sthn Afr.: **Vaccaria hispanica* (Mill.) Rausch. var. *hispanica*, North-West, Gauteng, Mpumalanga, Free State, Western and Eastern Cape.

*Casuarinaceae

(Hamamelidae—Casuarinales)

Compiled by M. Jordaan

Trees, dioecious or rarely monoecious, with persistent, at length bark-covered, woody branches from which arise numerous, very slender, ± straight, drooping, little-branched, green and usually flexible, deciduous, *Equisetum*-like, articulate branchlets, with several short basal articles and 1–many longer, distal articles; articles with as many 4–20 longitudinal ridges. **Leaves** on branches and on branchlets reduced to small, dark, triangular scales or teeth connate at base, in a whorl of 4–20 at apex of each article (1 per longitudinal ridge); on persistent branches leaves becoming separate as stem thickens; leaf whorls, and therefore also ribs, alternating at consecutive nodes; stipules 0. **Flowers** unisexual, wind-pollinated, very small and much reduced, sessile, solitary in axil of a bract and enclosed by 2 membranous lateral bracteoles, grouped into unisexual inflorescences with closely spaced alternating whorls of bracts similar to scale leaves. **Male inflorescences** short to elongated catkin-like spikes, terminating deciduous branches. **Male flowers** with a single stamen, enclosed in bud by 1 or 2 (anterior and posterior) concave or hood-shaped membranous perianth segments which break off at base as stamen develops; mature anther exserted, 2-thecous, basifixed. **Female inflorescences** shortly stalked or subsessile, ovoid or globular heads, axillary along persistent branches. **Female flower**: perianth 0; carpels 2, fused in ovary and in proximal part of style; placentation axile; ovules 2; style 2-branched, reddish, short, with 2 long, filiform, well-exserted stigmas. **Infructescences** cone-like, globular, ovoid or cylindrical, ± woody, formed by enlargement and thickening of accrescent bracts and bracteoles of individual flowers, bracteoles usually more elongated and forming pairs of valves enclosing the true fruit and opening when ripe. **Fruit** a small samara, very much laterally compressed, apex produced into large, ± translucent wing with 1 longitudinal nerve excurrent at apex. **Seed** solitary; endosperm 0; embryo straight, often more than one. $x = 9, 11$ (8, 10, 12, 13, 14).

Genera 4, species 70, native to Malaysia, Australia and Polynesia; with one widespread littoral species: **Casuarina equisetifolia* L. extending to Madagascar and the east coast of tropical Africa, occurring mainly in dry, infertile and saline areas; widely grown for timber and fuel wood in many parts of the tropics; naturalised in sthn Afr.

Brown: 571 (1814) as Casuarineae; Miquel: 332 (1868); Bentham: 401 (1880); Engler: 16 (1888) as Casuarinaceae; Johnson & Wilson: 237 (1993).

*Casuarina L. 1855000

Description as for family.

Species 17, tropical to warm-temperate habitats, almost throughout the range of the family except for Tasmania and parts of western and central Australia; 2 in sthn Afr. have become partially naturalised in KwaZulu-Natal and Eastern Cape; originally planted for stabilising coastal sands.

Celastraceae

(Rosidae—Celastrales)

Compiled by R.H. Archer & M. Jordaan

Trees, shrubs or woody climbers, without tendrils, or rarely ericoid shrubs (*Empleuridium*), sometimes polygamous to dioecious, glabrous or with simple hairs, unarmed or with spines (modified axillary shoots), sometimes with latex in leaves and bark, evident as elastic threads (trans-1, 4-polyisoprene) on pulling parts apart; branches often angular or 4-lined, often with yellow powdery pigments present on exposed bark. **Leaves** opposite, subopposite, alternate or spiral, sometimes fasciculate on short shoots (brachyblasts), simple, often leathery, entire or with crenate or denticulate to spinose margins; stipules small, mostly caducous, usually adjoining ridges on stem. **Inflorescences** axillary or terminal dichasial or monochasial cymes, panicles or thyrses, sometimes with accessory branches, fasciculate or solitary, usually bracteate; pedicels often articulate. **Flowers** bisexual or unisexual, regular, usually small. **Sepals** 3–5(6), imbricate or rarely valvate in bud, free or connate at base, usually persistent. **Petals** 3–5(6), usually free, usually longer than sepals, sometimes with ventral grooves or hollows, usually persistent. **Disc** fleshy, variously shaped, often saucer-shaped, 4- or 5-lobed or entire. **Stamens** (2)3–5, arising under or on margin of disc; filaments often broadened at base; free or connate to base of disc; anthers (1)2-thecous, extrorse or introrse, basi- or dorsifixed or versatile, opening by longitudinal slits; staminodes present in female flowers, shorter than stamens in male flowers. **Ovary** 2–5-locular, or rarely 1-locular by abortion, superior or half-inferior (*Empleuridium*), partly or almost completely immersed in disc (*Pseudosalacia*), sessile or on short androgynophore, with 2(3–12) erect or rarely pendulous ovules per locule; style usually thick, sometimes almost obsolete; stigma 2–5-lobed, rarely lobes bifid, absent in male flowers. **Fruit** capsular, loculicidally dehiscent, or with divergent, dorsally flattened, dehiscent mericarps, or follicle-like, or baccate or nut-like, or drupaceous or dry, indehiscent and winged. **Seeds** with or without a fleshy or submembranous, coloured aril, or winged with funicle free from wing or united to its base or neither (usually in indehiscent fruit); with or without endosperm; embryo erect, with cotyledons flat or fleshy.

Genera 60–70; species 1000, tropical and warmer temperate regions; sthn Afr.: genera 19, species ± 80.

Adamson: 564 (1950); Robson: 355 (1966); Robson *et al.*: 1 (1994); Jordaan: 1 (1995); Archer: 1 (1996); Archer & Van Wyk: 459 (1996a); Archer & Van Wyk: 146 (1997); Jordaan & Van Wyk: 299 (1998a); Jordaan & Van Wyk: 322 (1998b); Jordaan & Van Wyk: 177 (1999).

Key to genera

1a Fruit capsular or follicle-like, dehiscent when dry and mature; seeds arillate or without aril:
2a Plants with spines; leaves fasciculate on brachyblasts, at least on older branches:
3a Suffrutices, shrubs or small trees; flowers nearly always functionally unisexual with staminodes in female, and pistillodes in male flowers; ovules 2(3) per locule; ovary (2)3(4)-locular; seeds completely or incompletely enveloped by a well or weakly developed aril, or aril only a basal rim ..... **Gymnosporia**
3b Shrubs or woody climbers; flowers always bisexual; ovules 3–12 per locule; ovary always 3-locular; seeds completely enveloped by a well-developed aril:
4a Small shrubs; spines always leafy and floriferous, with more than one node per spine; leaves with venation obsolete, margin entire; disc cream, brown-spotted; ovules usually fewer than 6 per locule; aril pink ..... **Gloveria**
4b Shrubs or woody climbers; spines occasionally leafy and floriferous, when leafy not more than one node per spine; leaves with venation conspicuous, margin with few teeth in distal half, occasionally subentire; disc green; ovules usually 6 or more per locule; aril orange ..... **Putterlickia**
2b Plants without spines; leaves alternate or opposite, never fasciculate:
5a Ericoid shrublets; leaves scattered, needle-like; capsule follicle-like, dehiscing entirely along one suture ..... **Empleuridium**
5b Trees, shrubs or lianes; leaves not needle-like; capsule dehiscing entirely along 2 or 3 sutures:
6a Leaves alternate; seeds ellipsoid, with or without membranous aril:
7a Capsules with wing-like emergences ..... **Pterocelastrus**
7b Capsules smooth or verruculose, without wing-like emergences:
8a Leaves large, usually > 70 mm long; ovary almost completely immersed in disc; seeds exarillate ..... **Pseudosalacia**
8b Leaves small, usually < 70 mm long; ovary almost free or up to half immersed in disc; seeds covered by a thin membranous aril ..... **Maytenus**
6b Leaves opposite, at least on flowering shoots; seeds flattened or irregularly shaped, with wings, aril reduced or absent:
9a Capsule expanded laterally, forming 3 dehiscent mericarps, each dehiscing by median suture into 2 caducous valves; seeds with or without wings; stamens (2)3(4), inside disc or disc absent ..... **Hippocratea**
9b Capsule elongated, narrow, dehiscing loculicidally in 3 valves; seeds winged, aril reduced or absent; stamens 5, outside disc:
10a Seeds with wings; leaves narrowly elliptic to elliptic, very rarely widely ovate ..... **Catha**
10b Seeds without wings, aril reduced or absent; leaves widely elliptic to ovate ..... **Lydenburgia**
1b Fruit indehiscent; seeds without an aril:
11a Fruit drupaceous; leaves alternate, opposite or fasciculate:
12a Endocarp thick and woody (stone); leaves usually opposite or fasciculate, glabrous; sepals ± subcircular with margin entire ..... **Elaeodendron**
12b Endocarp thin and crustaceous; leaves alternate, pubescent or glabrous; sepals ± deltoid with laciniate margin:
13a Latex threads evident in leaves and bark on pulling parts apart; fruit white or yellow ..... **Robsonodendron**
13b Latex threads absent; fruit red or reddish ..... **Mystroxylon**

11b Fruit baccate or small and nut-like; leaves opposite or subopposite, rarely alternate:
14a Fruit small, nut-like and asymmetrical with persistent lateral style or stylar scar; ovules 2–4 per locule ..... **Pleurostylia**
14b Fruit baccate:
15a Fruit often large and globose, 1–20-seeded; seeds (pyrenes?) irregular, large; ovary with 2–8 ovules per locule.... ..... **Salacia**
15b Fruit usually smaller, globose or ellipsoid, 1–3(–6)-seeded; ovary with 2 ovules per locule:
16a Ovules pendulous; sepals vestigial; leaves coriaceous with margin revolute ..... **Maurocenia**
16b Ovules erect; sepals normal; leaves variously textured with margin plane or occasionally revolute:
17a Shrubs or trees; inflorescence a compound dichasium; flowers pedicellate; ovary 2- or 3-locular; ripe fruit light to dark brown or purplish, succulent or ± fleshy ..... **Cassine**
17b Lianes, scrambling shrubs or small trees; inflorescence a compact dichasium or thyrsoid; flowers sessile; ovary 2-locular; ripe fruit red or purple, fleshy or leathery:
18a Lianes or scrambling shrubs; leaves opposite to alternate; inflorescence a compact dichasium; flowers 5-merous; sepals triangular, coriaceous; berries elliptic..... **Allocassine**
18b Lianes, scrambling shrubs or small trees; leaves opposite; inflorescence thyrsoid with simple or compound cymules arranged along the axis; flowers 4- or 5-merous; sepals ± suborbicular, fleshy; berries spheroid ..... **Lauridia**

Allocassine N.Robson 4641030

Robson: 30 (1965); Codd: 124 (1966); Robson: 379 (1966); Archer & Van Wyk: 189 (1998b).

Slender scrambling shrubs or lianas, unarmed, glabrous; bark greyish or light brown, periderm persistent with no sequential periderm formation observed, phellem, 1–1.5 mm thick, with conspicuous orange pigment in slash, surface ± smooth. **Branchlets** terete or flattened, greyish brown. **Leaves** usually opposite or alternate on young shoots, occasionally bracteose on climbing shoots; lamina elliptic to broadly elliptic to oblong, very large, bluish green, glossy on both surfaces, base rounded to cuneate, apex rounded to retuse, rarely acute, margin entire or remotely glandular-crenulate, rigidly coriaceous; venation conspicuous on both surfaces, fine reticulation sometimes more conspicuous above, indistinctly brochidodromus; petiolate; stipules minute, ± triangular, brownish black, caducous. **Inflorescences** pedunculate, compact dichasial with flowers sessile, axillary, 1–10 per inflorescence; bracts minute, bracteoles occasionally present. **Flowers** bisexual. **Sepals** 5, greenish with reddish cilia, ovate, thick, coriaceous, margin ciliolate. **Petals** 5, yellow-green, narrowly obovate, erect, sessile, apex rounded, margin entire. **Disc** fleshy, entire. **Stamens** 5, erect; filaments relatively long, flattened, arising from and united at base with margin of disc; anthers basifixed, introrse. **Ovary** ± immersed in and adnate to disc, 2-locular, with 2 erect collateral ovules per locule; stigma inconspicuously lobed. **Fruit** baccate, red, ellipsoid, up to 32 × 20 mm, mesocarp fleshy. **Seeds** black, narrowly ellipsoid; fleshy endosperm present; embryo erect, with cotyledons fleshy, narrowly elliptic.

Monotypic: *Allocassine laurifolia* (Harv.) N.Robson, occurring in dry forest and forested ravines in the eastern parts of Zimbabwe, southern parts of Mozambique; in sthn Afr. in Swaziland, KwaZulu-Natal and Eastern Cape.

Linnaeus: 129 (1754); Candolle: 11 (1825) in part; Sonder: 465 (1860b); Davison: 326 (1927); Loesener: 176 (1942); Codd: 123 (1966); Archer & Van Wyk: 146 (1997b).

Hartogia Thunb. ex L.f.: 16 (1782); Candolle: 12 (1825); Sonder: 464 (1860b); Hooker: 363 (1862); Davison: 345 (1927); Loesener: 179 (1942). *Hartogiella* Codd: 219 (1983).

Slender to tall evergreen trees, shrubs or suffrutices, unarmed, glabrous; bark with yellow pigment usually present or hardly discernible. **Branchlets** 4-lined to subangular. **Leaves** opposite or rarely subopposite; stipules minute, triangular, brownish black, marcescent. **Inflorescences** pedunculate or sessile, axillary, dichasial. **Flowers** usually bisexual, pedicellate. **Sepals** 4 or 5, equal, ovate or deltoid to suborbicular, margin ciliolate or laciniate. **Petals** 4 or 5, cream to white, elliptic to oblong, spreading, margin entire. **Disc** fleshy, lobed or entire. **Stamens** 4 or 5, ± spreading or erect, arising from and united at base with margin of sinuses in disc. **Ovary** ± immersed and adnate to disc, 2- or 3-locular, with 2 erect collateral ovules per locule; style short or absent; stigma usually conspicuously 2- or 3-lobed. **Fruit** baccate, spheroid, ± 10 mm in diam., brown to dark brown or purplish; mesocarp fleshy or leathery. **Seeds** 1 or 2(–6), spheroid to ellipsoid, seed-coat brown; fleshy endosperm present; embryo erect with cotyledons fleshy, widely elliptic to circular.

Species 3, endemic to sthn Afr., especially Western Cape; forest and woodland in Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape. Most nonsouthern African species previously referred to as *Cassine* are best classified in *Elaeodendron*.

Catha Forssk. ex Scop. 4629000

Scopoli: 228 (1777); Oliver: 364 (1868); Davison: 339 (1927); Robson: 379 (1966); Friis: 661 (1984); Robson *et al.*: 25 (1994).

Slender trees, unarmed, glabrous or with conspicuous hairs in axils of stipules; powdery yellow pigments in bark. **Leaves** opposite on flowering shoots, alternate on vegetative ones, lanceolate, coriaceous, margin repand-serrate, petiolate; stipules triangular-acicular, free or ± united interpetiolarly, rapidly caducous. **Inflorescence** a many-flowered, dense, pedunculate, axillary dichasium; bracts persistent. **Flowers** bisexual, pedicellate; pedicels articulated at base. **Sepals** 5, small, ovate, imbricate, connate at base, deeply laciniate. **Petals** 5, much longer than sepals, oblong to elliptic, imbricate in bud, spreading, white or greenish. **Disc** saucer-shaped, with 5-crenate margin. **Stamens** 5, erect or soon becoming recurved, shorter than petals; filaments subterete; anthers basifixed. **Ovary** 3-locular, with 2 erect collateral ovules per locule; styles 3, free; stigmas 3. **Fruit** capsular, oblong, ± trigonous, dehiscing loculicidally into 3 valves; valves usually with prominent septal ridges on inner surface. **Seeds** 1–4, reddish, oblong, rugose-papillose, with a wing below point of attachment; endosperm present.

Monotypic: *Catha edulis* (Vahl) Endl. or Kat, widespread in eastern tropical Africa, Madagascar and the Arabian Peninsula; in sthn Afr., Northern Province, Mpumalanga, KwaZulu-Natal, Western and Eastern Cape. The leaves are chewed for an amphetamin-like stimulant action.

Elaeodendron Jacq. 4640000

Jacquin: t. 48 (1782) & 5 (1787); Robson: 385 (1966); Robson *et al.*: 29 (1994); Archer & Van Wyk: 41 (1996b); Archer & Van Wyk: 93 (1998c).

Cassine L. in part, Davison: 326 (1927). *Crocoxylon* Eckl. & Zeyh.: 128 (1834/1835); Robson: 40 (1965); Robson: 390 (1966). *Pseudocassine* Bredell: 330 (1937); Compton: 338 (1976).

Shrubs to tall evergreen trees, unarmed, glabrous; bark with layers of yellow pigment occasionally present or hardly discernible. **Branchlets** subangular to terete; lenticels usually prominent. **Leaves** opposite to subopposite, occasionally alternate, spiralled to fasciculate; stipules minute, ± triangular, marcescent. **Inflorescences** usually pedunculate, dichasial. **Flowers** usually bisexual or occasionally unisexual, sometimes with petaloid staminodes in female flowers; pedicellate. **Sepals** 3–5, equal, subcircular. **Petals** 3–5, cream to greenish, oblong to ovate, entire or with ventral projections, spreading. **Disc** entire to subentire and convex, fleshy, or flat and quadrangular, with sinuses at points where stamens arise, flat to concave. **Stamens** 3–5, erect to spreading; arising inside margin of disc or from sinuses in margin of disc. **Ovary** ± half immersed in and adnate to disc, 2–4-locular, with 2 erect, collateral ovules per locule; style short to astylous; stigma inconspicuous. **Fruit** drupaceous, spheroid to ellipsoid, white to yellow; stone narrowly elliptic to elliptic, surface smooth or with grooves. **Seeds** brownish, narrowly ellipsoid, ovoid, flattened to triangular, postchalazal vascular bundles often present; endosperm present; embryo erect with cotyledons fleshy, elliptic or ovate. $x = 17$.

Species ± 30, cosmopolitan; 8 widespread in Africa; 4 in sthn Afr. mainly in forest or woodland: Namibia, Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Empleuridium Sond. 4626010

Sonder in Harvey: 49 (1859); Sonder: 442 (1860a) assigned to Rutaceae; Goldblatt *et al.*: 167 (1985).

Ericoid, erect, unarmed, short-lived shrubs, glabrous. **Leaves** scattered, simple, needle-like; stipules small, scale-like. **Flowers** axillary, solitary, small, pedicellate. **Calyx** 4-partite, with ovate, acute segments. **Petals** 4, ovate, acute, spreading, whitish. **Disc** 4-lobed. **Stamens** 4, arising on margin of disc, opposite calyx segments; anthers introrse. **Ovary** half-inferior, elongate after anthesis, 1-locular, with 4 erect, basal ovules; style short, persistent; stigma capitate. **Fruit** relatively large, fusiform, follicle-like, 1-seeded, dehiscing entirely along one suture. **Seeds** black, large, with a large, white, basal aril (elaiosome).

Monotypic: *Empleuridium juniperinum* Sond. & Harv., mountains in the Caledon District (Western Cape).

Gloveria M.Jordaan 4628010

Jordaan & Van Wyk: 299 (1998a).

Evergreen, intricately branched, bluish grey, robust shrubs; branchlets arching downwards, spinescent, glabrous. **Spines** robust, always floriferous and leafy, 2–4(5) nodes with leaves or leaf scars per spine. **Branches** terete, young branchlets reddish brown, becoming grey, rigid, flexuous; bark splitting longitudinally, lenticels sunken. **Leaves** fasciculate, in axils of spines or more often on brachyblasts on spines, coriaceous, grey, glabrous, entire; petiole ± absent; stipules minute, subulate. **Inflorescence** a dichasium, borne on abbreviated branches. **Flowers** bisexual, hypogynous. **Sepals** 5, suborbicular, margin ciliate. **Petals** 5, ovate-oblong, fleshy, margin subentire, incurved, with distinct venation on ventral face, pink to red outside, cream inside. **Disc** fleshy, flat, faintly 5-lobed, margin slightly undulate, creamy white, brown-spotted. **Stamens** 5, shorter than petals; anthers oblong. **Ovary** 3-locular; ovules 3–6 per locule; style terete; stigma faintly 3-lobed. **Fruit** a capsule, red, obconic-trigonous, smooth, chartaceous. **Seeds** dark brown, almost completely enveloped by a pinkish aril.

Monotypic: *Gloveria integrifolia* (L.f.) M.Jordaan, confined to Northern and Western Cape.

Gymnosporia (Wight & Arn.) Hook.f. 4627000

Hooker: 365 (1862) emend. Loesener (1942) name conserved; Davison: 290 (1927) in part; Marais: 381 (1960) in part; Robson: 358 (1966) in part; Sebsebe Demisew: 45 (1985) in part; Robson *et al.*: 3 (1994) in part; Jordaan & Van Wyk: 177 (1999).

Celastrus sect. *Gymnosporia* Wight & Arnott: 159 (1834).

Small trees, shrubs or rhizomatous suffrutices, spinescent, usually with long shoots and weakly or well-developed brachyblasts. **Spines** slender to very robust, straight, axillary or terminating brachyblasts, occasionally leafy and/or floriferous. **Branches** terete, angular to striate-angular, often drooping; bark smooth or flaking, lenticels occasionally present. **Leaves** alternate or fasciculate on brachyblasts, glabrous or puberulous, entire or with irregular to regular teeth, subsessile or shortly petiolate; stipules free, subulate, marcescent. **Inflorescence** a subdichasium or dichasium, few- to many-flowered, fasciculate in axils of leaves or branches or on spines. **Flowers** mostly functionally unisexual with staminodes in female and pistillodes in male flowers, pedicels articulate at or near base. **Sepals** 5, equal, imbricate in bud, margin fimbriate, ciliate or rarely subentire. **Petals** 5, imbricate in bud, margin ciliate or laciniate, rarely entire, spreading or reflexed. **Disc** intrastaminal, convex or concave, 5–10-lobed, yellow or red. **Stamens** 5, arising at base of disc; anthers introrse. **Ovary** a quarter to half immersed in disc, (2)3(4)-locular with 2(3) erect, collateral ovules per locule; style terete, short or elongate; stigma (2)3(4)-lobed. **Fruit** a dry capsule opening longitudinally, loculicidal and septifragal, globose, obconic, trigonous, triquetrous, pyriform or conic-pyramidal, smooth to rugose, veined; pericarp semi-fleshy, chartaceous, coriaceous, woody or ridged. **Seeds** 1–4, glossy, reddish brown or black; aril fleshy or thin, completely to partially covering seed, or reduced to a rim at base of seed. $x = 10$ (9) (aneuploids, high polyploidy).

Species ± 80, extending over most of Africa and Madagascar, as far north as Spain in southern Europe and eastwards as far as India, Sri Lanka, Malesia and NE Australia and Polynesian Islands; 30 in sthn Afr., widely distributed.

Hippocratea L. 4661000

Linnaeus: 1191 (1753); Linnaeus: 498 (1754); Loesener: 226 (1893); Smith: 359 (1940); Ding Hou: 31 (1963) considers this a monotypic American genus; Robson: 46 (1965) takes broad view; Hallé: 1 (1986) and Robson *et al.*: 43 (1994) recognise segregate genera.

Lianes or scandent shrubs or small trees, unarmed, occasionally with latex. **Leaves** opposite or subopposite, entire or toothed, with petiole often articulated at base; stipules free or united interpetiolarly, caducous. **Inflorescences** pedunculate, cymose, dichasial or submonochasial, axillary; often with accessory branches. **Flowers** bisexual. **Sepals** (4)5, imbricate, more or less free. **Petals** (4)5(6), green, white or yellow, valvate or imbricate in bud. **Disc** extrastaminal, single or double, conical to saucer-shaped, free or variously united with other floral parts. **Stamens** (2)3(4), arising inside disc, usually shorter than petals; filaments broadened below, free or adnate at base or to ovary or gynophore; anthers ex-

trorse, didynamous, (1)2-thecous, with thecae at length confluent; pollen simple or polyads. **Ovary** free or confluent with disc, often 3-lobed, 3-locular, with 2–20 ovules in 2 series in each locule; style developed or obsolete, trifid. **Fruit** separating into 3 capsular mericarps, connate at base or rarely for most of their length; carpels dorsiventrally flattened or rarely biconvex, dehiscing by median suture or rarely indehiscent. **Seeds** with long stalks, rarely sessile, stalk usually expanded into a wing with raphe forming a submedial or marginal vein and thickened integuments forming a vein along other margin; germination epigeal or hypogeal. $x = 14$ (polyploidy).

Species ± 120. Differences of various segregate genera, mainly applied in tropical America and other parts of the world, are based on somewhat subtle variations in the shape of buds, arrangemcnt of petals and position and shape of the nectar disc. In Africa distinctions appear less marked. Perhaps the rank of subgenus under *Hippocratea* should be advocated, but it may well be that the segregate genera *Loeseneriella* A.C.Sm., *Reissantia* Hallé, *Elachyptera* A.C.Sm., *Prionostemma* Miers and *Pristimera* Miers will have to be used in sthn Afr. The following key would then be applicable, with number of sthn Afr. species indicated. *Hippocratea* in strict sense comprises only 2 species in tropical America and tropical Africa.

1a Flower bud conical; petals valvate or subimbricate in bud.....*Loeseneriella* (2)
1b Flower bud globose; petals imbricate in bud:
  2a Accessory branches in inflorescence absent; ovules 4–20 per locule; seeds 2 or more per mericarp:
    3a Petals unguiculate, lamina ovate to subcircular; leaves with prominent reticulate venation..... .....*Prionostemma* (1)
    3b Petals not unguiculate, elliptic to oblong; leaves without obvious reticulate venation... *Pristimera* (2)
  2b Accessory branches in inflorescence present; ovules 2 per locule; seeds 2 per mericarp:
    4a Disc deeply cup-shaped.....*Elachyptera* (1)
    4b Disc a low pad, narrowly sinuous.....*Reissantia* (3)

Lauridia Eckl. & Zeyh. 4647000

Ecklon & Zeyher: 124 (1834/1835); Sonder: 468 (1860b); Hooker: 363 (1862); Davison: 338 (1927); Robson: 39 (1965) in part; Archer & Van Wyk: 227 (1997c).

Cassine L. in part, Davison: 331 (1927).

Small evergreen trees, scrambling shrubs or lianas, unarmed, glabrous; bark with yellow pigment usually present or hardly discernible. **Branchlets** 4-lined to subangular. **Leaves** opposite, elliptic to ovate, entire to crenulate-denticulate; stipules minute, triangular, brownish black, marcescent. **Inflorescences** sessile or pedunculate, axillary, compact thyrsoid with cymules along straight central axis, or irregularly dichasial. **Flowers** bisexual, sessile. **Sepals** 4(5), equal, widely ovate. **Petals** 4(5), cream to white, widely elliptic to ovate; margin entire. **Disc** fleshy, entire. **Stamens** 4(5), ± erect, arising from and united at base with margin of disc; anthers introrse. **Ovary** ± immersed in and adnate to disc, 2-locular, with 2 erect, collateral, hypotropous, ventral ovules per locule; style very short or absent; stigma usually conspicuously lobed. **Fruit** baccate, red to purple or purplish black, spheroid; mesocarp fleshy. **Seeds** 1 or 2 per fruit, spheroid; seed-coat brown; endosperm present, fleshy; embryo erect, with fleshy, widely elliptic to widely ovate cotyledons.

Species 2, endemic to sthn Afr., Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Lydenburgia N.Robson 4629010

Robson: 35 (1965).

Catha Forssk. ex Scop. in part, Codd: 124 (1966); Van Wyk & Prins: 202 (1987).

Shrubs or trees, unarmed, glabrous; stems terete or angular; powdery yellow pigments in bark. **Leaves** often alternate when young, becoming opposite with age, lamina dark green or greyish green and glossy above, paler beneath, coriaceous or subcoriaceous; stipules long, triangular-acicular, caducous. **Inflorescence** a dichasium, 30–40-flowered, pedunculate. **Flowers** bisexual; bracts acicular to triangular. **Sepals** 5, ovate to semi-orbicular. **Petals** 5, oblong, margin entire, whitish. **Disc** fleshy, greenish, subentire with prominent sinuses at points where stamens arise. **Stamens** 5; filaments ± united at base; anthers basifixed, versatile, latrorse. **Ovary** 3-locular, ovoid, 2 ovules per locule; styles long. **Fruit** a 3(4)-valved capsule, narrowly elliptic to tri- or tetragonous, apex truncate and slightly concave; valves usually with prominent sepal ridges on inner surface. **Seeds** 1–3(4), elongate, trigonous, without or with a very reduced aril, rugose-papillose; endosperm fleshy.

Species 2, narrow endemics in sthn Afr. in Sekhukhuniland (Northern Province) and Pondoland (Eastern Cape). *Lydenburgia* is provisionally accepted awaiting critical morphological investigation. The strongest indication for separation are the vaalens compounds in *Lydenburgia* (Begley *et al.* 1990).

Maurocenia Mill. 4644000

Miller: [859] (1754); Sonder: 465 (1860b); Kuntze: 147 (1891), in part; Davison: 343 (1927); Loesener: 179 (1942); Archer & Van Wyk: 7 (1998a).

Maurocenia Mill. subg. *Eumaurocenia* Kuntze: 149 (1891).

Small evergreen shrubs to spreading trees, unarmed, glabrous; bark greyish with layers of powdery yellow pigment in exposed bark. **Branchlets** terete or slightly flattened, greyish brown. **Leaves** opposite; lamina widely elliptic to circular, dark green above, grey-green below, base rounded to cuneate, apex rounded to retuse, margin entire, revolute, coriaceous and rigid; venation brochidodromus, slightly raised above and more prominent below, midrib and petiole very conspicuous below owing to whitish green colour contrasting with grey-green lamina in dried leaves; petiolate; stipules minute, ± triangular, brownish black, marcescent. **Inflorescences** sessile, ± irregularly dichasial, axillary towards apices of branchlets, 4–10-flowered; bracts minute. **Flowers** often unisexual with staminodes, or bisexual; shortly pedicellate. **Sepals** 5, rudimentary. **Petals** 5, white, ovate, sessile, apex rounded, margin ± deflexed. **Disc** fleshy, entire, undulate. **Stamens** 5, ± erect; inserted below margin of disc; filaments of perfect flowers relatively long, well exserted above flowers; filaments of female flowers rudimentary (staminodes); anthers basifixed, introrse. **Ovary** ± immersed in and adnate to disc, 2(3)-locular with 2 pendulous collateral ovules per locule; ovules epitropous, dorsal; styles short; stigma in female flowers often conspicuously 2-lobed, papillate, stigma inconspicuous in perfect flowers. **Fruit** baccate, pale red, spheroid, mesocarp fleshy. **Seeds** 1 or 2 per locule (up to 5 per fruit), brown, ± spheroid; endosperm fleshy; embryo erect, with cotyledons fleshy, widely elliptic, base unequal.

Monotypic: *Maurocenia frangula* Mill. (note spelling of specific epithet), restricted to kloofs or coastal bush in Cape Peninsula and the West Coast National Park, Western Cape.

Maytenus Molina 4626000

Molina: 177 (1782); Loesener: 138 (1942); Blakelock: 237 (1956); Marais: 381 (1960) in part; Robson: 358 (1966) in part; Sebsebe Demisew: 45 (1985) in part.; Sebsebe Demisew & Robson: 331 (1989) in part; Robson *et al.*: 3 (1994) in part.

Gymnosporia in sense of Davison: 290 (1927) in part.

Trees or shrubs, without spines, erect or scrambling. **Leaves** alternate or spiral, usually subsessile, entire or serrated; sometimes with latex; stipules free, small, soon deciduous. **Inflorescences** pedunculate or sessile, monochasial or fasciculate, few-flowered, single in axils of foliage leaves or in clusters; bracts persistent. **Flowers** bisexual. **Sepals** (4)5, unequal or equal, imbricate, with margin entire or ciliolate. **Petals** (4)5, imbricate in bud, spreading, longer than sepals, oblong to suborbicular, with margins entire, undulate or ciliate, white, yellow, green or red. **Disc** intrastaminal, 5–10-lobed, angled or crenulate. **Stamens** (4)5; filaments flattened, shorter than petals; anthers versatile or basifixed, introrse. **Ovary** sessile, almost free or up to half immersed in disc, (1)2- or 3-locular, with 2 erect collateral ovules per locule; style usually short; stigma shortly (1)2- or 3-lobed. **Fruit** a smooth or rugose capsule, without emergences, dehiscing loculicidally to base. **Seeds** 1–6, glossy, subglobose, reddish brown, with complete or incomplete aril; with or without fleshy endosperm. $x = 9$ (polyploidy).

Species ± 150, mostly in tropics and subtropics of both hemispheres, widespread in the eastern parts of tropical and sthn Afr.; ± 11 in sthn Afr., widespread.

Mystroxylon Eckl. & Zeyh. 4642000

Ecklon & Zeyher: 125 (1834/1835); Loesener: 176 (1942); Robson: 29 (1965); Robson: 376 (1966); Robson *et al.*: 21 (1994); Archer: 107 (1996); Archer, Van Wyk & Condy: 76 (1997).

Mystroxylon Eckl. & Zeyh. sect. *Eumystroxylon* Loes.: 178 (1942).

Evergreen, rarely deciduous, shrubs or trees, unarmed, sparingly to densely pubescent; bark without yellow pigment, greyish to dark brown, surface smooth to longitudinally and transversely fissured; fissures often cutting deep into bark. **Branchlets** terete, smooth, usually pubescent, becoming greyish brown. **Leaves** alternate, coriaceous, margin glandular-crenate to glandular-crenulate, crenations 10–18 on either side; petiolate; stipules minute, ± triangular, pubescent, occasionally becoming glabrous, marcescent. **Inflorescences** sessile to pedunculate, composed of fasciculate cymes, axillary, 1–15-flowered; bracts minute. **Flowers** bisexual, pedicellate. **Sepals** 5, green, ± deltoid, with margin laciniate, equal, pubescent. **Petals** 5, greenish yellow, circular or depressed-ovate, margin entire or sparingly ciliolate, spreading. **Disc** fleshy, entire. **Stamens** 5, spreading, arising from and united at base with margin of disc; anthers introrse, dehiscing by longitudinal slits. **Ovary** three-quarters immersed in and adnate to and ± flush with disc, 3- or 4-locular, with 2 erect, collateral ovules per locule; style very short or absent, stigma inconspicuously lobed. **Fruit** a drupe, yellow-brown to bright red, ± spheroid; endocarp thin and crustaceous; mesocarp fleshy, the inner part often crustaceous or woody, resembling part of endocarp. **Seed** usually single, seed coat light brown, postchalazal vascular bundles often present; endosperm present; embryo erect, foliar.

Monotypic: *Mystroxylon aethiopicum* (Thunb.) Loes., a widespread and very polymorphic species in Africa and the Mascarene Islands; 4 subspecies are recognised for sthn Afr., Namibia, Botswana, Northern Province, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Pleurostylia Wight & Arn. 4646000

Wight & Arnott: 157 (1834); Davison: 342 (1927); Loesener: 180 (1942); Robson: 381 (1966); Robson *et al.* 27 (1994); Archer: 174 (1996).

Cathastrum Turcz.: 448 (1858).

Trees or shrubs, unarmed, glabrous, often with conspicuous orange pigments in exposed bark. **Leaves** opposite, lamina broadly elliptic, elliptic, or ovate to lanceolate, base acute to acuminate, apex rounded to slightly obtuse or acuminate, coriaceous, margin entire; venation usually conspicuous; petiolate; stipules minute, ± triangular, brown, marcescent. **Inflorescences** pedunculate, compact dichasial, axillary; bracts minute. **Flowers** bisexual, pedicellate. **Sepals** (4)5, subcircular to depressed-ovate, margin fringed. **Petals** (4)5, greenish white, ovate, sessile, margin entire, apex rounded. **Stamens** (4)5, erect, arising in sinuses in margin of disc; anthers dorsifixed, introrse. **Disc** subangular, with sinuses at point where stamens arise, flat. **Ovary** ± a quarter immersed in and adnate to disc, 2-locular, 1 infertile, with 2–4 erect, collateral ovules per locule; style short; stigma discoid, style and stigma occupying a lateral position on growing fruit due to development of 1 locule only. **Fruit** small, nut-like, ± ellipsoid with scar of stigma on one side below middle; pericarp thin, leathery, with fibrous bands arranged lengthwise on inside of pericarp. **Seeds** dark brown, ellipsoid, elliptic to broadly elliptic; fleshy endosperm present; embryo erect, cotyledons fleshy.

Species 3–5, with poor delimitation, in Africa, Mascarene Islands and Australasia; 1 widespread in Africa: *Pleurostylia capensis* (Turcz.) Loes., Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Pseudosalacia Codd 4662010

Codd: 565 (1972).

Trees, glabrous, unarmed; bark greyish, smooth. **Leaves** alternate, ± elliptic, very large, coriaceous, entire, petiolate; stipules 0. **Inflorescences** short, 1–7-flowered cymes or fascicles. **Flowers** bisexual. **Sepals** 5, shortly united, imbricate, persistent, becoming reflexed. **Petals** (4)5(6), spreading, subrotund, subentire. **Disc** fleshy, obscure, 5-angled. **Stamens** 5, alternating with petals, subsessile, arising from small protuberances near margin of disc. **Ovary** 3-locular, almost completely immersed in disc, with 2 collateral, erect ovules per locule; style subobsolete. **Fruit** capsular, eventually dehiscent, large, globose; pericarp thick, leathery, minutely verrucose. **Seeds** 2–5, brown, glabrous, trigonous; endosperm present.

Monotypic: *Pseudosalacia streyi* Codd, rare in coastal forest of S KwaZulu-Natal.

Pterocelastrus Meisn. 4630000

Meisner: 68 (1837); Walpers: 535 (1842); Sonder: 461 (1860b); Brown: 16 (1906); Davison: 321 (1927); Burtt Davy: 447 (1932); Loesener: 156 (1942); Robson: 374 (1966).

Celastrus L. in part, Candolle: 5 (1825). *Asterocarpus* Eckl. & Zeyh.: 122 (1834/1835). (*Pterocelastrus* Meisn. to be conserved against *Asterocarpus* Eckl. & Zeyh.)

Trees or shrubs, sometimes scandent, without spines, glabrous, often with conspicuous orange pigments in exposed bark; branches brownish grey, terete; branchlets angular. **Leaves** alternate, entire, coriaceous, petiolate; stipules free, small, thick, deciduous. **Inflorescence** a pedunculate or rarely sessile, few- or many-flowered dichasium, in axils of foliage leaves or rarely in axil of bracts forming pseudopanicles; bracts persistent. **Flow-**

ers bisexual, pedicellate. **Sepals** 5, membranous, unequal, imbricate, ± connate, with margin entire to laciniate. **Petals** 5, elliptic, imbricate in bud, spreading, white or greenish white to cream or pale yellow, often brownish-flecked. **Disc** fleshy, scarcely 5-lobed or crenulate and half enveloping ovary. **Stamens** 5, with ± flattened filaments, connate to base of disc; anthers versatile, introrse. **Ovary** superior, sessile, almost free or up to half immersed in disc, (2)3-locular, with 2 erect ovules per locule; style short, cylindric, terete; stigma (2)3-branched. **Fruit** a dry, woody, dehiscent capsule, often waxy or fleshy, with abrupt horn- or wing-like emergences which may be variously divided. **Seeds** 1–3, glossy, red-brown, almost completely covered by a thin yellow aril, with fleshy endosperm.

Species 3, southeastern Africa, occurring as far north as Mozambique, Zimbabwe and Malawi; sthn Afr.: Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Putterlickia Endl. 4628000

Endlicher: 1086 (1840); Davison: 336 (1927); Robson: 5 (1965); Jordaan & Van Wyk: 322 (1998b).

Glabrous evergreen shrubs, often spreading or straggling, or woody climbers, spinescent, with long shoots and brachyblasts. **Spines** straight or backward-pointing, axillary, occasionally leafy and floriferous, with only one node. **Branches** angular or terete and reddish brown when young, becoming terete and grey with age, lenticellate, smooth or verrucose. **Leaves** alternate or fasciculate, subsessile, glabrous; stipules free, small, subulate, marcescent. **Inflorescences** lax to dense, few to many-flowered dichasia or monochasia, in axils of leaves or in clusters on brachyblasts. **Flowers** bisexual, hypogynous, pedicellate. **Sepals** 5, subequal, imbricate, free or united at base, margin ciliolate. **Petals** 5, imbricate in bud, spreading or suberect, cream or white. **Disc** intrastaminal, single, convex, shallowly 5-crenate. **Stamens** 5, free, subterete; filaments slender, arising at base of disc; anthers basifixed, slightly versatile, latrorse. **Ovary** sessile, a quarter to half immersed in and adnate to disc, 3-locular; ovules (4–)6(–12) per locule; placentation axile with ovules arranged in 2 rows; style short, cylindric; stigma 3-lobed. **Fruit** a dry capsule, dehiscing loculicidally to base; capsules cream to pink or red, obconic-trigonous, smooth. **Seeds** 6–18, glossy, reddish brown, with fleshy endosperm, completely enveloped by a well-developed, fleshy, orange aril.

Species 4, confined to S Mozambique and sthn Afr.: Mpumalanga, Swaziland, KwaZulu-Natal, Northern, Western and Eastern Cape.

Robsonodendron R.H.Archer 4642010

Archer & Van Wyk: 116 (1997a).

Mystroxylon Eckl. & Zeyh. sect. *Pseudoscytophyllum* Loes.: 178 (1942).

Evergreen shrubs or trees, unarmed, glabrous with elastic threads of trans-1, 4-polyisoprene in bark; bark without yellow pigment. **Branchlets** ± 4-lined, ± rugulose. **Leaves** alternate; elastic (rubber) threads evident on breaking lamina; stipules minute, marcescent, brownish black. **Inflorescences** sessile, composed of fasciculate cymes. **Flowers** bisexual, pedicellate. **Sepals** 5, unequal, outermost pair larger, fleshy, ± deltoid, laciniate; inner pair membranous, enlarged, remaining sepal ± intermediate between outer and inner pair. **Petals** 5, cream, oblong, margin entire. **Disc** fleshy, entire. **Stamens** 5, erect, arising from and united at base with margin of disc; anthers introrse. **Ovary** ± immersed in and adnate to disc, 2-locular, with 2 erect, collateral ovules per locule; style very short or absent; stigma inconspicuously lobed. **Fruit** a drupe, white or yellow to light brown, spheroid, 5–10 mm in diameter; endocarp thin and crustaceous; mesocarp fleshy. **Seeds** 1 or 2 per fruit; seed coat brown; endosperm present, fleshy; embryo erect, linear.

Species 2, endemic to sthn Afr. in forests or coastal bush, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Salacia L. 4662000

Linnaeus: 159, 293 (1771); Harvey: 230 (1860); Robson: 391 (1966); Robson *et al.*: 33 (1994).

Shrubs, or small trees, often with upper branches scandent, rarely rhizomatous shrublets, unarmed; with or without latex. **Leaves** opposite, subopposite or sometimes alternate, entire or toothed, petiolate; stipules free, deciduous. **Inflorescences** pedunculate or sessile, cymose, dichasial or monochasial or fasciculate, simple, without accessory branches, axillary or extra-axillary. **Flowers** bisexual or functionally unisexual. **Calyx** 4- or 5-partite, imbricate; segments ovate, inner ones sometimes ± petaloid. **Petals** (4)5(6), variously coloured, imbricate in bud, spreading, sometimes with membranous apex, sometimes adnate to disc. **Disc** extrastaminal, thick, expanded or conical, often sinuate, sometimes of 5 transversely oblong lobes, variously united with other flower parts. **Stamens** (2)3(4), arising inside disc, usually shorter than petals; filaments linear and sometimes globose at base or expanded and ovate, becoming reflexed; anthers versatile, extrorse or apical. **Ovary** half-confluent with disc, 3-lobed, 3-locular, with 2–4(–8) ovules in 1 or 2 series in each locule; style long or short; stigma simple or 3-lobed. **Fruit** baccate, fleshy, globose or 1–3-locular, soon becoming 1-locular by evanescence of dissepiments, 1–4(–20) seeds; exocarp supple or tough; mesocarp soft, fleshy; endocarp mucilaginous. **Seeds** (pyrenes ?) usually large, angled or globose; integuments thin; germination hypogeal. $x = 14$.

Species ± 200, cosmopolitan in tropical regions; 5 in sthn Afr., Namibia, Botswana, Northern Province, Gauteng, Mpumalanga and KwaZulu-Natal; mainly in subtropical forest areas.

Ceratophyllaceae

(Magnoliidae—Ceratophyllales)

Compiled by R.P. Glen

Submerged aquatic herbs, perennating by buds, sometimes annual, rootless, branches occasionally modified as 'rhizomes'; monoecious. **Stem** branched but not more than 1 branch at a node. **Leaves** in whorls, (3–)6–8(–10) at a node, filiform, once or more dichotomously branched, with 2 rows of minute teeth along ultimate segments, apical segments truncate, tipped with two spines; stipules 0. **Flowers** unisexual, solitary in axil of 1 leaf in a whorl, male and female usually on alternate nodes; perianth lobes 6–13, united at base, strap-shaped or obovate, margin often with a single hyaline spine or lacerated, apex similar to leaf apex; water-pollinated. **Male flowers** subsessile; stamens up to 30 in several whorls on a domed receptacle around pistillode; filaments short or 0; anthers oblong, extrose, 2-thecous, dehiscing longitudinally, immature anthers resembling perianth lobes, margins 1–3-spined; mature anthers detach and float to water surface where they dehisce and shed pollen onto plants below. **Female flowers** sessile or shortly pedicellate; staminodes 0; ovary superior, 1-carpellate, 1-locular, ovoid, tapering into a long style; ovule 1, pendulous, unitegmic. **Fruit** a 1-seeded nut, ovoid or ellipsoid, tipped by persistent style, often with additional marginal and basal spines, also often warty. **Seed** without endosperm. $x = 12$ (aneuploids, polyploidy).

A worldwide family of only 1 genus; ± 6 polymorphic species are presently recognised, each with several varieties or formae: sthn Afr.: species 2 or 3.

Cook: 60 (1990); Wilmot-Dear: 124 (1991); Wilmot-Dear: 125 (1997).

Ceratophyllum L. 2516000

Linnaeus: 325 (1753); Wilmot-Dear: 125 (1997).

Description as for family.

Taxa 2 or possibly 3 in sthn Afr.: *Ceratophyllum demersum* L. var. *demersum*, in Caprivi (Namibia), N Botswana, Northern Province, Gauteng, Mpumalanga, Swaziland, Free State and coastal regions of KwaZulu-Natal, Western and Eastern Cape; in stagnant to fast-flowing water, tolerant of brackish estuarine water of high salinities but not found in alkaline, temporary pools. *C. muricatum* Cham. subsp. *muricatum* occurs in Mpumalanga and possibly elsewhere in sthn Afr.; in slow-flowing or stagnant water as well as seasonal, highly alkaline pools, not in brackish estuarine conditions. According to Wilmot-Dear (1997) sterile material with 3–4 times dichotomous leaves found in E KwaZulu-Natal and southern coastal regions of Western and Eastern Cape, could possibly be *C. submersum* L. var. *submersum*.

Chenopodiaceae

(Caryophyllidae—Caryophyllales)

Compiled by M. Jordaan

Annual or perennial herbs, shrublets or shrubs, often halophytic or nitrophilous, farinose, lepidote, glabrous, with a mealy bloom of vesicular hairs or an indumentum of simple to branched hairs, sometimes fleshy; stems continuous or with distinct segments or joints; plants sometimes monoecious or dioecious. **Leaves** usually alternate, rarely opposite, simple, sometimes succulent; opposite and reduced to small lobes at apex of jointed internodes (articles) (in Salicornieae); stipules 0. **Inflorescences** compact or open cymes or panicles, or reduced to solitary axillary flowers; bracts and bracteoles present or 0. **Flowers** bisexual or unisexual, usually regular, sessile, monochlamydeous, small to minute, mostly green or grey. **Perianth** of 1–5 tepals, or absent from female flowers, free or often connate below, imbricate or almost valvate, persistent, sometimes enlarged and developing lobes with a horn or spines at back, or winged or becoming succulent in fruit. **Stamens** 1–5, opposite to, as many as, or fewer than tepals, hypogynous or perigynous; filaments usually free, occasionally connate at base; anthers exserted, 2-thecous with connective sometimes produced, thecae with or without a terminal appendage, often inflated and coloured, dehiscing by longitudinal slits; staminodes usually 0. **Disc** sometimes present. **Ovary** free and superior (half-inferior in **Beta*) 2- or 3-carpellate, 1-locular; ovule solitary, basal, campylotropous to amphitropous; stigmas usually 2–3(–6), sessile or on stylar arms. **Fruit** dehiscent or indehiscent, a utricle, achene or berry, dry or with membranous, crustaceous, or succulent pericarp, usually enclosed in and falling off with a bladdery perianth, rarely a hard nut. **Seed** often lenticular, subglobose or reniform; testa membranous to crustaceous; embryo straight, curved, annular or spiral, surrounding the endosperm (0 in *Salicornia*).

Genera ± 100, with ± 1 500 species, cosmopolitan, particularly common in semi-arid environments and in saline habitats; a few species have given rise to cultivars of agriculture; many occur as weeds of cultivation; sthn Afr.: genera 14 (2 exotic), species 164.

Ventenat: 253 (1799); Fenzl: 292 (1837); Moquin-Tandon: 1 (1840); Moquin-Tandon: 41 (1849); Hooker: 43 (1880); Volkens: 36 (1892); Ulbrich: 375 (1934); Williams & Ford-Lloyd: 353 (1974); Friis & Gilbert: 127 (1993); Kühn: 253 (1993).

Classification of Chenopodiaceae

I. Subfamily CHENOPODIOIDEAE
(Plants herbaceous; leaves well developed. Inflorescences mostly richly flowered, paniculate; perianth lobes usually 5, not or rarely modified in fruit; ovary superior or semi-inferior. Fruits surrounded by the persistent perianth or by bracteoles. Embryo annular or curved; endosperm present.):

1. Tribe **Beteae** (Fruit subtended by persistent perianth lobes, opening by a circumscissile lid. Ovary half-inferior.): **Beta*
2. Tribe **Chenopodieae** (Plants often with bladdery hairs. Flowers proterogynous, ebracteolate. Ovary superior.): *Chenopodium*, **Einadia*
3. Tribe **Atripliceae** (Flowers usually unisexual; male flowers with a perianth, female ones perianthless, bracteolate. Fruit surrounded by the accrescent bracteoles.): *Exomis*, *Manochlamys*, *Atriplex*
4. Tribe **Camphorosmeae** (Inflorescences usually spiciform or paniculate; flowers usually ebracteolate; perianth persistent in fruit, chartaceous, membranous or scarious.): *Bassia*, *Kochia*

II. Subfamily SALICORNIOIDEAE
(Plants succulent; stems often articulate. Leaves reduced. Flowers usually in groups of 3, sunken into cavities in the axis of spiciform inflorescences; perianth often 2–4-lobed. Embryo annular or curved, rarely straight.):

1. Tribe **Halopeplideae** (Leaves alternate, amplexicaul. Stems entire.): *Halopeplis*
2. Tribe **Salicornieae** (Leaves usually opposite, connate. Stems articulate.): *Halosarcia*, *Salicornia*, *Sarcocornia*

This subfamily is sometimes placed in its own family, Salicorniaceae J.Agardh (1858), e.g. by Scott (1977a).

III. Subfamily SALSOLOIDEAE (Plants herbaceous or succulent. Leaves, if developed, mostly linear. Flowers usually 1–3, in the axils of the bracts, usually bracteolate. Embryo spiral; endosperm 0.):

1. Tribe **Suaedeae** (Bracteoles scarious, small. Embryo plano-spiral.): *Suaeda*
2. Tribe **Salsoleae** (Bracteoles large, surrounding the flower bud. Embryo mostly conical-spiral.): *Salsola*

This subfamily is sometimes placed in its own family, Salsolaceae Moq. (1849), e.g. by Scott (1977a, b).

Key to genera

1a Plants with well developed, ± flat leaves; branches not articulate; plants mostly hairy, mealy or glandular, sometimes glabrous:
2a Plants glabrous; fruiting perianth hard, united in clusters; ovary semi-inferior ..... ***Beta**
2b Plants glabrous, mealy, pilose, or glandular; fruiting perianth membranous or fleshy; ovary superior:
3a Plants mealy when young; flowers unisexual; male flowers with 5-lobed perianth and 5 stamens; female flowers without perianth but surrounded by a pair of bracteoles that may be free or fused:
4a Bracts connate into a somewhat inflated, spongy, winged casing, with a small, apical opening ..... **Atriplex**
4b Bracts not connate, becoming subsucculent:
5a Flowers in axillary clusters, bisexual and male together ..... **Exomis**
5b Flowers in naked, terminal inflorescences ..... **Manochlamys**
3b Plants variously hairy to glabrous; flowers bisexual or female, all with perianth, not surrounded by bracteoles:
6a Fruit with a succulent pericarp, not enveloped by the perianth ..... ***Einadia**
6b Fruit with a membranous pericarp, enveloped by the perianth ..... **Chenopodium**
1b Plants apparently leafless or leaves narrow, usually subterete, or scale-like and imbricate:
7a Leaves distinct, though sometimes scale-like; stems entire, not jointed at nodes or not made up of apparently leafless succulent internodes (articles); leaves usually alternate; plants glabrous or hairy:
8a Fruiting perianth without obvious appendages:
9a Leaves reduced to small succulent scales, shorter than 2 mm, amplexicaul; flowers immersed in upper parts of stem, without bracts or bracteoles, forming cylindrical, lateral and terminal, spike-like inflorescences ..... **Halopeplis**
9b Leaves distinct, terete or flat, sometimes succulent, usually longer than 3 mm, not amplexicaul; flowers in axils of leaf-like bracts, subtended by 2 or 3 minute, scarious bracteoles, forming glomerules in leaf axils or at leaf base, some distance from axil ..... **Suaeda**
8b Fruiting perianth with 1 or more wings, spines, or tubercles:
10a Annual or perennial herbs or subshrubs; flowers usually 1–3, in axils of the bracts, bibracteolate; perianth horizontally winged at or above the middle ..... **Salsola**
10b Annual herbs; flowers in axillary clusters; fruiting perianth accrescent with spine-like or tubercle-like appendages, or membranous scarious wings at the back, bracts 0; bracteoles 0:
11a Fruiting perianth segments with spines or spine-like tubercles ..... **Bassia**
11b Fruiting perianth segments with membranous scarious wings ..... **Kochia**
7b Leaves apparently absent (much reduced or obsolete); stems jointed at nodes, apparently made up of leafless succulent internodes (articles); plants glabrous:
12a Annual herbs; adventitious roots not formed; flowers exposed or not, with or without a truncate lateral shield; seeds with a soft or hard testa ..... **Salicornia**
12b Perennial herbs or subshrubs; adventitious roots formed; flowers always exposed, each with a truncate lateral shield; seeds with a thin membranous testa, minutely hairy:
13a Fruiting spikes disarticulating into separate ring-like segments, cylindrical, corky; flowers concealed in spike; seed with hard crustaceous testa ..... **Halosarcia**
13b Fruiting spikes persistent, or breaking up irregularly; flowers exposed; seed with soft membranous testa ... **Sarcocornia**

Atriplex L. 2229000

Linnaeus: 1052 (1753); Linnaeus: 472 (1754); Volkens: 64 (1892); Baker & Clarke: 81 (1909); Wright: 442 (1910); Aellen: 383 (1940a); Brenan: 14 (1954); Aellen: 665 (1960); Brenan: 144 (1988); Friis & Gilbert: 130 (1993); Kühn: 267 (1993); Hedge: 63 (1997).

Blackiella Aellen: 423 (1938); Aellen: 398 (1940a); Aellen: 6 (1967).

Annual or perennial herbs, subshrubs or shrubs, ± scurfy or with a mealy grey to white indumentum of vesicular scales or glabrous; monoecious or dioecious with some bisexual flowers. **Leaves** well developed, alternate, rarely opposite, flat, entire to irregularly toothed or lobed, mostly petiolate. **Inflorescence** spiciform, paniculate, in sessile axillary clusters, or flowers rarely solitary. **Flowers** unisexual. **Male flowers** without bracteoles, with (3–) 5 small scarious tepals and 3–5 stamens, arising at base of perianth; filaments free or connate at base; ovary 0 or rudimentary. **Female flowers** bibracteate, bracteoles persistent, herbaceous, relatively large, slightly connate, rarely separate, increasing in size in fruit; fruiting bracts of varied shape, degree of fusion and ornamentation; perianth 0, rarely present; disc and staminodes rudimentary or 0; ovary ovoid or depressed-globose; ovule erect or pendulous on basal funicle; stigmas 2 or 3, diverging, filiform. **Fruits** heterocarpous, enclosed by persistent, accrescent, and often modified bracteoles, with pericarp free or slightly adherent, membranous and indehiscent. **Seed** vertical, rarely horizontal; pericarp membranous; testa thin and hard; endosperm present; embryo annular. $x = 9$ (aneuploids, high polyploidy).

Species ± 250, cosmopolitan, particularly in Australia, mainly in deserts, saline habitats and on waste ground in temperate and tropical regions; 19 in sthn Afr., some introduced and naturalised, mostly widespread.

Bassia All. 2239010

Allioni: 177, t. 4, fig. 2 (1766); Volkens: 70 (1892); Scott: 106 (1978a); Kühn: 269 (1993).

Chenoleoides (Ulbr.) Botsch.: 1408 (1976). *Chenolea* Thunb.: 9 (1781); Hooker: 59 (1880); Volkens: 70 (1892); Wright: 447 (1910); Botschantsev: 1462 (1973). *Kochia* Roth: 307 (1801) section *Bassiae* (All.) Boiss.: 925 (1879).

Annual or rarely perennial herbs with an indumentum of spreading or adpressed, usually barbellate hairs. **Leaves** well developed, alternate, small, thin or succulent, usually linear to oblong, entire, pubescent, subsessile. **Inflorescences** elongated, spike-like or spreading panicles. **Flowers** bisexual or unisexual, axillary, solitary or clustered, ebracteate, small. **Tepals** 5, membranous, glabrous, tomentose or woolly, urceolate, connate above the middle; fruiting perianth accrescent, chartaceous, smooth or with up to 5 horizontal spine-like or tubercle-like appendages. **Stamens** 5, exserted; anthers oblong; thecae broadly oblong, without appendages. **Ovary** broadly ovoid, without disc at base; ovule subsessile; style short; stigmas 2, exserted. **Fruit** ± circular, horizontally compressed or sometimes vertical, with membranous pericarp, free from seed coat. **Seed** orbicular, horizontal or vertical; testa hard; endosperm copious or 0, mealy; embryo horseshoe-shaped. $x = 9$.

Species ± 10, Eurasia, Africa and introduced to Northern America; 4 in sthn Afr., in salt marshes along the whole coastal belt and inland riverbanks, in Namibia, Northern, Western and Eastern Cape, and KwaZulu-Natal.

*Beta L. 2221000

Linnaeus: 222 (1753); Linnaeus: 103 (1754); Jussieu: 85 (1789); Hooker: 52 (1880); Volkens: 56 (1892); Ulbrich: 457 (1934); Aellen: 550 (1960); Ball: 91 (1964a); Brenan: 91 (1964); Zohary: 138 (1966); Ford-Lloyd & Williams: 89 (1975); Wilson: 277 (1984); Kühn: 265 (1993); Letschert: 31 (1993); Hedge: 20 (1997).

Erect annual, biennial or perennial herbs, with furrowed, glabrous stems; roots woody, fleshy or much swollen. **Leaves** alternate, large, broad, flat, entire or nearly so, long-petiolate. **Inflorescences** simple or paniculate, with spike-like branches, composed of small, (1)2–4-flowered clusters, flowers of each cluster fused by their basally indurated perianth, whole cluster falling off at maturity, bracteate; bract 1, herbaceous, small to abortive; bracteoles 2. **Flowers** bisexual, sessile. **Tepals** 5, green or whitish, sometimes petaloid, basally indurated at fruiting time and often connate with other flowers in the glomerule, perigynous. **Stamens** 5; filaments inserted on a glandular disc. **Ovary** semi-inferior, connate with perianth tube at base, 3-carpellate, ± trigonous; stigmas 2–5, sessile, ovate, papillose on inner surface. **Fruit** enclosed in perianths that are connate by their swollen bases to form a pseudocarp which becomes detached at maturity, opening by a lid (operculum); pericarp fleshy or hard. **Seed** horizontal, lenticular or reniform, smooth or glossy; testa crustaceous; endosperm copious, central; embryo subannular. $x = 9$ (polyploidy).

Species ± 12, mainly in the Euro-Siberian and Mediterranean regions; cultivars derived from *Beta vulgaris* L. are food plants including Beetroot, Sugarbeet, Spinach Beet, etc.; some of these have escaped from cultivation, especially in Western Cape.

Chenopodium L. 2223000

Linnaeus: 218 (1753); Linnaeus: 103 (1754); Thunberg: 245 (1823); Volkens: 60 (1892); Baker & Clarke: 77 (1909); Wright: 435 (1910); Aellen: 337 (1928); Brenan: 2 (1954); Brenan: 165 (1956); Aellen: 569 (1960); Brenan: 92 (1964); Aellen: 7 (1967); Scott: 205 (1978b); Wilson: 139 (1983); Brenan: 136 (1988); Friis & Gilbert: 128 (1993); Kühn: 266 (1993); Uotila: 24 (1997).

Blitum L.: 4 (1753). *Roubieva* Moq.: 289 (1834).

Annual, biennial or rarely short-lived perennial herbs, rarely becoming woody, with white vesicular or glandular hairs, or rarely glabrous; stems erect to ascending or prostrate, usually grooved or angular, yellowish, green or green-striped, sometimes red to purple, especially in branch and leaf axils; plants gynomonoecious. **Leaves** alternate, flat and mostly broad, entire or pinnatifid, membranous to ± fleshy, mostly petiolate. **Inflorescences** mostly cymose glomerulate clusters, variously arranged, axillary and terminal, spiciform or paniculate; ebracteate. **Flowers** small, often dimorphic; terminal flowers bisexual or male; lateral flowers usually female. **Tepals** (3)4 or 5, often keeled or winged, sometimes with fringed appendages, in fruit rarely becoming succulent or basally indurated. **Stamens** 1–5, usually free, hypogynous or subperigynous; filaments sometimes connate at base. **Disc** 0 or annular. **Ovary** horizontally flattened; ovule subsessile; style usually 0; stigmas 2–5, slender, free or sometimes connate below. **Fruit** enclosed in perianth; pericarp membranous, indehiscent, free or adherent to seed. **Seed** usually horizontal, oblique or vertical; testa normally thin, hard and brittle; endosperm present; embryo annular. $x = 9$ (8) (high polyploidy).

Species ± 150, cosmopolitan, ranging from temperate to tropical regions, often weedy; 23 in sthn Afr., probably mostly introduced, widespread.

*Einadia Raf. 2261010

Rafinesque: 121 (1838); Wilson: 199 (1983); Wilson: 161 (1984).

Perennial herbs or weak shrubs. **Leaves** opposite or alternate, linear to broadly hastate, mealy when young. **Inflorescences** racemose or open, paniculate clusters; pedicels constricted at apex. **Flowers** small; terminal flower of cluster bisexual; lateral flowers female, without staminodes. **Tepals** 5, rarely 4. **Stamens** 1–3, glabrous; disc 0. **Ovary** glabrous; stigmas 2, slender. **Fruit** not enveloped by perianth; pericarp membranous or succulent. **Seed** horizontal, lenticular with rounded margin; endosperm central, copious; embryo annular.

Species 6, 4 endemic to Australia and 2 to New Zealand; **Einadia nutans* (R.Br.) A.J.Scott subsp. *nutans* introduced in sthn Afr., Gauteng and Eastern Cape.

Exomis Fenzl ex Moq. 2226000

Moquin-Tandon: 49 (1840); Moquin-Tandon: 89 (1849); Hooker: 53 (1880); Volkens: 63 (1892); Wright: 441 (1910); Ulbrich: 500 (1934) in part; Aellen: 373 (1940b); Aellen: 11 (1967); Kühn: 267 (1993).

Subshrubs with dichotomous branching, ashy grey, with simple hairs, monoecious with few bisexual flowers. **Leaves** alternate, ovate to lanceolate, the larger ones hastate, entire. **Inflorescences** terminal spikes or axillary clusters. **Male flowers** without bracts; tepals 4 or 5, herbaceous, broadly linear, ± recurved and hood-like towards tip; stamens 5, filaments strap-like, slightly tapering towards apex, longer than tepals, and connate at base; staminodes 0; ovary rudimentary. **Bisexual flowers** bibracteate; bracteoles cylindrical, accrescent in fruit; tepals 3–5, sometimes 0, slightly united below; staminodes 0; ovary fully developed; styles 2, free or united below. **Fruit** beaked at top; pericarp fleshy, adherent. **Seed** vertical, elongate to roundish or laterally compressed, blackish brownish; testa firm, glossy, smooth; embryo annular; radicle pointing downward.

Species 1: *Exomis microphylla* (Thunb.) Aellen with 2 varieties, confined to dryish areas of sthn Afr.: Namibia, Free State, Northern, Western and Eastern Cape.

Halopeplis Bunge ex Ung.-Sternb. 2249000

Ungern-Sternberg: 102 (1866); Hooker: 64 (1880); Volkens: 74 (1892); Adamson: 359 (1950); Zohary: 154 (1966); Scott: 372 (1977a); Kühn: 271 (1993); Hedge: 123 (1997).

Succulent annual or perennial herbs, glabrous; stems not jointed. **Leaves** opposite or upper ones alternate, reduced to small, succulent scales, subglobose to ovoid, amplexicaul. **Inflorescences** densely spicate; bracts fleshy, spirally placed, suborbicular, persistent. **Flowers** bisexual, in triads, in axils of spirally arranged bracteal scales, connate to one another and adnate to bracts. **Perianth** small, connate, compressed 4-angled, 3-dentate at apex. **Stamens** 1–3, shortly exserted; thecae without connectival appendages. **Ovary** pear-shaped, ± laterally compressed; styles 2; stigmas 2, subulate. **Fruit** enclosed in perianth with a membranous pericarp. **Seed** ovoid to ± circular, compressed; endosperm copious, central; embryo hook-shaped. $x = 9$ (1 report).

Species 3, in southern Europe, W Asia, north and sthn Afr.; 1 in sthn Afr.: *Halopeplis amplexicaulis* (Vahl) Bunge ex Ung.-Sternb., saline habitats, West Coast.

Halosarcia Paul G.Wilson 2255020

Wilson: 28 (1980); Brenan: 147 (1988); O'Callaghan: 433 (1992); Friis & Gilbert: 132 (1993); Kühn: 273 (1993).

Arthrocnemum not of Moq. (1840) in strict sense: Ungern-Sternberg: 36 (1866) in part; Wright: 449 (1912) in part; Moss: 4 (1954) in part; Brenan: 18 (1954) in part; Tölken: 273 (1967) in part.

Perennial dwarf shrubs, usually thinly woody, low, glabrous, apparently built up of many, superposed, ± tubular

segments which are green or glaucous and ultimately shrivel and fall away from stem. **Leaves** opposite, forming an insignificant fleshy bilobed rim at apex of each internode; sclereids 0 in chlorenchyma. **Inflorescence** a spike-like cyme (thyrse), usually terminal to branchlets, consisting of 3-flowered cymules each in axil of opposite, usually connate succulent bracts. **Flowers** usually bisexual or rarely pistillate, sessile. **Perianth** 3-lobed at apex, funnel-shaped. **Stamens** 0–1, abaxial; filament initially turgid and terete, eventually lorate, sometimes indurated towards base. **Ovary** vertical, membranous or succulent, ovoid; ovule suspended from a basal funicle; style short, with 2 or 3 stigmas. **Seed** erect, ovoid to circular, smooth, coat membranous to crustaceous; perisperm present, lateral; embryo curved. $x = 9$.

Species 23, all confined to Australia, except *Halosarcia indica* (Willd.) Paul G.Wilson (= *Arthrocnemum indicum* (Willd.) Moq.) occurring on shores of the Indian Ocean from Somalia southwards to Mozambique, KwaZulu-Natal coast and on Madagascar, Sri Lanka, in India and northern coasts of Australia.

Kochia Roth 2240000

Roth: 307 (1801); Hedge: 104 (1997).

Bassia in part, in strict sense *Bassia* section *Kochia* (Roth) A.J.Scott: 107 (1978a); Kühn: 269 (1993).

Annual or perennial herbs or subshrubs; stems ascending or erect, rather slender, with a prominent indumentum of spreading or adpressed barbellate or smooth hairs, or almost glabrous. **Leaves** alternate, flat or semicylindrical, linear to lanceolate, sessile, not or scarcely fleshy. **Flowers** bisexual or unisexual, urceolate, solitary, or in pairs in leaf axils; bracteate or ebracteate. **Tepals** 5, membranous, connate to ± middle; in fruit developing variously-shaped spreading wings. **Stamens** (4)5, exserted; thecae broadly oblong-ovoid, without appendages. **Ovary** broadly ovoid; style elongate with 2 prominently papillose apical arms. **Fruit** enclosed within persistent segments, horizontally compressed. **Seed** horizontal; endosperm scanty; embryo horseshoe-shaped. $x = 9$ (aneuploids, polyploidy).

Species ± 5; Africa and Eurasia; 1 in sthn Afr.: *Kochia tricophylla* Stapf, Northern and Eastern Cape.

Manochlamys Aellen 2229020

Aellen: 379 (1940b); Adamson: 355 (1950); Aellen: 12 (1967).

Atriplex L. in part C.H.Wright: 442 (1910). *Exomis* Fenzl ex Moq. in part Kühn: 267 (1993).

Grey aromatic shrubs. **Leaves** alternate, hastate, roundish-cordate to ovate-lanceolate, entire. **Inflorescences** terminal spikes. **Flowers** unisexual. **Male flowers** with 5 tepals, ovate; stamens 5, longer than perianth. **Female flowers** with 3 or 4 very small tepals and 2 broad-based bracts; bracts becoming fleshy, encircling, but not covering fruit. **Fruit** white or greenish. **Seed** compressed with rounded margin, smooth, shiny, black, vertical; embryo ± circular.

Monotypic, sthn Afr.: *Manochlamys albicans* (Aiton) Aellen, Namibia, Northern Cape (Namaqualand) to SW Western Cape.

Salicornia L. 2257000

Linnaeus: 3 (1753); Linnaeus: 4 (1754); Moquin-Tandon: 113 (1840); Volkens: 77 (1892); Wright: 448 (1912) partly; Adamson: 357 (1950); Brenan: 20 (1954); Moss: 20 (1954); Ball: 1 (1964b); Tölken: 296 (1967); Brenan: 153 (1988); O'Callaghan: 432 (1992); Kühn: 274 (1993); Hedge: 130 (1997).

Arthrocnemum not of Moq. in strict sense.

Annual herbs, erect or decumbent, sometimes becoming thinly woody below, glabrous, appearing leafless, built up of many superposed, ± tubular-segments which are green to reddish and succulent, and ultimately shrivel, each segment at apex forming a little cup, with 2 short teeth, embracing base of next higher segment; branches opposite, articulated. **Leaves** much reduced, opposite, consisting of small connate scales. **Inflorescences** short or long, terminal and lateral, fleshy, cylindrical spikes; spike not disarticulating, persistent or breaking up irregularly. **Flowers** minute, bisexual, or occasionally a few unisexual, usually in clusters of 3, ± connate, a pair of clusters to each fertile segment, clusters on opposite sides and immersed in hollows at articulations of branches. **Perianth** angular, minutely 3- or 4-lobed, fleshy, opening in middle of a truncate flattened lateral shield, lobes hard and spongy in fruit, persistent. **Stamens** 1 or 2 per flower; thecae exserted, nonappendiculate. **Ovary** ovoid, vertical, narrowed to apex; ovule subsessile; style lacerated at apex. **Fruit** an utricle, ovoid or oblong in outline, enclosed in spongy perianth; pericarp membranous. **Seed** erect, small, compressed, ± oblong; testa thin membranous, minutely hairy; perisperm 0; embryo folded. $x = 9$ (high polyploidy).

Species ± 13, cosmopolitan, excluding Australia, 7 in Europe, mostly maritime; 4 in sthn Afr., sheltered saline situations near coast of Namibia, Northern, Western and Eastern Cape, and KwaZulu-Natal.

Salsola L. 2269000

Linnaeus: 222 (1753); Linnaeus: 104 (1754); Thunberg: 243 (1823); Volkens: 82 (1892); Baker & Clarke: 87 (1909); Wright: 451 (1912); Brenan: 23 (1954); Aellen: 21 (1961); Aellen: 13 (1967); Botschantsev: 989 (1969); Botschantsev: 140 (1972); Botschantsev: 597 (1974); Wilson: 314 (1984); Brenan: 159 (1988); Kühn: 275 (1993); Freitag & Rilke: 154 (1997).

Annual or more often perennial herbs, shrubs or subshrubs, glabrous or pubescent; hairs 1- or few-celled, papillose, vesicular, setose or variously branched. **Leaves** alternate, rarely opposite, usually semiterete or terete, fleshy, entire, sessile, narrow, often scale-like, sometimes linear-subulate, sometimes amplexicaul at base. **Inflorescences** clusters of loose or dense, simple or paniculate spikes, or flowers solitary, bracteate; bracts leaf-like or scaly; bracteoles 2, green at least in upper part, with wide hyaline margins ± enclosing the small flowers, often cucullate. **Flowers** axillary, usually bisexual, sessile, protandrous. **Tepals** 4 or 5, outer wider than inner, radially veined, each tepal developing in fruit above the middle a scarious horizontally spreading, translucent to opaque, pinkish to pale brown wing. **Stamens** 5 or less, antitepalous; filaments band-shaped, fused at ovary base or inserted on outside of disc; anthers linear, oval or sagittate in outline, often with a connective disc; disc thin or thick, often lobed, glabrous, glandular papillose or ciliate; apically with small or large, distinctly shaped appendages. **Ovary** globose, depressed or broadly ovoid, narrowed into style; ovule basal, subsessile, suspended from apex of an enlarged funicle; style short or long, thin or thick, rarely 0; stigmas 2, rarely 3. **Fruit** usually consisting of a utricle and adnate fruiting perianth, both shed together as an anemophilous diaspore; pericarp membranous or fleshy. **Seed** orbicular, with membranous testa, usually horizontal; endosperm almost 0; embryo plano- or conical-spiral, greenish. $x = 9$ (high polyploidy).

Species ± 150, in Europe, Asia, and Africa, introduced into America and Australia, in arid or semi-arid regions; 89 in sthn Afr., conspicuous under karroid conditions, in Namibia, Botswana, North-West, Northern Province, Free State, Northern and Western Cape; **Salsola kali* L., a native of Asia, is a very widespread weed.

Sarcocornia A.J.Scott 2255010

Scott: 366 (1977a); Wilson: 278 (1984); Brenan: 149 (1988); O'Callaghan: 433 (1992).

Salicornia L. in part, C.H.Wright: 449 (1910). *Arthrocnemum* not of Moq. (1840) in strict sense; Ungern-Sternberg: 36 (1866) in part; Baker & Clarke: 85 (1909) in part; Ulbrich: 379 (1934) in part; Brenan: 18 (1954) in part; Moss: 4 (1954) in part; Tölken: 273 (1967) in part.

Perennial herbs or subshrubs, glabrous, appearing leafless; branches made up of cylindrical segments (articles), cup-shaped or 2-lobed at apex, succulent, usually green or greenish to reddish; sclereids usually present in palisade tissue. **Inflorescence** a terminal spike-like thyrse, consisting of 3–12-flowered cymules, sessile in axils of bracts; bracts united in opposite pairs. **Flowers** minute, apparently embedded in the spongy mesophyll of the succulent axis, bisexual or unisexual by abortion, or plant dioecious. **Perianth** succulent, gamotepalous; apex truncate, exposed, the orifice a vertical slit; lobes 3 or 4, 2 lateral and 1 small, semicircular outer adaxial lobe. **Stamens** 1 or 2 per flower, on abaxial and adaxial side of ovary. **Fruiting** perianth spongy; pericarp membranous. **Seed** ovate to orbicular; testa weak, papillose or with slender hairs; endosperm 0; embryo horseshoe-shaped. $x = 9$ (high polyploidy).

Species ± 15, in Europe, Africa, Asia, North and South America, 3 native to Australia; 9 in sthn Afr., coast of Namibia, Northern, Western and Eastern Cape, and KwaZulu-Natal.

Suaeda Forssk. ex J.F.Gmel. 2261000

Forsskål: (1775); Gmelin: 797 (1776) name conserved and emended; Scopoli: 333 (1777); Volkens: 80 (1892); Baker & Clarke: 91 (1909); Wright: 450 (1912); Brenan: 21 (1954); Aellen: 27 (1961); Aellen: 20 (1967); Wilson: 310 (1984); Brenan: 154 (1988); Pedrol: 337 (1992); Kühn: 274 (1993); Akhani & Podlech: 133 (1997).

Annual or perennial herbs, or subshrubs, erect or prostrate, ± fleshy, usually glabrous to sparsely puberulous. **Leaves** alternate or in whorls of three, fleshy, entire, narrow, cylindrical or somewhat flattened. **Flowers** bisexual or unisexual, sessile, in clusters of (1–)3(–9) in upper axils of bracts, at length adnate to base of leaves, subtended by 2 or 3 minute, scarious, pellucid bracteoles. **Perianth** succulent, 5-lobed; lobes free or connate to middle, keeled, or rounded on back, sometimes cucullate or horned. **Stamens** 5, hypogynous or attached to perianth tube. **Ovary** free from or rarely united with perianth, hemispherical to conical, broadly sessile; ovule basal; stigmas 2–5. **Fruit** with membranous or sometimes spongy, thickened, indehiscent pericarp; pericarp thin, free from perianth; heterocarpy common. **Seed** horizontal or vertical, lenticular; testa smooth, thin, hard and glossy; endosperm 0 or scanty; embryo spiral. $x = 9$ (high polyploidy).

Species ± 110, cosmopolitan, mainly in the northern hemisphere; 6 in sthn Afr., widespread along seashores and in saline or brackish inland areas.

Chrysobalanaceae

(Rosidae—Rosales)

Compiled by M. Jordaan

Evergreen trees, shrubs or rhizomatous geoxylic suffrutices; wood with abundant silica inclusions. **Leaves** alternate, simple, entire, coriaceous, lower surface with close, prominent, reticulate venation which delimits small stomatal cavities filled with hairs, sometimes with 2 glands on upper side of petiole or at junction of petiole with blade; stipules subulate or lanceolate, caducous or persistent. **Inflorescences** axillary, many-flowered, complex cymes or cymose panicles; bracts and bracteoles eglandular, completely concealing flower bud. **Flowers** bisexual, slightly irregular, strongly perigynous. **Calyx**: tube (receptacle) turbinate and often obliquely bent or cup-shaped and ± unilaterally gibbous, hairy inside throughout; lobes 5, free, obtuse and imbricate or triangular-acute and sometimes subvalvate. **Petals** 5, free, inserted in mouth of perianth tube, sessile or clawed, caducous. **Stamens** 6–10 or more, sometimes unequal, inserted in throat of perianth tube, connate at base into a short ring or unilateral bundle, sometimes almost free, about as long as perianth lobes; filaments subulate-filiform, white; anthers small, dorsifixed, 2-thecous, dehiscing longitudinally and introrsely. **Ovary** superior, adnate to one side of perianth tube; carpels 1, rarely 2 or 3, 2-locular, with a single, erect ovule in each locule, often villous; style arising at base of carpel(s), terete, often hairy, arcuate, included; stigma ± truncate. **Fruit** drupaceous, 1-seeded, ellipsoid, obovoid or globose; epicarp verrucose; endocarp hard, thick, with a rough, fibrous surface, with 2 basal obturators. **Seed** erect; endosperm 0. $x = 11$ (polyploidy).

Genera 17, species ± 490; restricted to the lowlands of the tropical and subtropical regions of both hemispheres, concentrated near the equator, especially in the Neotropics; sthn Afr.: genus 1, species 2.

Description as for family.

Species ± 43, fairly cosmopolitan in tropics and subtropics, 6 in tropical Africa, of which 1 also in Madagascar; 2 in sthn Afr., Namibia, Botswana, the northern provinces, Swaziland and KwaZulu-Natal.

Clusiaceae (Guttiferae)

(Dilleniidae—Guttiferales)

Compiled by C.L. Bredenkamp

Trees, shrubs or herbs, with resinous juice. **Leaves** opposite, subopposite or whorled, simple, glandular; stipules 0. **Flowers** regular, bisexual or unisexual. **Sepals** 4 or 5, quincuncial or decussate. **Petals** as many as sepals, free, usually convolute, sometimes imbricate or decussate, alternating with sepals. **Stamens** many, basically in 2 whorls of stamen fascicles (bundles), the outer often sterile (fasciclodes) or absent, with filaments variously united or free, inner fascicles variously united or free, very rarely each one reduced to a single stamen. **Ovary** superior, 2–many-locular; placentation usually axile, sometimes ± parietal; ovules 1–many; styles free, ± united or absent; stigmas as many as locules. **Fruit** a septicidal (rarely loculicidal) capsule or berry. **Seeds** carinate or arillate, without endosperm.

Genera 40, species ± 1 000, mainly tropical but Hypericoideae also northern temperate; sthn Afr.: 2 genera, 12 species.

Sonder: 117 (1860); Robson: 378 (1961); Adams: 231 (1962); Friedrich-Holzhammer: 1 (1968); Killick & Robson: 14 (1976).

Key to genera

Flowers bisexual; sepals 5; styles (2)3–5, elongate; ovules several to many per locule ..... **Hypericum**

Flowers unisexual, rarely bisexual; plants polygamous or dioecious; sepals 4; styles absent and stigmas sessile; ovules 1 per locule ..... **Garcinia**

Garcinia L. 5199000

Linnaeus: 443 (1753); Robson: 396 (1961); Killick & Robson: 20 (1976).

Trees or shrubs, usually with yellow juice, sometimes with leafy branches modified into thorns. **Leaves** opposite or in whorls of 3, sometimes large, usually entire, coriaceous, venation usually prominent, often with translucent glandular canals and brownish resin canals. **Flowers** terminal or axillary, solitary or in few- to many-flowered cymes, usually unisexual and plants then either dioecious or polygamous, or flowers rarely bisexual. **Sepals** 4(5), decussate. **Petals** 4(5), longer than sepals. **Male flowers**: stamens many, free or all connate in (3)4 or 5(–9) fascicles (bundles) with each fascicle forming a solid staminal column bearing free or partially fused filaments above, sometimes with a whorl of sterile stamen fascicles (fasciclodes) alternating with stamen fascicles or forming a cushion from which stamens arise; anthers opening by a circular rim or longitudinal slits. **Female** or **bisexual flowers**: usually with 4(5) stamen fascicles or staminode fascicles, similar to those of male flowers but smaller and with fewer members, sometimes with fasciclodes free or fused together in a ring at base of ovary. **Ovary** 2–many-locular with 1 ovule per locule; styles absent; stigma sessile, peltate, lobed, smooth or tuberculate. **Fruit** baccate. **Seeds** 1–4, large, arillate; embryo with minute cotyledons. $x = 8$ or 12 (high polyploidy).

Species ± 400, fairly cosmopolitan in tropical countries with a concentration in Asia; 2 in sthn Afr., Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape; in forests.

Hypericum L. 5168000

Linnaeus: 783 (1753); Sonder: 117 (1860); Bredell: 571 (1939); Robson: 379 (1961); Killick & Robson: 14 (1976).

Trees, shrubs or herbs. **Leaves** opposite, sessile, amplexicaul or shortly petiolate, entire, with translucent glandular dots or linear striae and frequently with dark submarginal glandular dots. **Flowers** terminal, solitary or cymose, sometimes forming a corymb or panicle, bisexual. **Sepals** usually 5, equal, subequal or unequal, with translucent gland dots or striae, with or without dark, often submarginal dots and sometimes with stalked marginal glands. **Petals** usually 5, usually yellow, often red-tinged, asymmetrical, with translucent or dark glandular dots or striae. **Stamens** usually very numerous, free or connate at base into 3–5 distinct or indistinct groups; filaments thread-like; anthers with or without yellow or black gland. **Ovary** sessile, ovoid or subround, 3–5-locular, with few to many ovules on parietal placentas in each locule; styles 3–5, free or variously united; stigmas small, capitate. **Fruit** a septicidal capsule with few to many seeds, rarely indehiscent. **Seeds** minute, cylindric to ovoid, straight or slightly curved; testa thin, ribbed, punctate or smooth; embryo straight or curved. $x = 8$ (7, 9, 10) (high polyploidy).

Species ± 400, widespread in temperate climates; 10 in sthn Afr., widespread, but mainly eastern regions, extending westwards along Cape coastal area to near Riversdale (Western Cape); **Hypericum perforatum* L., is an introduced weed in the Western Cape region (Henderson & Anderson 1966).

Combretaceae

(Rosidae—Myrtales)

Compiled by C.L. Bredenkamp

Trees, shrubs, shrublets or climbers, rarely subherbaceous; indumentum of unicellular, compartmented (rarely non-compartmented) hairs, multicellular stalked glands and multicellular scales (in which the head consists of a multicellular plate only one cell thick). **Leaves** opposite, verticillate, spiral or alternate, simple and almost always entire (very rarely crenulate); stipules 0. **Flowers** bisexual or bisexual and male in same inflorescence or very rarely plants dioecious, usually 4- or 5-merous, rarely slightly irregular, in axillary or extra-axillary, elongated or subcapitate spikes or racemes or in terminal or axillary panicles. **Receptacle** (calyx tube or hypanthium) usually in two distinct parts: lower receptacle surrounding and adnate to the inferior ovary, upper receptacle usually produced beyond ovary to form a short or long tube terminating in (sometimes scarcely developed) sepals. **Sepals** 4 or 5 (rarely 6 or 8) or almost absent, sometimes accrescent. **Petals** 4 or 5 (rarely more) or absent, free, conspicuous or sometimes very small, usually inserted near mouth of upper receptacle. **Stamens** usually twice as many as sepals or petals but occasionally the same number, borne inside upper receptacle with biseriate or, more rarely, uniseriate insertion (one whorl very rarely as staminodes), exserted or included; anthers dorsifixed, versatile. **Disc** intrastaminal, hairy or glabrous, sometimes inconspicuous or absent. **Style** usually free (attached to upper receptacle for part of its length in *Quisqualis* and a very few species of *Combretum*). **Ovary** inferior, 1-locular with usually 2 (up to 6) pendulous anatropous ovules of which only 1 usually develops. **Fruit** a pseudocarp, very variable in size and shape, fleshy or dry, stipitate or sessile, usually indehiscent, occasionally tardily dehiscent, often variously winged or ridged, 1-seeded. **Seeds**: albumen absent; cotyledons 2 (rarely 3 or 4) occasionally with their petioles connate almost to apex.

Genera 20, species 500, cosmopolitan in tropics and subtropics; in sthn Afr.: genera 5, species 41.

Exell & Roessler: 1 (1966); Exell: 100 (1978); Carr: 13 (1988); Rodman: 45 (1990).

Key to genera

1a Inland trees, shrubs or lianes:
  2a Petals present:
    3a Calyx produced into a short, campanulate or cup-shaped limb above ovary:
      4a Flowers bisexual; fruit 4- or 5-winged or -angled ..... **Combretum**
      4b Flowers male and bisexual; fruit 2(3 or 4)-winged..... **Pteleopsis**
    3b Calyx produced into a long tube above ovary ..... **Quisqualis**
  2b Petals absent; calyx produced into a short, constricted tube above ovary; fruit 2–5-winged..... **Terminalia**
1b Coastal mangrove associate, with leathery leaves; fruit woody, compressed, obtusely angled, crowned with persistent calyx ..... **Lumnitzera**

Combretum Loefl. 5538000

Loefling: 308 (1758) name conserved; Sonder: 508 (1862); Exell: 101 (1978); Van Wyk: 125 (1984); Carr & Rogers: 173 (1987); Carr: 13 (1988); Carr & Retief: 38 (1989); Rodman: 45 (1990); Hennessy & Rodman: 149 (1995).

Poivrea Thouars: 28 (1811); Sonder: 512 (1862).

Trees, shrubs, shrublets or woody climbers, very rarely subherbaceous; lepidote or with microscopic and sometimes macroscopic stalked glands. **Leaves** opposite, or sometimes in whorls of 3 or 4, or rarely alternate, usually petiolate (rarely subsessile), almost always entire; petiole sometimes persisting (especially in climbers) forming a ± hooked spine. **Flowers** bisexual, regular, or slightly irregular, 4- or 5-merous, in elongated or subcapitate axillary or extra-axillary spikes or racemes or in terminal or terminal and axillary, often leafy panicles. **Receptacle** usually clearly divided into a lower part and an upper part which varies from patelliform to infundibuliform and is itself sometimes visibly differentiated into a lower part containing the disc (when present) and an often more expanded upper part. **Sepals**: lobes 4 or 5 (rarely more), deltate to ± subulate or filiform, sometimes scarcely developed. **Petals** usually 4 or 5 (rarely absent, in aberrant specimens and up to 7 in occasional flowers), small and inconspicuous to showy and exceeding the sepals, of various colours. **Stamens** twice as many as petals, inserted in 1 or more, usually 2, series inside upper receptacle and usually exserted. **Disc** glabrous or hairy, with or without a free margin, sometimes inconspicuous or absent. **Style** free (in sthn Afr. species); stigma sometimes ± expanded. **Ovary** completely inferior. **Fruit** 4- or 5-winged, ridged or angled, sessile or stipitate, indehiscent or rarely tardily dehiscent; pericarp usually thin and papery, sometimes leathery, more rarely fleshy. **Seeds**: cotyledons various. $x = 13$ (11, 12, 14) (high polyploidy).

Species 250, fairly cosmopolitan in warm climates, excluding Australia and Pacific Islands; ± 30 in sthn Afr., widespread in all countries and provinces, except in Free State (rare), Lesotho and Western Cape.

Lumnitzera Willd. 5550000

Willdenow: 186 (1803); Exell: 181 (1978); Carr: 159 (1988).

Mangroves: small evergreen trees or shrubs. **Leaves** alternate, sessile or subsessile, somewhat fleshy and coriaceous. **Flowers** bisexual, regular, 5-merous, in short terminal spikes or racemes, red, white, pink or yellow. **Receptacle** not externally differentiated into an upper and lower part but produced beyond inferior ovary to form a tube bearing 2 adnate persistent bracteoles and terminating in a 5-lobed persistent calyx. **Petals** 5, caducous. **Stamens** 5–10, 2-seriate. **Disc** inconspicuous. **Style** filiform, persistent, not adnate to wall of receptacle, not expanded at apex. **Ovary** with 2–5 ovules. **Fruit** indehiscent, ± woody, compressed-ellipsoid and obtusely angled, crowned by persistent calyx. **Seeds**: cotyledons unknown.

Species 2, 1 in tropical Asia, Northern Australia and Polynesia, the other in eastern and sthn Afr., Madagascar and Polynesia: *Lumnitzera racemosa* Willd. in KwaZulu-Natal, associate in mangrove swamps.

Pteleopsis Engl. 5539000

Engler: 25 (1894); Engler: 293 (1895); Exell: 162 (1978); Carr: 28 (1988).

Small or medium-sized trees or occasionally shrubs, without scales or stalked glands. **Leaves** opposite or subopposite, petiolate, entire, almost glabrous or hairy. **Flowers** andromonoecious, bisexual and male in same inflorescence, 4- or 5-merous, pedicellate, in terminal and/or axillary or extra-axillary subcapitate racemes. **Receptacle**: upper part campanulate, joined to lower receptacle by a slender stalk-like region; lower part somewhat flattened. **Bisexual flowers**: sepals deltate, little developed; petals 4 or 5, usually ± obovate; stamens 8–10, often 2-seriate; disc pilose with a short free margin; style not expanded at apex. **Male flowers** usually towards base of the inflorescence, as in bisexual ones but with ovary not developing and with a slender stalk replacing the lower receptacle (perhaps a true pedicel only towards base); style present or vestigial. **Fruit** 2–5-winged, often decurrent into comparatively long slender stipe. **Seeds**: cotyledons (where known) unfolding spirally and borne above soil level.

Species 9–11, all in tropical Africa; 1 in sthn Afr.: *Pteleopsis myrtifolia* (M.A.Lawson) Engl. & Diels, Botswana, Northern Province, Mpumalanga, Swaziland, and KwaZulu-Natal.

Quisqualis L. 5541000

Linnaeus: 556 (1762); Sonder: 512 (1862); Carr: 177 (1988).

Shrubs, scandent. **Leaves** opposite or subopposite, simple, oblong or obovate, acuminate, entire. **Flowers** showy, usually in a short, axillary or terminal spike or sometimes a raceme. **Receptacle**: tube ovoid below and elongated, cylindric above ovary. **Sepals**: lobes 5, short. **Petals** 5, longer than calyx lobes, oblong or suborbicular. **Stamens** 10, arising from within throat of calyx tube. **Ovary** with 3 or 4 ovules; style partly adnate to calyx tube; stigma subdilated. **Fruit** dry, leathery, oblong, acutely 5-angled, 5-winged and 5-furrowed, 1-seeded. **Seed** 5-angled and 5-furrowed. $x = 13$ (11, 12) (polyploidy).

Species 17, Africa, India, and Philippine islands; 1 in sthn Afr.: *Quisqualis parviflora* Gerrard ex Sond., Mpumalanga, KwaZulu-Natal and Eastern Cape.

Terminalia L. 5544000

Linnaeus: 674 ('638') (1767a); Linnaeus: 21 (1767b) name conserved; Exell: 168 (1978); Carr: 182 (1988).

Trees, usually small in our area but sometimes very tall elsewhere, or rarely shrubs, without scales or microscopic stalked glands. **Leaves** usually alternate, often crowded at ends of branches, sometimes on short shoots, rarely opposite, petiolate or subsessile, usually entire but occasionally subcrenate, often with 2 or more glands at or near base of lamina or on petiole. **Flowers** usually bisexual and male in the same inflorescence (rarely all bisexual), usually in axillary spikes with male flowers towards apex and bisexual ones towards base, rarely in terminal panicles; male flowers stalked, stalks resembling pedicels but corresponding to lower receptacle with abortion of ovary; bisexual flowers sessile. **Receptacle** divided into a lower and an upper part, often scarcely developed, expanding into a shallow cup terminating in sepals (or calyx lobes). **Petals** 0. **Stamens** usually 10, exserted. **Disc** intrastaminal. **Style** free, not expanded at apex. **Ovary** completely inferior. **Fruit** a pseudocarp, very variable in size and shape but usually 2-winged, usually with an, at least partially, sclerenchymatous endocarp. **Seeds**: cotyledons (where known) spirally convolute. $x = 12$ (7, 13) (high polyploidy, B-chromosomes).

Species 250, fairly cosmopolitan, throughout tropics and extending to subtropics; 7 in sthn Afr., widespread except in Free State, Lesotho, Western and Eastern Cape.

Connaraceae

(Rosidae—Rosales)

Compiled by M. Jordaan

Lianas climbing by means of the winding ends of young branches, less often shrubs or small trees. **Leaves** alternate, imparipinnate; leaflets entire, persistent or deciduous, petiolate; petiole pulvinate at base; stipules 0. **Inflorescences** axillary or terminal racemes, panicles, or rarely in fascicles. **Flowers** bisexual, or rarely unisexual, regular; androecium and gynoecium dimorphic. **Sepals** 5, imbricate or valvate, free or connate at base, caducous or often persistent and sometimes ± accrescent in fruit to strongly so. **Petals** 5, free or sometimes slightly connate at middle, imbricate, rarely valvate. **Stamens** 10, in 2 whorls, free or connate at base, the 5 outer episepalous longer than the 5 inner epi-

petalous ones, which are often imperfect, hypogynous; filaments free or united basally into a short tube; anthers dorsifixed, 2-thecous, dehiscing lengthwise, introrse. **Gynoecium** superior, of (1–3)–5, free, hirsute, 1-locular carpels; ovules 2, collateral, nearly basal to nearly apical, anatropous to hemitropous. **Fruit** of 1–5 follicles, sometimes connate at base, usually dehiscing by a ventral suture. **Seed** 1(2) per follicle, with or without endosperm, hilum lateral to basal; testa partly to entirely fleshy, sarcotesta (aril) sometimes partly free.

Genera ± 12, species 110–200, cosmopolitan in tropics and subtropics; sthn Afr.: genera 2, species 2.

Brown: 431 (1818); Gilg: 61 (1894); Schellenberg: 311 (1915); Mendes: 615 (1966); Breteler: 1 (1989).

Key to genera

Apex of leaflets tapering, base asymmetric; flowers in terminal or axillary racemes, often clustered in old leaf bases; follicles velvety, ± rostrate ..... **Cnestis**

Apex of leaflets rounded, base symmetric; flowers in few-flowered, axillary racemes, usually produced before the leaves; follicles glabrous or glabrescent, mostly acute to rounded apically ..... **Rourea**

Cnestis Juss. 3428000

Jussieu: 374 (1789); Candolle: 86 (1825); Endlicher: 1140 (1840); Sonder: 527 (1860); Hooker: 433 (1862); Gilg: 67 (1894); Burtt Davy: 511 (1932); Mendes: 615 (1966); Lemmens: 174 (1989).

Lianas, shrubs or rarely small trees; branches cylindrical. **Leaves**: leaflets many-jugate, opposite or not, often asymmetric and often also acuminate. **Inflorescences** racemose, or occasionally in panicles, fascicles, or flowers solitary on main stem, axillary, usually more than 1 together in axil of single leaf, sometimes pseudoterminal. **Flowers** bisexual or unisexual with some bisexual, small, tomentose, heterostylous, often heterodistylous; pedicels with a distinct joint. **Sepals** ± free, imbricate in bud. **Petals** shorter, as long as or somewhat longer than sepals, free, white, yellowish or red-tinged, imbricate in bud, glabrous or with some hairs outside near base. **Stamens**: filaments free or shortly connate at base, glabrous; anthers usually recurved with age. **Gynoecium** of 5, free, sessile carpels; ovules 2 per locule; styles often pilose at base, short; stigmas capitate. **Follicles** 1–5 per flower, reniform or cylindrical, curved or undulated, beaked or not, opening lengthways along ventral suture, densely tomentose and sometimes also with long rigid hairs outside, velutinous and sometimes with rigid, easily detached, stinging hairs inside. **Seed** solitary, attached to base of follicle, ovoid, with yellow to red sarcotesta at base, surrounding the hilum; testa usually black and shiny; endosperm present, abundant. $x = 14$ (1 report).

Species ± 13, largely restricted to tropical Africa and Madagascar, but 1 species in tropical Asia; 1 in sthn Afr.: *Cnestis polyphylla* Lam., in Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and northern Eastern Cape.

Rourea Aubl. 3424000

Aublet: 467 (1775) name conserved; Jussieu: 369 (1789); Baillon: 228 (1867); Jongkind: 310 (1989).

Byrsocarpus Thonn. ex Schumach.: 246 (1827); Hooker: 431 (1862); Gilg: 66 (1894); Hemsley: 15 (1956); Mendes: 622 (1966).

Lianas, shrubs, or small trees; branches cylindric or clearly lobed, often ending in a tendrilloid tip; lenticels usually present. **Leaves**: leaflets many-jugate, opposite or subopposite, usually ± symmetric. **Inflorescences** axillary, paniculate or racemose, frequently more than 1 per axil of sometimes rudimentary leaf, sometimes 1– more together at end of leafy branch and resembling a terminal inflorescence; pedicel always with a distinct joint. **Flowers** bisexual, heterodistylous, sweet-scented, usually produced before leaves. **Sepals** free or almost completely connate, imbricate in bud, ciliate, persistent and usually accrescent soon after pollination. **Petals** as long as to much longer than sepals, free or connivent near base, often lorate and inrolled or folded, white often with a trace of yellow or red, glabrous or with a few apical hairs. **Stamens**: filaments connate into a short tube below, glabrous. **Gynoecium** of 5, free, glabrous to glabrescent carpels; ovules 2, basal; styles terete; stigmas ± capitate. **Follicles** 1–5 per flower, ovate to elliptic with rounded to acute apex or beaked, glabrous or velutinous, and/or with orange to red or rarely white glandular hairs outside, glabrous inside, with persistent calyx, dehiscing by a ventral suture or circumscissile at base. **Seed** solitary, rarely 2 per follicle, usually extruded, subovoid to ellipsoid, enclosed or partially so in a brightly coloured sarcotesta (aril) fused with the partly to almost totally fleshy testa; hilum basal; endosperm 0 in mature seed. $x = 14$ (1 report).

Species 40–70, circumtropical, occurring in forests and savannas; 1 in sthn Afr.: *Rourea orientalis* Baill., Caprivi and Botswana.

Jongkind (1989) divided the genus into 5 sections, the sthn Afr. species belongs to section *Byrsocarpus* (Thonn. ex Schumach.) Jongkind.

Convolvulaceae

(Asteridae—Solanales)

Compiled by W.G. Welman

Herbs or shrubs, frequently twining, rarely leafless parasites (*Cuscuta*). **Leaves** alternate, simple, sometimes palmately or pinnately lobed (scale-like in *Cuscuta*); stipules usually 0. **Flowers** regular, bisexual, often showy, in pedunculate, bracteate, axillary cymes or sometimes solitary. **Calyx** (4)5(6)-partite, persistent, imbricate. **Corolla** united, usually only slightly 5-lobed, campanulate or funnel-shaped, rarely cylindric. **Disc** (nectary) often present and surrounding base of ovary. **Stamens** 5, alternating with corolla lobes, arising from base of corolla tube; filaments with anthers 2-thecous and dehiscing longitudinally. **Ovary** superior, 1–4-locular, entire or sometimes deeply lobed, with 1–4 basal ovules in each locule; styles 1 or 2, terminal on ovary or gynobasic, sometimes with the 2 styles connate at base; stigmas terete, capitate, dilated, or linear. **Fruit** capsular or indehiscent. **Seeds** as many as ovules or fewer, glabrous, villous, woolly, or verrucose; embryo straight; cotyledons foliaceous, sometimes small or 0 (*Cuscuta*); endosperm scanty to fairly copious.

Genera ± 55, species ± 1700, cosmopolitan, especially warm regions, mostly natives of tropical Asia and America, extending to Australia, Africa and Madagascar; sthn Afr.: 16 genera, 115 species.

Meeuse: 641 (1957); Verdcourt: 1 (1963); Gonçalves: 1 (1987); Meeuse & Welman: 1 (2000).

Key to genera

1a Leaves minute, scale-like or absent; yellowish twining parasites; flowers small, usually in clusters, often many ..... **Cuscuta**
1b Leaves well developed, green:
2a Ovary 2- or 4-lobed or -cleft; styles 2, inserted between lobes of ovary; prostrate herbs:
3a Ovary 2-cleft, with 2 ovules in each locule ..... **Dichondra**
3b Ovary 4-cleft, with 1 ovule in each locule ..... **Falkia**
2b Ovary not deeply lobed; style simple or if 2, then terminal; plants of various habit:
4a Styles 2, free or ± united at base:
5a Styles forked; stigmas 4, linear or subclavate ..... **Evolvulus**
5b Styles simple; stigmas 2, peltate or capitate:
6a Leaves greyish velvety pubescent above, densely coated with golden brown hairs beneath ..... **Bonamia**
6b Leaves glabrous to densely hirsute on both surfaces, but never as above ..... **Seddera**
4b Style 1, stigmas globose to linear:
7a Pollen smooth or with folds or ridges, but not spinulose:
8a Stigmas filiform, terete or subclavate:
9a Bracteoles small or narrow, usually ± remote from calyx ..... **Convolvulus**
9b Bracteoles large, ± enclosing calyx as an involucre ..... **Calystegia**
8b Stigmas globose, ovate, oblong or elliptic:
10a Ovary 1-locular; stigmas ovate; sepals unequal; corolla white or cream with purple centre. ..... **Hewittia**
10b Ovary 2(4)-locular:
11a Flowers in pedunculate, subglobose heads, usually blue; leaves entire or slightly lobed, cordate ..... **Jacquemontia**
11b Flowers in cymes, dichasia, or solitary, white or yellow, often with dark centre; leaves usually lobed or dissected, sometimes auricled at base, rarely entire:
12a Anthers at anthesis helically twisted; pollen tricolpate; leaves entire or deeply palmately or pinnately lobed or compound ..... **Merremia**
12b Anthers at anthesis straight; pollen pantoporate; leaves oblong to linear-lanceolate, much longer than broad with hastate, sagittate or truncate base ..... **Xenostegia**
7b Pollen spinulose:
13a Plants covered in all parts, except corollas, with stellate hairs; stigmas oblong ..... **Astripomoea**
13b Plants glabrous to densely hairy, but never with stellate hairs; stigmas biglobose or 3-lobed:
14a Fruit completely enclosed by the much enlarged calyx; pericarp thin, opening irregularly; seeds 4; leaves with dense black glandular dots on lower surface ..... **Stictocardia**
14b Fruit dehiscent or indehiscent, not as above; leaves without black glandular dots below:
15a Stamens arising directly from corolla tube; style not completely caducous in fruit ..... **Ipomoea**
15b Stamens arising from scales situated near base of corolla tube; style completely caducous in fruit ..... **Paralepistemon**

Astripomoea A.Meeuse 7000000

Meeuse: 709 (1957); Meeuse & Welman: 66 (2000).

Astrochlaena Hallier f.: 120 (1893a).

Annual or perennial herbs or undershrubs, not twining, sparsely branched, stellately pubescent. **Leaves** petiolate, usually ovate and entire. **Flowers** in cymes, sometimes paniculate, rarely solitary. **Calyx** of unequal sepals, often 2 innermost smaller. **Corolla** funnel-shaped; limb almost entire. **Stamens** included, inserted near base of corolla tube, usually 2 larger than others; filaments linear; anthers oblong, lobed at base or sagittate and sometimes with swollen hairs; pollen spherical, spinulose. **Disc** annular. **Ovary** subglobose, 2-locular, with 2 ovules in each locule; style simple, included; stigmas 2,

thick, oblong, obliquely truncate. **Fruit** a capsule. **Seeds** with short or cobwebby hairs. $x = 15$ (1 report).

Species ± 12, Africa; 3 in sthn Afr., Namibia, Botswana, Swaziland, KwaZulu-Natal.

Bonamia Thouars 6979000

Du Petit-Thouars: 8 (1804) name conserved; Myint & Ward: 121 (1968); Meeuse & Welman: 29 (2000).

Breweria R.Br. in part: 487 (1810).

Herbaceous or woody twiners, rarely erect undershrubs. **Leaves** entire. **Flowers** axillary, solitary or cymose, sometimes in leafy panicles; bracteoles small. **Calyx** 5-parted; sepals usually equal or subequal. **Corolla** funnel-shaped, 5-lobed, with midpetaline bands hairy outside. **Stamens** included or slightly exserted; filaments glabrous or glandular at base; anthers oblong, cordate, or sagittate at base; pollen smooth. **Ovary** 2-locular, with 2 ovules in each locule; style bifid or 2 free styles, often unequal in length; stigmas 2, globose or peltate, rarely 2-partite. **Capsule** 2–4(8)-valved, 2-locular. **Seeds** 4 or fewer, glabrous or pilose. $x = 15$ (14).

Species ± 40, cosmopolitan in tropics; 1 in sthn Afr.: *Bonamia velutina* Verdc., Botswana, Northern Province, KwaZulu-Natal.

Calystegia R.Br. 6994000

Brown: 483 (1810) name conserved; Meeuse: 696 (1957); Meeuse & Welman: 49 (2000).

Volvulus Medik.: 42 (1791). *Convolvulus* L. in part, Salter: 685 (1950).

Characters generally as in **Convolvulus**, but bracteoles large and clasping calyx. **Corolla** medium-sized to large, white or pink. **Pollen** smooth. **Ovary** 1-locular or imperfectly 2-locular, 4-ovuled; stigmas 2, oblong or elliptic, compressed. **Seeds** black, smooth or verrucose. $x = 11$ (12).

Species ± 25, in temperate and tropical regions of both hemispheres; 2 in sthn Afr., rare and local on the Western Cape coast, 1 introduced.

Convolvulus L. 6993000

Linnaeus: 153 (1753); Meeuse: 666 (1957); Meeuse & Welman: 35 (2000).

Herbs, spreading, erect or twining, sometimes with woody rootstock. **Leaves** sessile or petiolate, often cordate or hastate, entire to variously incised. **Flowers** pedunculate, axillary, solitary or in few-flowered cymes, with a pair of short bracts on upper portion of peduncle. **Calyx** of 5 sepals, usually subequal. **Corolla** ± funnel-shaped to campanulate; limb plicate, 5-angled to obscurely 5-lobed. **Stamens** 5, arising near base of corolla, included; filaments linear, often dilated at base; anthers oblong, sagittate or cordate at base; pollen smooth. **Disc** annular. **Ovary** 2-locular, with 2 ovules in each locule; style included; stigmas 2, linear-terete, subclavate, slightly dilated or filiform. **Fruit** a globose capsule, dehiscing irregularly, or into 4 valves. **Seeds** rounded on back, flat on two lateral faces, or irregularly angled, glabrous, sometimes shortly tuberculate or with transverse ridges. $x = 15$ (11, 12) (aneuploids, polyploidy).

Species ± 250, cosmopolitan, mainly temperate and subtropical regions; 14 in sthn Afr., widespread in both summer- and winter-rainfall areas, 1 introduced.

Cuscuta L. 6968000

Linnaeus: 124 (1753); Yuncker: 113 (1932); Meeuse: 644 (1957); Meeuse & Welman: 3 (2000).

Parasitic, usually glabrous, slender, twining, yellowish annuals. **Leaves** rudimentary. **Flowers** clustered, whitish or rose-coloured. **Calyx** with shortly campanulate tube, (4)5-lobed or -segmented. **Corolla** with campanulate, urceolate, ovoid, or globose tube, with membranous, fimbriated or toothed scales within, alternating with lobes; lobes (4)5, as long as or shorter than tube. **Stamens** arising in corolla throat; filaments subterete, rarely absent; anthers elliptic; pollen smooth. **Ovary** subglobose, completely or partly 2-locular, with 2 ovules in each locule; styles 2, free or connate at base; stigmas clavate, cylindric or capitate. **Fruit** a globose or ovoid, dry or fleshy capsule, circumscissile or irregularly dehiscent. **Seeds** somewhat convex on one side and flattish on other. $x = 7$ (15, 8) (aneuploids, polyploidy).

Species ± 140, cosmopolitan in warmer regions; 15 in sthn Afr., widespread in all regions except arid areas, including 3 introductions.

***Dichondra** J.R.Forst. & G.Forst. 6971000

Forster & Forster: 20 (1776); Meeuse: 657 (1957); Meeuse & Welman: 16 (2000).

Small, prostrate, glabrous or silky-pubescent herbs. **Leaves** cordate-orbicular or reniform, petiolate, entire. **Flowers** small, solitary, axillary. **Calyx** 5-segmented. **Corolla** with broadly campanulate tube; lobes 5, induplicate. **Stamens** shorter than corolla; anthers oblong to subglobose; pollen smooth. **Ovary** deeply 2-lobed, 2-locular, with 2 ovules in each locule, hairy; styles 2, free or connate below, attached between lobes of ovary; stigmas capitate. **Fruit** of 2 membranous capsules, indehiscent or irregularly 2-valved. **Seeds** 1(2) in each locule, subglobose or obovoid. $x = 15$ (12—1 report).

Species 4 or 5, principally American, with 1 species introduced in the tropical and subtropical regions of both hemispheres: **Dichondra micrantha* Urb., Northern Province, North-West, Gauteng, KwaZulu-Natal, Western and Eastern Cape.

Evolvulus L. 6973000

Linnaeus: 391 (1762); Verdcourt: 16 (1963); Meeuse & Welman: 22 (2000).

Volvulopsis Roberty: 28 (1952).

Spreading annual or perennial herbs, rarely suffrutices. **Leaves** usually small, often sessile, entire. **Flowers** solitary and sessile, or 1–3 on axillary peduncles, or sometimes in terminal spikes, racemes or panicles. **Calyx** 5-lobed. **Corolla** funnel-shaped, campanulate, or subrotate; limb plicate, shortly 5-lobed. **Stamens** arising usually above middle of corolla tube; filaments and anthers linear. **Ovary** (1)2-locular, with 2 ovules in each locule; styles 2, free, each bifid or bilobed; stigmas linear-terete or subclavate. **Fruit** a subglobose capsule dehiscing into 2–4 valves. **Seeds** 4 or fewer by abortion, globose. $x = 13$ (12).

Species ± 100, mainly tropical America; 2 in sthn Afr., all regions except Free State, Lesotho, Western and Eastern Cape; 1 introduced.

Falkia Thunb. 6972000

Thunberg: 17 (1781), name and spelling conserved; Meeuse: 658 (1957); Meeuse & Welman: 19 (2000).

Slender, prostrate, matted, perennial herbs. **Leaves** ovate or cordate, entire, petiolate. **Flowers** small, solitary, axillary. **Calyx** deeply 5(6)-lobed or -segmented. **Corolla** with funnel-shaped or campanulate tube; limb plicate, shortly and broadly 5-lobed. **Stamens** arising on corolla tube, included; filaments linear; anthers oblong; pollen smooth. **Ovary** deeply 4(5)-lobed, with 1 ovule in each locule, hairy; styles 2(3), gynobasic, nearly as long as corolla tube, linear; stigmas subglobose. **Fruit** split into

4(5) membranous utricles, sometimes fewer by abortion. **Seeds** obovoid or subglobose.

Species 2 or 3, Africa; 2 in sthn Afr., all regions except Swaziland and Lesotho.

Hewittia Wight & Arn. 6995000

Wight & Arnott: 22 (1837); Meeuse: 698 (1957); Meeuse & Welman: 52 (2000).

Shutereia Choisy: 485 (1833). *Eremosperma* Chiov.: 143 (1936).

Twining herb, pubescent. **Leaves** petiolate, broadly cordate, entire, angled, or 3-lobed. **Flowers** axillary, long-peduncled, 1–3 together; bracteoles at some distance from calyx. **Calyx** of 5 sepals with 2 outer larger than others. **Corolla** funnel-shaped or campanulate; limb plicate, 5-angled or obscurely 5-lobed. **Stamens** arising at base of corolla tube; included; filaments linear, dilated and with few hairs at base; anthers oblong-linear, lobed at base. **Disc** shortly cup-shaped. **Ovary** imperfectly 1-locular, with 4 ovules, densely pilose; style simple, included; stigmas 2, ovate-oblong, thick. **Fruit** a capsule, dehiscing into 4 valves. **Seeds** black, glabrous, opaque. $x = 15$.

Species 1, tropics and subtropics of Old World: *Hewittia malabarica* (L.) Suresh, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Eastern Cape.

Ipomoea L. 7003000

Linnaeus: 159 (1753); Meeuse: 711 (1957); Verdcourt: 81 (1963); Meeuse & Welman: 70 (2000).

Pharbitis Choisy: 438 (1833). *Calonyction* Choisy: 441 (1833). *Rivea* Choisy: 325 (1845). *Turbina* in sense of A.Meeuse: 773 (1957).

Erect or twining, annual or perennial herbs, or undershrubs, sometimes tuberous, rarely aquatic. **Leaves** entire, lobed or divided. **Flowers** usually showy, solitary or in cymose clusters. **Calyx** of 5 variable sepals. **Corolla** broadly funnel-shaped or campanulate; limb 5-plicate and shortly 5-lobed. **Stamens** arising towards base of corolla tube, included; filaments sometimes dilated and often pilose at base; pollen spinulose. **Disc** entire or undulate. **Ovary** usually 2-locular, with 2 ovules in each locule, or 4-locular with 1 ovule in each locule, rarely 3-locular with 2 ovules in each locule; style simple; stigma subglobose or 2- or 3-globular. **Fruit** a globose, rarely ovoid capsule, membranous, leathery or rarely somewhat fleshy, dehiscing into (2)4 valves, rarely opening by an operculum or dehiscing irregularly, also indehiscent (*Turbina* in sense of A.Meeuse). **Seeds** 4(6) or fewer by abortion, glabrous to silky-villous. $x = 15$ (14) (aneuploids, B-chromosomes—1 report, polyploidy).

Species ± 500, cosmopolitan in tropical and subtropical areas; 56 in sthn Afr., widespread in all regions, but rare in Northern and Western Cape.

Jacquemontia Choisy 6991000

Choisy: 476 (1833); Meeuse: 699 (1957); Meeuse & Welman: 32 (2000).

Thyella Raf.: 84 (1836).

Twining herbs, sometimes annual. **Leaves** ovate, sometimes cordate, petiolate, usually entire. **Flowers** in axillary, pedunculate cymes or heads; bracteoles various. **Calyx** of 5 leafy sepals; sepals equal or outer longer than inner. **Corolla** united, campanulate or funnel-shaped, limb plicate, shallowly 5-lobed. **Stamens** arising near base of corolla tube, included; filaments linear; anthers oblong. **Ovary** 2-locular, with 2 ovules in each locule; style simple, included. **Stigmas** 2, ovate or oblong. **Fruit** a globose capsule, dehiscing into 4(8) valves. **Seeds** rounded on back with 2 flat lateral faces and ± 3-angled in cross section, glabrous. $x = 9$ (10).

Species ± 120, mainly America, a few in tropical Africa, Asia and Australia; 1 in sthn Afr.: *Jacquemontia tamnifolia* (L.) Griseb., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal.

Merremia Dennst. ex Endl. 6997000

Endlicher: 1403 (1841); Hallier: 581 (1893b); Meeuse: 700 (1957); Meeuse & Welman: 55 (2000).

Perennial herbs, prostrate or sometimes twining. **Leaves** sessile or petiolate, entire or palmately or pinnately lobed. **Flowers** axillary, solitary or in variously branched or cymose inflorescences. **Calyx** of 5 equal sepals, sometimes accrescent. **Corolla** funnel-shaped or campanulate; usually obscurely 5-lobed. **Stamens** arising nearly at base of corolla tube, included; filaments linear, often unequal, slightly broadening below; anthers oblong, lobed at base, or sometimes contorted. **Disc** saucer-shaped. **Ovary** 2(4)-locular, with 2(1) ovules in each locule; style included; stigma biglobose or somewhat 2-lobed. **Fruit** a membranous, 4-valved capsule. **Seeds** somewhat flattened, elliptic or subquadrate in outline, sometimes somewhat tubercled. $x = 15$ (14) (aneuploids).

Species ± 80, cosmopolitan in warm regions; 9 in sthn Afr., widespread in all regions but absent from Western Cape.

Paralepistemon Lejoly & Lisowski 7003020

Lejoly & Lisowski: 196 (1986); Gonçalves: 127 (1987); Meeuse & Welman: 121 (2000).

Ipomoea L. in small part: 159 (1753). *Turbina* Raf. in small part: 81 (1836).

This genus differs from *Ipomoea* as follows: **Stamens** arising on triangular, large (2 mm long) glandular-pilose scales situated near base of corolla tube. **Ovary** with a very short beak persistent in fruit. **Style** articulated at base, caducous. **Fruit** indehiscent, ± woody.

Species 1: *Paralepistemon shirensis* (Oliv.) Lejoly & Lisowski, central and southern tropical and subtropical Africa, reaching Northern Province.

Seddera Hochst. 6978000

Hochstetter: 7, t. 5 (1844); Meeuse: 662 (1957); Meeuse & Welman: 25 (2000).

Breweria R.Br.: 487 (1810) in part.

Shrublets or suffrutices, prostrate to suberect. **Leaves** sessile or subsessile, entire. **Flowers** sometimes solitary or in axillary cymes or terminal, thyrsoid panicles; bracteoles usually small. **Calyx** with 5 subequal or unequal segments. **Corolla** funnel-shaped or rotate, sometimes plicate, shortly 5-lobed. **Stamens** (4)5, arising on corolla tube; filaments usually dilated at base and toothed on each side; anthers oblong. **Disc** small or rudimentary. **Ovary** 2-locular, with 2 ovules in each locule; styles 2(3), almost as long as corolla, somewhat connate or free; stigmas capitate, peltate, bifid, or bilobed. **Fruit** a capsule, dehiscing into 4 valves. **Seeds** irregularly concave-convex.

Species ± 20, mainly Africa, also Madagascar, Arabian Peninsula and India; 3 in sthn Afr., present in all regions except Western Cape.

Stictocardia Hallier f. 7010000

Hallier: 159 (1893a); Verdcourt: 68 (1963); Meeuse & Welman: 124 (2000).

Herbaceous or woody, perennial twiners. **Leaves** entire, ovate to orbicular, cordate, usually large, minutely

gland-dotted on lower surface. **Flowers** axillary, pedunculate, solitary or in few- to many-flowered cymes; bracts small, deciduous. **Calyx** 5-parted; sepals elliptic to orbicular, accrescent in fruit. **Corolla** large, funnel-shaped with shallowly lobed limb. **Stamens** arising near base of corolla tube; pollen globose, spinulose. **Disc** annular, entire or somewhat 5-lobed. **Ovary** 4-locular, with 1 ovule in each locule; style filiform; stigma bi-globular. **Fruit** enclosed in accrescent calyx, globose, winged, woody; walls between wings thin, rupturing irregularly and fruit becoming lantern-shaped. **Seeds** dark brown or black, pubescent.

Species ± 12, throughout the Old and New World tropics; 1 in sthn Afr.: *Stictocardia laxiflora* (Baker) Hallier f., KwaZulu-Natal.

Xenostegia D.F.Austin & Staples 6997010

Austin & Staples: 533 (1980); Meeuse & Welman: 63 (2000).

Merrenia Dennst. ex Hallier f. in part: 581 (1893b).

Prostrate or climbing herbs. **Leaves** shortly petiolate, mostly glabrous, linear to lanceolate-elliptic or spathulate; truncate or hastate-sagittate at base; basal lobes of blade dentate or entire; apex acute or obtuse to truncate or emarginate, mucronate or tridentate. **Inflorescence** cymose, 1–3-flowered. **Calyx** subequal or 2 outer sepals larger, oblong to oblong-ovate, acute to subobtuse, occasionally sagittate at base; inner sepals usually lanceolate or lanceolate-acuminate. **Corolla** broadly funnel-shaped to campanulate; pale yellow to sometimes white, often with purple to brown centre. **Anthers** straight at anthesis; pollen grains pantoporate, smooth. **Fruit** ovoid, 4-valved, glabrous or pubescent towards apex. **Seeds** 1–4, ovoid-trigonous, brown or black, obtuse at apex.

Species 2, Old World tropics; 1 species with 1 subspecies: *Xenostegia tridentata* (L.) D.F.Austin & G.W.Staples subsp. *angustifolia* (Jacq.) A.Meeuse, widespread in sthn Afr. but absent from Lesotho, Western and Eastern Cape.

Cornaceae

(Asteridae—Cornales)

Compiled by R.H. Archer

Small trees or shrubs; young growth densely greyish- or brownish-tomentose. **Leaves** opposite, leathery, simple, coarsely toothed, prominently veined on lower surface, shiny dark green above; stipules 0. **Flowers** bisexual, regular, arranged in panicles. **Calyx**: lobes 4, triangular-ovate, persistent; tube ± 4-angled, twice as long as lobes. **Petals** 4, free, valvate. **Stamens** 4, alternating with petals and ± as long; anthers 2-thecous, dehiscing laterally. **Disc** tumid, 4-angled, pubescent. **Ovary** inferior, 4-locular; 1 anatropous, pendulous, unitegmic ovule in each locule; placentation usually axile; style 1, shorter than stamens; stigma 4-lobed. **Fruit** a small, ± globose drupe crowned by calyx lobes, reticulately veined. **Seeds** 1 per locule; endosperm copious; embryo small. $x = 13$ (1 report).

Genera ± 10, species ± 90; widely distributed in tropical and temperate regions; sthn Afr.: genus 1, species 1.

Cannon: 635 (1978).

Curtisia Aiton 6156000

Aiton: 162 (1789); Cannon: 635 (1978).

Description as for family.

Monotypic, confined to southern parts of Africa: *Curtisia dentata* (Burm.f.) C.A.Sm., Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Crassulaceae

(Rosidae—Rosales)

Compiled by L.L. Dreyer & A.M. Makwarela

Herbs, undershrubs or shrubs, sometimes treelets, rarely aquatics, usually succulent. **Leaves** opposite, in whorls or spirally arranged, simple, usually entire or crenate, rarely lobed, often in basal rosettes, often with hydathodes (water-excreting pores); stipules 0. **Flowers** bisexual, regular (except in *Tylecodon grandiflorus*), usually in terminal thyrses, sometimes solitary. **Calyx**: sepals 4 or 5(–12), free or ± united, persistent. **Corolla**: petals 4 or 5(–12), free or ± united, as many as sepals, persistent. **Stamens** 8 or 10(–12), usually twice as many as sepals, at one or two levels; filaments arising from base of petals or on corolla tube; anthers 2-thecous, introrse to lateral, with longitudinal slits. **Squamae** (nectary scales/glands) 1 at base of each carpel. **Carpels** as many as calyx lobes, usually free or almost so, each gradually tapering into a style; ovules few to many on the adaxial suture; stigma simple, usually terminal. **Fruit** usually a head of free follicles often enclosed by dry petals. **Seeds** small; endosperm present.

Genera ± 33, species over 1500, cosmopolitan (excluding Australia and western Pacific), with centres in sthn Afr. and Central America; sthn Afr.: genera 6 (1 exotic), species 234 (1 exotic).

Harvey: 327 (1862); Keay: 114 (1954); Friedrich: 1 (1968); Tölken: 1 (1985).

Key to genera

1a Leaves spirally arranged, often in dense clusters; flowers in a thyrse with monochasia, often single-flowered or spike-like:
  2a Leaves soft, herbaceous, seasonal; inflorescence a single-flowered to branched thyrse ..... **Tylecodon**
  2b Leaves usually tough, perennial; inflorescence a spike-like thyrse, rarely branched ..... **Adromischus**
1b Leaves opposite or in whorls, at least on vegetative branches; inflorescence a thyrse with dichasia ending in monochasia, rarely with a single, terminal or axillary flower (*Cotyledon woodii*):
  3a Leaves opposite, ± fused to one another; stamens as many as calyx lobes ..... **Crassula**
  3b Leaves opposite or spirally arranged, ± free; stamens twice as many as calyx lobes:
    4a Flowers 5-merous ..... **Cotyledon**
    4b Flowers 4-merous:
      5a Flowers erect; filaments fused to corolla tube at or above middle ..... **Kalanchoe**
      5b Flowers pendulous; filaments fused to corolla tube in lower third ..... ***Bryophyllum**

Adromischus Lem. 3175000

Lemaire: 59 (1852); Smith: 613 (1939); Jacobsen: 189 (1966); Friedrich: 1 (1968); Tölken: 382 (1979); Tölken: 37 (1985).

Shrublets, rarely herbs with branches usually decumbent, rarely erect, carnose or sometimes slightly woody. **Leaves** spirally arranged but usually in dense clusters, sessile or petiolate, free, fleshy, persistent. **Inflorescence** usually a spike-like thyrse, rarely branched, with one to many monochasia each with 1(–5) flowers; peduncle present, with distinct bracts abruptly shorter than leaves; flowers erect or spreading (pendulous in *A. phillipsiae*), 5-merous. **Calyx** with 5 triangular, sharply acute lobes. **Corolla** fused into tube, and spreading lobes joined at base by a membrane. **Stamens** 10, in 2 whorls; filaments glabrous or minutely papillose and fused to lower third of corolla tube; anthers protruding or included, with terminal appendages spherical or almost so. **Squamae** 5, free. **Carpels** 5, usually free, gradually tapering into short styles. **Seeds** ellipsoid, with constrictions before abruptly widening at blunt proximal end, covered with vertical ridges and dense horizontal striations in grooves. $x = 9$ (polyploidy).

Species 27, endemic to sthn Afr., widespread.

***Bryophyllum** Salisb. 3165000

Salisbury: t. 3 (1805); Harvey: 380 (1862); Bentham & Hooker: 658 (1865); Britten: 389 (1872); Berger: 408 (1930); Keay: 116 (1954); Tölken: 73 (1985). Sometimes included in *Kalanchoe*.

Shrubs to shrublets with branches erect, cartilaginous, but usually somewhat woody, rarely regenerating from base. **Leaves** opposite, free, fleshy, persistent, usually producing pseudobulbils on margin. **Inflorescence** a thyrse consisting of several dichasia usually ending in monochasia with few flowers; bracts on peduncle distinct, abruptly shorter than leaves; flowers pendulous, 4-merous. **Calyx**: sepals 4, fused more than half their length. **Corolla** fused into tube longer than spreading lobes. **Stamens** 8, in 2 whorls; filaments glabrous, fused to corolla tube in lower third; anthers usually protruding, with terminal appendage spherical or almost so. **Squamae** 4, free. **Carpels** 4, free, with ovary abruptly constricted into long, ± filiform styles. **Seeds** ellipsoid, with a constriction and abruptly widening at blunt proximal end, covered with vertical ridges and dense horizontal striations in grooves between them. $x = 17$ (aneuploids, polyploidy).

Genus possibly originally restricted to Madagascar; 1 in sthn Afr.: **Bryophyllum delagoense* (Eckl. & Zeyh.) Schinz, naturalised in disturbed areas and on roadsides, especially in sheltered frost-free areas of Mpumalanga, but also often seen as a garden escape in and around towns.

Cotyledon L. 3164000

Linnaeus: 429 (1753); Harvey: 370 (1862); Schonland: 130 (1915); Berger: 412 (1930); Friedrich: 5 (1968); Tölken: 377 (1979); Tölken: 3 (1985).

Shrubs or shrublets with branches usually erect, slightly carnose but somewhat woody. **Leaves** opposite or rarely whorled, free, sessile, fleshy, persistent. **Inflorescence** a thyrse with one to several dichasia usually ending in monochasial branches; bracts on peduncle distinct and abruptly shorter than leaves; flowers usually pendulous, 5-merous. **Calyx** 5-partite. **Corolla** with 5 petals fused

into a tube often longer than lobes. **Stamens** 10, in 2 whorls; filaments usually with a tuft of hairs where fused to lower third of corolla tube; anthers exserted, with terminal appendage spherical or almost so. **Squamae** ± fused laterally to opposite carpel to form a cup. **Carpels** sometimes slightly fused at base, with slender styles. **Seeds** ellipsoid, with constriction before abruptly widening at blunt proximal end, covered with vertical ridges and dense horizontal striations in grooves. x = 9 (6, 8, 17) (aneuploids, polyploidy).

Species 9, widespread throughout sthn Afr. extending into eastern tropical Africa, Ethiopia and the SW Arabian Peninsula; 9 in sthn Afr.

Crassula L. 3168000

Linnaeus: 282 (1753); Harvey: 332 (1862); Schonland: 151 (1929); Friedrich: 11 (1968); Tölken: 75 (1985).

Tillaea L.: 128 (1753). *Bulliarda* DC.: 1 (1801); Harvey: 329 (1862). *Rochea* DC.: t. 103 (1802). *Vauanthes* Haw.: 18 (1821). *Grammanthes* DC.: 392 (1828). *Helophytum* Eckl. & Zeyh.: 288 (1836). *Dinacria* Harv.: 330 (1862). *Pagella* Schönl.: 67 (1921). *Rhopalota* N.E.Br.: 7 (1931).

Delicate annual or perennial undershrubs to shrubs, rarely treelets, with cartilaginous to soft-wooded branches, rarely perennating in tubers. **Leaves** opposite, ± connate, membranous to thickly fleshy, persistent or deciduous, rarely regenerating from base. **Inflorescence** a thyrse with 1–many dichasia, rarely reduced to monochasia or a single terminal flower; peduncle present to indistinct, with bracts distinctly shorter to as long as leaves; flowers spreading or stiffly erect, (4)5(–12)-merous. **Corolla** with (4)5(–12) petals, basely shortly fused into a tube (often not visible with the naked eye), free lobes often tubular with ± spreading apices. **Stamens** (4)5(–12), in one whorl; filaments glabrous and ± fused to corolla tube; anthers included or exserted, without terminal appendage. **Squamae** (4)5(–12), free. **Carpels** (4)5(–12), usually free and gradually constricted into style terminating in a single stigma, but stigma sometimes sessile or laterally placed. **Seeds** ellipsoid, smooth to covered with variously shaped tubercles which are often arranged in vertical rows. x = 7, 8 (aneuploids, high polyploidy).

Species over 300, the centre of distribution in sthn Afr., but extending beyond Africa to Europe, America, Australia, New Zealand and southern islands; 150 in sthn Afr., widespread but concentrated especially in semi-arid, winter-rainfall areas.

Kalanchoe Adans. 3166000

Adanson: 248 (1763); Candolle: (1828); Harvey: 378 (1862); Bentham & Hooker: 659 (1865); Britten: 390 (1872); Berger: 402 (1930); Keay: 116 (1954); Friedrich: 37 (1968); Tölken: 61 (1985).

Shrublets to shrubs with branches spreading, fleshy but somewhat woody towards base, often regenerating from base. **Leaves** opposite, free or slightly fused, fleshy, persistent or deciduous, rarely regenerating from base. **Inflorescence** a thyrse consisting of several dichasia usually ending in monochasia with few to many flowers; peduncle present or absent with gradual transition from leaves to shorter bracts below flowers; flowers spreading or stiffly erect, 4-merous. **Calyx** 4-partite. **Corolla** with 4 petals fused into a tube longer than spreading lobes. **Stamens** 8, in 2 whorls; filaments glabrous and medially fused to corolla tube; anthers included, with ± spherical terminal appendage. **Squamae** 4, free. **Carpels** 4, free, with ovary gradually constricted into styles with terminal stigma. **Seeds** ellipsoid, with a constriction and abruptly widening at blunt proximal end, covered with vertical ridges and dense horizontal striations in grooves. x = 17 (aneuploids, high polyploidy).

Species ± 200; tropical Africa, Madagascar, S and SE Asia and N Australia; 13 in sthn Afr., restricted to the summer-rainfall areas excluding most parts of S Namibia and most of the Eastern Cape.

Tylecodon Tölken 3164010

Tölken: 378 (1979); Tölken: 19 (1985).

Shrublets or rarely shrubs to treelets, with branches erect, rarely decumbent, cartilaginous. **Leaves** spirally arranged, free, fleshy, deciduous. **Inflorescence** a thyrse (if spike-like then few-flowered) with 1–many monochasia with 1–many flowers; peduncle present with gradual transition from leaves to much shorter bracts below flowers; flowers spreading, 5-merous. **Calyx** 5-partite. **Corolla** with 5 petals fused into a tube usually longer than lobes. **Stamens** 10, in 2 whorls; filaments usually with a tuft of hairs where fused to lower third of corolla tube; anthers usually exserted, with terminal appendage ± spherical. **Squamae** 5, free. **Carpels** 5, usually free, with distinct styles. **Seeds** ellipsoid with constriction before widening abruptly at blunt proximal end, covered with vertical ridges and dense horizontal striations in grooves.

Species 41, endemic to sthn Afr., Namibia, Northern and Western Cape, with concentration of species in the Northern Cape.

Cucurbitaceae

(Dilleniidae—Violales)

Compiled by W.G. Welman

Monoecious or dioecious herbs, shrubs or undershrubs, prostrate or scandent, usually variably hairy, rarely spiny, mostly with coiled tendrils, sometimes with tuberous or woody rootstock. **Leaves** alternate, usually palmately veined, often palmately lobed, variable, rarely undeveloped; stipules 0 but stipule-like structures sometimes present. **Flowers** usually unisexual, usually regular, sometimes paniculate, often solitary, usually white or yellow. **Male flowers**: calyx and corolla united below to form a tubular receptacle; calyx lobes 5, usually free; corolla lobes usually 5, free or united at the base, often small and inconspicuous, but in some genera rather large but rarely showy; stamens (1 or 2)3(4 or 5), sometimes with a staminode; filaments free or joined, usually shorter than anthers; anthers free or cohering, 1- or 2-thecous, sometimes varying in one flower; thecae straight, curved, or variously bent; connective sometimes appendaged; pistil rudimentary or absent. **Female flowers**: calyx and corolla as in male flower, occasionally different in size; staminodes present or absent; ovary inferior, more rarely free at apex, usually 3-locular, sometimes 1- or 2- or spuriously 4–6-locular, with intruded parietal placentas, with many, rarely 1 or 2, ovules in each locule; style terminal, simple or divided, sometimes surrounded at base by disc-like structure; stigma various, usually of fleshy lobes. **Fruit** often a berry, fleshy or corky, usually indehiscent, many-seeded. **Seeds** often flattened, smooth or pitted, sometimes hairy; cotyledons conforming to shape of seed, thick or flattened; radicle usually short, conical; endosperm very scanty or 0.

Genera ± 120; species ± 735, cosmopolitan in mostly tropical and subtropical countries; in sthn Afr.: 18 genera, 76 species. Several species cultivated, many of economic importance.

Meeuse: 1 (1962); Jeffrey: 1 (1967); Jeffrey: 414 (1978).

Key to genera

1a Tendrils apically 2-fid; styles 3, free:
- 2a Stamen 1, central, with thecae ring-like; ovary compressed, containing 1 ovule ..... **Cyclantheropsis**
- 2b Stamens 4 or 5 with thecae short, straight; ovary trigonous, containing several ovules ..... **Gerrardanthus**

1b Tendrils simple or proximally 2–4-fid, spine-like or absent; style 1:
- 3a Receptacle tube relatively long in both male and female flowers; fruit terete, ribbed or trigonous; stamens 3, with one 1-thecous and the others 2-thecous:
  - 4a Monoecious, scabrid herbs; flowers small; tendrils simple; petioles usually with sessile, stipuliform, leafy bract at base ..... **Dactyliandra**
  - 4b Monoecious or dioecious herbs, sometimes villous; tendrils unequally bifid or simple, rarely 0:
    - 5a Style long, linear; stigma 3-lobed, dilated; fruit fleshy, few-seeded ..... **Trochomeria**
    - 5b Style thick, fleshy; stigma 3-lobed, fleshy; fruit fleshy, many-seeded ..... **Peponium**
- 3b Receptacle tube short, at least in female flowers, or small and campanulate:
  - 6a Leaves with large stipuliform bracts at bases of petioles ..... **Ctenolepis**
  - 6b Leaves without stipuliform bracts at bases of petioles:
    - 7a Fruit muricate or with distinct protuberances or with soft spines:
      - 8a Fruit ultimately dehiscent, often orange or scarlet; seeds much compressed, marginate, usually appearing as if corroded especially along the margin ..... **Momordica**
      - 8b Fruit indehiscent, rarely orange or scarlet; seeds not appearing as if corroded:
        - 9a Soft spines on fruit bearing several bristles and intermingled with setae; seeds marginate ..... **Oreosyce**
        - 9b Soft spines or warts on fruit not setiferous on the sides and not intermingled with setae but sometimes terminating in a single soft bristle; seeds emarginate (see also *Cucumis*) ..... **Acanthosicyos**
    - 7b Fruit not bearing warts, spines or other protuberances, but sometimes hairy:
      - 10a Fruit circumscissile at the base, scarlet when ripe; seeds tumid ..... **Corallocarpus**
      - 10b Fruit not circumscissile at the base:
        - 11a Leaves twice trifoliolate ..... **Momordica**
        - 11b Leaves not twice trifoliolate:
          - 12a Outer layer of fruit soft, usually easily squashed or, if harder, either fruit under 20 mm in diameter or geocarpic, or ellipsoid-fusiform, rarely longer than 100 mm; seeds ovate or elliptic to subglobose, not subrectangular and not notched on one or both ends:
            - 13a Seeds distinctly compressed, often marginate:
              - 14a Fruit small, globose or ellipsoid to ovoid, smooth or finely foveolate, glabrous, shorter than 35 mm; seeds marginate:
                - 15a Fruit subsessile in axillary clusters ..... **Mukia**
                - 15b Fruit not subsessile in axillary clusters:
                  - 16a Fruit globose ..... **Zehneria**
                  - 16b Fruit ellipsoid to ovoid ..... **Cucumella**
              - 14b Fruit larger, mostly longer than 35 mm, glabrous or hairy, never foveolate:
                - 17a Fruit over 50 mm in diameter, often much larger, not geocarpic, glabrous, never scarlet, globose (in cultivated specimens often very large, oblong, and seeds usually dark-coloured) ..... **Citrullus**
                - 17b Fruit not globose or, if so, seeds whitish or fruit geocarpic or fruit under 50 mm in diameter:

18a Seeds smooth, ± regularly elliptic or ovate in outline (not triangular or produced on one side), white; fruit hairy or glabrous, but not scarlet when ripe ..... **Cucumis**

18b Seeds ± triangular in outline, or ovate-oblong and produced on the one side, white or dark-coloured; fruit scarlet and always quite glabrous when ripe ..... **Coccinia**

13b Seeds not much compressed, not marginate ..... **Kedrostis**

12b Outer layer of large fruit (over 60 mm in diameter, never geocarpic) hard and almost bony (see also *Citrullus*, which has almost invariably dark and rather regularly-shaped ovate, elliptic or oblong seeds); seeds narrowly triangular, notched or emarginate on the one side, or subrectangular, truncate or bidentate at one or both ends ..... **Lagenaria**

Acanthosicyos Welw. ex Hook.f. 8590000

Hooker: 824 (1867); Meeuse: 52 (1962); Launert & Roessler: 5 (1968); Jeffrey: 433 (1978).

Dioecious, much-branched, spiny shrub or scrambler. **Leaves** rudimentary or palmatifid. **Tendrils** spine-like or 0. **Male flowers** axillary, solitary or subfascicled: calyx 5-lobed, tube ± campanulate or obconical, leathery, lobes ovate; corolla 5-lobed, lobes ± quadrate, subtruncate, ribbed, glandular-papillose; stamens 3 or 5, inserted in calyx tube, filaments free, broadly linear, villous, anthers 2-thecous or with one 1-thecous, connective dilated; pistil rudimentary, 2-lobed or 0. **Female flowers** solitary: calyx and corolla as in male, but more leathery; staminodes present; ovary ovoid, with 3–5 placentas and many ovules, tuberculate, stigmas 3–5, capitate, 2-lobed or depressed and saucer-shaped (sometimes all forms in a single flower). **Fruit** subglobose, ± size of a large orange, covered with hard protuberances, many-seeded, indehiscent. **Seeds** elliptic, subcompressed, smooth.

Species 2, Africa; both in sthn Afr., Namibia, Botswana, Northern Province, North-West, Gauteng, Free State, Northern Cape.

Citrullus Eckl. & Zeyh. 8598000

Ecklon & Zeyher: 279 (1836) name conserved; Meeuse: 54 (1962); Launert & Roessler: 6 (1968).

Colocynthis Mill.: 1 (1754) name rejected.

Monoecious or dioecious, annual or perennial herbs. **Leaves** circular or triangular-ovate, cordate, or deeply 3–5-lobed, with lobes lobulate or cut. **Tendrils** 2–4-fid, rarely undivided or straight and spinescent or none. **Male flowers** solitary, rarely fascicled: calyx 5-lobed; tube saucer-shaped or campanulate; corolla 5-lobed, lobes elliptic, oblong, or ovate-oblong, glandular-hairy or setose outside; stamens 3(4), one anther 1-thecous and others 2-thecous, thecae bent, connective flat and broad, inserted at base of calyx tube; pistil 0 or represented by a small gland. **Female flowers** solitary, rarely fascicled: calyx and corolla as in male; staminodes 3, tongue-shaped or represented by setae; ovary ovoid, pubescent, with 3 placentas and many ovules, style short, columnar, stigmas 3, thick, kidney-shaped, somewhat bilobed. **Fruit** globose or ellipsoid, fleshy or dry, indehiscent, many-seeded; pericarp smooth or tubercled. **Seeds** obovate, somewhat compressed, with woody testa; cotyledons oblong to obovate, radicle subacute. $x = 11$ (12).

Species 4, Africa to Asia; 3 in sthn Afr., all regions, rare in KwaZulu-Natal, Western and Eastern Cape.

Coccinia Wight & Arn. 8628000

Wight & Arnott: 347 (1834); Meeuse: 95 (1962); Jeffrey: 442 (1978).

Cephalandra Eckl. & Zeyh.: 280 (1836).

Dioecious, prostrate or climbing, glabrous or scabrid herbs with (always?) tuberous rootstock. **Leaves** digitately 3–5-lobed, with lobes often toothed, usually cordate. **Tendrils** simple or bifid. **Male flowers** in racemes: calyx short, 5-lobed, tube turbinate or campanulate, glabrous, lobes linear; corolla 5-lobed, tube campanulate, sometimes glandular within, lobes broadly elliptic or ovate, sometimes bluntly apiculate, membranous, sometimes glandular; stamens 3, filaments partly free or connate to form a broad flattened structure, anthers sometimes cohering to form a flattened disc, with one anther 1-thecous and the others 2-thecous, thecae bent; pistil 0. **Female flowers** solitary: calyx and corolla as in male; staminodes 3; ovary ovoid, narrowly elliptic or flattened and linear or oblong, with 3 placentas and many ovules, style columnar, stigmas 3, fleshy or flattened, glandular. **Fruit** a many-seeded berry, cylindric or ellipsoid. **Seeds** much compressed, obliquely obovate to oblong, often tomentose, with crustaceous testa. $x = 12$ (polyploidy).

Species ± 30, Old World, all but 1 confined to Africa; 7 in sthn Afr., all regions.

Corallocarpus Welw. ex Hook.f. 8569000

Hooker: 831 (1867); Meeuse: 38 (1962); Jeffrey: 485 (1975).

Monoecious or rarely dioecious, scandent or prostrate herbs, rarely shrubs, scabrid or subtomentose. **Leaves** entire or ± divided, often subcordate. **Tendrils** simple. **Male flowers** usually in dense or lax, pedunculate racemes: calyx shortly 5-lobed, tube broadly campanulate; corolla 5-partite, with segments ovate-oblong; stamens 5, all 1-thecous, inserted in mouth of tube or paired stamens ± united, appearing as 3 (two double 2-thecous, one single 1-thecous), thecae straight, filaments short, with connective often bifid and dilated or produced at apex; pistil minute. **Female flowers** sessile or shortly pedicelled, solitary or aggregated, rarely racemose: calyx and corolla as in male; staminodes 0 or rudimentary; ovary ovoid, often beaked, 2- or 3-locular, with few ovules, style straight, stigmas (2)3(4)-lobed. **Fruit** circumscissile at base, few-seeded. **Seeds** obovoid, swollen or subglobose; cotyledons obovate, thick, fleshy. $x = 12$ (13, 14—1 report) (polyploidy—1 report).

Species ± 15, Old World tropics, mostly African; 7 in sthn Afr., Namibia, Botswana, Northern Province, North-West, Gauteng, KwaZulu-Natal, Northern Cape.

Ctenolepis Hook.f. 8564010

Hooker: 832 (1867); Jeffrey: 460 (1978).

Blastania Kotschy & Peyr.: 15 (1867).

Monoecious, scabrid, prostrate, rarely scandent herbs, often turning black on drying. **Leaves** orbicular, deeply cordate, 5–7-lobed or -partite, with a large stipuliform bract at base of petiole. **Tendrils** simple. **Male flowers** in racemes, in same axil as female ones: calyx 5-lobed, with short tube, lobes subulate; corolla rotate, 5-parted, segments ovate; stamens 3, free, filaments short, anthers small, one 1-thecous, others 2-thecous, thecae straight; pistil 0. **Female flowers** solitary, shortly pedicelled, in same axil as male ones: bracts stipule-like, orbicular or oblong, toothed or ciliate; calyx and corolla as in male; staminodes 0; ovary ovoid, with few ovules on 2 or 3 placentas, style columnar, stigmas 2 or 3. **Fruit** small,

subglobose or subquadrate in outline, oblique, 2–few-seeded, indehiscent. **Seeds** ovoid, strongly compressed, boat-shaped or concave above, convex beneath, smooth, with an acute margin.

Species 2, Old World tropics; 1 in sthn Afr.: *Ctenolepis cerasiformis* (Stocks) Hook.f., N Botswana and Mpumalanga.

Cucumella Chiov. 8599010

Chiovenda: 183 (1929); Kirkbride: 161 (1994).

Monoecious or sometimes dioecious, rather small, annual or perennial climbers or trailers. **Leaves** usually ± palmately lobed. **Tendrils** simple. **Flowers** small, yellow. **Male flowers** solitary or, more often, in small fascicles, pedicellate; calyx: receptacle tube campanulate, lobes small; petals united below; stamens 3, two 2-thecous, one 1-thecous, shortly arising from tube, connective shortly produced apically, thecae straight, subparallel, sometimes apically hooked; disc elevated, convex. **Female flowers** solitary, pedicellate: perianth as in male flowers; staminodes, when present, 3; ovary smooth, hairy, ovules many, horizontal; disc surrounding base of style, stigma 3-lobed. **Fruit** rather small, fleshy, hairy, sometimes scabrid, ellipsoid and sometimes beaked, or fusiform, indehiscent. **Seeds** small, ovate or elliptic, compressed, lenticular.

Species 11, mostly Africa, also Asia; 4 in sthn Afr., Namibia, Northern Province, Mpumalanga.

Cucumis L. 8599000

Linnaeus: 1011 (1753); Meeuse: 59 (1962); Kirkbride: 1 (1993).

Monoecious, rarely dioecious, annual or perennial herbs, hispid or scabrid, often with woody rootstock. **Leaves** toothed to variably lobed or dissected, sometimes cordate at base. **Tendrils** simple. **Male flowers** fascicled, rarely solitary: calyx 5-lobed, tube campanulate or turbinate, lobes subulate or long-linear, sometimes setose or 3-lobed; corolla 5-partite, lobes oblong, ovate or obovate-oblong; stamens 3, filaments free, linear-oblong, short, anthers free or cohering, with one anther 1-thecous and others 2-thecous, thecae bent, rarely straight, connective produced at apex into an appendage; pistil rudimentary. **Female flowers** usually solitary, rarely fasciculate: calyx and corolla as in male; staminodes often 3; ovary globose, ovoid, or subcylindric, often tubercled or variously hairy, with 3–5 placentas and many ovules, styles short, surrounded at base by cup-like structure, stigmas 3–5(6). **Fruit** various, fleshy, often indehiscent, many-seeded; pericarp smooth or tubercled, glabrous or hairy. **Seeds** suborbicular, or ovate-oblong or obovate; radicle obtuse or subacute. $x = 12$ (7) (high polyploidy, B-chromosomes).

Species 32, mainly Africa, also Asia, Australia; a few widely cultivated; 14 in sthn Afr., all regions, rare in Western Cape.

Cyclantheropsis Harms 8641000

Harms: 169 (1896); Jeffrey: 497 (1978).

Scandent herbs, stems becoming woody when old, arising from perennial tuberous rootstock. **Leaves** simple, petiolate. **Tendrils** apically 2-fid. **Flowers** small, greenish yellow, dioecious, regular. **Male flowers** in lax, many-flowered, axillary paniculoid fascicles: calyx with receptacle tube very shallow, lobes 5, small; petals 5, free, small; stamens united into a single central column, inserted on basal disc, thecae 2, semicircular, horizontal, apical on short central column, forming a split horizontal ring. **Female flowers** in rather few-flowered axillary fascicles: ovary compressed, 1-locular, styles 3, very short, ovule solitary, pendulous; perianth similar to that of male flower; disc 3-angled, basal. **Fruit** compressed, samaroid, 1-seeded, outline elliptic. **Seed** compressed, outline elliptic, rather large.

Species 3; 2 in Africa, 1 in Madagascar; 1 in sthn Afr.: *Cyclantheropsis parviflora* (Cogn.) Harms, Namibia in Caprivi area.

Dactyliandra (Hook.f.) Hook.f. 8563000

Hooker: 557 (1871a); Meeuse: 10 (1962).

Monoecious, scabrid, scandent or prostrate herbs. **Leaves** 3-partite or 5–7-lobed, petiolate, with stipuliform bract at base of petiole. **Tendrils** simple. **Male flowers** subumbellate, in different axils than female ones: calyx 5-lobed, tube campanulate; corolla shortly campanulate, with ring of globule-tipped hairs in throat, lobes longer than tube, oblong or oblong-elliptic, pubescent or glandular-papillose; stamens 3, inserted near base of corolla tube, filaments somewhat longer than anthers, anthers dissimilar, one 1-thecous and two 2-thecous; pistil rudimentary. **Female flowers** in different axils than male ones: calyx and corolla as in male; staminodes 0; ovary oblong, with 3 placentas, style columnar, arising from disc, stigma subcapitate, 3-lobed. **Fruit** small, globose, with few to many seeds. **Seeds** irregularly oblong, pointed on one side with both surfaces flattish and sinuate on edges; testa thick. $x = 11$ (1 report).

Species 2, Africa and India; 1 in sthn Afr.: *Dactyliandra welwitschii* Hook.f., Namibia.

Gerrardanthus Harv. ex Hook.f. 8555000

Hooker: 840 (1867); Meeuse: 8 (1962).

Dioecious, climbing or scandent plants, with (always ?) tuberous rootstock. **Leaves** ovate, cordate. **Tendrils** 2-fid. **Male flowers** on long pedicels in subumbellate fascicles: calyx small, rotate, 5-lobed; corolla rotate, 5-partite, segments linear-oblong or ovate-oblong, with 2 somewhat larger than others, with margin recurved; stamens 4, connivent in pairs and a staminode, filaments linear, somewhat incurved, ± as long as anthers, fleshy, anthers 1-thecous, slightly curved, sometimes connective tailed; ovary 0, rudimentary style sometimes present. **Female flowers**: calyx and corolla as in male; stamens 0; ovary 3-locular, with pendulous ovules in each locule, styles 3, free, short, conical, stigmas shortly reniform, with sinus uppermost. **Fruit** dry, terete, ribbed, 3-valved at apex. **Seeds** oblong-lanceolate, biconvex, with a membranous wing as long as seed at one end; testa pustulate, somewhat woody; cotyledons oblong, straight; radicle straight.

Species 5, Africa; 2 in sthn Afr., Swaziland, KwaZulu-Natal, Eastern Cape.

Kedrostis Medik. 8568000

Medikus: 69 (1791); Meeuse: 24 (1962); Jeffrey: 484 (1978).

Monoecious, rarely dioecious, scandent or prostrate, perennial herbs, scabrid or glabrous, sometimes subfleshy and with tuberous rootstock. **Leaves** entire to lobed or partite. **Tendrils** simple, rarely bifid. **Male flowers** racemose or subcorymbose: calyx 5-lobed, tube campanulate, pilose within, lobes linear-lanceolate, ovate-oblong or subulate, with few glandular hairs; corolla 5-partite, lobes ovate or oblong-linear, often pubescent or glandular-hairy; stamens 3(4 or 5) arising from receptacle tube, filaments free, ± as long as anthers, when 3 present then 1 anther 1-thecous and 2 anthers 2-thecous, when 5 stamens present then all anthers 1-

thecous, thecae straight or ± curved, connective often produced and often bifid or bipartite; pistil 0, or gland-like. **Female flowers** solitary or clustered, shortly pedicelled: calyx and corolla as in male; staminodes 0–5 often 3; ovary ovoid or elliptic, sometimes beaked, with 2 or 3 placentas and few, rarely many ovules, sometimes hairy, with long, glandular hairs, style columnar, not or only slightly surrounded by disc at base, stigmas 2 or 3, broad or narrow, each stigma often shortly bilobed. **Fruit** a berry, ovoid, often beaked, few- to many-seeded. **Seeds** often globose with a margin and crustaceous, punctate or slightly pustulate or smooth; cotyledons thick, fleshy. $x = 12$, 13 (1 report).

Species ± 25, Old World tropics, mostly Africa; 9 in sthn Afr., all regions.

Lagenaria Ser. 8610000

Seringe: 25, t.2 (1825); Meeuse: 82 (1962); Jeffrey: 437 (1978).

Adenopus Benth.: 372 (1849). *Sphaerosicyos* Hook.f.: 824 (1867).

Monoecious or dioecious, annual or perennial, scandent or prostrate herbs. **Tendrils** bifid, rarely simple. **Leaves** petiolate, palmately lobed, with lobes apiculate and with 2 glands at apex of petiole. **Male flowers** in racemes: calyx 5-lobed, tube subcampanulate, lobes subulate, each with 2 or 3 subglobose swellings at base; corolla 5-lobed, lobes elliptic or oblong, densely papillose on inner face, papillose on outer, villous at base within, veined and with 3 prominent ribs on outer face; stamens 3, filaments oblong-linear, free, 1 anther 1-thecous, others 2-thecous, thecae much folded, connective broad and flat; pistil 0. **Female flowers** solitary: calyx and corolla as in male; staminodes 3, small; ovary ellipsoid, with 3 placentas and many ovules, style cylindric, stigma globose, shortly 3-lobed, fleshy. **Fruit** the size of a large orange, many-seeded, with leathery pericarp. **Seeds** elliptic in outline, with tough, smooth testa; cotyledons elliptic; radicle subacute. $x = 11$ (13—1 report).

Species ± 6, mostly tropical Africa; 2 in sthn Afr., all regions, except Namibia, Free State, Lesotho and Northern Cape.

Momordica L. 8591000

Linnaeus: 1009 (1753); Meeuse: 45 (1962); Jeffrey: 419 (1978).

Raphanocarpus Hook.f.: 67 (1871b). *Raphanistrocarpus* (Baill.) Pax: 25 (1889).

Monoecious, rarely dioecious, scandent or prostrate herbs. **Leaves** entire, lobed or palmately 3–9-foliolate. **Tendrils** simple or bifid. **Male flowers** solitary, corymbose, subumbellate or racemose, often with a conspicuous, barren bract at apex of pedicel: calyx with variably shaped tube and lobes; stamens (2)3(5), filaments free or somewhat cohering, broadly linear, anthers at first cohering, with 1 anther 1-thecous and others 2-thecous, thecae bent, connective bilobed, not produced at apex; pistil 0, rudimentary, or glandular. **Female flowers** solitary: calyx and corolla as in male; staminodes 0 or represented by 3 glands at base of style; ovary oblong or fusiform, with 3 placentas and many ovules, sometimes echinate, style slender, stigmas 3, entire or bifid. **Fruit** fusiform or cylindric, fleshy, indehiscent or 3-valved, sometimes with short protuberances on margins, few- to many-seeded. **Seeds** turgid or flattened, smooth or variously sculptured, with crustaceous testa; cotyledons elliptic. $x = 11$ (7) (aneuploids, polyploidy).

Species ± 40, Old World, mostly tropical Africa; 9 in sthn Afr., all regions, except Lesotho and Western Cape.

Mukia Arn. 8562000

Arnott: 50 (1840); Jeffrey: 475 (1978).

Annual, monoecious, hispid climbers. **Leaves** 3–7-angled or -lobed. **Tendrils** simple. **Flowers** clustered, small, yellow. **Male flowers** fascicled: calyx campanulate, 5-dentate; corolla with 5-parted limbs; stamens 3, inserted at base of corolla, free, anthers extrorse, linear, straight, cohering, terminated by short, conical appendage of connective. **Female flowers** clustered: calyx and corolla as in male flowers; ovary ovoid, setulose, with 2 or 3 placentas, style short, with a fleshy, annular disc at base, stigmas 3, erect. **Fruit** a berry, globose, smooth or echinulate, few-seeded. **Seeds** turgid, oblong-oval, subcompressed, surrounded by a broad or narrow zone. $x = 6$ (1 report).

Species 4, tropics of Old World, 1 in Africa: *Mukia maderaspatana* (L.) M.J.Roem., Mpumalanga, Swaziland, KwaZulu-Natal.

Oreosyce Hook.f. 8560000

Hooker: 548 (1871a); Meeuse: 21 (1962); Jeffrey: 470 (1978).

Hymenosicyos Chiov.: 62 (1911).

Scandent herb, monoecious, usually slender, variably pubescent. **Leaves** petiolate, undivided to palmately 3–5-lobed. **Tendrils** simple. **Flowers** small, yellow, pedicellate. **Male flowers** solitary or fascicled: receptacle cylindric-campanulate, hispid; sepals dentiform or subulate; corolla rotate to campanulate, with oblong segments; stamens 3, subsessile in middle of receptacle, dorsally attached in their middle, anthers slightly cohering or free, linear or oblong, two 2-thecous, third 1-thecous, thecae straight, obtuse, connective narrow, usually toothed at apex; pistil rudimentary, gland-like. **Female flowers** solitary, rarely with male in same axis: calyx and corolla as in male; staminodes 3, sometimes stamens appearing fertile; ovary fusiform, oblong or ellipsoid, setulose, with 3 placentas and numerous horizontal ovules, style columnar, surrounded by disc at base, stigma 3-lobed, lobes usually fringed. **Fruit** relatively small, indehiscent, ellipsoid or ovoid, covered with hairy or bristly protuberances, intermingled with setae, many-seeded. **Seeds** compressed, ovate, marginate.

Probably monotypic, Africa and Madagascar; *Oreosyce africana* Hook.f. in Northern Province.

Peponium Engl. 8612000

Engler: 318 (1897); Meeuse: 91 (1962).

Peponia Naud.: 29 (1866) name illegitimate.

Monoecious or dioecious, prostrate or scandent, often villous herbs. **Leaves** lobed, rarely entire, toothed. **Tendrils** unequally bifid, rarely simple. **Male flowers** solitary or in racemes: calyx 5-lobed, tube gradually widening upwards or subcylindric, sometimes pilose outside and inside, with vibratile hairs, lobes linear, subulate, rarely sublanceolate; corolla 5-lobed, lobes obovate or oblong-elliptic, entire, sometimes glandular-hairy within and without; stamens 3, arising near base of calyx tube, filaments free, sometimes shorter than anthers, anthers cohering, with 1 anther 1-thecous and others 2-thecous, sometimes sagittate at base, thecae bent; pistil rudimentary. **Female flowers** solitary: calyx and corolla as in male; staminodes 0 or 3, linear; ovary oblong or linear-oblong, with 3 placentas and many ovules, sometimes tomentose, style thick, fleshy, linear, stigma 3-lobed, fleshy. **Fruit** ovoid or cylindric, fleshy, many-seeded. **Seeds** obovate, smooth or sometimes tomentose with crustaceous testa. $x = 12$ (1 report).

Species ± 20, Africa, Madagascar, Aldabra and Seychelles; 4 in sthn Afr., Northern Province, North-West, Gauteng, Free State, KwaZulu-Natal, Northern and Eastern Cape.

Trochomeria Hook.f. 8608000

Hooker: 822 (1867); Meeuse: 85 (1962); Jeffrey: 456 (1978).

Heterosicyos Hook.f.: 822 (1867).

Dioecious, rarely monoecious, scandent, prostrate or erect herbs, with thick roots. **Leaves** entire, lobed or partite, sometimes palmately lobed, often with bract at base of petiole. **Tendrils** simple or 0. **Male flowers** solitary, fascicled or in racemes: calyx 5-lobed, tube funnel-shaped or cylindric, often elongate, sometimes pilose within, lobes small, ovate, linear or subulate; corolla 5-lobed, lobes ovate, linear, linear-oblong or linear-lanceolate, sometimes glandular without; stamens 3, arising at middle or near base of calyx tube, filaments free, terete, ± as long as or longer than anthers, sometimes hairy at base, anthers slightly cohering, with one 1-thecous and others 2-thecous, often sparsely glandular; pistil rudimentary. **Female flowers** solitary: calyx and corolla as in male; staminodes 3, setiform or long-linear; ovary ovoid or elliptic or oblong, with 3 placentas and many ovules, style long, linear, stigma 3-lobed, dilated or 2 large, flat lobes, each bilobed to appear 4-lobed. **Fruit** ovoid, subglobose or oblong, fleshy, few-seeded. **Seeds** ellipsoid, sometimes compressed, smooth, with crustaceous testa; cotyledons elliptic. $x = 12$.

Species ± 8, Africa; 4 in sthn Afr., all regions, except Free State, Lesotho and Western Cape.

Zehneria Endl. 8564000

Endlicher: 69 (1833); Jeffrey: 477 (1978).

Herbs, monoecious or dioecious, with tuberous rootstock. **Leaves** lobed. **Tendrils** simple. **Flowers** small, white. **Male flowers** racemose: calyx campanulate or rugulose, 5-dentate; corolla with spreading, 5-parted limb; stamens 3, 2-thecous, inserted at base of corolla, filaments free, filiform-cylindraceous, terminated by a subcordate connective, along each margin of which at back are attached linear, straight, 2-locular, free or cohering anthers. **Female flowers** umbellate or on simple peduncles: calyx and corolla as in male flowers; stigma cup-shaped, somewhat trilobed. **Fruit** a berry, oblong-fusiform, ovate or globose, with a subcoriaceous pericarp, pseudotrilocular or bilocular, few-seeded. **Seeds** compressed. $x = 12$ (1 report).

Species ± 30; Africa to East Indies and Australia; 3 in sthn Afr., all regions, rare in Northern Cape.

Cunoniaceae

(Rosidae—Rosales)

Compiled by M. Jordaan

Trees or shrubs, evergreen, glabrous. **Leaves** opposite, trifoliolate or imparipinnate, leathery, often glandular, usually with serrate margins; stipules either conspicuous and united in pairs or small, caducous. **Inflorescences** dense, spike-like racemes or axillary panicles. **Flowers** regular, bisexual, small. **Calyx**: sepals 4 or 5, imbricate or valvate, free or sometimes connate at base. **Petals** 4 or 5, free or connate at base, imbricate, entire or toothed or 3-lobed. **Stamens** free, 8 or 10, alternating with petals, inserted on disc; anthers 2-thecous, didymous, with longitudinal slits. **Disc** annular, nectar-secreting. **Ovary** superior, 2-locular; ovules apotropus, 2–many per locule with axile or apical placentation; styles 2, free; stigmas simple. **Fruit** a capsule, crowned by persistent styles. **Seeds** oblong or ovoid, sometimes winged; testa thin; endosperm copious; embryo small.

Genera ± 6, species ± 250, native to the southern hemisphere, with main centres of distribution Oceania and Australasia, but 2 genera in tropical America; sthn Afr.: genera 2, species 2.

Brown: 548 (1814); Candolle: 12 (1830) as Saxifragaceae; Endlicher: 819 (1839) as Saxifragaceae suborder Cunonieae; Harvey: 305 (1862) as Saxifragaceae; Engler: 94 (1891) as Cunoniaceae; Engler: 229 (1928) as Cunoniaceae.

Key to genera

Stipules united into a large spoon-like structure; inflorescences dense, spike-like racemes; petals longer than sepals; ovules many per locule ..... **Cunonia**

Stipules small, free; inflorescences long-pedunculate, axillary panicles; petals shorter than sepals; ovules 2 per locule..... **Platylophus**

Cunonia L. 3275000

Linnaeus: 1025 (1759); Jussieu: 310 (1789); Candolle: 12 (1830); Endlicher: 819 (1839); Harvey: 306 (1862); Engler: 101 (1891); Engler: 250 (1928); Adamson: 440 (1950).

Trees or shrubs. **Leaves** petiolate, imparipinnate; leaflets 2- or 3-jugate, lanceolate, obtuse or sometimes shortly acuminate, with serrate margins; stipules large, oblong, united into a spoon-shaped structure around leaf buds. **Inflorescences** dense, spike-like racemes. **Calyx** 5-lobed, with short, open tube; lobes imbricate, persistent. **Petals** 5, oblong, imbricate. **Stamens** 10, inserted with petals; filaments filiform, much longer than petals. **Disc** adnate to ovary. **Ovary**: ovules many, axile, pendulous in 2 rows; styles 2, terete. **Fruit** a 2-horned, 2-locular, coriaceous capsule, opening by 2 valves. **Seeds** ± ovoid, with narrow, membranous wing. $x = 8$ (1 report, polyploidy).

Species ± 17, discontinuous distribution with 16 in New Caledonia and 1 in sthn Afr.: *Cunonia capensis* L., forests of Western and Eastern Cape to N KwaZulu-Natal.

Platylophus D.Don 3269000

Don: 92 (1830); Endlicher: 818 (1839); Harvey: 307 (1862); Engler: 99 (1891); Engler: 246 (1928).

Small to large trees. **Leaves** petiolate, trifoliolate; leaflets lanceolate, coriaceous, with toothed margin; stipules small, acuminate, free, deciduous. **Inflorescences** long-pedunculate, many-flowered, axillary panicles. **Calyx** 4- or 5-lobed, with short tube adnate to base of ovary; lobes triangular-ovate, persistent. **Petals** 4 or 5, inserted at base of disc, 3-fid or -toothed, shorter than sepals. **Stamens** 8 or 10, inserted on rim of disc. **Disc** thick, saucer-shaped. **Ovary** with 2 collateral ovules below apex of each locule; styles 2, subulate. **Fruit** a turgid capsule, compressed above, with persistent styles. **Seeds** curved.

Monotypic: *Platylophus trifoliatus* D.Don, forests of S Western Cape to Uitenhage in Eastern Cape.

Dichapetalaceae

(Rosidae—Malpighiales)

Compiled by R.H. Archer

Trees, shrubs, or rhizomatous shrublets; sometimes very poisonous. **Leaves** alternate, simple, entire, petiolate; stipules caducous. **Flowers** bisexual or unisexual, regular or irregular; in corymbose cymes. **Sepals** 5, free or partially connate, imbricate. **Petals** 5, inserted with sepals, free or united with stamens into a tube, often narrow, 2-fid or 2-lobed. **Disc** often of 5 free glands opposite petals, sometimes connate into an entire or lobed cup. **Stamens** 5, alternating with petals, free or united; anthers dehiscing by longitudinal slits. **Ovary** superior, 2- or 3(4)-locular, with 2 apical-axile pendulous ovules in each locule, often hairy; style mostly simple or 2- or 3(4)-fid. **Fruit** a drupe with 1–3(4) one-seeded free pyrenes. **Seeds**: embryo large, straight, oily; endosperm 0 or rarely present.

Genera 3, species ± 160, circumtropical with few in subtropics; sthn Afr.: genera 2, species 3.

Harvey: 450 (1860) under Chailletiaceae; Torre: 319 (1963); Breteler: 1 (1986).

Key to genera

Flowers regular; petals equal; fertile stamens 5; peduncle rarely adnate to petiole ..... **Dichapetalum**

Flowers irregular; petals unequal, 1 or 2 distinctly larger; fertile stamens 2 or 3; peduncle adnate to petiole ..... **Tapura**

Dichapetalum Thouars 4283000

Thouars: 23 (1806); Torre: 319 (1963); Breteler: 1 (1978); Bretcler: 1 (1982); Breteler: 1 (1986).

Chailletia DC.: 153 (1811); Harvey: 450 (1860).

Trees, shrubs, or rhizomatous shrublets. **Leaves** often with glands at base; with 2 caducous stipules. **Flowers** regular, in axillary cymes or corymbs. **Calyx** 5-partite, with very short, campanulate tube; lobes equal or unequal. **Petals** 5, equal, free, inserted on calyx tube, as long as calyx, sometimes clawed, emarginate or 2-lobed. **Disc** of 5 free glands opposite petals or connate into a cup. **Stamens** 5. **Ovary** superior, 2- or 3(4)-locular; styles 1–3, free or connate, and 2- or 3(4)-lobed. **Fruit** a leathery drupe with 1–3 one-seeded free pyrenes. **Seeds** exalbuminous with thin testa. $x = 12$ (polyploidy).

Species 124, 86 in Africa, 38 in neotropics and Asian tropics; 2 in sthn Afr., Namibia, Northern Province, Mpumalanga, Gauteng and KwaZulu-Natal; leaves and seeds of *Dichapetalum cymosum* (Hook.) Engl., Gifblaar, very poisonous as they contain fluoroacetic acid and pyridene alkaloids.

Tapura Aubl. 4285000

Aublet:126, t. 48 (1775); Torre: 328 (1963); Bretelcr: 1 (1986).

Trees or shrubs. **Leaves**: stipules minute, caducous. **Flowers** irregular, in small, axillary, shortly pedunculate glomerules; peduncle adnate to petiole. **Calyx** with 5 unequal lobes. **Petals** 5, adnate at base to stamens to form an unequal, 5-lobed tube, 3 lobes entire, 2 bifid. **Stamens**: 2 or 3 fertile, 2 sterile. **Ovary** sessile, 2- or 3-locular; style filiform, shortly 2- or 3-fid at apex. **Fruit** drupaceous. **Seeds** with or without distinct endosperm. $x = 12$ (1 report, polyploidy).

Species 21, tropical America and Africa; 1 in sthn Afr.: *Tapura fischeri* Engl., KwaZulu-Natal.

Dipsacaceae

(Asteridae—Dipsacales)

Compiled by W.G. Welman

Annual or perennial herbs or suffrutices, glabrous or variously hairy. **Leaves** opposite or rarely whorled, entire to variably incised; stipules 0. **Flowers** bisexual, irregular, aggregated into heads, surrounded by an involucre, with individual flowers or florets bracteate or in a calyx-like, dry, persistent involucre. **Calyx** with tube often constricted above ovary; limb cup-shaped, disciform, or divided into 5–20 stellately spreading bristles. **Corolla** gamopetalous, 4- or 5-lobed, somewhat 2-lipped, usually pilose on outer surface; tube widening gradually from base, usually pilose within; lobes unequal, imbricate, usually oblong, shorter than tube. **Stamens** 4(5), arising in upper part of corolla tube and alternating with lobes, often exserted; filaments longer than anthers; anthers linear-oblong, versatile, 2-thecous, opening by longitudinal slits. **Ovary** inferior, 1-locular, with a single, pendulous ovule; style filiform or linear, included or exserted; stigma undivided or with groove on one side, globose, disc-like or oblong. **Fruit** a dry cypsela, crowned with enlarged, persistent calyx limb and enclosed in cup-like involucre.

Genera 11, species 350–400, mostly Mediterranean region, spreading through Europe and Africa to Asia; absent from New World; sthn Afr.: 2 genera, ± 25 species.

Sonder: 41 (1865); Heine: 1 (1968); Cannon & Cannon: 77 (1983).

Key to genera

Calyx small, pappus-like; involucral bracts in several rows ..... **Cephalaria**
Calyx of 5 long awns; involucral bracts in 1 or 2 rows ..... **Scabiosa**

Cephalaria Schrad. 8541000

Schrader: 1, 43 (1818) name conserved; Sonder: 41 (1865); Von Szabo: 1 (1940); Napper: 466 (1968).

Annual or perennial herbs, often with woody rootstock. **Leaves** opposite, often radical, variable in shape and lobing. **Flowers** aggregated into pedunculate heads, rarely heads sessile; individual flowers or florets bracteate or surrounded by an involucre which is often ciliate. **Calyx** small, shallowly lobed, usually ciliate, pappus-like. **Corolla** 4(5)-lobed; tube funnel-shaped, hairy within; lobes often unequal, shorter than tube. **Stamens** 4(5), arising in corolla throat, exserted; filaments linear, longer than anthers; anthers linear or oblong. **Ovary** usually ribbed; style included or exserted; stigma linear, thickened, grooved, or unequally 2-lobed. **Fruit** as for family. $x = 9$ (5, 8) (B-chromosomes).

Species ± 60, Mediterranean and Africa; ± 15 in sthn Afr., all regions except Namibia, Botswana, and Northern Cape.

Scabiosa L. 8546000

Linnaeus: 98 (1753); Sonder: 43 (1865); Heine: 1 (1968); Cannon & Cannon: 81 (1983).

Annual or perennial herbs, sometimes robust, often with woody rootstock, rarely somewhat suffruticose, usually hairy. **Leaves** opposite, often radical, simple to variably cut or dissected. **Flowers** aggregated into pedunculate, rarely sessile, heads; individual flowers or florets subtended by a bract or involucre which is ribbed and expanded into a saucer-shaped, membranous structure. **Calyx** of 5 awns almost as long as corolla. **Corolla** subbilabiate, pilose, 4- or 5-lobed; tube narrowly funnel-shaped, pilose within; lobes oblong, shorter than tube. **Stamens** 4, inserted in upper part of corolla tube, exserted; filaments linear, longer than anthers; anthers linear-oblong. **Ovary**: style linear, shortly exserted; stigma subcapitate, grooved, rarely shortly 2-lobed. **Fruit** as for family. $x = 8, 9$ (aneuploids, B-chromosomes).

Species ± 100, Europe, Africa and to Asia; 9 in sthn Afr., all regions.

Droseraceae

(Dilleniidae—Nepenthales)

Compiled by L.L. Dreyer & M. Jordaan

Herbaceous, insectivorous, glanduliferous annuals or perennials or floating aquatics (*Aldrovanda*). **Roots** well developed or usually true roots suppressed, parts of stem becoming rhizoids (absent in *Aldrovanda*). **Stems** aerial, rhizomatous, tuberous or suppressed. **Leaves** basal, rosulate and/or caulescent and alternate (verticillate in *Aldrovanda*), with irritable gland-tipped hairs (*Drosera*) or an active trap (*Aldrovanda*); venation folded or circinnate; lamina simple or differentiated (*Aldrovanda*), covered with glandular excrescences such as tentacles, sensitive bristles, stipitate and sensitive glands; stipules intra-axillary, well developed, reduced or 0. **Inflorescence** axillary or terminal, often scapose cymose, sometimes reduced to 1 or 2 flowers. **Flowers** bisexual, usually regular, hypogynous. **Calyx** with 5 lobes connate at base, imbricate, persistent. **Petals** 5, free, sometimes cohering at first, imbricate, marcescent. **Stamens** 5; filaments free; anthers opening by longitudinal slits, extrorse; pollen forming tetrads. **Ovary** superior, 1-locular, of 3–5 carpels; ovules many (rarely few), anatropous; on parietal placentas; styles 3–5, usually free, rarely connate, simple or variously divided; stigma apical. **Fruit** a loculicidal capsule, enclosed in persistent calyx, usually thin-walled, dehiscing in 3–5 sections or rarely irregularly. **Seeds** 3–many, fusiform; embryo short, straight; endosperm copious, rich in starch, oil and protein.

Genera 4, 3 genera monotypic, species ± 100, cosmopolitan; sthn Afr.: genera 2, species 21.

Sonder: 75 (1860); Drude: 261 (1891); Diels: 56 (1906); Phillips: 358 (1951); Obermeyer: 187 (1970); Laundon: 62 (1978); Laundon & Basto: 6 (1993); Mabberley: 242 (1997).

Key to genera

Free-floating aquatic, without roots; leaf lamina articulate ..... **Aldrovanda**
Terrestrial plants, rooting at base; leaf lamina not articulate ..... **Drosera**

Aldrovanda L. 3134000

Linnaeus: 281 (1753); Linnaeus: 136 (1754); Drude: 269 (1891); Diels: 56 (1906); Phillips: 359 (1951); Obermeyer: 187 (1970); Laundon: 62 (1978); Laundon & Basto: 6 (1993).

Floating, rootless herbs. **Stems** unbranched, horizontal, transparent, just submerged, occasionally branching pseudo-dichotomously, new parts developing apically with older leaf whorls dying off successively; forming turions in winter. **Leaves** 6–9 in verticils, connate at base, petiolar part broad, hollow, turgid, apically forming 4–6 subulate, ciliate segments; lamina reniform-rounded, articulate, with long sensitive bristles inside near midrib, causing lobes to close tightly when irritated; sessile, digestive glands present. **Flowers** axillary, solitary, emergent; peduncle robust, reflexed in fruit. **Calyx**: lobes imbricate, ovate-elliptic. **Petals** cohering at first to form cap, white, obovate. **Stamens** 5; filaments subulate; anthers didymous. **Ovary** sessile, subglobose; placentas 5; styles 5, filiform, patent, incurved above; stigmatic apex dilated, much divided, penicillate. **Capsule** subglobose, membranous, 5-valved, ripening below water surface. **Seeds** 6–8, shortly ovoid, black, crustaceous and shiny. $x = 12$ (polyploidy).

Species 1, widespread in Europe, Asia, Australia and scattered localities in tropical Africa; 1 in sthn Afr.: *Aldrovanda vesiculosa* L., Botswana.

Drosera L. 3136000

Linnaeus: 281 (1753); Linnaeus: 136 (1754); Sonder: 75 (1860); Hooker: 661 (1865); Drude: 270 (1891); Diels: 61 (1906); Phillips: 359 (1951); Laundon: 1 (1959); Roessler: 45 (1966); Obermeyer: 189 (1970); Laundon: 64 (1978); Cheek: 738 (1987); Bennett & Cheek: 375 (1990); Laundon & Basto: 6 (1993).

Herbaceous, insectivorous, glanduliferous annuals or deciduous perennials; few, axillary, positively geotropic shoots or pseudo-roots are formed from stem, becoming swollen with reserve foods and densely covered (except tip) with long 'root hairs'; true roots absent (suppressed during germination). **Stems** aerial, rhizomatous or suppressed, annual or perennial (apical tissue persisting as a turion). **Leaves** basal and rosulate and/or caulescent and alternate; lamina simple, bearing various types of glandular hairs; vernation folded (viz. apical part of petiole reflexed so that upper face of lamina touches petiole) or circinnate with blade rolled inwards; petioles often persistent and reflexed or confluent with lamina; stipules well developed, reduced or 0, membranous, often laciniate. **Inflorescence** scapose, axillary or terminal (at least primarily), cymose, helicoid or dichasial, often reduced to 1 or 2 flowers; cyme nodding beyond open flower (viz. buds situated below open flower). **Flowers** usually opening one at a time in bright sunlight, sometimes for a few hours only; pollination often autogamous, seldom cleistogamous. **Calyx**: lobes ovate, occasionally slightly dentate. **Petals** usually obovate or spathulate, sometimes unguiculate, white, pink, purple, yellow or red, sometimes with a dark base, marcescent and coalescing to form a cap over capsule. **Stamens** 5, upper part of filament and connective often swollen dorsally, rhomboidal, causing locules to diverge below. **Ovary** with 3 placentas; styles 3, free, simple or often forked from base, sometimes bifurcate or multifid at stigmatic apex. **Capsule** loculicidally 3-valved, enclosed in persistent calyx. **Seeds** black, ovoid or fusiform, with outer integument extended on both sides; testa smooth, reticulate or warty. $x = 10$ (aneuploids, polyploidy).

Species ± 80, cosmopolitan with a concentration in the southern hemisphere; 20 in sthn Afr., widespread.

Ebenaceae

(Dilleniidae—Theales)

Compiled by C.L. Bredenkamp

Trees, shrubs, undershrubs, rarely scandent, usually dioecious. **Leaves** alternate, occasionally opposite or whorled, simple, entire, coriaceous; stipules 0. **Flowers** regular, usually unisexual, sometimes bisexual, 3–8-merous, in axillary cymes, racemes, panicles, or solitary; bracts usually present. **Calyx** usually divided almost to base, occasionally with distinct, truncate or shortly toothed tube, persistent and often accrescent in fruit. **Corolla** usually with a short tube and lobes contorted in bud, deciduous. **Stamens** 3 or more in 1 or 2 whorls, arising from base of corolla or on tube, sometimes hypogynous; filaments free or connate at base, in pairs or groups, shorter than basifixed anthers. **Ovary** superior, on a glabrous or fringed disc, 2–16-locular, with axile placentation and 1 or 2 pendulous ovules in each locule; styles 1–3, simple or with 2–5 branches. **Fruit** a berry, with 1–several seeds, becoming dry and occasionally dehiscing slowly. **Seeds** globose or ellipsoid; embryo straight; endosperm usually copious and bony.

Genera 2, species ± 500, throughout tropics and subtropics of both hemispheres, most species in the Indo-Pacific region but centre of variation in Africa (including Madagascar); represented in Africa in most terrestrial vegetation types below 2000 m except in the driest areas; sthn Afr.: genera 2, species 37.

Hiern: 444 (1906); De Winter: 54 (1963); De Winter *et al.*: 107 (1967); White: 248 (1983).

Key to genera

Calyx not accrescent; ovary on a fringed disc; fruit usually 1-seeded; leaves alternate, subopposite, opposite or whorled..... **Euclea**
Calyx usually accrescent; ovary on a glabrous disc; fruit usually with 2 or more seeds; leaves alternate..... **Diospyros**

Diospyros L. 6406000

Linnaeus: 1057 (1753); Hiern: 476 (1906); De Winter: 54 (1963); White: 251 (1983).

Royena L.: 397 (1753); Hiern: 445 (1906).

Trees, shrubs or undershrubs, rarely scandent, usually dioecious. **Leaves** usually alternate, simple, chartaceous to coriaceous. **Flowers** in axillary, subsessile clusters, cymes, pseudoracemes, or solitary, unisexual or falsely bisexual and functionally male. **Calyx** (4)5(–7)-lobed, persistent and mostly accrescent, deeply lobed or bladder-shaped and toothed on mouth. **Corolla** urceolate, 3–5-lobed. **Stamens** 3–15, in a single or double whorl. **Ovary** on somewhat fleshy disc, 2–16-locular, with 1 or 2 pendulous ovules in each locule. **Fruit** a berry with several seeds, rarely only 1, becoming dry and dehiscing slowly. **Seeds** usually elongate, encircled by a single, thin, ± straight line; endosperm bony or flinty, occasionally ruminate. $x = 15$ (high polyploidy, B-chromosomes).

Species ± 475, cosmopolitan in tropical, subtropical and temperate areas (America ± 80, Africa ± 94, Madagascar ± 100, Asia ± 200); in sthn Afr. ± 20 species and several subspecies, Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Lesotho, Northern, Western and Eastern Cape.

Euclea Murray 6404000

Murray: 747 (1774); Hiern: 460 (1906); De Winter: 80 (1963); White: 289 (1983); Retief: 228 (1986).

Trees, shrubs or undershrubs, dioecious. **Leaves** alternate, subopposite or subverticillate, simple, coriaceous. **Flowers** in axillary racemes, pseudoracemes, pseudocymes, panicles, or solitary. **Calyx** 4- or 5-lobed, persistent. **Corolla** urceolate to subglobose and shallowly 5–8-lobed on mouth or campanulate and deeply 4- or 5-lobed. **Stamens** 10–30, free or filaments joined at base in pairs or groups; filaments shorter than anthers; anthers dehiscing by lateral, longitudinal slits; staminodes present or absent in female flowers. **Ovary** on a fimbriate, somewhat fleshy disc, 2–6-locular, with a single, pendulous ovule in each locule, or locules incompletely septate and then with 2 ovules; styles 1 or 2(3). **Fruit** a berry, 1(2 or 3)-seeded. **Seeds** usually globose or, if 2 or 3 together, then hemispherical or 3-angled, marked into 3 areas by a curved groove as in a tennis ball; endosperm usually flinty. $x = 15$.

Species ± 20, Africa; 16 in sthn Afr., Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Lesotho, Northern, Western and Eastern Cape.

Elatinaceae

(Dilleniidae—Guttiferales)

Compiled by C.L. Bredenkamp

Annual herbs or low shrublets, usually of moist places, with branches either deciduous from a persistent woody crown, or perennial, often creeping and rooting; often aromatic. **Leaves** decussate (rarely verticillate), simple, sessile or subsessile, serrate or rarely entire; stipules paired, interpetiolar, small, deciduous or persistent. **Flowers** bisexual, regular, small, axillary, pedicellate or subsessile, persistent, solitary or in dichasia; bracts resembling reduced stipules or 0. **Sepals** 2–5, free or fused at base, imbricate with outermost somewhat longer than others. **Petals** 3–5, free, imbricate, shorter or longer than sepals. **Stamens** as many as petals or twice as many; filaments of outer whorl alternating with petals and often expanded below, those of inner whorl shorter, sometimes slightly expanded; anthers 2-thecous, opening by longitudinal slits, introrse, versatile, dorsifixed. **Ovary** superior, 3–5-locular; placenta axile; styles 3–5, free with apical, usually swollen stigmas; ovules many, attached to a convex placenta with axis protruding and subulate above. **Fruit** a septicidal capsule. **Seeds** subcylindrical, obtuse, straight or somewhat reniform to horseshoe-shaped, smooth or reticulate; endosperm 0.

Genera 2, species ± 30, cosmopolitan, inhabiting damp areas such as marshes, riverbanks or temporary pools; sthn Afr.: genera 2, species 11.

Linnaeus: 367 (1753); Linnaeus: 172 (1754); Linnaeus: 1309 (1771); Harvey: 115 (1860); Wild: 373 (1961); Friedrich-Holzhammer: 1 (1968); Obermeyer: 23 (1976).

Key to genera

Flowers 5-merous; sepals with a prominent, firm midrib and membranous margin; ovary ovoid or globose, attenuate into short or long styles; herbs or shrublets ..... **Bergia**

Flowers 3-(rarely 2-)merous; sepals without a prominent midrib, texture homogeneous; ovary depressed-globose with minute styles; small, creeping, soft herbs, usually hygrophytic ..... **Elatine**

Bergia L. 5230000

Linnaeus: 1309 (1771); Harvey: 115 (1860); Friedrich-Holzhammer: 1 (1968); Obermeyer: 24 (1976).

Erect shrublets or with annual, repent, decumbent or ascending branches from a woody crown, or annuals, glabrous, pilose or glandular-pubescent, often aromatic. **Roots** of hygrophilous plants usually with a spongy outer covering. **Leaves** decussate or rarely verticillate; lamina linear to ovate or obovate, margin entire or serrate, the teeth usually gland-tipped, pointing upwards. **Flowers** small. **Sepals** 5, midrib prominent, margin membranous. **Petals** 5, delicate, white, pink or mauve. **Stamens** 10 (5 in *B. ammannioides*). **Ovary** 5-locular, bearing 5 short or long, patent styles with apical, usually capitate, stigmas (in older flowers these curve outwards and touch stamens; probably self-pollinated); ovules many. **Capsule** with 5 valves breaking away from hard, thin dissepiments; placentas bulging or recurved to horn-shaped, covered with short, hardened funicles; axis prolonged above into a subulate tip. **Seeds** very small, subcylindric to somewhat reniform, usually obtuse above and below, tesselated or smooth, yellow to brown or black. $x = 9$ or 12 (polyploidy).

Species ± 25, widespread in tropical and subtropical countries; 10 in sthn Afr., Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, Northern, Western and Eastern Cape.

Elatine L. 5231000

Linnaeus: 367 (1753); Linnaeus: 172 (1754); Wild: 377 (1961); Obermeyer: 30 (1976).

Small, herbaceous, glabrous, aquatic or semi-aquatic annuals. **Leaves** decussate or verticillate, margin entire or serrulate; stipules small, deciduous. **Flowers** solitary in leaf axils, sessile or pedicels up to 5 mm long, very small, often cleistogamous; bracts 0. **Sepals** 2–4, connate below, midrib indistinct, margin not membranous. **Petals** 3 or 4, free, larger than sepals, white or pink. **Stamens** as many as, or twice as many as petals. **Ovary** globose, 3- or 4-locular; styles 3 or 4, minute, situated on depressed apex of ovary. **Capsule** globose, membranous, dissepiments remaining attached to central axis as wings. **Seeds** numerous, straight or bent to horseshoe-shaped, tesselate. $x = 9$ or 12 (high polyploidy).

Cosmopolitan with ± 12 species occurring in tropical, subtropical and temperate regions as aquatics or in moist situations; 2 in sthn Afr., Botswana, Northern Province, North-West, Gauteng, Mpumalanga and KwaZulu-Natal.

Ericaceae

(Dilleniidae—Ericales)

Compiled by E.G.H. Oliver

Shrublets, shrubs or occasionally small trees. **Leaves** mostly whorled, sometimes alternate or spirally arranged, rarely opposite, simple, mostly 'ericoid' (linear, trigonous, with revolute margins almost touching on underside, leaving only a narrow channel or sulcus), rarely broad; stipules 0. **Flowers** bisexual, regular, axillary in various racemose

florescence types; bract on main axis or partially to fully recaulescent; bracteoles 2(1 or 0), sometimes fully recaulescent. **Calyx** 2–5-lobed or -partite, hypogynous, rarely perigynous. **Corolla** (2–)4(5)-lobed or -subpartite, hypogynous, rarely perigynous, persistent or deciduous. **Stamens** (3–)8(–10), free of fused, included to exserted; filaments, when free, linear to broadening towards base, pilose; anthers 2-thecous, 2-lobed to -partite, often with dorsal appendages; dehiscing by terminal or lateral, small to very long pores; pollen shed mostly as tetrads, occasionally as monads. **Ovary** superior, rarely half-inferior, (1–)4(–8)-locular with 1–many, axile, pendulous, rarely erect, ovules per locule; with or without basal nectaries; style terete, rarely almost absent; stigma simple to broadly funnel-shaped, entire to markedly lobed. **Fruit** mostly a loculicidal capsule, sometimes an indehiscent capsule, drupe, achene or berry. **Seeds** mostly ellipsoid or variously angled; testa thick or almost nonexistent; embryo embedded in copious endosperm.

Genera ± 140, species ± 4500, cosmopolitan, mostly in temperate and tropical regions; sthn Afr.: genera 2, species 771.

Bolus *et al.*: 2 (1905/6); Stevens: 1 (1971); Oliver: 158 (1991); Stevens: 1 (1995).

The 24 minor genera formerly recognised in the subfamily Ericoideae in sthn Afr. (Bolus *et al.* 1905/6; Oliver 1975; Oliver & Van Wyk 1993), are postulated to belong to the single monophyletic genus *Erica*. Some have been reduced to synonymy under *Erica* [Oliver: 1 (1988); Oliver: 771 (1993); Oliver: 121 (1994)] and the remainder are to be published soon (Oliver, in prep.). The following minor genera will be placed in synonymy of *Erica*: *Acrostemon* Klotzsch, *Anomalanthus* Klotzsch, *Arachnocalyx* Compton, *Coccosperma* Klotzsch, *Coilostigma* Klotzsch, *Eremia* D.Don, *Eremiella* Compton, *Grisebachia* Klotzsch, *Nagelocarpus* Bullock, *Platycalyx* N.E.Br., *Salaxis* Salisb., *Scyphogyne* Brongn., *Simocheilus* Klotzsch, *Stokoeanthus* E.G.H.Oliv., *Sympieza* Licht. ex Roem. & Schult., *Syndesmanthus* Klotzsch, *Thamnus* Klotzsch and *Thoracosperma* Klotzsch.

Key to genera

Leaves flat, more than 40 × 10 mm; corolla deciduous; ovary half-inferior ..... **Vaccinium**
Leaves ericoid, if flat then less than 10 × 5 mm; corolla persistent; ovary superior, half-inferior in one species ..... **Erica**

Erica L. 6237000

Linnaeus: 352 (1753); Guthrie & Bolus: 4 (1905) in part; Salter: 627 (1950) in part; Dulfer: 25 (1965) in part; Oliver (1975) in part; Oliver in broad sense, in prep.

Blaeria L.: 112 (1753); Oliver: 771 (1993). *Philippia* Klotzsch: 354 (1835); Oliver: 455 (1987). *Ericinella* Klotzsch: 222 (1838); Oliver: 121 (1994).

Shrublets, shrubs or occasionally small trees up to 5 m tall. **Leaves** 3- or 4-nate in whorls, occasionally 6-nate, rarely opposite or spirally arranged, mostly linear-oblong to ovate, trigonous, with revolute margins almost touching on underside (ericoid), less commonly broad, flat and open-backed but then less than 10 × 5 mm, sometimes very reduced and scale-like below florescences. **Flowers** always axillary, in 1–12 whorls variously arranged in elongate racemose to subumbellate florescences, either at ends of all leafy branches or of very short lateral branchlets or of only the main branches, sometimes forming dense synflorescences; pedicel usually present, sometimes very reduced, very rarely non-existent; bract always present, on the main axis to partially recaulescent to fully recaulescent forming abaxial lobe/segment of the calyx; bracteoles [0](1)2, sometimes fully recaulescent forming lateral lobes/segments of calyx. **Calyx** (2–)4-partite or -lobed, hypogynous, small and leaf-like or large and showy, rarely longer than corolla, sometimes enlarging and thickening considerably in fruiting stage. **Corolla** (2–)4-lobed, hypogynous but semiperigynous in 1 species, tubular, ampullaceous, urceolate, globose, ovoid, campanulate, cyathiform, obconic or funnel-shaped, small to large and brightly coloured, dull-coloured in most wind-pollinated species, persistent. **Stamens** (3–)8[–10], free or completely fused, included or exserted; anthers dorsifixed or basifixed, with or without simple or elaborate dorsal appendages, thecae partly united or sometimes free, with small subterminal pores or pores sometimes as long as thecae; pollen shed as tetrads or sometimes as monads. **Ovary** superior, half-inferior in 1 species, (1–)4[–8]-locular, with 1–180 ovules per locule, sessile or stalked nectaries usually prominent around base, sometimes absent in wind-pollinated species; style filiform, rarely nonexistent, exserted or included; stigma simple-truncate, capitate, peltate, cyathiform or funnel-shaped and considerably enlarged in wind-pollinated species, rarely 4-lobed. **Fruit** mostly a dehiscent loculicidal capsule, sometimes an indehiscent capsule, drupe or achene; seeds with thick testa, mostly alveolate, sometimes smooth or spiky, in indehiscent fruits testa sometimes very thin, transparent or almost nonexistent. $x = 12$.

Species 860. Africa, Madagascar and Europe: 770 confined to sthn Afr., Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal with the greatest diversity in Western and Eastern Cape.

Vaccinium L. 6216000

Linnaeus: 349 (1753); Brown: 1 (1905) under Vacciniaceae; Verdoorn: 92 (1954).

Shrubs up to 4 m tall. **Leaves** alternate, broad, flat, 40–60 × 10–20 mm. **Flowers** in small axillary racemes; bract much reduced, on main axis; bracteoles 2, much reduced. **Calyx** 4- or 5-lobed; tube short, adnate to ovary. **Corolla** 4- or 5-lobed, deciduous. **Stamens** 10, free; filaments broadening towards base, pilose; anthers dorsifixed near apex, with 2 small dorsal appendages, thecae produced into 2 long tubes opening by terminal pores; pollen shed as tetrads. **Ovary** half-inferior, 4- or 5-locular or falsely 10-locular owing to intrusion of partitions from placenta, with few to numerous ovules per locule; style slender, included; stigma simple or subcapitate. **Fruit** a berry ± the size of a small pea, crowned with persistent calyx lobes; seeds ellipsoid, with thick alveolate testa. $x = 12$ (polyploidy).

Species ± 450, cosmopolitan, mainly in South America and southeast Asia; 1 (*Vaccinium exul* Bolus) in sthn Afr., Drakensberg escarpment of Mpumalanga.

Erythroxylaceae

(Rosidae—Linales)

Compiled by C.L. Bredenkamp

Trees, shrubs, or undershrubs, glabrous. **Leaves** usually alternate, occasionally opposite, simple, entire or sometimes slightly crenate; stipules intrapetiolar, rarely extrapetiolar, persistent, deciduous or caducous. **Flowers** regular, bisexual, rarely unisexual, small, solitary or fascicled or inflorescence a panicle of cymes; bracts present or absent. **Calyx** with (4)5(6) sepals, free or ± connate, persistent. **Petals** as many as sepals, free, imbricate, deciduous, usually with a transverse, bifid scale at base of limb, rarely wide, but if so, then texture of claw different from that of limb. **Stamens** twice as many as petals; filaments united at base. **Ovary** superior, usually 2- or 3-locular with 1 or 2 axile, pendulous ovules in each locule, sometimes all but one locule aborted; styles 3–5, free or more or less connate; stigmas oblique, depressed-capitate or clavate. **Fruit** a drupe.

Genera 4, species ± 260, tropical, especially American; in sthn Afr. genera 2, species 6.

Browne: 278 (1756); Sonder: 233 (1860); Engler: 109 (1902); Robson: 102 (1963).

Key to genera

Styles 2, completely united; stigmas flattened, spreading or reflexed; petal-nectaries small, hidden by sepals; flowers opening on leafless shoots ..... **Nectaropetalum**
Styles 3, rarely 2, free or partially united; stigmas capitate or obliquely capitate; petal-nectaries large, convolute, exceeding the sepals; flowers on leafy shoots ..... **Erythroxylum**

Erythroxylum P.Browne 3956000

Browne: 278 (1756); Sonder: 233 (1860); Robson: 103 (1963).

Shrubs or trees. **Leaves** alternate, membranous or coriaceous, entire; stipules caducous or occasionally subpersistent, sometimes crowded towards tips of leafless twigs, leaving conspicuous scars. **Flowers** small, pedicellate, solitary or fascicled. **Calyx** with 5(6) sepals, usually slightly connate at base. **Petals** free, usually with an erect, transverse, 2-fid appendage on inner face, occasionally with a transverse pocket. **Stamens** 10(12) connate at base into a cup- or saucer-shaped structure; filaments equal or unequal in length, inserted in 1 or 2 rows. **Ovary** superior, 3(2)-locular, with 1(2) ovule in each locule, if more than 1 locule sometimes all but one aborted; styles 3(2), free or connate at base or for half their length; stigmas subclavate, subglobose, or discoid, flat and recurved in the simple-styled species. **Fruit** a small, 1-seeded drupe. $x = 12$.

Species ± 250, cosmopolitan in tropical and subtropical regions; 4 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Eastern Cape; forests.

Nectaropetalum Engl. 3956010

Engler: 109 (1902); Phillips: 432 (1951) under *Erythroxylum*; Robson: 108 (1963).

Peglera Bolus: 362 (1907).

Shrubs or small trees, with twigs sometimes compressed. **Leaves** petiolate, simple, entire, more or less coriaceous, penninerved, with densely reticulate tertiary nervation; stipules intrapetiolar, usually completely united, caducous or deciduous. **Flowers** axillary, solitary or in few-flowered fascicles, heterostylous. **Sepals** (4)5, valvate, connate at base, ± coriaceous. **Petals** free, clawed, deciduous, white, nectary appendage small, rarely absent. **Stamens** united at base into shallow cup, sometimes with glands outside; filaments of equal or unequal length. **Ovary** 2-locular, each locule with 1 ovule; styles united; stigmas 2, free, spreading or reflexed. **Fruit** fleshy, oval, up to 10 mm long, green, turning yellow after falling.

Species 6, Africa; 2 in sthn Afr., KwaZulu-Natal and Eastern Cape.

Escalloniaceae

(Rosidae—Rosales)

Compiled by M. Jordaan

Small trees or scrambling shrubs; dioecious or polygamous. **Leaves** alternate, simple, usually glandular-serrate, penninerved, midrib and lateral veins prominent below, often with domatia in axils; stipules usually 0 or minute. **Inflorescences** dense, much branched, axillary panicles, shorter than leaves. **Flowers** bisexual, sometimes unisexual, ± regular, small. **Calyx**: tube obconic, adnate to ovary; lobes 5, subulate, distant, triangular at base, puberulous, persistent. **Petals** 5, ± free, ovate-deltoid, perigynous, broad at base and confluent with epigynous disc, valvate, puberulous, persistent. **Stamens** 5, alternating with petals, inserted at margin of disc; filaments subulate, villous; anthers dorsifixed, villous, small, ovoid, the thecae separated by a thick connective. **Ovary** partly inferior, 2-locular; ovules many on axile placentas; styles 2, subulate, adherent or diverging; stigmas capitate. **Fruit** a small leathery capsule, half-inferior, 2-locular, dehiscing septicidally through persistent styles, many-seeded. **Seeds** small, irregularly obovoid or oblong-obovoid, sculptured, slightly curved; testa black; endosperm copious; embryo small or large.

Genera ± 9, ± 150 species; tropical and south temperate, mainly in South America and Australia, also eastern and central tropical and sthn Afr.; 1 genus, 1 species in sthn Afr.

Dumortier: 35, 37 (1829) as Escalloneae; Harvey: 305 (1862) as Saxifragaceae; Hooker: 629 (1865); Engler: 211 (1928) as Saxifragaceae subfamily Escallonioideae; Airy Shaw: 248 (1973) as Iteaceae; Verdcourt: 1 (1973) as Escalloniaceae; Brummitt: 564 (1992) as Escalloniaceae; Mabberley: 267 (1997) as Grossulariaceae.

Choristylis is sometimes placed in the Grossulariaceae in a broad sense (Cronquist 1981; Mabberley 1997) but is retained here in Escalloniaceae (as by Verdcourt 1973; Brummitt 1992). *Choristylis* and *Itea* are sometimes placed in the small family Iteaceae (Airy Shaw 1973), mainly because of their extraordinary 2-porate subisopolar pollen grains.

Choristylis Harv. 3241000

Harvey: 19 (1842); Harvey: 308 (1862); Hooker: 647 (1865); Engler: 214 (1928); Verdcourt: 1 (1973).

Description as for family.

Species 1, restricted to east, central and sthn Afr.: *Choristylis rhamnoides* Harv., Northern Province, Mpumalanga (eastern lowveld) to KwaZulu-Natal and Eastern Cape.

(Dilleniidae—Malpighiales)

Compiled by R.H. Archer

Herbs, shrubs, trees, sometimes succulent, sometimes twining or climbing, monoecious or dioecious; latex often present, milky, sometimes watery, rarely reddish. **Leaves** alternate, rarely opposite, or in whorls, simple, rarely compound, sometimes rudimentary; indumentum simple to stellate or lepidote (sometimes absent); stipules free, rarely connate or absent. **Inflorescences** terminal or axillary, basically cymose; flowers solitary or in glomerules, these often grouped into spiciform or capitate thyrses or pseudanthia, sometimes in cyathia (*Euphorbia*); bracts often glandular. **Flowers** unisexual, regular, usually small, often dissimilar in the two sexes; perianth present or 0 in 1 or both sexes, usually of 5 segments, sometimes sepals and petals present, petals rarely united at base. **Male flowers**: stamens 1–50(–400), hypogynous, rarely perigynous; filaments free or connate; anthers 2(3 or 4)-thecous, opening lengthwise or sometimes by pores; ovary rudimentary or absent. **Female flowers**: ovary superior, (1–)2–5(–20)-locular, with 1 or 2 pendulous, apical-axile, inverted ovules in each locule; styles as many as carpels, free or ± connate, entire, 2-lobed or variously cut. **Disc** annular, entire or lobed, of free scales or absent. **Fruit** usually capsular, (1 or 2)3(4–7)-locular, mericarps elastically dehiscent from persistent columella, or indehiscent and drupaceous, or of a single nut or 2 or 3 connate nuts. **Seeds** with or without caruncle; embryo straight or curved; endosperm copious, oily, rarely 0, often poisonous.

Genera over 300, species over 5000; cosmopolitan, mainly in tropics.; sthn Afr.: genera 50, species 484.

Brown, Hutchinson & Prain: 216 (1915); Meyer: 1 (1967); Radcliffe-Smith: 1 (1987a); Radcliffe-Smith: 47 (1987b); Webster: 3 (1994a); Webster: 33 (1994b); Radcliffe-Smith: 1 (1996).

For keys and descriptions of 5 subfamilies and 49 tribes and subtribes, see Webster: 33 (1994b); Radcliffe-Smith: 1 (1996).

Key to subfamilies

1a Locules of ovary each with 2 ovules; pollen grains binucleate:
2a Leaves usually alternate, simple; petals present or 0; pollen grains not spiny ..... **Phyllanthoideae**
2b Leaves often opposite, compound; petals 0; pollen grains spiny ..... **Oldfieldioideae**
1b Locules of ovary each with 1 ovule; pollen grains binucleate or trinucleate:
3a Latex absent; petals present or 0; indumentum simple or stellate; pollen grains binucleate ..... **Acalyphoideae**
3b Latex present; pollen grains binucleate or trinucleate:
4a Latex reddish, yellowish or milky; indumentum often stellate or lepidote; petals mostly present (at least in staminate flowers) ..... **Crotonoideae**
4b Latex whitish, often caustic or toxic; indumentum simple or 0; petals 0 ..... **Euphorbioideae**

Key to genera

1a Herbs, sometimes woody at base, or succulent herbs or shrubs:
2a Leaves opposite or whorled:
3a Apparent flower (cyathium) a ± cup-shaped structure with glands around its rim enclosing several stamens (reduced male flowers) and a central reduced female flower ..... **Euphorbia**
3b Flowers male, female or bisexual, not borne in a cyathium:
4a Calyx 3-lobed ..... ***Mercurialis**
4b Calyx 5-lobed ..... **Adenocline**
2b Leaves mostly alternate, often much reduced in succulent species:
5a Apparent flower (cyathium) a ± cup-shaped structure with glands around its rim enclosing several stamens (reduced male flowers) and a central reduced female flower:
6a Cyathium with (2,3) 4 or 5 (6–8) separate glands ..... **Euphorbia**
6a Cyathium with a glandular rim open on one side ..... **Monadenium**
5b Flowers male, female or bisexual, not borne in a cyathium:
7a Plants twining or trailing, often with stinging hairs:
8a Inflorescences surrounded by 2 large foliaceous involucral bracts ..... **Dalechampia**
8b Inflorescences not involucrate:
9a Stinging hairs absent; capsule breaking into 4 dorsally winged cocci ..... **Plukenetia**
9b Stinging hairs usually present; capsule of 3 wingless cocci:
10a Styles united into a tube ..... **Tragiella**
10b Styles free above ..... **Tragia**
7b Plants erect to diffuse, not climbing or trailing:
11a Leaves palmately lobed, large, peltate; plant often tree-like ..... ***Ricinus**
11b Leaves not deeply palmately lobed; petiole attached to leaf base:
12a Petals present, at least in male flowers:
13a Indumentum stellate or lepidote:
14a Anthers reversed and filaments inflexed in bud, becoming erect in the open flower; racemes or spikes terminal ..... **Croton**
14b Anthers erect or twice flexed in bud ..... **Chrozophora**
13b Indumentum simple or 0:
15a Flowers in axillary fascicles:
16a Male disc of separate glands; stamens connate into a tube ..... **Clutia**
16b Male disc saucer-shaped; stamens free or connate basally ..... **Andrachne**
15b Flowers in racemose or cymose inflorescences:
17a Annual herbs; disc obsolete ..... **Caperonia**
17b Perennial herbs or shrubs; disc of 5 free glands or annular ..... **Jatropha**
12b Petals absent:
18a Female flowers usually subtended by accrescent bracts; styles laciniate with filiform segments, often red; anthers vermiform ..... **Acalypha**
18b Female flowers not subtended by accrescent bracts; styles not laciniate; anthers vermiform:
19a Styles 2; ovary 2-locular:
20a Flowers in terminal racemes ..... **Leidesia**
20b Flowers in terminal or axillary fascicles or cymules ..... **Seidelia**
19b Styles 3(4); ovary usually 3-locular:
21a Sepals 4–6, membranous, imbricate; stamens 2–6 in middle of flower ..... **Phyllanthus**
21b Sepals 3 or 4, valvate; stamens 3–30, usually intermingled with small glands ..... **Micrococca**
1b Shrubs or trees:
22a Leaves opposite or whorled:
23a Leaves in whorls of 4, leathery, glabrous ..... **Hyaenanche**
23b Leaves opposite:
24a Leaves glabrous; latex milky; stipules minute or 0 ..... **Excoecaria**
24b Leaves white-silky below; latex absent; stipules large, sheathing ..... **Androstachys**
22b Leaves mostly alternate, often much reduced to absent in succulents:

25a Apparent flower (cyathium) a ± cup-shaped structure with glands around its rim enclosing several stamens (reduced male flowers) and a central reduced female flower:
26a Cyathium with (2,3) 4 or 5 (6–8) separate glands ..... **Euphorbia**
26b Cyathium with a continuous, occasionally 2–5-notched glandular ring ..... **Synadenium**
25b Flowers male or female, not borne in cyathia:
27a Leaves palmately lobed to compound:
28a Leaves palmately compound with 5–7 petiolate leaflets, sparingly stellate above ..... **Schinziophyton**
28b Leaves palmately 5–11-lobed to -partite, without stellate hairs:
29a Leaves peltate; inflorescences unisexual ..... ***Ricinus**
29b Leaves attached at base; inflorescences bisexual ..... ***Manihot**
27b Leaves not compound nor deeply palmately lobed:
30a Petals present, at least in male flowers:
31a Indumentum stellate or lepidote:
32a Indumentum usually densely stellate or lepidote; fruit a globose capsule ..... **Croton**
32a Indumentum silver to ferruginous-silver; fruit very large, indehiscent ..... ***Aleurites**
31b Indumentum simple or 0:
33a Flowers in axillary fascicles:
34a Male disc of separate glands; stamens connate into a tube ..... **Clutia**
34b Male disc annular or cupular; stamens free or basally connate:
35a Male calyx lobes valvate ..... **Bridelia**
35b Male calyx lobes imbricate:
36a Male flowers with 3 sepals; ovary 0 ..... **Heywoodia**
36b Male flowers with 5 sepals; ovary rudimentary:
37a Male disc annular, villous ..... **Lachnostylis**
37b Male disc saucer-shaped, glabrous ..... **Andrachne**
33b Flowers in spicate, racemose, paniculate, thyrsiform or cymose inflorescences:
38a Flowers panicled or in 2- or 3-branched, fasciculate cymes, the female flowers surrounded by male ones ..... **Jatropha**
38b Flowers spicate or racemose:
39a Male calyx lobes imbricate ..... **Jatropha**
39b Male calyx lobes valvate:
40a Fruit large, up to 50 mm in diameter, tardily dehiscent ..... ***Vernicia**
40b Fruit up to 30 mm in diameter, dehiscent:
41a Inflorescences terminal; pistillode present ..... **Cavacoa**
41b Inflorescences axillary; pistillode 0 ..... **Cleistanthus**
30b Petals absent:
42a Female flowers usually subtended by accrescent bracts; style laciniate with filiform segments, often red; anthers vermiform ..... **Acalypha**
42b Female flowers, style and anthers not as above:
43a Sepals of male flowers open in bud (exposing anthers); typically with milky latex:
44a Spikes of male flowers dense, ovoid or globose; seeds caruncled ..... **Maprounea**
44b Spikes of male flowers narrow, elongate; seeds caruncled or not:
45a Male sepals 1 or 2, if 2 then vertical and flowers appearing compressed; stamens 5–50 ..... ***Homalanthus**
45b Male sepals 2–5; stamens 2 or 3(–8):
46a Inflorescence lateral; capsule large, inflated ..... **Excoecaria**
46b Inflorescence a terminal spike; capsule not more than 20 mm in diameter:
47a Inflorescence a lax spike; caruncle, if present, remaining attached to seed ..... **Sapium**
47b Inflorescence a dense spike, subcylindric; caruncle attached to the columella, separated from the seed ..... **Spirostachys**
43b Sepals of male flower closed in bud; latex mostly absent, if present, watery to reddish to milky:
48a Female calyx lobes pinnatifid ..... **Cephalocroton**
48b Female calyx lobes entire or ± obsolete:
49a Sepals of male flowers valvate in bud:
50a Bud scales coriaceous, persistent ..... **Erythrococca**
50b Buds naked:
51a Stamens 2–4; leaves with 3 or 4 prominent veins from base ..... **Macaranga**
51b Stamens ± 8; leaves penninerved ..... **Alchornea**
49b Sepals of male flowers imbricate in bud:
52a Fruit flattened, winged ..... **Hymenocardia**
52b Fruit not markedly winged:
53a Fruit indehiscent, drupaceous, usually 1-seeded by abortion:
54a Flowers in axillary fascicles; drupe ± globose ..... **Drypetes**
54b Flowers in spikes or racemes, often catkin-like; drupe compressed ..... **Antidesma**
53b Fruit dehiscent, sometime tardily so, mostly with more than 1 seed:
55a Flowers in leaf-opposed cymose glomerules; ovule 1 per locule ..... **Suregada**

55b Flowers in axillary inflorescences; ovules 2 per locule:
56a Pistillode absent in male flowers:
57a Male disc annular ..... **Margaritaria**
57b Male disc usually composed of ± separate glands ..... **Phyllanthus**
56b Pistillode present in male flowers:
58a Male disc composed of 5 separate glands ..... **Flueggea**
58b Male disc annular ..... **Pseudolachnostylis**

Acalypha L. 4407000

(Acalyphoideae—Acalypheae)
Linnaeus: 1003 (1753); Prain: 466 (1920); Radcliffe-Smith: 185 (1987a); Webster: 90 (1994b); Radcliffe-Smith: 182 (1996).

Herbs, undershrubs, shrubs, or trees; monoecious or rarely dioecious; indumentum simple, often glandular. **Leaves** alternate, petiolate, 3–7-nerved from base. **Inflorescence** various, when bisexual usually basal, when unisexual the male flowers often in long-peduncled spikes below female ones or in close-set spikes or some other variation. **Petals** 0. **Disc** 0. **Male flowers**: calyx splitting into 4 valvate lobes; stamens usually 8, attached to a slightly raised receptacle; filaments free; anther thecae separate, twisted; pistil absent. **Female flowers** usually subtended by accrescent bracts; calyx membranous, 3- or 4-lobed or -partite, imbricate, shorter than ovary; ovary 3-locular, with a single ovule in each locule; styles exserted, free or connate at base, variable. **Fruit** a 3-locular, 3-lobed capsule, soon dehiscing septicidally into bivalved cocci. **Seeds** subglobose or ellipsoid, with crustaceous testa; carunculate or not; albumen fleshy; cotyledons broad, flat. $x = 10$ (7, 12—1 report) (high polyploidy).

Species 450, cosmopolitan in warm regions: 22 from sthn Afr., widespread.

Adenocline Turcz. 4370000

(Crotonoideae—Adenoclineae)
Turczaninow: 59 (1843); Prain: 488 (1920); Webster: 101 (1994b); Radcliffe-Smith: 247 (1996).

Herbs, erect or diffuse; dioecious, rarely monoecious. **Leaves** alternate, rarely opposite. **Inflorescence** of axillary cymules, often passing into a terminal raceme or panicle, with several male flowers and few to solitary female ones. **Petals** 0. **Male flowers**: calyx deeply 5-lobed; disc glandular; stamens 6–12; filaments free; anther thecae ± separate. **Female flowers**: calyx deeply 5-lobed, imbricate; disc of 3 spatulate or broad glands; ovary 3-locular, with solitary ovule in each locule; styles bipartite, slightly united at base. **Fruit** a 3-lobed, globose capsule, breaking into bi-valved cocci. **Seeds** globose or ovoid, ecarunculate; testa thinly crustaceous; albumen fleshy; cotyledons scarcely broader than radicle. $x = 9$ (B-chromosomes).

Species 3 (or 8 in the sense of Prain): sthn Afr., fairly widespread; also Malawi.

Alchornea Sw. 4388000

(Acalyphoideae—Alchorneae)
Swartz: 98 (1788); Pax & Hoffmann: 220 (1914); Prain: 484 (1920); Radcliffe-Smith: 251 (1987a); Webster: 81 (1994b); Radcliffe-Smith: 151 (1996).

Trees or shrubs; dioecious, rarely monoecious; occasionally with watery latex. **Leaves** alternate, shortly petiolate, often 3-nerved from base, frequently glandular between nerves on lower surface at base; stipellate. **Inflorescence** of male flowers in axillary or lateral, simple or branched spikes, several to a bract and with female flowers in axillary spikes or racemes, solitary to a bract. **Petals** 0. **Disc** usually 0. **Male flowers**: calyx splitting into 2–5 valvate lobes; stamens 8 or rarely fewer; filaments free or nearly so; pistil 0. **Female flowers**: calyx 3–6-lobed, with lobes imbricate; ovary (1)2- or 3(4)-locular, with a single ovule in each locule; styles free, usually entire. **Fruit** a 2- or 3(4)-coccous capsule, with cocci bivalved, leaving persistent columella; endocarp crustaceous. **Seeds** subglobose, ecarunculate; testa crustaceous; albumen fleshy; cotyledons broad, flat. $x = 11$ (polyploidy).

Species ± 50, cosmopolitan in tropics; 6 African; 2 in sthn Afr.; Northern Province, Mpumalanga to N KwaZulu-Natal.

*__Aleurites__ J.R.Forst. & G.Forst. 4428000

(Crotonoideae—Aleuritideae)
Forster & Forster: 111, t. 56 (1776); Radcliffe-Smith: 176 (1987a); Webster: 114 (1994b). Radcliffe-Smith: 299 (1996); Stuppy *et al.*: 79 (1999).

Trees, indumentum stellate, silver; monoecious. **Leaves** alternate, simple, entire or palmately lobed, without glands in marginal sinuses between lobes, petiolate; stipules minute and fugacious. **Inflorescences** terminal, thyrsiform, androgynous, protogynous, with a solitary female flower terminating each major axis, lateral cymules male; bracts subulate, readily caducous. **Male flowers**: calyx valvate, 2- or 3-lobed; petals free, imbricate; disc 5-lobed; stamens 4-verticillate, ± 20, outer free, inner ± united, borne on a conical receptacle; anthers introrse; pistillode 0. **Female flowers**: calyx, petals and disc as in male flowers; ovary 2- or 3-locular, with 1 ovule per locule; styles 2 or 3, thick, bilobed. **Fruit** large, drupaceous, indehiscent, 2- or 3-locular or 1-locular by abortion; exocarp fleshy; endocarp thin, woody. **Seeds** ovoid, ecarunculate; testa thick, woody; albumen hard; embryo straight, embedded in copious endosperm; cotyledons broad, flat. $x = 11$ (polyploidy).

Species 2 from tropical Asia and Oceania; 1 in sthn Afr.: *__Aleurites__ *mollucana* (L.) Willd., Tung-nut, cultivated in Mpumalanga and KwaZulu-Natal in subtropical areas and may occur as escape.

Andrachne L. 4286000

(Phyllanthoideae—Phyllantheae)
Linnaeus: 1014 (1753); Hutchinson: 385 (1915); Webster: 42 (1994b); Radcliffe-Smith: 27 (1996).

Herbs, undershrubs, or shrubs; monoecious. **Leaves** alternate; stipulate. **Flowers** often in axillary fascicles (male) and solitary (female). **Male flowers**: sepals and petals 5(6); petals membranous, subequalling sepals; disc saucer-shaped, crenulate; stamens 5(6), free or subconnate at base; anthers subglobose; ovary rudimentary. **Female flowers**: sepals and petals as in male; disc saucer-shaped, crenulate; ovary 3-locular, with 2 ovules in each locule; styles bifid or bipartite. **Fruit** a 3-lobed capsule; endocarp thinly woody. **Seeds** ± 3-angled, somewhat wrinkled, ecarunculate; albumen fleshy; embryo curved, radicle long, cotyledons broad and flat. $x = 12$ (11) (polyploidy).

Species 15, mainly in warm parts of northern hemisphere; 1 in sthn Afr., *Andrachne ovalis* Müll.Arg.; Northern Province, Mpumalanga, KwaZulu-Natal, Eastern and Western Cape (near George).

Androstachys Prain 4345010

(Oldfieldioideae—Picrodendreae)

Prain: 438 (1908); Hutchinson: 377 (1915); Airy Shaw: 251 (1965) Androstachydaceae Airy Shaw; Airy Shaw: 519 (1970); Leroy: 147 (1976); Alvin: 579 (1987); Dahlgren & Van Wyk: 3 (1988) Androstachydaceae; Webster: 61 (1994b); Radcliffe-Smith: 120 (1996).

Trees, dioecious; rather rigid, even branchlets, decussately branched; branchlets adpressed silky-pilose, angled, articulated. **Leaves** decussate, petiolate, ovate to suborbicular, usually subcordate, densely silky on undersurface; stipules large, connate, sheathing, deciduous. **Flowers** axillary; male inflorescence a shortly pedunculate triad of cernuous, catkin-like spikes or racemes; female flowers solitary. **Petals** 0. **Disc** 0. **Male flowers**: calyx of 2–5 bract-like, spirally arranged, ciliate sepals; stamens many, spirally arranged on prolonged axis, with lowest filaments short and recurved, upper subsessile; anthers with thecae slightly divided and with few, long hairs at apex; pistil absent. **Female flowers**: calyx 5-partite, with ovate-acuminate, imbricate segments; ovary 3- or 4-locular, with 2 ovules in each locule; densely tomentose; styles connate into a pilose column; stigmas 3, spreading, large, linear-lanceolate. **Fruit** breaking up into 3 or 4 bivalved cocci, depressed-globose, often with dense indumentum. **Seeds** elliptic-globose; testa hard and shiny; embryo straight with two collateral rounded cotyledons, chlorophyllous; endosperm abundant, oily.

Species 1, Africa and Madagascar, *Androstachys johnsonii* Prain; Northern Province, Mpumalanga and Swaziland.

Antidesma L. 4327000

(Phyllanthoideae—Antidesmeae)

Linnaeus: 1027 (1753); Hutchinson: 405 (1920); Airy Shaw: 1076 (1966) Stilaginaceae; Radcliffe-Smith: 572 (1988); Webster: 52 (1994b); Radcliffe-Smith: 105 (1996).

Trees or shrubs; dioecious. **Leaves** alternate, large, entire; stipulate. **Inflorescence** a raceme or spike, often catkin-like, more rarely subpaniculate, sometimes male flowers in a spike and female in a panicle; bracts small, usually ciliate. **Petals** 0. **Male flowers**: calyx membranous, small, 3–5(–8)-lobed or -partite, imbricate; disc subentire or consisting of distinct glands; stamens (2)3–5(–10); ovary rudimentary. **Female flowers**: calyx as in male; disc annular, surrounding base of ovary; ovary 1(2)-locular, with 2 ovules in each locule; styles (2)3(–5), usually bilobed. Fruit a small, often oblique and compressed-ellipsoid, red or black drupe; endocarp hardened. **Seeds** usually solitary by abortion, ecarunculate; albumen fleshy; cotyledons broad, flat. $x = 13$ (high polyploidy, B-chromosomes).

Species ± 200, mostly in warmer parts of Old World; only 7 in Africa; 2 in sthn Afr., mainly *Antidesma venosum* Tul.; Namibia, Botswana, Northern Province, Mpumalanga, to KwaZulu-Natal and Eastern Cape.

Bridelia Willd. 4345000

(Phyllanthoideae—Bridelieae)

Willdenow: 978 (1806) as *Briedelia*; Hutchinson: 378 (1915); Radcliffe-Smith: 120 (1987a); Webster: 39 (1994b) adopting Willdenow's original spelling; Radcliffe-Smith: 12 (1996); proposal for spelling of name to be conserved.

Shrubs or small trees; monoecious or sometimes dioecious. **Leaves** alternate, petiolate, entire; stipulate. **Inflorescence** of axillary glomerules, rarely spicate, with female flowers fewer or solitary, sometimes pedicellate; bracts scale-like. **Male flowers**: sepals 5, usually small and scale-like, valvate; petals 5, obovate, shorter than sepals; disc entire or sinuately lobed; stamens 5; filaments connate; ovary rudimentary at apex of staminal column. **Female flowers**: sepals often narrower than those of male; disc double, the outer annular, the inner usually cup-like and surrounding base of ovary, or of separate scales; ovary 2(3)-locular, with 2 ovules in each locule; styles distinct or shortly connate, bilobed or subentire. **Fruit** a capsule separating into 2 cocci, or drupaceous or berry-like; endocarp crustaceous, forming 2 pyrenes. **Seeds** often solitary by abortion in each pyrene; albumen copious, fleshy; embryo curved; cotyledons broad, foliaceous. $x = 13$.

Species ± 60, Africa to Asia and Australia; 4 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga to KwaZulu-Natal and Eastern Cape.

Caperonia A.St.-Hil. 4361000

(Acalyphoideae—Chrozophoreae)

Saint-Hilaire: 244 (1824); Prain: 457 (1920); Radcliffe-Smith: 163 (1987a); Radcliffe-Smith: 448 (1989); Webster: 71 (1994b). Radcliffe-Smith: 138 (1996).

Erect annual herbs; monoecious, rarely dioecious. **Leaves** alternate, shortly petiolate; stipulate. **Flowers** in lax, axillary and solitary, pedunculate racemes; upper flowers male, lower 1 or more female. **Male flowers**: calyx closed in bud, ovoid or subglobose, splitting into 5 valvate lobes; petals 5, imbricate, subequal or with 2 lowest reduced or even obsolete; disc obsolete; stamens usually 10; filaments connate below into a column, 2-seriate above, free portion spreading; anthers short, ovoid, with 2 thecae pendulous from glandular connective and dehiscing longitudinally; ovary rudimentary, at apex of staminal column. **Female flowers**: sepals 5(or 6), generally unequal, imbricate, outer smaller than inner; petals 5, subequal; disc absent; ovary sessile, 3-locular, with ovules solitary in each locule; styles slightly connate at base, ovate, deeply laciniate. **Fruit** a capsule with bivalved cocci, with obtuse or subulate processes mixed with or passing into gland-tipped setae; endocarp thinly crustaceous; columella not usually persistent. **Seeds** subglobose or oblong-globose, with minutely punctate-reticulate testa, without caruncle but with thin adhering aril which may form a false raphe; albumen fleshy; cotyledons broad, flat. $x = 11$ (1 report, polyploidy).

Species ± 40, tropical to subtropical, mostly America, 6 in Africa; 2 in sthn Afr., Namibia, Northern Province, Mpumalanga lowveld to N KwaZulu-Natal.

Cavacoa J.Léonard 4353020

(Crotonoideae—Aleuritideae)

Léonard: 320 (1955); Radcliffe-Smith: 174 (1987a); Webster: 115 (1994b); Radcliffe-Smith: 304 (1996).

Trees with buttressed trunks; dioecious. **Leaves** alternate, simple, entire, very minutely translucent-punctate, petiolate; petiole longitudinally grooved or narrowly canaliculate along upper surface; stipules early caducous, leaving a conspicuous, ± semicircular scar. **Flowers** in terminal racemes with male ones in spikes of few-flowered fascicles and with pedicels articulated near base; bracts broad, soon caducous, overlapping when young in cone-like clusters at tips of branchlets. **Male flowers**: calyx membranous; sepals valvate in bud and splitting into 2 segments on opening; petals 4 or 5, free, imbricate; disc of 4 or 5(6) fleshy glands alternating with petals; stamens 15–30, with filaments erect in bud and arising from a central, cone-like receptacle; anthers subcordate with a somewhat fleshy, glabrous connective; anthers inclined and dehiscing longitudinally; ovary absent. **Female flowers**: sepals (4)5, free, imbricate; disc saucer-shaped; ovary 3–5-locular; ovules solitary in each locule; styles 3–5, bifid. **Fruit** a large capsule, 3–5-

lobed, of 3–5 bivalved cocci; pericarp thin, crustaceous; endocarp thick, woody; columella large, persistent. **Seeds** ecarunculate, ovoid-subglobose.

Species 3, Africa, 1 in sthn Afr., *Cavacoa aurea* (Cavaco) J.Léonard; Kenya, Mozambique to KwaZulu-Natal.

Cephalocroton Hochst. 4439000

(Acalyphoideae—Epiprineae)

Hochstetter: 370 (1841); Prain: 458 (1920); Radcliffe-Smith: 282 (1987a); Webster: 79 (1994b); Radcliffe-Smith: 149 (1996).

Shrubs, with stellate hairs; monoecious. **Leaves** alternate, shortly petiolate; stipules laciniate. **Inflorescence** a terminal raceme with male flowers in apical clusters and female flowers pedicelled, basal. **Petals** 0. **Male flowers**: calyx splitting into 3–5 valvate lobes; disc absent; stamens 5–8; filaments free; anther thecae separate in upper half; pistil rudimentary, columnar, entire or 2- or 3-lobed. **Female flowers**: sepals 4–6, unequal, shortly pinnatifid, accrescent in fruit, glandular and stellately hairy; disc small, annular; ovary 3(4)-locular, with a single ovule in each locule, glandular and stellately hairy; styles connate at base, lobed or multifid at apex. **Fruit** a woody capsule of 3(4) bivalved cocci. **Seeds** ovoid-subglobose, smooth, evenly greyish or marbled, ecarunculate; testa crustaceous and albumen fleshy; cotyledons broad, flat.

Species 5, Africa; Socotra, Madagascar and Comoro Islands and Sri Lanka; 1 in sthn Afr.: *Cephalocroton mollis* Klotzsch in Namibia, Botswana, Northern Province and KwaZulu-Natal.

Chrozophora Neck. ex Juss. 4355000

(Acalyphoideae—Chrozophoreae)

Jussieu: 27 (1824) as *Crozophora*, current name conserved; Prain: 457 (1920); Radcliffe-Smith: 160 (1987a); Webster: 73 (1994b); Radcliffe-Smith: 141 (1996).

Annual herbs, often diffuse, with stellate hairs or hispid; monoecious. **Leaves** alternate, petiolate; stipules small, setaceous. **Inflorescence** a short, dense, axillary raceme. **Male flowers**: calyx 5-partite, densely stellately hairy; petals 5, membranous, equalling or shorter than sepals; disc inconspicuous, of 5 glands or circular; stamens 5–15, in 1–3 series, outer filaments very short, the rest united into a minutely pubescent tube; ovary absent. **Female flowers**: calyx segments narrowly linear; petals small, setaceous or absent; disc swollen or of glands alternating with petals; ovary 3-locular, with single ovule in each locule, stellately hairy; styles bifid, papillate. **Fruit** a somewhat fleshy capsule, splitting into 3 cocci, leaving a columella; endocarp thinly woody. **Seed** ovoid or subglobose, smooth with woody testa, enveloped in thin shiny aril; albumen thick, fleshy; cotyledons broad, flat.

Species 10, S Europe, east Africa, central and S Asia; 1 in sthn Afr.: *Chrozophora plicata* (Vahl) Spreng., Northern Province near Punda Milia.

Cleistanthus Hook.f. ex Planch. 4343000

(Phyllanthoideae—Bridelieae)

Planchon: t. 779 (1848); Hutchinson: 382 (1915); Léonard: 421 (1960); Radcliffe-Smith: 130 (1987a); Webster: 38 (1994b); Radcliffe-Smith: 8 (1996).

Trees or shrubs; monoecious or rarely dioecious. **Leaves** alternate; stipulate. **Flowers** in axillary fascicles or short racemes; petals usually present. **Male flowers**: calyx segments 5, valvate; petals 5 or rarely 0, scale-like; disc entire or sinuately lobed; stamens 5, with filaments united in their lower half into a central column; anther thecae parallel, dehiscing longitudinally; ovary rudimentary within staminal column. **Female flowers**: calyx somewhat united at base; disc double, with inner part surrounding ovary; ovary 3-locular, with 2 ovules in each locule; styles bifid. **Fruit** a globose capsule, sometimes depressed, often 3-lobed, dehiscent into bivalved cocci; endocarp woody, separating from pericarp at maturity; columella persistent. **Seeds** usually 2 per coccus; albumen scanty or copious; cotyledons thick and fleshy. $x = 10, 11$.

Species ± 140, Africa, India to Australia; 1 in sthn Afr.: *Cleistanthus schlechteri* (Pax) Hutch.; subtropical forests of N KwaZulu-Natal.

Clutia L. 4448000

(Acalyphoideae—Clutieae)

Linnaeus: 1042 (1753); Prain: 427 (1920); Radcliffe-Smith: 331 (1987a); Webster: 64 (1994b); Radcliffe-Smith: 123 (1996).

Shrubs or subshrubs; dioecious, rarely monoecious. **Leaves** alternate, usually sessile or subsessile, sometimes ericoid; stipules small or 0. **Inflorescences** axillary; male inflorescences composed of many-flowered, axillary fascicles; female inflorescences composed of few-flowered fascicles, or flowers solitary; pedicels varying in length, those of female flowers articulate. **Male flowers**: sepals 5, united only at base, imbricate; petals usually ± as long as sepals, sessile or clawed, often with 1 or more glands at base within; disc of a single gland or of lobed glands at base of sepals; stamens 5; filaments connate into a tube; pistil rudimentary. **Female flowers**: sepals and petals as in male; disc commonly only in 1 series; ovary spherical, 3-locular, with a single ovule in each locule, hairy or warted; styles free or shortly connate at base, bi-fid or -lobed, sometimes very short; stigmas often thick and laminated. **Fruit** a usually woody capsule, subglobose, breaking into 3 partially loculicidal valves with woody endocarp, with thin septa partially adhering to columella. **Seeds** ovoid, black, shiny, carunculate, with crustaceous testa; albumen fleshy; cotyledons broad, flat.

Species ± 70, Africa and 2 in tropical Arabian Peninsula; 35 in sthn Afr., widespread.

Croton L. 4348000

(Crotonoideae—Crotoneae)

Linnaeus: 1004 (1753); Prain: 410 (1920); Radcliffe-Smith: 135 (1987a); Webster: 111 (1994b); Radcliffe-Smith: 275 (1996).

Eremocarpus Benth.: 53 t. 26 (1844).

Shrubs or trees, rarely herbs, usually with stellate hairs or orbicular scales; monoecious, rarely dioecious. **Leaves** usually alternate, rarely opposite or whorled, usually with 2 glands at apex of petiole. **Inflorescence** a spike or raceme, in monoecious plants usually with many male flowers above few female ones, occasionally with sexes mixed. **Male flowers**: calyx (4)5(6)-lobed or -segmented; petals usually present, equal or smaller than sepals; disc of free scales or adnate to base of sepals, sometimes indistinct; stamens 5–many, inserted on a usually pilose receptacle, anthers reversed and filaments inflexed in bud, becoming erect in open flower; ovary 0. **Female flowers**: calyx usually smaller than in male, somewhat accrescent in fruit; petals, when present, smaller than in male and sometimes reduced to tuft of hairs; disc as in male or annular; ovary (2)3(4)-locular, with a single ovule in each locule; styles usually recurved, 1–3 times dichotomously branched, sometimes multifid. **Fruit** a capsule, often globose, usually 3-locular, breaking into bivalved cocci, rarely subindehiscent; endocarp woody or crustaceous. **Seeds** smooth or rarely rugulose, triangular-convex in transverse section,

carunculate, often with hard testa and abundant fleshy albumen; embryo straight; cotyledons broad and flat. x = 10 (7, 8, 9, 11) (high polyploidy).

Species at least 800, pantropical, the majority American; ± 11 in sthn Afr., fairly widespread.

Dalechampia L. 4422000

(Acalyphoideae—Plukenetieae)
Linnaeus: 1054 (1753); Prain: 497 (1920); Webster: 95 (1994b); Radcliffe-Smith: 238 (1996).

Subshrubs or herbs, twining or climbing, sometimes from woody rootstock; monoecious. **Leaves** alternate, petiolate, entire, 3–5-lobed or -partite. **Inflorescences** few-flowered, surrounded by 2 large, veined and usually brightly coloured, simple or lobed bracts. **Petals** 0. **Disc** 0. **Male flowers**: calyx splitting into 4–6 valvate lobes; stamens usually 9–30; filaments united into a short or long column; pistil 0. **Female flowers**: calyx usually 6-partite; segments often coriaceous and accrescent in fruit; ovary 3(4)-locular with a single ovule in each locule, usually hairy; style simple, often thickening upwards, hollow at apex. **Fruit** a 3(4)-didymous capsule, somewhat woody, breaking into bivalved cocci. **Seeds** globose or ellipsoid, with raised, vein-like markings from base and with apical cap. x = 9, 11 (1 report each).

Species 110, fairly cosmopolitan in warm regions; 4 in sthn Afr., widespread.

Drypetes Vahl 4309000

(Phyllanthoideae—Drypeteae)
Vahl: 49 (1807); Hutchinson: 403 (1920); Radcliffe-Smith: 88 (1987a); Webster: 47 (1994b); Radcliffe-Smith: 87 (1996); Tokuoka & Tobe: 189 (1999). Embryological and *rbc*L gene sequence data suggest a separate familial placement: Putranjivaceae near Erythroxylaceae and Rhizophoraceae.

Trees or shrubs; dioecious, rarely monoecious. **Leaves** alternate, petiolate, often large; stipules caducous, rarely persistent. **Inflorescence** usually of axillary fascicles of flowers, sometimes flowers produced on older wood, usually pedicelled. **Petals** 0. **Male flowers**: sepals 4 or 5, deeply concave, imbricate, sometimes hairy; stamens 3–12(–50); filaments free; anthers sometimes large, ovate; disc concave, rarely cup-like, central, inside stamens; ovary 0 or rudimentary in middle of disc. **Female flowers**: calyx as in male; disc annular, cup- or saucer-shaped, sometimes thick and fleshy with papillae on inner surface and irregularly lobed on margin; ovary 1–4-locular, sometimes thick-walled and warty, with 2 ovules in each locule, usually hairy; styles short or absent; stigmas thick, flattened, bifid or entire. **Fruit** globose, ellipsoid or ovoid, sometimes large, indehiscent; pericarp somewhat fleshy, becoming indurated on drying; endocarp coriaceous, papery or bony. **Seeds** solitary by abortion, ecarunculate; albumen fleshy; embryo straight, cotyledons broad, flat. x = 10 (high polyploidy).

Species ± 200, mainly Old World tropics, few in West Indies and South America; 5 in sthn Afr., Northern Province, Mpumalanga to KwaZulu-Natal and Eastern Cape.

Erythrococca Benth. 4368000

(Acalyphoideae—Acalypheae)
Bentham: 506 (1849); Prain: 459 (1920); Radcliffe-Smith: 265 (1987a); Webster: 87 (1994b); Radcliffe-Smith: 165 (1996).

Shrubs; twigs lenticelled; buds covered with protective, persistent scales; dioecious. **Leaves** alternate; stipulate; stipules chartaceous or membranous, often accrescent and modified into weak thorns. **Flowers** usually racemose, small, with male flowers usually several within a bract, female solitary; pedicels capillary, articulate. **Petals** 0. **Male flowers**: calyx closed in bud, splitting into 3 or 4 valvate lobes; stamens (2–)10–40(–60), usually intermixed with small glands and sometimes surrounded by a ring of similar, free or connate glands; filaments free; anthers erect, 2-locular; locules free from base, opening by longitudinal, extrorse slits; ovary absent. **Female flowers**: calyx 2(–4)-partite; disc usually of 2(3) free scales or lobes; ovary 2- or 3-locular; ovules solitary in each locule; styles usually connate below; stigmas usually plumosely laciniate. **Fruit** 2(3)-coccous; cocci subglobose, opening loculicidally; valves coriaceous; subpersistent. **Seeds** subglobose, covered by a thin, fleshy, viscid, usually scarlet aril; testa crustaceous, foveolate-reticulate or smooth; albumen fleshy; embryo axile, radicle conical, cotyledons broad, flat. x = 10, 11 (1 report each, polyploidy).

Species ± 50, mainly Africa; 4 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga and KwaZulu-Natal.

Euphorbia L. 4498000

(Euphorbioideae—Euphorbieae)
Linnaeus: 450 (1753); Brown: 222 (1915); White, Dyer & Sloane: 59 (1941); Meyer: 1 (1967); Carter: 409 (1988); Webster: 128 (1994b); LaFon & Schwartz (general editors of *Euphorbia Journal*) (1983–1994).

Chamaesyce S.F.Gray: 260 (1821); Koutnik: 262 (1984); Carter: 415 (1988) treated as subgenus; Webster: 129 (1994b) artificial but usable group, although the recognition of *Chamaesyce* as a separate genus makes *Euphorbia* a paraphyletic group.

Poinsettia Graham: 412 (1836).

Annual or perennial herbs, shrubs or trees, usually with milky, usually caustic latex, often fleshy (succulent) and sometimes spinescent; monoecious, or less often dioecious. **Leaves** alternate or opposite, often much reduced in succulent species; with or without stipules, sometimes stipules spinescent in succulent species. **Inflorescences** axillary or terminal with flowers in cyathia: distinct, cup-shaped structures with (2–)4 or 5(–8) nectariferous glands around the rim alternating with (2–)4 or 5(–8) involucral lobes; inside involucre numerous very reduced male flowers and 1 female flower, or in separate involucres; sepals and petals 0 or rudimentary; cyathia solitary or 2–many in cymes, umbels, panicles, or clusters. **Male flowers** reduced to individual stamens which are usually arranged in groups opposite involucral lobes, often interspersed with bracteoles; pedicel articulated with filament; anthers 2-thecous, longitudinally dehiscent. **Female flowers** solitary within involucre surrounded by male flowers, sessile or on short pedicel, usually elongating after fertilisation, with or without much reduced calyx; ovary (2)3(4–7)-locular, with 1 pendulous ovule in each locule; styles usually 3, free or ± connate, entire or bifid. **Fruit** a capsule with carpels bivalved, sometimes fleshy but becoming woody at maturity, separating from persistent, central axis and opening along inner face. **Seeds** with smooth or sculptured surface; with or without caruncle. x = 6, 7, 9, 10, 11 (5, 8, 13, 19) (high polyploidy, B-chromosomes).

Species ± 1600, or over 2000 with some segregate genera like *Chamaesyce* included, worldwide; over 300 in sthn Afr., widespread, predominantly succulent in drier areas.

Excoecaria L. 4478010

(Euphorbioideae—Hippomaneae)
Linnaeus: 1288 (1759); Prain: 1018 (1913b); Léonard: 133 (1959); Radcliffe-Smith: 382 (1987a); Webster: 122 (1994b); Radcliffe-Smith: 315 (1996).

Trees or shrubs, glabrous, usually with milky latex; mostly dioecious, rarely monoecious. **Leaves** alternate

or opposite, entire or crenulate; stipules minute or absent. **Flowers** in uni- or occasionally bisexual, axillary spikes; male dense, female lax. **Petals** 0. **Disc** 0. **Male flowers** sessile or subsessile; calyx small, (2)3(–5)-lobed; lobes slightly imbricate; stamens (2)3(–8), exserted; filaments free; anthers longitudinally dehiscent; ovary 0. **Female flowers** shortly pedunculate; calyx (2)3-lobed; ovary (2)3-locular, each locule with 1 ovary; styles 3, shortly connate at base, entire. **Fruit** a large, inflated capsule breaking into (2)3 bivalved cocci; valves separating and coiling up; exocarp smooth, not separating from endocarp; endocarp thinly crustaceous; columella present. **Seeds** globose or ovoid, caruncle (? swollen funicle) separating from seed and remaining adnate to columella; testa crustaceous; albumen fleshy; cotyledons broad, flat. $x = 11, 12$ (high polyploidy).

Species ± 40, Africa to Asia and Australia; 2 in sthn Afr., Namibia, Botswana, KwaZulu-Natal and Eastern Cape.

Flueggea Willd. 4298000

Phyllanthoideae—Phyllantheae)
Willdenow: 637 (1806); Hutchinson: 402 (1920); Pax & Hoffmann: 60 (1931) as *Securinega* Juss.; Webster: 273 (1984); Radcliffe-Smith: 68 (1987); Webster: 43 (1994b); Radcliffe-Smith: 29 (1996).

Trees or shrubs, sometimes with abbreviated branchlets; dioecious or rarely monoecious. **Leaves** alternate, shortly petiolate, entire; stipulate. **Flowers** in axillary fascicles; male often many, female few or solitary. **Petals** 0. **Male flowers**: sepals (4)5(–7), unequal, membranous, imbricate, shortly ciliate; stamens (4)5(–7); filaments free; pistillodes present; disc of 5 glands, hairy; ovary rudimentary, 2- or 3-partite. **Female flowers**: sepals as in male; disc flat, annular, entire or nearly so; ovary (2)3(4)-locular, with 2 ovules in each locule; styles connate at base, bifid or bilobate, spreading. **Fruit** slightly fleshy, usually loculicidally dehiscent, small, globose; endocarp crustaceous. **Seeds** obtusely 3-angled, rounded on back, smooth, ecarunculate, testa thick, crustaceous; albumen scanty; embryo incurved; cotyledons ovate, elliptic or obovate, flat. $x = 8, 13$ (polyploidy).

Species 14, tropics and E Asia; 2 in sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, KwaZulu-Natal and Eastern Cape.

Heywoodia Sim 4291010

(Phyllanthoideae—Wielandieae)
Sim: 326, t.140, fig.1 (1907); Hutchinson: 384 (1915); Radcliffe-Smith: 85 (1987a); Webster: 36 (1994b); Radcliffe-Smith: 6 (1996).

Trees; dioecious. **Leaves** alternate, large, entire; stipules 0. **Male flowers** in dense, axillary glomerules; sepals 3, imbricate, unequal; petals 5, membranous, imbricate, larger than sepals; disc shortly cupular, fleshy, with margins irregularly undulate; stamens 8–12, inserted inside disc, 2-seriate; outer stamens free, inner ones connate at base; anthers 2-thecous, with thecae somewhat distinct; ovary rudimentary, 3-fid. **Female flowers**: sepals and petals ± as in male flowers; ovary 4- or 5-locular, 2 ovules per locule; stigmas 4 or 5, sessile, bilobed. **Fruit** a capsule, subglobose, 4-locular, with 8–10 wrinkled (when dried) valves; endocarp bony. **Seeds** solitary per locule by abortion, somewhat trigonous, smooth, brown, ecarunculate; endosperm papery; embryo minute, cotyledons broad and flat.

Species 1, *Heywoodia lucens* Sim, tropical East Africa; KwaZulu-Natal and Eastern Cape.

***Homalanthus** A.Juss. 4480000

(Euphorbioideae—Hippomaneae)
Jussieu: 50, t.60 (1824) as *Omalanthus*; Pillans: 558 (1950); Webster: 120 (1994b); Esser: 555 (1996) proposal to conserve the spelling of name.

Shrubs or small trees, glabrous, with milky latex; monoecious or dioecious. **Leaves** alternate, long-petiolate, often peltate, with pair of glands at apex of petiole; stipules caducous. **Inflorescences** terminal or subterminal, pseudoracemose, solitary, usually bisexual, predominantly male with 1 or more female flowers at base; male bracts broad, with a pair of sessile glands at base. **Petals** 0. **Disc** 0. **Male flowers** pedicellate; sepals 1 or 2, if 2 then imbricate and vertically disposed; stamens 5–50, free, filaments short; pistillode 0. **Female flowers** long-pedicellate; sepals 2 or 3, open; ovary 2(3)-locular, with 1 ovule per locule; styles 2(3), connate at base, undivided or bilobate, straight, the adaxial stigmatic surface running length of arms, canaliculate and minutely papillose, abaxial surface glandular. **Fruit** 2(3)-lobed, subindehiscent or tardily loculicidally dehiscent; endocarp thinly crustaceous; columella small, subpersistent. **Seeds** ovoid-ellipsoid; endotesta crustaceous; caruncle fleshy, sometimes half-enclosing seed; cotyledons broad, flat. $x = 8, 9, 11$ (high polyploidy).

Species 35, Indo-Pacific region; 1 in sthn Afr.: *Homalanthus populifolius* Graham, cultivated and found as an escape in parts of the Cape Peninsula (Western Cape).

Hyaenanche Lamb. 4336000

(Oldfieldioideae—Caletieae)
Lambert: 52, t. 10 (1797).

Toxicodendrum Thunb.: 188 (1796) not of Gaertn.; Hutchinson: 408 (1920); Phillips: t. 837 (1941).

Shrub or small tree; dioecious. **Leaves** in whorls of 4, leathery, entire, glabrous; stipules obscure or 0. **Inflorescence** of male flowers axillary, densely cymulose, much shorter than leaves; in female 1–3 flowers, axillary, sessile. **Petals** 0. **Disc** 0. **Male flowers**: sepals 4–8(–12), rounded; stamens 8–30; anthers large; pistillode 0. **Female flowers**: sepals 3–8, in 2 series, the outer the smaller; ovary ovoid, 3- or 4-locular; with 2 pendulous ovules in each locule, tomentulose; styles 3–5, connate in lower half. **Fruit** a subglobose, 8-lobed capsule, with a crustaceous exocarp and bony endocarp, breaking into 2-valved cocci. **Seeds** black, shiny, carunculate; endosperm scanty; cotyledons green.

Species 1: *Hyaenanche globosa* (Gaertn.) Lamb., Western Cape; mountains of Vanrhynsdorp and Clanwilliam districts.

Hymenocardia Wall. ex Lindl. 4325000

(Phyllanthoideae—Hymenocardieae)
Lindley: 441 (1836); Hutchinson: 409 (1920); Airy Shaw: 262 (1965) Hymenocardiaceae Airy Shaw; Radcliffe-Smith: 577 (1988) Hymenocardiaceae; Webster: 53 (1994b) Hymenocardieae; Radcliffe-Smith: 113 (1996).

Trees or shrubs; dioecious; **Leaves** alternate, shortly petiolate, entire; stipulate. **Inflorescence** in male a catkin-like spike; in female a short raceme. **Petals** 0. **Disc** 0. **Calyx** 4–6-lobed. **Male flowers**: calyx lobes imbricate; stamens 4–6; filaments free or connate at base; anthers usually with conspicuous yellow or golden-coloured gland on back; pistil rudimentary. **Female flowers**: sepals free, 4–6(–8), caducous; ovary 2-locular, with 2 ovules in each locule; styles 2, free. **Fruit** a flat capsule with 2 large, apical wings or broadly winged on margin, splitting into cocci from central axis; pericarp subcrustaceous; endocarp thin, membranous. **Seeds** usually solitary in each coccus, flat with sparse endosperm.

Species 7 or 8, mostly tropical Africa; 1 in sthn Afr., *Hymenocardia ulmoides* Oliv.; Northern Province, KwaZulu-Natal.

Jatropha L. 4433000

(Crotonoideae—Jatropheae)

Linnaeus: 1006 (1753); Prain: 418 (1920); Radcliffe-Smith: 343 (1987a); Radcliffe-Smith: 141 (1991); Webster: 103 (1994b); Radcliffe-Smith: 253 (1996).

Perennial herbs or shrubs; monoecious, rarely dioecious. **Leaves** alternate, petiolate or subsessile, from simple to digitately lobed, rarely pinnately lobed; stipules various. **Inflorescence** a terminal, dichotomous cyme with lateral male flowers and terminal, solitary, female flowers. **Male flowers**: sepals usually 5, imbricate, often shortly connate at base, often with stalked glands on margin; petals 5, free or shortly connate at base, rarely obsolete; disc of 5 free glands, sometimes annular; stamens 6–10, rarely more, in 2 series; filaments connate at base; pistil 0. **Female flowers**: sepals, petals and disc as in male flowers; ovary glabrous or hairy, (1)2 or 3(–5)-locular, with a single ovule in each locule; styles free or connate at base, often bifid; stigmas laminated. **Fruit** a schizocarpic capsule, ovoid or subglobose, breaking septicidally or loculicidally into 3 bivalved cocci, rarely subdrupaceous and ± indehiscent; endocarp crustaceous or indurated. **Seeds** ovoid or oblong, carunculate, caruncle often much divided; testa crustaceous; albumen fleshy; cotyledons broad, flat. $x = 11$.

Species ± 156, cosmopolitan in tropics and subtropics; ± 19 in sthn Afr., widespread.

Lachnostylis Turcz. 4291000

(Phyllanthoideae—Wielandieae)

Turczaninow: 503 (1846); Hutchinson: 383 (1915); Dyer: 123 (1943); Webster: 37 (1994b).

Shrubs or small trees; dioecious. **Leaves** alternate, entire; stipulate. **Flowers** fasciculate, axillary, sometimes solitary in female. **Male flowers**: sepals 5, imbricate, subequal; petals 5, membranous; disc annular, villous; stamens 5, free or connate into a short, basal tube. **Female flowers**: sepals and petals as in male; disc annular, thick, villous; ovary globose, 2- or 3-locular, with 2 ovules in each locule, tomentose externally and internally; styles bifid. **Fruit** a capsule breaking up into 2-valved cocci. **Seeds** subglobose or hemispherical, smooth or slightly wrinkled.

Species 2, Western Cape and Eastern Cape.

Leidesia Müll.Arg. 4372000

(Acalyphoideae—Acalypheae)

MüllerArgau: 792 (1866); Prain: 399 (1913a); Prain: 462 (1920); Pax & Hoffmann: 284 (1913); Webster: 85 (1994b); Radcliffe-Smith: 159 (1996).

Herbs, delicate; monoecious. **Leaves** alternate or nearly opposite, petiolate, usually slightly crenate and with scattered setae on margin. **Inflorescence** of minute male flowers in fascicles arranged in terminal racemes and of a few female flowers towards base of rachis, subtended by a leafy bract. **Petals** 0. **Disc** 0. **Male flower**: calyx membranous, splitting into 3 valvate, setaceous lobes; stamens 3–7; filaments free or sometimes connate at base; pistil 0. **Female flowers**: calyx reduced to bract or obsolete; ovary 2-locular, with a solitary ovule in each locule, usually with few setae; styles 2, free, entire. **Fruit** a 2(1)-locular capsule, setose-muricate, globose. **Seeds** subglobose, with sculptured testa; albumen fleshy; cotyledons broad, flat.

Species 1, *Leidesia procumbens* (L.) Prain, sthn Afr., fairly widespread.

Macaranga Thouars 4400000

(Acalyphoideae—Acalypheae)

Thouars: 26 (1806); Prain: 485 (1920); Radcliffe-Smith: 239 (1987a); Webster: 87 (1994b); Radcliffe-Smith: 161 (1996).

Trees or shrubs, often with watery latex; dioecious, rarely monoecious. **Leaves** often large, alternate, petiolate, usually 3–7-nerved from base. **Inflorescence** a raceme or spike, lateral or forming a terminal, thyrsoid panicle, with male flowers glomerulate, several to a bract and female flowers solitary to each bract. **Petals** 0. **Disc** 0. **Male flowers**: calyx splitting into 3 or 4 valvate lobes; stamens (1)2 or 3(few); filaments short, usually free; anthers (2)4-thecous and (2)4-valved; pistil 0. **Female flowers**: calyx widely cupular or obliquely spathaceous, rarely splitting into 2 or 3 lobes; ovary (1)2- or 3(4)-locular, with a single ovule in each locule, sometimes glandular; styles free or shortly connate at base, sometimes 1, ligulate. **Fruit** a capsule with (1)2–several cocci, with cocci bivalved, granular-glandular, becoming smooth and glabrous when glands rub off. **Seeds** subglobose, smooth, shiny, exotesta fleshy, endotesta crustaceous; albumen fleshy; cotyledons broad, flat. $x = 11$ (10).

Species ± 300, mainly tropics of the Old World; 1 in sthn Afr., *Macaranga capensis* (Baill.) Sim, coastal forests of KwaZulu-Natal to border of Eastern Cape.

*__Manihot__ Mill. 4444000

(Crotonoideae—Manihoteae)

Miller: [851] (1754); Radcliffe-Smith: 366 (1987a); Webster: 99 (1994b); Radcliffe-Smith: 244 (1996).

Shrubs or trees, lactiferous; monoecious. **Leaves** alternate, simple or peltate, deeply 3–11-palmatilobed to palmatipartite; stipules small or large, sometimes leafy. **Inflorescences** racemose or paniculate, terminal or axillary in uppermost leaf axils, generally composed of 1 or more long-pedicellate basal female flowers and several short-pedicellate male flowers; bracts small or large, sometimes leafy. **Petals** 0. **Male flowers**: calyx campanulate, 5-lobed, often pigmented, with lobes imbricate; stamens 10 in 2 whorls, free, arising between lobes or glands of disc; pistillode small, trifid if present. **Female flowers**: calyx as in male flowers; disc hypogynous; ovary 3-locular, smooth or longitudinally winged; 1 ovule per locule; styles shortly connate at base. **Fruit** septicidally dehiscent into 3 bivalved cocci, smooth or longitudinally winged. **Seeds** carunculate; testa crustaceous; albumen fleshy; cotyledons flat, broad. $x = 9$ (polyploidy).

Species ± 100, America; **Manihot esculenta* Crantz, Cassava, with starchy, tuberous roots, cultivated in tropical areas, often occurs as escape.

Maprounea Aubl. 4485000

(Euphorbioideae—Hippomaneae)

Aublet: 895, t. 342 (1775); Prain: 511 (1920); Radcliffe-Smith: 395 (1987a); Webster: 123 (1994b); Radcliffe-Smith: 325 (1996).

Trees or shrubs, glabrous; monoecious. **Leaves** alternate, glaucous, with 1–4 glands underneath. **Flowers** in spikes terminating in abbreviated twigs, with many male flowers in dense heads and usually shortly pedicellate, female flowers at base; male bracts small, imbricate, glandular at base on each side, each 3–5-flowered; female bracts 1-flowered. **Petals** 0. **Disc** 0. **Male flowers**: calyx shortly 2- or 3-lobed, slightly imbricate in bud; stamens (1)2(3), exserted; filaments united below; anthers oblong; locules parallel, dehiscing longitudinally; ovary rudimentary. **Female flowers** pedicellate; pedicels extending in fruit; calyx 3(–6)-lobed; ovary (2)3(–5)-

locular, with 1 ovule in each locule; styles (2)3(–5)-lobed, connate at base, straight then reflexed, adaxial stigmatic surface canaliculate and minutely papillose. **Fruit** globose or slightly (2)3(–5)-lobed, dehiscing into (2)3(–5) bivalved cocci; exocarp thin, smooth, not separating from endocarp; endocarp ligneous; columella persistent. **Seeds** obovoid; outer testa smooth, slightly fleshy (sarcotesta); endotesta crustaceous, smooth, rugulose or foveolate; caruncle large, conical, shallowly 2-lobate, fleshy; albumen fleshy; cotyledons broad, flat.

Species 4, Africa and South America; 1 in sthn Afr., *Maprounea africana* Müll.Arg., Namibia and Botswana.

Margaritaria L.f. 4299020

(Phyllanthoideae—Phyllantheae)
Linnaeus f.: 66 (1782); Webster: 407 (1979); Radcliffe-Smith: 32 (1996).

Shrubs or trees; dioecious, rarely monoecious. **Leaves** distichous, shortly petiolate, entire; stipulate. **Inflorescence** axillary; male flowers several, fasciculate; female solitary or few per axil. **Petals** 0. **Male flowers**: sepals 4, membranous, free or slightly connate at base, imbricate; disc annular, entire; stamens 4, filaments free; ovary absent. **Female flowers**: pedicels stouter than in male; sepals, petals and disc as in male; ovary (2)3- or 4(5)-locular, with 2 ovules in each locule; styles 3, free or partly connate, usually bifid or bilobed. **Fruit** a capsule, dry or somewhat fleshy, irregularly dehiscent; exocarp green, usually separating from crustaceous endocarp. **Seeds** hemispherical; sarcotesta fleshy, bluish; sclerotesta thick, woody; chalaza invaginated; albumen fleshy; embryo straight; cotyledons thin, flat. $x = 13$.

Species 13; pantropical; 1 widespread in tropical and sthn Afr., Namibia, Botswana, Northern Province, Mpumalanga, KwaZulu-Natal.

***Mercurialis** L. 4371000

(Acalyphoideae—Acalypheae)
Linnaeus: 1035 (1753); Prain: 461 (1920); Pillans: 559 (1950); Webster: 85 (1994b).

Annuals or perenial herbs; dioecious. **Leaves** opposite, often toothed. **Inflorescences** axillary, male slender with flowers in sparse distant clusters on distal half of rachis; female usually short with 1 or 2 subsessile flowers. **Petals** 0. **Disc** 0. **Male flowers**: calyx split in 3 valvate lobes; stamens 8–20, filaments free, attached to a small receptacle; ovary 0. **Female flowers**: ovary 2(3)-locular; ovules solitary; styles erect, free, almost to base, undivided. **Fruit** a capsule; 2(3)-coccous, breaking up into bivalved cocci; endocarp crustaceous. **Seeds** ovoid or globose, smooth or rough; testa crustaceous; albumen fleshy; cotyledons broad, flat. $x = 8$ (6, 7) (high polyploidy).

Eurasian genus of 8 species; **Mercurialis annua* L., common introduction into waste places and gardens, mainly Western Cape.

Micrococca Benth. 4367000

(Acalyphoideae—Acalypheae)
Bentham: 503 (1849); Prain: 460 (1920); Radcliffe-Smith: 260 (1987b); Webster: 88 (1994b); Radcliffe-Smith: 176 (1996).

Herbs or shrubs; monoecious or dioecious. **Leaves** alternate, often large and serrate; stipulate. **Inflorescence** a raceme or spike with male flowers glomerulate and distant, with an occasional pedicellate female flower. **Petals** 0. **Male flowers**: calyx splitting into 3 or 4 valvate lobes; disc 0; stamens 3–30, usually intermixed with small glands and sometimes surrounded by a ring of similar, free or connate glands; filaments free; pistil 0. **Female flowers**: calyx 2–4-partite; lobes imbricate; disc glands 2–6, resembling staminodes, alternating with carpels, rarely saucer-shaped; ovary (2)3(4)-locular, with a solitary ovule in each locule; styles 3(4), free or connate near base, plumose-laciniate. **Fruit** a capsule breaking up into (2)3(4) bivalved cocci or by abortion 1 coccus, separating septifragally from a crustaceous or woody columella; pericarp thin; endocarp crustaceous. **Seeds** subglobose, enclosed by thin aril; testa crustaceous, foveolate-reticulate, sometimes muricate or smooth; albumen fleshy; cotyledons suborbicular, sometimes scarcely larger than radicle. $x = 10$ (polyploidy).

Species 12, mostly tropical Africa, also Madagascar to Asia; 2 in eastern parts of sthn Afr.

Monadenium Pax 4503000

(Euphorbioideae—Euphorbieae)
Pax: 126 (1894); Burtt Davy: 290 (1932); White, Dyer & Sloane: 941 (1941); Bally: 14 (1961); Carter: 540 (1988); Webster: 129 (1994b); Forster: 142 (1996).

Perennial herbs, fleshy shrubs or small trees, usually with fleshy or tuberous rootstock, fleshy or succulent stems and branches and caustic milky latex; monoecious. **Leaves** alternate, ± fleshy; stipules modified as glands or spines or 0. **Inflorescence** axillary, of sessile cyathia in dichotomously branching cymes, cyathia rarely solitary; bracts paired, free or partly united along one edge to form a bract-cup behind and enveloping the involucre, persistent; involucre cup-like, but with opening down one side and with a continuous gland around rim and with 5 fringed lobes within. **Flowers** produced within involucres; sepals and petals 0 or rudimentary. **Male flowers** in 5 groups, reduced to individual stamens which are arranged in groups opposite involucre lobes; pedicels articulated with filaments, sometimes bracteate. **Female flowers** solitary within involucre, surrounded by male flowers, on short or slightly elongated pedicel, with or without much-reduced calyx; ovary recurved and exserted from slit in involucre, 3-locular, with single, pendulous ovule in each locule; styles 3, free or united below, bifid at apex. **Fruit** a capsule, 3-angled, with or without a double keel down angles. **Seeds** oblong, with a cup-like, pale yellow caruncle, rarely ecarunculate. $x = 17$ (12, 19) (high polyploidy).

Species ± 50, Africa; 1 in sthn Afr., *Monadenium lugardiae* N.E.Br.; Botswana, Northern Province and KwaZulu-Natal.

Phyllanthus L. 4299000

(Phyllanthoideae—Phyllantheae)
Linnaeus: 987 (1753); Hutchinson: 386 (1920); Radcliffe-Smith: 10 (1987a); Webster: 44 (1994b); Radcliffe-Smith: 36 (1996).

Herbs, undershrubs from perennial rootstocks, shrubs, or trees; monoecious or sometimes dioecious. **Leaves** scale-like cataphylls or foliage leaves, alternate; stipulate. **Inflorescence** mainly of many fascicled male flowers and solitary female flowers in upper axils. **Petals** 0. **Male flowers**: sepals 4–6, membranous, free or slightly connate at base, imbricate; disc often small, of separate glands, rarely annular; stamens 2–6, in middle of flower; filaments free or connate, or some free and some connate; ovary 0. **Female flowers**: sepals as in male or larger; disc usually annular, saucer- or cup-shaped, rarely of separate glands; ovary 3(–many)-locular, with 2 ovules in each locule; styles 3, free or partly connate, usually bifid or bilobed. **Fruit** a capsule, dry or somewhat fleshy, dehiscent or subdehiscent; endocarp usually crustaceous. **Seeds** 3-angled, often longitudinally sulcate or pitted; testa thinly crustaceous; albumen fleshy; embryo straight or slightly incurved; cotyledons flat,

straight or rarely flexuous. $x = 13$ (6, 7, 8, 9, 10, 11, 12) (aneuploids, high polyploidy, B-chromosomes).

Species 750–800; cosmopolitan in tropical and subtropical regions, ± 150 in Africa; 22 in sthn Afr., widespread.

Plukenetia L. 4421010

(Acalyphoideae—Acalypheae)
Linnaeus: 1192 (1753); Prain: 496 (1920); Webster: 93 (1994b).

Pterococcus Hassk.: 41 (1842) not of Pallas, name conserved; Meyer: 41 (1967); Radcliffe-Smith: 210 (1996).

Herbs, undershrubs, or rarely shrubs, usually twining; monoecious. **Leaves** alternate, petiolate, entire or toothed, 3–5-nerved from base. **Inflorescence** leaf-opposed or sometimes axillary racemes; male flowers ± glomerulate above; female flowers solitary towards base, rarely 0. **Petals** 0. **Disc** 0. **Male flowers**: calyx with 4 or 5 valvate lobes; stamens 8–20; filaments free, sometimes inserted on a fleshy receptacle; pistil rudimentary or 0. **Female flowers**: calyx with 4 or 5 imbricate lobes; ovary usually 4-locular, with a single ovule in each locule; styles connate into a hollow, cylindric or subglobose column crowned with free, stigmatic lobes. **Fruit** a capsule, strongly 4-lobed, breaking into bivalved, dorsally winged cocci. **Seeds** globose or compressed; testa crustaceous, sometimes winged; albumen fleshy; cotyledons broad, flat.

Species ± 15, mostly neotropical, 3 in Africa; 1 variable species in sthn Afr., *Plukenetia africana* Sond., usually known as *Pterococcus*; Namibia, Botswana and Northern Province.

Pseudolachnostylis Pax 4295000

(Phyllanthoideae—Phyllantheae)
Pax: 19 (1899); Hutchinson: 407 (1920); Radcliffe-Smith: 80 (1987a); Webster: 41 (1994b); Radcliffe-Smith: 22 (1996).

Trees or shrubs; dioecious, rarely monoecious. **Leaves** alternate, petiolate, entire, somewhat coriaceous; stipulate. **Inflorescence** of male flowers in few-flowered, pedunculate cymes, surrounded by bracts; female flowers axillary, usually solitary. **Petals** 0. **Male flowers**: sepals 5(6), imbricate; disc annular, glabrous; stamens (4)5–7; filaments connate for greater part of their length; ovary rudimentary, 2-fid. **Female flower**: sepals as in male, with circumscissile dehiscence; disc ± basin-shaped, partially surrounding ovary; ovary 3-locular, with 2 ovules in each locule, often densely villous; styles 3, slightly connate at base, bilobed. **Fruit** globose, tardily septicidally dehiscent, subdrupaceous; exocarp smooth, shiny, becoming wrinkled on drying; endocarp thick, woody. **Seed** solitary in each locule by abortion, ellipsoid-ovoid, ecarunculate; albumen fleshy; cotyledons broad and flat.

Species 1, *Pseudolachnostylis maprouneifolia* Pax with 4 varieties, Africa; Namibia, Botswana, Northern Province and Mpumalanga.

***Ricinus** L. 4424000

(Acalyphoideae—Acalypheae)
Linnaeus: 1007 (1753); Henderson & Anderson: 206 (1966); Radcliffe-Smith: 322 (1987a); Webster: 84 (1994b); Radcliffe-Smith: 156 (1996).

Large annual or perenial herbs, often attaining tree proportions; monoecious. **Leaves** alternate, petiolate, peltate, palmately lobed, lobes glandular-serrate; petioles adaxially glandular near base; stipules present, united to form a sheath, caducous. **Inflorescences** leaf-opposed or subterminal, paniculate; male flowers in tight clusters in lower half; female flowers in open clusters in upper half, or rarely all female. **Petals** 0. **Disc** 0. **Male flowers** pedicellate; calyx membranous, splitting into 3–5 valvate lobes; stamens up to 1000; filaments variously united to form much-branched structures. **Female flowers** pedicellate; sepals 5, valvate, caducous; ovary 3-locular, with 1 ovule per locule; styles 3, ± free or connate at base, bipartite. **Fruit** 3-lobed, echinate or rarely smooth, dehiscing into 3 bivalved cocci; spines (if present) accrescent; endocarp crustaceous or thinly woody; columella persistent, 3-winged. **Seeds** sometimes dorsiventrally compressed-ovoid, smooth, carunculate, usually marmorate; testa crustaceous; albumen fleshy; cotyledons broad, flat. $x = 5$.

Monotypic, originally native to NE Africa, **Ricinus communis* L., Castor Oil, cultivated in warm parts, mainly in Northern Province, often occurs as an escape.

Sapium P.Browne 4483000

(Euphorbioideae—Hippomaneae)
Browne: 338 (1756); Prain: 513 (1920); Radcliffe-Smith: 389 (1987a); Webster: 123 (1994b); Radcliffe-Smith: 318 (1996).

Trees or shrubs, usually with milky latex; monoecious, rarely dioecious. **Leaves** alternate, entire or remotely toothed; stipules 0. **Inflorescence** a terminal, bisexual spike with many male flowers above and few basal female flowers, bracteate; bracts sometimes with 2 or 3 glands on either side at base. **Petals** 0. **Disc** 0. **Male flowers**: calyx 2- or 3(4)-lobed; stamens 2 or 3(4); filaments free; pistil absent. **Female flowers** long-pedicellate; calyx 2- or 3(4)-lobed; ovary (2)3(4)-locular, with 1 ovule in each locule; styles (2)3(4), free or slightly connate at base, sometimes spreading around ovary. **Fruit** a capsule, often woody, (2)3(4)-coccous, globose, often wrinkled; cocci bivalved or subindehiscent or bacciform; endocarp smooth or cornute, often coriaceous; endocarp woody or crustaceous, thick or thin; columella generally persistent. **Seeds** (1)2 or 3(4) per fruit, globose or ellipsoid, rarely carunculate; sarcotesta thin or fleshy; endotesta crustaceous; albumen fleshy; cotyledons broad, flat. $x = 11$ (10) (high polyploidy, B-chromosomes).

Species ± 125, pantropical but predominantly neotropical; 2 in sthn Afr., Mpumalanga, KwaZulu-Natal to Eastern Cape.

Schinziophyton Hutch. ex Radcl.-Sm. 4463010

(Crotonoideae—Ricinodendreae)
Radcliffe-Smith: 157 (1990); Webster: 113 (1994b); Radcliffe-Smith: 296 (1996).

Ricinodendron Müll.Arg.: 533 (1864) in part.

Pachycaul trees; dioecious. **Leaves** alternate, digitately compound, with 5–7 petiolulate leaflets, sparsely stellately hairy above, densely so below; stipules small, fugacious. **Inflorescence** a panicled cyme. **Male flowers**: sepals 4 or 5, densely stellate-pubescent; petals 5, connate into a wide, ± truncate tube; stamens 13–21, free; filaments often hairy at base; disc of 5 ± free, quadrate bodies attached to base of petals; pistil 0. **Female flowers**: sepals and petals similar to those of male; staminodes 0; disc crenulate; ovary 1- or 2-locular, with a single ovule in each locule, densely stellate-hairy; style 2-lobed or -partite or divided for half its length into 2 lobes. **Fruit** drupaceous, ± size of large walnut, densely fulvous-tomentose, with thick, woody, pitted endocarp divided by membrane into 2 portions except at base and apex. **Seeds** compressed-ellipsoid, ecarunculate, irregularly ridged on outer face; albumen copious, fleshy, oily; cotyledons flat, broad, palminerved.

Species 1, Africa; *Schinziophyton rautanenii* (Schinz) Radcl.-Sm.; Namibia, Botswana and Northern Province.

Seidelia Baill. 4373000

(Acalyphoideae—Acalypheae)
Baillon: 465, t. 9, fig. 7 (1858); Pax & Hoffmann: 282 (1914); Prain: 464 (1920); Webster: 85 (1994b).

Herbs, annual; monoecious. **Leaves** alternate. **Inflorescence** of small flowers in glomerules of cymules at end of branches or in axils of upper leaves; male flowers in dense fascicles above; female fewer, below. **Petals** 0. **Disc** 0. **Male flowers**: calyx membranous, splitting into 3 valvate lobes; stamens 3(2); filaments connate towards base; anther thecae somewhat separate and deeply grooved; pistil 0. **Female flowers**: calyx as in male; ovary 2-locular, with a single ovule in each locule; styles 2, short, undivided. **Fruit** a 2-lobed, smooth capsule; cocci bivalved. **Seeds** ovoid; testa crustaceous, sculptured.

Species 3, sthn Afr., Free State, Northern Cape and Western Cape.

Spirostachys Sond. 4478000

(Euphorbioideae—Hippomaneae)
Sonder: 106 (1850); Prain: 512 (1920); Radcliffe-Smith: 385 (1987a); Webster: 121 (1994b); Radcliffe-Smith: 313 (1996).

Trees or shrubs, usually with milky latex; monoecious or dioecious. **Leaves** alternate, shortly petiolate, entire or remotely crenate, with 2 glands at junction of petiole; stipules small, caducous. **Inflorescence** axillary, sessile, spicate, with many male flowers above and a solitary or few basal, female flowers. **Petals** 0. **Disc** 0. **Male flowers** small, sessile; calyx (2–)5-lobed, free, imbricate; stamens 3; filaments free or united into a slender tube, exserted; pistillode 0. **Female flowers** small, shortly pedunculate; calyx 3–5-lobed, ± free; ovary (2)3-locular, with 1 ovule in each locule, glabrous; styles (2)3, connate into a column, with lanceolate, entire lobes. **Fruit** a (2)3-coccous capsule, valves not separating immediately; exocarp smooth, not separating from endocarp; endocarp thinly crustaceous; columella persistent. **Seeds** globose or ovoid; caruncle minute, separating from seed and remaining adnate to columella; testa crustaceous; albumen fleshy; cotyledons broad, flat.

Species 2; subtropical East Africa; Namibia, Northern Province and KwaZulu-Natal.

Suregada Roxb. ex Rottler 4464000

(Crotonoideae—Gelonieae)
Rottler: 206 (1803); Merrill: 79 (1951); Radcliffe-Smith: 376 (1987); Webster: 102 (1994b); Radcliffe-Smith: 249 (1996).

Gelonium Roxb. ex Willd.: 831 (1806) non Gaertn.: Prain: 494 (1920).

Trees or shrubs; dioecious, rarely monoecious. **Leaves** alternate, sessile or subsessile, entire or crenate, gland-dotted, glabrous; stipules connate, caducous. **Flowers** in leaf-opposed, sessile or subsessile, cymose glomerules. **Petals** 0. **Male flowers**: sepals (4)5(–7), imbricate, often unequal, 3 outer ones concave and with blunt horn on back; disc shallowly basin-shaped, hairy; stamens 6–25(–60); filaments free; pistil 0. **Female flowers**: sepals similar to those of male; disc shallowly basin-shaped, sometimes bearing rudimentary staminodes, hairy; ovary (2)3(4)-locular, with 1 ovule in each locule, glabrous; styles (2)3(4), shortly bifid or lacerate. **Fruit** somewhat woody, globose, columella persistent, or 3-didymous, capsular or drupaceous, (2)3(4)-locular, or by abortion 1-locular. **Seeds** ovoid, with thin pulpy sarcostesta and crustaceous, smooth or foveolate-reticulate endotesta, ecarunculate; albumen fleshy; cotyledons broad, flat.

Species ± 40, Old World tropics, 8 in Africa; 3 in eastern parts of sthn Afr.

Synadenium Boiss. 4500000

(Euphorbioideae—Euphorbieae)
Boissier: 187 (1862); Brown: 220 (1915); White, Dyer & Sloane: 951 (1941); Carter: 534 (1988); Webster: 129 (1994b).

Shrubs or small trees, with branches fleshy, cylindrical, containing copious caustic milky latex; monoecious. **Leaves** alternate, usually large and fleshy; stipules modified as small but conspicuous dark brown glands. **Inflorescence** with sessile cyathia in dichotomously branching axillary cymes, usually crowded into pseudoumbels at branch apices; bracts at base of involucres paired, persistent. **Involucres** with an entire (rarely lobed), spreading, furrowed, glandular rim and 5 fringed lobes. **Sepals** and **petals** 0 or rudimentary. **Male flowers** reduced to individual stamens which are arranged in 5 groups opposite involucral lobes; stamens shortly exserted from involucre; bracteoles present. **Female flowers**: solitary within involucre, surrounded by male flowers, sessile or on short pedicel, pedicel elongating slightly in fruit; perianth reduced to 3-lobed rim below ovary; ovary 3-locular, with 1 pendulous ovule in each locule; styles 3, united below, with bifid stigma. **Fruit** a dehiscent capsule. **Seeds** with a sessile, often rudimentary caruncle. $x = 9$ (polyploidy).

Species 19, Africa; 1 in sthn Afr., *Synadenium cupulare* (Boiss.) Wheeler; Northern Province, Mpumalanga to N KwaZulu-Natal.

Tragia L. 4416000

(Acalyphoideae—Plukeneteae)
Linnaeus: 980 (1753); Prain: 502 (1920); Radcliffe-Smith: 291 (1987a); Webster: 95 (1994b); Radcliffe-Smith: 216 (1996).

Ctenomeria Harv.: 29 (1842).

Herbs, twining; with stinging hairs; monoecious. **Leaves** alternate, petiolate, cordate, usually lobed. **Inflorescence** a raceme, terminal or leaf-opposed, with many male flowers above and 1 or 2 basal female flowers. **Petals** 0. **Disc** 0. **Male flowers**: calyx herbaceous, with 5 valvate lobes; stamens 2–5(–50) on hemispherical receptacle; filaments free; anthers linear, minutely apiculate; pistil 0. **Female flowers**: calyx 6-partite; segments pectinately lobulate on each side, setose; ovary 3-locular, with a single ovule in each locule, setose; styles 3, free or connate below, densely papillose. **Fruit** a 3-coccous capsule, with cocci 2-valved. **Seeds** globose, ecarunculate; albumen fleshy; cotyledons broad, flat. $x = 12$ (aneuploids, high polyploidy).

Species ± 125, cosmopolitan in warm areas; 14 in sthn Afr., widespread. *Ctenomeria* Harv., with more than 30 stamens, may be recognised as a separate genus.

Tragiella Pax & K.Hoffm. 4416020

(Acalyphoideae—Plukenetieae)
Pax & Hoffmann: 104 (1919); Radcliffe-Smith: 318 (1987); Webster: 94 (1994b); Radcliffe-Smith: 212 (1996).

Sphaerostylis Baill.: 466, t. 21 (1858) in sense of some authors; Webster: 94 (1994b), endemic to Madagascar but doubtfully separable.

Perennial herbs, usually twining, up to ± 3 m long; with stinging hairs; monoecious. **Leaves** alternate, long-petiolate, finely toothed; stipulate. **Flowers** in lateral, pedunculate racemes, with many bracteate male flowers above and 1 or 2 female flowers at base. **Petals** 0. **Male flowers**: calyx 3-partite, valvate above, at length with lobes folded inwards and resembling a disc; stamens 3(4), alternating with sepals; filaments united into a short column; anthers at first erect and later becoming reflexed, apiculate, with longitudinal, introrse dehiscence; ovary usually 0. **Female flowers**: calyx 6-partite;

lobes pinnately 8–10-lacinulate on each side; ovary 3-lobed, with single ovule in each locule, hispid; styles 3, united almost to apex into a slender tube, with spreading stigmas. **Fruit** a 3-didymous capsule, dehiscing into 3-bivalved cocci; pericarp thin, crustaceous; endocarp woody; columella trifid, not persistent. **Seeds** globose, ecarunculate; cotyledons broad, flat.

Species 5, Africa; 1 in sthn Afr., *Tragiella natalensis* (Sond.) Pax & K.Hoffm. in eastern parts of sthn Afr.

*Vernicia Lour. 4428010

(Crotonoideae—Aleuritideae)

Loureiro: 586 (1790); Radcliffe-Smith: 178 (1987a); Webster: 114 (1994b); Radcliffe-Smith: 301 (1996); Stuppy *et al.*: 88 (1999).

Trees; indumentum simple; monoecious or subdioecious. **Leaves** alternate, simple, entire or palmately lobed, lobed leaves with gland at sinus between lobes, petiolate; stipules minute and soon deciduous. **Inflorescences** terminal, thyrsiform, bisexual, protogynous, with a solitary, terminal female flower and several male flowers and cymules, or else inflorescences unisexual; bracts lanceolate, lower sometimes persistent, upper soon deciduous; flowers large. **Male flowers**: calyx valvate, 2- or 3-lobed; petals free, contorted; disc of 5 free, erect glands; stamens 2-verticellate, (8–)10–14, outer ± free or fused for a third of their length, inner fused for over half their length; anthers introrse; pistillode 0. **Female flowers**: calyx, petals and disc as in male flowers; ovary 3(–5)-locular, with 1 ovule per locule; styles 3(–5), ± free or united at base, bifid. **Fruit** large, tardily dehiscent from base; exocarp fibrous; endocarp woody or crustaceous, 3(–5)-locular. **Seeds** ovoid-trigonous, ecarunculate; testa thick, woody; albumen hard; embryo straight; cotyledons broad, flat. $x = 11$.

Species 3 from East and Southeast Asia, of which 2 are cultivated in sthn Afr. and may occur as escapes.

Fabaceae (Leguminosae)

(Rosidae—Fabales)

Compiled by G. Germishuizen

Trees, shrubs, climbers, lianes or herbs. **Leaves** usually alternate, often pinnate or pinnately 3-foliolate or digitately compound, occasionally 1-foliolate; stipules usually present, various. **Inflorescence** a spike, raceme, panicle or head. **Flowers** various, usually bracteate, regular or irregular, mostly bisexual. **Sepals** in regular flowers (3)4–5(6), connate or free, in irregular flowers (4)5, free or connate into a toothed or lobed calyx. **Petals** connate or free, in regular flowers as many as sepals, in irregular flowers 5 or fewer by abortion. **Stamens** twice as many as petals, sometimes more, rarely as many as or fewer than number of petals; filaments free or variously connate; anthers 2-thecous, generally opening by longitudinal slits. **Ovary** almost always superior, 1-locular, 1–many-ovuled; style and stigma simple. **Fruit** generally a 2-valved, dehiscent pod, rarely fleshy and sometimes indehiscent and occasionally breaking into segments. **Seeds** various, without or with very little endosperm.

Genera 650, species ± 18 000; sthn Africa: genera 149, species ± 1705; economically important family.

Harvey: 1 (1862); Brenan: 1 (1959); Hutchinson: 221 (1964); Brenan: 1 (1967); Schreiber: 1 (1967a); Schreiber: 1 (1967b); Schreiber: 1 (1970); Gillett, Polhill & Verdcourt: 1 (1971); Ross: 1 (1975); Ross: 1 (1977); Polhill: 191 (1981b).

One of the principles followed in this work is to maintain uniformity of treatment, where practicable, with the Floras of neighbouring territories. The case of the Fabaceae (Leguminosae) leaves one in a dilemma. Hutchinson (1964) and others prefer to treat Caesalpiniaceae, Mimosaceae and Fabaceae (Papilionaceae) as separate families. Brenan (1967), who maintains Leguminosae, summarises the position in the following words: 'Although some authors consider the three subfamilies of Leguminosae as separate families, this really represents no more than a slight difference of opinion. If emphasis is laid on the borderline tribes mentioned, then subfamily is the reasonable rank; if, on the other hand, these are discounted in favour of the numerically much larger mass of genera about whose position there is no room for doubt or difference of opinion, then the subfamilies are reasonably considered as families. The three groups, however, remain very much the same in content, whatever taxonomic rank is assigned to them'.

In this work I have used Fabaceae, an alternate name for Leguminosae, with Mimosoideae, Caesalpinioideae and Papilionoideae as subfamilies. The following keys to the subfamilies, groups and genera are based very largely on the publications of Dyer (1975), Ross (1975, 1977), Polhill (1981a) and Polhill & Raven (1981).

Key to subfamilies

1a Flowers regular; petals valvate in bud, often united basally; sepals usually united basally; stamens as many as petals or twice as many or numerous, free or all united into a tube or to the base of the petals; anthers uniform, dehiscing lengthwise, sometimes with a deciduous gland at the apex; leaves bipinnate or, rarely, pinnate in indigenous species#; seeds normally with an areole on each face or side ..... **Mimosoideae** (p. 263)

1b Flowers nearly always irregular; petals imbricate in bud, free or some of them united; seeds usually without an areole:

2a Adaxial (uppermost) petal overlapped on each side by the adjacent lateral petals (when present); sepals often free; stamens 10 or fewer, free or, less often, variously united; anthers uniform, rarely dimorphic, dehiscing lengthwise or by terminal pores; leaves mostly pinnate or bipinnate, rarely simple or 1-foliolate; seeds with radicle usually straight ..... **Caesalpinioideae** (p. 264)

2b Adaxial (uppermost) petal outside the adjacent lateral petals or wings and usually forming with the keel-petals an irregular corolla; sepals united basally; stamens 10 or rarely fewer, rarely free, most often the adaxial ones free or nearly so and the other 9 united, sometimes united into 2 groups of 5 or all united; anthers mostly dehiscing lengthwise; leaves very rarely bipinnate (*Rhynchosia*); seeds with radicle usually curved ..... **Papilionoideae** (p. 266)

Some exotic species of *Acacia* growing in our flora area have phyllodes which may appear to be simple leaves.

Subfamily **Mimosoideae** (Mimosaceae)

Trees, shrubs, or rarely herbs, often armed with prickles or spines. **Leaves** bipinnate or rarely once-pinnate; stipules present, sometimes spinescent. **Flowers** regular, bisexual, unisexual, or some neuter and sterile, small and short or sometimes elongated and tubular, (3)5(6)-merous, usually sessile in cylindric spikes or globose heads, rarely racemose or in globose umbels; bracts small, often caducous; bracteoles rarely present. **Sepals** imbricate or valvate, connate into a toothed or lobed limb, rarely free. **Petals** valvate, free or connate into a lobed corolla, hypogynous or slightly perigynous. **Disc** usually 0. **Stamens** 4–10 (as many as or twice as many as petals), free or monadelphous or adnate to base of corolla tube; anthers small, versatile, often crowned by a deciduous gland, dehiscing lengthwise. **Ovary** free at base of calyx tube, 1-locular; style usually filiform; stigma small, terminal; ovules mostly many. **Pod** dehiscent or indehiscent, sometimes breaking into 1-seeded segments. **Seeds** mostly ovate or orbicular, compressed, sometimes winged, hilum basal, rarely thick, globose or ovoid; aril rarely present, testa hard, endosperm none or thin; cotyledons flat; radicle straight.

Key to genera

1a Plant armed with prickles or spines:
2a Inflorescence bicoloured, the upper part bisexual, yellow, the lower neuter, mauve, pink or white; short lateral branches terminating in spines, plants otherwise unarmed ..... **Dichrostachys**
2b Inflorescence concolorous; plants armed with recurved prickles or stipular spines, very rarely short lateral branchlets terminating in spines:
3a Plant armed with recurved prickles or stipular spines, spine-tipped lateral branchlets 0:
4a Flowers in globose or subglobose heads, rarely the inflorescence reduced to only 2–4 flowers per 'head':
5a Stamens as many as or twice as many as the (3)4–5(6) corolla lobes:
6a Small rigid much-branched shrub with pale green to olive, cano-puberulous, substriate branches; stipules spinescent, recurved, up to 3.5 mm long; leaves small, each with 1 pinna pair; stamens 10, the 5 opposite the petals shorter than those alternating with the petals; anthers with a minute deciduous apical gland ..... **Xerocladia**
6b Annual or perennial herb or small shrub; stems armed with scattered prickles and usually densely hispid or setulose; stipules not spinescent, persistent; leaves sensitive to touch, with (1)2–14 pinnate pairs; stamens 4 or 8; anthers eglandular apically; flowers pink or mauve ..... **Mimosa**
5b Stamens many (± 35–200):
7a Inflorescence reduced to 2–4 flowers; flowers pink; filaments shortly united into a tube, basally..... **Calliandra**
7b Inflorescence not as above; flowers mostly white, yellowish white, bright or deep yellow; filaments free ..... **Acacia**
4b Flowers in spikes or spiciform racemes:
8a Stamens 10:
9a Recurved prickles scattered along the stem; pods compressed, slightly curved to falcate, at maturity the valves splitting transversely into 1-seeded segments ..... **Adenopodia**
9b Straight stipular paired spines; pods slightly curved or coiled, indehiscent, not segmented..... ***Prosopis**
8b Stamens many (± 35–200):
10a Petioles glandular; stamen filaments free; pods mostly dehiscent, various ..... **Acacia**
10b Petioles eglandular; stamen filaments shortly connate basally; pods indehiscent, falcate or spirally coiled..... **Faidherbia**
3b Plant armed with spine-tipped lateral shoots, recurved prickles and stipular spines 0; inflorescence globose; stamen filaments united basally into a tube ..... **Albizia**
1b Plant unarmed:
11a Inflorescence capitate, globose or subglobose:
12a Aquatic herb with creeping, usually floating and swollen stems; flowers of two sorts, bisexual in upper part of head, neuter with elongate staminodes in lower part ..... **Neptunia**
12b Tree, shrub or suffrutex, rarely herbaceous and then not aquatic:
13a Leaves reduced to simple, entire phyllodes ..... **Acacia**
13b Leaves bipinnate:
14a Stamens 10:
15a Leaves with 1 pinna pair; leaflets large, 20–60 mm wide; large tree up to 15 m high ..... **Xylia**
15b Leaves with (2)3–8 pinnae pairs; leaflets small, less than 5 mm wide; perennial herb, suffrutex, shrub or small tree:
16a Anthers with conspicuous scattered hairs; flowers in heads up to 18 mm in diameter; shrub or small tree with densely grey-puberulous branchlets; leaflets 1.5–4.0 mm wide..... ***Leucaena**
16b Anthers glabrous; flowers in heads up to 8 mm in diameter; perennial herb or suffrutex with subglabrous to sparingly puberulous, ± angular stems; leaflets 0.8–1.5 mm wide..... **Desmanthus**
14b Stamens many to numerous (± 19–200):
17a Stamen filaments free; central flower of inflorescence not different from the rest ..... **Acacia**
17b Stamen filaments united basally into a tube, tube included or exserted beyond the corolla; central flower of inflorescence usually differing from and often larger than the rest..... **Albizia**
11b Inflorescence elongate, spicate or racemose:
18a Leaflets alternate to subopposite, 7–19 mm wide, with petiolules 1.5–3.0 mm long..... **Amblygonocarpus**
18b Leaflets opposite, very rarely alternate but then sessile and less than 2 mm wide:
19a Stamens 10:
20a Leaf rachis with a gland at the junction of each pair of pinnae or the upper pairs; large tree ..... **Newtonia**

20b Leaf rachis eglandular; liane, climber, shrub, suffrutex or small tree:
21a Liane, climber or erect suffrutex, the latter with leaflets 7–20 mm wide ..... **Entada**
21b Suffrutex, shrub or small tree; leaflets less than 6.5 mm wide ..... **Elephantorrhiza**
19b Stamens many to numerous (± 19–200):
22a Stamen filaments free ..... **Acacia**
22b Stamen filaments united basally into a tube, tube included or scarcely exserted beyond the corolla; flowers uniform ..... ***Paraserianthes**

Subfamily **Caesalpinioideae** (Caesalpiniaceae)

Trees, shrubs, sometimes climbers or lianes, or rarely herbs, unarmed or often armed. **Leaves** nearly always alternate, pinnate or bipinnate; with pinnae or leaflets in 1–many pairs, rarely leaves simple or 1-foliolate, sometimes gland-dotted; stipules paired, mostly caducous; stipels occasionally present and minute. **Flowers** irregular, rarely regular, usually 5-merous, mostly bisexual, some large and showy, others small, in axillary, terminal, or rarely leaf-opposed racemes, panicles or spikes. **Sepals** 5 or 4 by fusion of 2, free or partly united, imbricate or rarely valvate, often much reduced when the bracteoles are large and calyx-like and covering the bud. **Petals** 5 or fewer, rarely 0, the adaxial innermost, others variously imbricate. **Stamens** 10 or fewer, rarely many, free or variously connate; anthers various, usually dehiscing lengthwise, rarely by terminal pores, 2-locular; extra-staminal disc sometimes present. **Ovary** free or, when stalked, the stalk sometimes ± adnate to the calyx tube, of 1 carpel, 1-locular, with a ventral suture; style simple; ovules 1–many, superposed. **Pod** 2-valved, or indehiscent and drupaceous or samaroid. **Seeds** sometimes arillate, rarely with endosperm; cotyledons fleshy or foliaceous; radicle straight or rarely slightly oblique.

Key to genera

1a Leaves simple, emarginate apically to deeply bilobed, sometimes with a pair of leaflets:
2a Petals 0; leaves with a single pair of leaflets:
3a Stamens (8–)10(–12); inflorescence an axillary or terminal panicle; leaflets with a midrib and lateral nerves or without a midrib but with 3–6 conspicuous nerves arising from the base; pods pale yellowish brown, reniform, indehiscent; seeds with small sticky reddish resin glands ..... **Colophospermum**
3b Stamens 20–25; inflorescence a slender raceme or panicle; leaflets with 7–12 prominent nerves arising from the base, without a midrib; pods brown or reddish brown, obliquely semiorbicular, ovate or ovate-oblong, dehiscent or indehiscent; seeds not as above ..... **Guibourtia**
2b Petals 5; leaves emarginate apically to deeply bilobed, occasionally with a single pair of leaflets:
4a Plants with trailing or climbing, mostly herbaceous stems arising from a large underground tuber; tendrils usually present; fertile stamens 2, accompanied by staminodes; calyx with the 2 upper sepals partly or completely fused, the rest free ..... **Tylosema**
4b Plants growing as a shrub or small tree, seldom scandent or climbing but then woody and without tendrils:
5a Flowers normally unisexual and plants dioecious; female flowers with the stigma sessile on the ovary, capitate, flattened-globose; male flowers with 10 fertile stamens; calyx turbinate with 4 or 5 short broad lobes..... **Piliostigma**
5b Flowers bisexual; style elongate; fertile stamens 1–10; calyx spathaceous or campanulate with 5 short lobes or teeth:
6a Calyx spathaceous, splitting to the base down one side only, with the sepals fused or sometimes partly separated; fertile stamens 1–10, sometimes accompanied by staminodes; pods oblong or oblanceolate-oblong, valves thinly woody ..... **Bauhinia**
6b Calyx campanulate, with 5 short teeth or lobes; fertile stamens 10; plants often conspicuously glandular; pods semiorbicular, valves papery, with or without stalked glands ..... **Adenolobus**
1b Leaves pinnately or bipinnately compound with more than 2 leaflets, very seldom leaves reduced to green, ± terete, 'needle-like' pinna-rachillae with or without minute inconspicuous leaflets, or the rachillae laterally winged and appearing flattened, '± phyllodial', with many pairs of small leaflets:
7a Leaves reduced, the pinna-rachillae green, ± terete and 'needle-like', with or without minute inconspicuous leaflets, or the rachillae laterally winged and appearing flattened, '± phyllodial', with many pairs of leaflets up to 9 x 3 mm; plant armed with stout spines ..... **Parkinsonia**
7b Leaves not reduced, pinna-rachillae not 'needle-like' or '± phyllodial'; plant unarmed or armed with recurved prickles, rarely armed with spines:
8a Leaves bipinnate:
9a Plant unarmed:
10a Leaflets alternate; flowers small (petals 2–5 mm long, white to cream-coloured or pale green); sepals open from a very early stage, leaving the petals covering the flower until anthesis:
11a Flowers pedicellate; with narrow petals which are ± densely pubescent, at least on the margins; anthers 0.5–0.75 mm long; stigma minute, cup-shaped-punctiform on a narrow conical style; stamen filaments pubescent or tomentose to near the apex; hairs (when present) on vegetative buds and young branchlets grey-brown to yellowish ..... **Erythrophleum**
11b Flowers sessile; petals glabrous or almost so; anthers 1.5–2.0 mm long; style very short, ending in a funnel-shaped stigma slit down one side; stamen filaments glabrous; hairs on vegetative buds, young branchlets and inflorescence axes rusty red ..... **Burkea**
10b Leaflets opposite; flowers usually medium to large (petals 7–32 mm long, seldom smaller, yellow, orange, red or magenta); sepals valvate or imbricate:
12a Leaves imparipinnate; herb or low shrub up to 0.5 m high; stems, leaves and calyces with many dark sessile glands; petals up to 9 mm long ..... **Hoffmannseggia**

12b Leaves paripinnate; tree or large shrub; petals 7–32 mm long:

13a Stigma broadly peltate; inflorescence axes, calyces and ovaries rusty tomentose; petals yellow; stipules up to 14 mm long, linear-subulate with up to 7 linear, alternate lateral appendages up to 6 mm long..... **Peltophorum**

13b Stigma not broadly peltate; inflorescence axes, calyces and ovaries not rusty tomentose; petals yellow, pink, red or magenta; stipules not as above ..... **Caesalpinia**

9b Plant armed with prickles or spines:

14a Calyx lobes valvate; flowers small, greenish to white; spines usually branched ..... ***Gleditsia**

14b Calyx lobes or teeth imbricate; flowers yellow, pale yellowish white, pink, red or magenta; spines not branched:

15a Petals 2–3 mm long; pods samaroid, with a basal seed-containing portion whose upper suture is greatly extended beyond the seed-containing part and is broadly winged on its lower side..... **Pterolobium**

15b Petals 6–25 mm long; pods unwinged ..... **Caesalpinia**

8b Leaves simply pinnate:

16a Plants armed with spines:

17a Leaves with 3 pairs of opposite leaflets; inflorescence a relatively few-flowered lateral or terminal raceme; petals yellow, 8–10 x 5–7 mm; ovary glandular ..... **Haematoxylum**

17b Leaves with (3–)5–10(–12) pairs of subopposite or irregularly alternate leaflets; inflorescence a short, lax panicle or many-flowered, drooping raceme; petals greenish or white; ovary eglandular:

18a Inflorescence a lax panicle; pods 30–50 mm long, 9–12 mm wide, straight or almost so, dehiscent ..... **Umtiza**

18b Inflorescence a dense drooping raceme; pods large, 150–300 mm long, 25–35 mm wide, usually slightly falcate but often twisting with age, indehiscent ..... ***Gleditsia**

16b Plant unarmed:

19a Bracteoles paired, valvate throughout, well developed, completely enclosing the flower bud, usually persistent:

20a Bracteoles enclosing the young flower bud but soon caducous, exposing the bud enclosed by the calyx; stamen- and staminode filaments all united basally for ± half their length; fertile stamens 3, alternating with 5 sterile teeth or short filaments; larger petals 3, subequal, gold with red veins..... **Tamarindus**

20b Bracteoles enclosing the young flower bud and persistent below the open flower; stamens not as above and more than 3 fertile; petals or tepals not coloured as above:

21a Perianth clearly differentiated into 5 obvious petals and 5 sepals..... **Julbernardia**

21b Perianth 0 or of 1–7(–11) parts, usually 4–7 all sepaloid and of similar form, grading inwards from broader to narrower ..... **Brachystegia**

19b Bracteoles nonvalvate, often scale-like, often caducous or 0, seldom enclosing the flower bud, but, if so, then one or both margins of one bracteole overlapping the other, at least at the base, and the flower with only 1 petal:

22a Petals 0 or sometimes petals present but reduced to minute, linear, inconspicuous filaments and apparently absent:

23a Stamens 10, filaments united basally for 1.5–3.5 mm, tube entire or split down one side; calyx leathery, 4-(rarely 5-)lobed, red or scarlet, glabrous or sparingly puberulous; ovary glabrous; inflorescence a dense, congested, subglobose panicle, usually cauliflorous on older branches but occasionally terminal... ..... **Schotia**

23b Stamens 5–10, filaments free; sepals 5, fulvous or rusty brown puberulous outside; ovary densely ferruginous-hirsute; inflorescence a many-flowered panicle or raceme:

24a Inflorescence a many-flowered panicle; ovules 2; pod ovoid-ellipsoid, densely brown velutinous-puberulous ..... **Dialium**

24b Inflorescence a dense raceme; ovules many; pod elongated, compressed, thick and coriaceous, glabrous ..... ***Ceratonia**

22b Petals 1–5, well developed:

25a Petals 1–4:

26a Petals 1, pubescent and green outside, dark red inside, 25–45 mm long, with a long claw suddenly widening into a deeply bilobed lamina 22–31 mm wide; fertile stamens usually 7 (rarely 9) ..... **Afzelia**

26b Petals 1–4, pale pink or red throughout, smaller than above and not widened above into a deeply bilobed lamina; fertile stamens 10 ..... **Schotia**

25b Petals 5:

27a Anthers opening by terminal or basal pores or short slits, usually basifixed; petals mostly yellow; glands often present on petiole or leaf rachis:

28a Filaments of the 3 adaxial stamens sigmoidally incurved, many times longer than their small anther; filaments of other stamens straight, shorter, the anthers dehiscing by basal pores; pedicels 2-bracteolate at or just above their base; pod elongate, usually cylindric, indehiscent; seed coat smooth, without areoles; tree ..... **Cassia**

28b Filaments of all stamens straight, either shorter or not more than twice as long as their anthers; if longer, then the anthers dehiscing by apical pores; pods various, but if cylindric and indehiscent then the pedicels without bracts:

29a Bracteoles 0; pod either indehiscent, or breaking inelastically through one or both sutures; if through both, then the valves not coiling; androecium often irregular, the members tending to decrease in size from the abaxial to the adaxial side of the flower; anther thecae naked along the sutures; seed coat often with a closed areole on each face or margins; tree, shrub or herb..... **Senna**

29b Bracteoles 2; pod elastically indehiscent, the valves coiling at or after dehiscence; androecium virtually regular, the two cycles sometimes of different lengths but not decreasing regularly from

abaxial to adaxial side of the flower; anther thecae ciliolate along the sutures; seed-coat without areoles; usually a herb ..... **Chamaecrista**

27b Anthers opening by longitudinal slits which are as long as the anther, usually dorsifixed; petals pink, red, mauve, magenta or sometimes yellow; conspicuous glands not present on petiole or rachis:

30a Petals yellow; small shrub to 2 m high; leaves up 12 mm long with 3 pairs of obcordate or broadly obovate to obovate-suborbicular leaflets ..... **Haematoxylum**

30b Petals pink, red, mauve or magenta; large shrub or tree; leaves much larger than above:

31a Inflorescence a short raceme or panicle; calyx glabrous or almost so; petals pink, red or scarlet; ovary glabrous or almost so ..... **Schotia**

31b Inflorescence a stout raceme up to 350 mm long; sepals densely fulvous-tomentose outside; petals pink, mauve or magenta; ovary fulvous-tomentose ..... **Baikiaea**

Subfamily **Papilionoideae** (Papilionaceae)

Lianes, mostly herbs, shrubs, or trees, unarmed or, less often, spiny. **Leaves** pinnate or pinnately 3-foliolate, less often digitately 3-foliolate, occasionally 1-foliolate, simple or palmate; stipels sometimes present. **Flowers** irregular, mostly bisexual, solitary, racemose or paniculate, less often umbellate, spicate or capitate. **Sepals** usually 5, ± connate into a tube. **Petals** 5, imbricate, free, the upper (adaxial) exterior and forming the standard or vexillum, the two lateral (wings) ± parallel with each other, the lowest two interior and connate by their lower margins into a keel or carina. **Stamens** arising from base of petals, often 10, monadelphous or diadelphous, mostly all perfect; anthers mostly opening lengthwise, basifixed or dorsifixed. **Fruit** usually a legume (pod) or indehiscent, sometimes jointed and breaking into 1-seeded segments.

Key to tribes

1a Filaments all free from base upwards, occasionally shortly and ± equally connate at base only; anthers usually uniform in size and shape:

2a Calyx entire in bud; stamens 9–numerous; petals 0–9, not much differentiated ..... **Swartzieae** (p. 273)

2b Calyx lobes apparent or corolla markedly papilionoid; stamens (5–)10(–30); petals generally 5; rarely 1 or 0:

3a Leaves pinnately foliolate or of only 1 leaflet and then with distinct pulvinus at apex of petiolule ..... **Sophoreae** (p. 273)

3b Leaves digitately foliolate or simple, very rarely pinnate or reduced to scales ..... **Podalyrieae** (p. 272)

1b Filaments partly or almost wholly united to one another, either monadelphous in a closed tube, or diadelphous with the vexillary (adaxial) filament often free or partly so:

4a Anthers distinctly dimorphic, alternately basifixed and shorter dorsifixed; leaves simple, 1-foliolate or digitately 3(–many)-foliolate, if compound, leaves generally pulvinate or with a raised leaf base, rarely distichous, never glandular-punctate; fruit never jointed:

5a Upper 2 calyx lobes joined higher than lower ones, sometimes enlarged; lowermost (carinal) calyx lobe generally longer or narrower than upper ones; flowers mostly in heads or clusters; style glabrous; seeds arillate ..... **Liparieae** (p. 270)

5b Calyx lobes variously united, but not as above, or subequally lobed; lowermost lobe often much shorter and narrower than upper ones; flowers in terminal, rarely leaf-opposed, spikes, racemes, or heads, rarely axillary; seeds rarely arillate:

6a Filaments fused into a sheath open on upper side ..... **Crotalarieae** (p. 268)

6b Filaments fused into a closed tube ..... **Genisteae** (p. 270)

4b Anthers ± uniform at least in size, some sometimes aborted, or if dimorphic (in Aeschynomeneae, Psoraleeae and a few Phaseoleae, by abortion in *Teramnus*) then leaves pinnate or glandular punctate:

7a Leaves with pulvinus 0 (stipules often adnate to petiole base) or reduced, often with a stipular ridge forming an abaxial commissure, generally distichous or crowded; inflorescence axillary; herb or small softly woody shrub:

8a Leaflets ± toothed; nerves extending to ± toothed margin of leaflets; stipules adnate to petiole base ..... **Trifolieae** (p. 274)

8b Leaves not toothed (except some Psoraleeae); nerves looped within the margin (except some Galegeae):

9a Leaves generally paripinnate, ending in a tendril or bristle, rarely imparipinnate; stipules free from petiole, generally foliaceous; fruit 2-valved; seeds lenticular to globose with ± linear hilum and no radicular lobes; herb ..... **Vicieae** (p. 274)

9b Leaves generally ending in a leaflet or a spine, less often in a bristle; stipules generally small and/or adnate to the petiole; seeds with a small round hilum generally below a radicular lobe:

10a Filaments of all or alternate stamens dilated apically; flowers 1 or 2 from axils, in heads or more often umbellate, sometimes subtended by a foliar bract; compound leaves generally with at least 3 terminal leaflets conjugate, lowermost pair sometimes stipule-like, sometimes with a glandular stipule:

11a Fruit not jointed, generally dehiscent if long-exserted ..... **Loteae** (p. 271)

11b Fruit jointed or elongated with thickened margins and hooked tip ..... **Coronilleae** (p. 268)

10b Filaments not dilated upwards:

12a Ovule 1; fruit 1-seeded, glandular; inflorescences compound, with more than 1 series of bracts; foliage ± glandular-punctate or pustulate ..... **Psoraleeae** (p. 273)

12b Ovules 2–many; fruit not both 1-seeded and glandular; racemes or fascicles simple with flower bracts only ..... **Galegeae** (p. 269)

7b Leaves pulvinate, mostly free from stipules if present:

13a Petals 5, all similar, ribbon-like or spathulate; fruit drupaceous or flat and curved, eglandular 1(–2)-seeded, indehiscent ..... **Dalbergieae** (p. 269)

13b Petals differentiated, papilionoid:

14a Stamens 9; leaves paripinnate; flowers in pseudoracemes (pedicels several at a rachis node) or axillary fascicles; pods elastically dehiscent, with brown to brightly coloured seeds ..... **Abreae** (below)

14b Not as above:

15a Anthers apiculate or appendaged; petals usually reddish and caducous; biramous hairs present (often among others); normally leafy ..... **Indigofereae** (p. 270)

15b Anthers not appendaged (if petals caducous):

16a Anther thecae confluent above; perennial herb with astragaloid flowers, ± glandular foliage and minute peltate scales; fruit several-seeded, dehiscent or not, often muricate or bristly ..... **Galegeae** (subtribe **Glycyrrhizinae**) (p. 270)

16b Anther thecae separate, sometimes reduced to terminal pores (then plant woody):

17a Fruit 1-seeded, often nutlet-like, small, generally glandular, with marcesent calyx; foliage glandular-pustulate or -punctate; never twining or large tree; inflorescence axillary; leaves (1–)3(–5)-foliolate ..... **Psoraleeae** (p. 273)

17b Fruit more pod-like, eglandular or woody; glands, if present, generally on surface or small internal punctae:

18a Fruit transversely jointed, sometimes of only 1 article, or less often opening down one suture (then tertiary venation of leaflets scalariform); seeds with radicular lobe longer than cotyledonary lobe; lower petals generally withering and caducous after explosive pollen release; inflorescence generally compound with more than 1 series of bracts; leaves pinnately 3(–11)-foliolate, generally stipellate; stipules and bracts often striately nerved ..... **Desmodieae** (p. 269)

18b Fruit not jointed, or if so (Aeschynomeneae), seeds more symmetrical; lower petals more retractible or little interconnected and differentiated:

19a Style straight or curved away from standard; standard with a median gutter; leaves digitately 3-foliolate ..... **Crotalarieae** (p. 268)

19b Style curved towards standard:

20a Hypanthium 0; intrastaminal disc generally present; vexillary filament often connate medially, but free, arched and thickened to form openings at base; flowers generally in pseudoracemes, sometimes in extensive panicles or clustered in axils; leaves generally imparipinnate, 3–many-foliolate, leaflets generally strictly opposite and stipellate, occasionally alternate, sometimes 1-foliolate or simple:

21a Leaves 1–many-foliolate, if 3-foliolate the lateral leaflets only slightly asymmetrical; tree, shrub or liane with hard wood, less often a subshrub or herb (*Tephrosia* generally have closely parallel nerves extending to leaflet margins, but easily confused with Phaseoleae subtribe Ophrestiinae); inflorescences aggregated towards branch ends ..... **Tephrosieae** (p. 273)

21b Leaves (1–)3-foliolate, the laterals usually markedly asymmetrical and regularly stipellate, occasionally 5–9-foliolate; twining prostrate or erect herb, sometimes a shrub, liane or tree; inflorescences often in many axils ..... **Phaseoleae** (p. 271)

20b Hypanthium present, short to long; intrastaminal disc generally lacking; vexillary filament not flared at base of staminal tube; flowers almost always arising singly if inflorescence extended; leaves variously paripinnate to imparipinnate; leaflets alternate to opposite, with or without stipels, sometimes 1–3-foliolate:

22a Fruit jointed or geocarpic ..... **Aeschynomeneae** (below)

22b Fruit not jointed, nor geocarpic:

23a Ovules 1–4; fruit indehiscent, the seeds generally in separate seed chambers with hard endocarp; keel petals generally overlapping abaxially or, if margins adnate, flowers usually secund on the rachis, ± free from wings; stamens often shortly and/or irregularly joined ..... **Dalbergieae** (p. 269)

23b Ovules generally more numerous; fruit generally more pod-like even if flat and indehiscent:

24a Flowers in axillary racemes (occasionally with 1 or 2 branches if on leafless shoots) or rarely strictly leaf-opposed or in axillary clusters; stamens three-quarters joined except some bird-flowers; keel petals abaxially joined (shortly in some bird-flowers); pods usually dehiscent, often septate internally ..... **Robinieae** (p. 273)

24b Flowers in terminal panicles, sometimes with supplementary axillary racemes, rarely all axillary; stamens very rarely joined so high and keel petals usually overlapping abaxially; fruit generally indehiscent ..... **Sophoreae** (p. 273) and **Tephrosieae** (p. 273)

Tribe **Abreae**

Only one genus in tribe ..... **Abrus**

Tribe **Aeschynomeneae**

Key to subtribes

1a Conspicuous pellucid or pustular glands on leaves, calyx, etc. or, if obscure, flowers sessile in many paired bracts; pedicels without joints or bracteoles; fruit without strong longitudinal nerves on sides; articles several, quadrate, often ornamented with glands, crests or bristles ..... **Poiretiinae** (p. 268)

1b Pellucid or pustular glands lacking; pedicels almost always articulate and/or bracteolate:

2a Flowers pedicellate; receptacle broader than long or 0; ovary generally stipitate:

3a Leaves almost always imparipinnate; fruit (unless globular or covered by bristles) with strong continuous nerves on sides; ovary septa formed late; 3 lower calyx lobes discrete; stamens variously united but tending to split on vexillary side first, deflexed after anthesis ..... **Ormocarpinae** (below)

3b Leaves paripinnate, subimparipinnate or occasionally imparipinnate; articles reticulately veined; ovary septa generally formed by anthesis; 3 lower calyx lobes discrete or largely joined in a lip; stamens tending to split on carinal side first, usally 10 or 5 + 5, usually lying above the fruit ..... **Aeschynomeninae** (below)

2b Flowers sessile or subsessile in axils or on a common axis (bracts and 2 bracteoles then adjacent); receptacle longer than broad, sometimes tubular; ovary sessile or nearly so; fruit with strong continuous longitudinal nerves on sides.... ..... **Stylosanthinae** (below)

Subtribe **Aeschynomeninae**

Key to genera

1a Fruit exserted from the calyx ..... **Aeschynomene**

1b Fruit enclosed within the calyx:

2a Stipules spurred at base; spur bilobed, with one side linear and longer than the other; leaflets opposite, 1-nerved ..... **Smithia**

2b Stipules not spurred at base; leaflets alternate, with 2–7 basal nerves ..... **Kotschya**

Subtribe **Ormocarpinae**

Only one genus represented ..... **Ormocarpum**

Subtribe **Poiretiinae**

Only one genus represented ..... **Zornia**

Subtribe **Stylosanthinae**

Key to genera

Leaflets 3; fruit not maturing below the soil; petals arising in throat of calyx tube ..... **Stylosanthes**

Leaflets 2 or 4; fruit maturing below the soil, reticulate; petals and stamens arising at the apex of the calyx tube ..... ***Arachis**

Tribe **Coronilleae**

Only one genus represented ..... ***Ornithopus**

Tribe **Crotalarieae**

Key to genera

1a Stipules 0 or inconspicuous; anthers often dimorphic:

2a Leaves simple:

3a Calyx lobes unequal, the lower smaller and narrower than the upper; leaves usually with 1 main nerve and several lateral nerves:

4a Fruit lanceolate or linear; a shrub or shrublet, ± glabrous and often glaucous; leaves from orbicular to linear, sessile or subsessile ..... **Rafnia**

4b Fruit ovate, turgid; perennial herb, villous; stems prostrate from a woody rootstock; leaves lanceolate ..... **Lotononis**

3b Calyx lobes subequal; leaves with 3–several parallel nerves; vexillum villous; fruit linear, compressed; shrub or shrublet, glabrous or sparsely villous ..... **Aspalathus**

2b Leaves compound, rarely reduced to a single leaflet:

5a Calyx ± regularly 5-toothed:

6a Fruit linear; leaves petiolate, 3-foliolate or simple or reduced to scales ..... **Lebeckia**

6b Fruit semi-ovate or lanceolate, obliquely acute or obliquely rhomboid; leaves in threes or fascicles, not petiolate.... ..... **Aspalathus**

5b Calyx not regularly 5-toothed:

7a Calyx with 4 upper lobes ± united in pairs, the lowest free; anthers dimorphic:

8a Keel and style curved; mostly a shrublet ..... **Lotononis**

8b Keel and style straight; mostly a herb ..... **Pearsonia**

7b Calyx 2-lipped:

9a Calyx with trifid lower lip (lateral sinuses deeper than the lower ones); fruit subtorulose, linear, flat; keel longer than the vexillum ..... **Dichilus**

9b Calyx without trifid lower lip (lateral sinuses may be wider than the lower ones, but not deeper); fruit winged along the upper or both sutures, flat and indehiscent, ovate or oblong ..... **Wiborgia**

1a Stipules conspicuous, free from each other and from leaf:

10a Stipules fused with the petiole and forming a cylindrical sheath around the stem ..... **Polhillia**

10b Stipules not sheathing the stem:

11a Calyx equally 5-toothed or -lobed:

12a Anthers uniform, all bearing anthers; leaves digitately 3-foliolate or only the upper 1-foliolate ..... **Rothia**
12b Anthers alternately longer (basifixed) and shorter (dorsifixed):
13a Stipules small; flowers in terminal, often unilateral racemes; fruit linear ..... **Lebeckia**
13b Stipules conspicuous, sometimes foliaceous and toothed; peduncles leaf-opposed:
14a Beak of keel not spirally coiled ..... **Crotalaria**
14b Beak of keel and genitalia spirally coiled ..... **Bolusia**
11b Calyx not equally 5-toothed or -lobed:
15a Calyx with the 4 upper teeth ± united in pairs, the lower one free ..... **Lotononis**
15b Calyx bilabiate; anthers alternately dissimilar; fruit linear, compressed, often tortulose ..... **Melolobium**

Tribe **Dalbergieae**

Key to genera

Wing petals not much broader than keel, not crimped, white or cream-coloured; anthers basifixed, with apical dehiscence; some branches modified as spines or climbing aids ..... **Dalbergia**
Wing petals broadly expanded, ± crimped, bright yellow or orange-yellow; anthers dorsifixed with longitudinal dehiscence; branches not modified as spines or climbing aids ..... **Pterocarpus**

Tribe **Desmodieae**

Key to subtribes

Plants with characteristic uncinate hairs; tertiary venation ± scalariform; stipels present; flowers chasmogamous, with an explosively dehiscent pollination mechanism; vexillum with hardly or slightly inflexed auricles; ovary (1)–many-ovulate ..... **Desmodiinae** (below)
Plants without uncinate hairs; tertiary venation reticulate; stipels 0; flowers chasmogamous, not explosively dehiscent, often mixed with cleistogamous flowers; vexillum with inflexed auricles more persistent than most Desmodiinae; ovary 1-ovulate ..... **Lespedezinae** (below)

Subtribe **Desmodiinae**

Key to genera

1a Calyx often membranous, not glumaceous or striate, shallowly divided, usually inconspicuous in fruit; fruit mostly held away from erect; leaves (1)3(5)-foliolate:
2a Stipules stramineous, striate, erect or spreading but never sharply recurved and velutinous; fruit distinctly jointed, breaking up into individual articles ..... **Desmodium**
2b Stipules mostly sharply recurved, dark brown adaxially, silver-velutinous abaxially; fruit splitting into 2 valves ..... **Pseudarthria**
1b Calyx glumaceous, striate, deeply divided, persistent and often partially enclosing the fruit; fruit held erect, usually consisting of a number of 'stacked' terete or subterete articles; leaves 1-foliolate ..... **Alysicarpus**

Subtribe **Lespedezinae**

Only one genus represented ..... ***Lespedeza**

Tribe **Galegeae**

Key to subtribes

1a Style bearded (sometimes just a tuft of hairs below stigma on one side); claws of keel largely joined; pods generally inflated (sometimes bladdery), if compressed, generally membranous, with sutures intruding or not, but without a longitudinal septum ..... **Coluteinae** (p. 270)
1b Style glabrous, but stigma sometimes penicillate (short, uniform hairs all round); pods not as above:
2a Pod nerves transverse, confluent over middle part of valves, fine or inconspicuous; vexillary filament generally free; keel blades generally auriculate; leaflet nerves usually looped within the margin or inconspicuous .... **Astragalinae** (below)
2b Pod nerves oblique, closely parallel, raised at maturity, confluent towards placental margin; vexillary filament connate with others; keel blades not auriculate; leaflet nerves extending to margin ..... **Glycyrrhizinae** (p. 270)

Subtribe **Astragalinae**

Key to genera

Perennial herb; unarmed; leaflets many ..... **Astragalus**
Rigid much-branched shrub; armed with axillary spines; leaves 1-foliolate ..... ***Alhagi**

Subtribe **Coluteinae**

Key to genera

Style bearded with hairs on the upper (adaxial) face; fruit membranous-bladdery, inflated ..... **Sutherlandia**
Style bearded around the stigma; fruit membranous, slightly inflated or compressed ..... **Lessertia**

Subtribe **Glycyrrhizinae**

Only one genus represented ..... ***Glycyrrhiza**

Tribe **Genisteae**

Key to subtribes

Leaves 5–17-foliolate, palmate, or leaves simple and large (most over 30 × 10 mm); keel strongly beaked; wings generally adnate at apex ..... **Lupininae** (below)
Leaves 1–3-foliolate or leaves simple and smaller; keel obtuse, rarely slightly beaked; wings free at apex ..... **Genistinae** (below)

Subtribe **Genistinae**

Key to genera

1a Plant spiny ..... ***Ulex**
1b Plant not spiny:
  2a Leaves simple or 1-foliolate, sometimes very small:
    3a Calyx split to the base adaxially ..... ***Spartium**
    3b Calyx not split to the base ..... ***Cytisus**
  2b Leaves 3-foliolate:
    4a Calyx nearly as long as the keel; plant often herbaceous ..... **Argyrolobium**
    4b Calyx with short teeth and not as long as keel; plant always a shrub ..... ***Cytisus**

Subtribe **Lupininae**

Only one genus represented ..... ***Lupinus**

Tribe **Indigofereae**

Key to genera

1a Pods 3–5 mm wide, erect, longitudinally ridged; leaflets often dentate; vexillary (adaxial) stamen completely united with others into a closed tube; corolla darkly veined when dry ..... **Cyamopsis**
1b Pods less than 3 mm wide, erect, patent or reflexed, not as above; leaflets never dentate; vexillary (adaxial) stamen free from others or united with them only at base; corolla not darkly veined when dry:
  2a Keel (and usually dorsal surface of standard) hairy; upper margin of the keel with a fringe of hairs; standard mostly broad at the base, tapering suddenly to a short claw; keel with lateral spurs, not prolonged-rostrate at the apex... **Indigofera**
  2b Keel (and usually dorsal surface of standard) glabrous; standard narrow at the base, tapering gradually to the claw; keel with lateral pockets (spurs 0), often prolonged-rostrate at the apex:
    3a Style short, thick; stigma discoid; fruiting pedicels mostly over 2 mm long, ± patent; pods often held at ± a right angle; bracts persistent; inflorescence lax in bud ..... **Microcharis**
    3b Style narrow, tapering to an oblique or capitate stigma; fruiting pedicels rarely over 2 mm long, reflexed (as are pods); bracts caducous; inflorescence dense in bud ..... **Indigastrum**

Tribe **Liparieae**

Key to genera

1a Leaves digitately 3-foliolate; stamens in a closed tube; bracteoles present ..... **Hypocalyptus**
1b Leaves simple; stamens in an open sheath; bracteoles 0:
  2a Keel petals not laterally appendaged; flowers mostly yellow; anthers ± equal in length; flowers in terminal heads or clusters:
    3a Calyx lobes unequal, lowest petaloid and large; keel narrow, slightly falcate, with a forwardly directed beak; leaves completely sessile ..... **Liparia**
    3b Calyx lobes subequal, not petaloid; keel obtuse or with an upwardly directed beak; leaves with a short petiole ..... **Xiphotheca**
  2b Keel petals gibbous on one side or with spur; flowers small; anthers dimorphic:
    4a Vexillary stamen free; the joined part of the stamen usually longer than the free part ..... **Amphithalea**
    4b Vexillary stamen joined with others, the free part usually longer than the joined part ..... **Coelidium**

Tribe **Loteae**

Only one genus represented ..... **Lotus**

Tribe **Phaseoleae**

Key to subtribes

1a Leaflets and calyx generally with yellowish gland-dots; bracteoles 0; style slender below, hardened and a little thickened distally, glabrous; inflorescence not nodose ..... **Cajaninae** (below)

1b Leaflets and calyx eglandular:

2a Style with distinctive expansion, flattening, coiling or specialised hairs, or if rarely unbearded as well as terete then petals elaborate with appendages on standard and keel petals adaxially joined; hila usually covered with spongy tissue ..... **Phaseolinae** (p. 272)

2b Style generally terete and unbearded (sometimes a few hairs below the stigma), occasionally coiled in Erythrininae, sometimes bearded or flattened in Clitoriinae but then petals less complex; hila rarely covered with tissue:

3a Flowers generally resupinate; calyx naked inside; style narrow or expanded to naked, penicillate or bearded in distal part; petals often hairy; leaflets 3, 1 or 5–9, with minute hooked hairs ..... **Clitoriinae** (below)

3b Flowers not resupinate or, if so, then differing in other respects:

4a Standard silky hairy outside, rather small, without appendages inside; seeds smooth, with a prominent aril; inflorescence not or slightly nodose ..... **Ophrestiinae** (p. 272)

4b Standard glabrous, or if hairy then inflorescence generally nodose or flowers much modified:

5a Flowers mostly adapted to pollination by birds or bats, the petals generally unequal in length, the fertile parts loosely housed or exserted, sometimes with small bee-type flowers but then either style coiled or flowers in extensive panicles and pod samaroid ..... **Erythrininae** (below)

5b Flowers mostly adapted to pollination by bees or, if bird-flowers, then petals subequal in length:

6a Inflorescence generally nodose, occasionally paniculate or axillary and few-flowered; seeds diverse, with short to long hilum ..... **Diocleinae** (below)

6b Inflorescence not or scarcely nodose (sometimes branched in *Pueraria*); seeds smooth, granular or rough, with short hilum ..... **Glycininae** (p. 272)

Subtribe **Cajaninae**

Key to genera

1a Ovules 4 or more; arils often prominent:

2a Fruit ± compressed, acuminate, marked between the seeds with oblique, depressed lines ..... ***Cajanus**

2b Fruit turgid; without depressions ..... **Bolusafra**

1b Ovules 2, rarely 3; arils usually inconspicuous:

3a Calyx lobes not enlarged after flowering:

4a Fruit compressed; flowers usually several in racemes:

5a Stems usually twining or trailing; funicle of the seed attached in the middle of the hilum ..... **Rhynchosia**

5b Stems usually stiff and erect; funicle of the seed attached at the end of the linear hilum ..... **Eriosema**

4b Fruit turgid; leaves digitately 3-foliolate or 1-foliolate; flowers spicate-racemose or paniculate ..... **Flemingia**

3b Calyx lobes enlarged and membranous or scarious after flowering, the lowest largest; fruit falcate-ovate, enclosed by the calyx ..... **Rhynchosia**

Subtribe **Clitoriinae**

Only one genus represented ..... ***Clitoria**

Subtribe **Diocleinae**

Key to genera

Calyx not strongly 2-lipped; upper calyx lobes completely united (calyx appears 4-lobed); fruit narrowly linear, straight or curved, many-seeded; usually a herb or subshrub, prostrate, climbing or erect ..... **Galactia**

Calyx 2-lipped, the upper lip large, entire or 2-lobed, the lower lip small; fruit large, linear-oblong to oblong, usually with longitudinal ribs close to upper margin; usually a woody climber or liane ..... **Canavalia**

Subtribe **Erythrinae**

Key to genera

Carina shorter than vexillum; anthers uniform; fruit glabrescent, often moniliform; stipels glandular or, rarely, coriaceous; usually a tree or shrub ..... **Erythrina**

Carina exceeding vexillum; anthers alternately dorsifixed and basifixed, the shorter often bearded; fruit with indumentum of irritant hairs; stipels nonglandular; woody liane or climber ..... **Mucuna**

Subtribe **Glycininae**

Key to genera

1a Stamens alternately aborted; persistent style of the fruit turned up into a hook ..... **Teramnus**
1b Stamens all fertile; pod without a hook:
2a Claw of the wings and keel shorter than the blade; seeds usually with a rough surface; hilum often with a scarious flap; calyx lobes often distinct:
3a Vexillary stamen usually united with the others; flowers small, white; inflorescence lax, 20–150-flowered; upper calyx teeth united..... **Neonotonia**
3b Vexillary stamen free below but connate above with the rest; flowers usually purple; inflorescence elongate, with the groups of flowers arising from very conspicuous nodes; upper calyx teeth distinct..... ***Pueraria**
2b Claws of the wings and keel longer than the blade; seeds with a smooth surface without a scarious flap; calyx thin and glabrous on the inside, translucent; upper calyx lobes united..... **Dumasia**

Subtribe **Ophrestiinae**

Only one genus represented ..... **Ophrestia**

Subtribe **Phaseolinae**

Key to genera

1a Stigma lateral, oblique; style filiform, coiled with 3–5 or more revolutions ..... **Vigna**
1b Stigma terminal:
2a Stigma bilabiate; stamens monadelphous..... **Otoptera**
2b Stigma not bilabiate; adaxial stamen usually free:
3a Pollen grains tuberculate or spinulose, zonitriporate; style tenuous throughout or slightly widened above; standard with narrow, elongated appendages; wings very narrow, flowers mostly yellow or orange; ovary 3–9-ovulate..... **Macrotyloma**
3b Pollen grains not spinulose or, if somewhat granulate, then other characters not as above; flowers often shades of red, violet, purple or blue:
4a Style not narrowed into a thin waist:
5a Style conspicuously flattened throughout and blade-like, slightly less than at right angles to the ovary; staminal appendages 2:
6a Style 2-winged, glabrous; stigma ± penicillate; keel somewhat rounded ..... **Alistilus**
6b Style not winged, with a line of hairs along inner margin; stigma not penicillate; keel sharply angled in middle; pods usually verrucose along margins ..... **Lablab**
5b Style not conspicuously flattened throughout:
7a Style with apex flattened into a tenuous, spatulate portion, stigmatose along the terminal edge..... **Sphenostylis**
7b Style not flattened (except in *Dolichos junodii*):
8a Style strongly curved near base and apex in same direction, the middle part gently curved in opposite direction..... **Dipogon**
8b Style not so complicatedly curved:
9a Style with a distinct, bulging, eccentric callus at its junction with the ovary..... **Neorautanenia**
9b Style without prominent callus at junction with ovary; stigma terminal, usually ringed with hairs ..... **Dolichos**
4b Style of two parts, an upper, incrassated part and a basal, tenuous part:
10a Keel not so strongly curved; stigma terminal, scarcely penicillate; flowers on a nodulate rachis ..... **Dolichos**
10b Keel incurved through 180–360°; stigma terminal, penicillate, with simple or branched hairs; flowers in axillary fascicles, usually precocious..... **Decorsea**

Tribe **Podalyrieae**

Key to genera

1a Leaflets many; flowers in extended racemes..... **Virgilia**
1b Leaflets 1–3; flowers 1 or 2(–4):
2a Leaves digitately or palmately 3-foliolate; calyx lobes longer than tube, imbricate; flowers solitary, axillary; wings with a transverse fold; fruit oblong, compressed..... **Cyclopia**
2b Leaves simple or unifoliolate; calyx lobes longer than tube; flowers 1–2(3–4)-nate on axillary peduncles; wings with curved, linear claw; fruit ovoid or oblong:
3a Flowers purple, pink or white; style base glabrous..... **Podalyria**
3b Flowers yellow; style base pubescent..... **Stirtonanthus**

Tribe **Psoraleeae**

Key to genera

1a Flower pedicel subtended by a distinctive, lobed cupulum:
2a Calyx lobes covered with black stubby hairs on inner surface, tube prominently ribbed and encrusted with glands; internal secretory cavities present in leaflets ..... **Psoralea**
2b Calyx lobes not covered with black stubby hairs on inner surface, tube weakly ribbed and sparsely glandular; internal secretory cavities 0 in leaflets ..... **Hallia**
1b Flower pedicel never subtended by a distinctive, lobed cupulum:
3a Fruit ovoid, with conspicuous black glandular warts when mature ..... **Cullen**
3b Fruit never with black glandular warts ..... **Otholobium**

Tribe **Robinieae**

Key to genera

Hard-wooded tree and shrub; stipules spinescent, usually paired; seeds not in distinct compartments ..... ***Robinia**
Upright herb, rarely tall and subshrubby; stipules not spinescent; fruit septate ..... **Sesbania**

Tribe **Sophoreae**

Key to genera

1a Leaves with 2 or more leaflets:
2a Fruit or pod moniliform, stalked; flowers white, yellow or rarely blue-violet, in racemes or leafy panicles ..... **Sophora**
2b Fruit not moniliform:
3a Fruit broadly linear, ± winged or margined; flowers yellow ..... **Calpurnia**
3b Fruit not winged; flowers mainly blue and pink:
4a Vexillum much broader than other petals; racemes simple, pendulous; flowers blue; fruit linear to oblong, compressed ..... **Bolusanthus**
4b Vexillum only slightly broader than other petals; racemes paniculate; fruit stalked, drupe-like ..... **Xanthocercis**
1b Leaves reduced to 1 leaflet (unifoliolate); fruit linear or falcate ..... **Baphia**

Tribe **Swartzieae**

Key to genera

Petals 0; leaflets (7)11–28 per leaf, with many pellucid glands; stamen filaments confluent basally with the hypanthium (calyx tube) ..... **Cordyla**
Petals 1, large; leaflets (3)5–11 per leaf, without pellucid glands; stamen filaments free or nearly so; disc and hypanthium 0 (filaments arising around base of gynophore or ovary) ..... **Swartzia**

Tribe **Tephrosieae**

Key to genera

1a Herb or undershrub, never scandent:
2a Legume contorted, membranous, subindehiscent; leaves digitately foliolate; stipules small or 0; flowers 2 or 3 in leaf axils ..... **Ptycholobium**
2b Legume coriaceous or rigid:
3a Legume 2–few-seeded; leaves usually pinnately trifoliolate ..... **Tephrosia**
3b Legume 1-seeded; leaves unifoliolate; leaflet obcordate ..... **Requienia**
1b Robust shrub or tree, sometimes scandent:
4a Leaves imparipinnate; stipulate; leaflets opposite:
5a Leaflets stipellate ..... **Millettia**
5b Leaflets not stipellate:
6a Fruit winged along the upper or both sutures; calyx truncate or with very short or obsolete teeth ..... **Derris**
6b Fruit not winged, flat and compressed, membranous or coriaceous:
7a Flowers white, pink or purple, in dense panicles, with most flowers reaching maturity ..... **Lonchocarpus**
7b Flowers orange, in terminal pseudoracemes, with only one flower per node reaching maturity ..... **Tephrosia**
4b Leaves imparipinnate; stipulate; leaflets alternate or subopposite:
8a Fruit woody, soon dehiscent ..... **Craibia**
8b Fruit coriaceous or membranous, never woody, indehiscent or tardily dehiscent:
9a Wing petals adnate to keel:
10a Leaves sometimes only pinnately 3-foliolate or rarely 1-foliolate; fruit broadly ovate to linear-oblong ..... **Lonchocarpus**

10b Leaves with 6 pairs of leaflets, silvery pubescent; fruit linear ..... **Mundulea**
9b Wing petals free from keel; keel petals free from each other; flowers in terminal panicles; fruit margined with a wing on each side ..... **Xeroderris**

Tribe **Trifolieae**

Key to genera

1a Petals falling after flowering; filaments not dilated:
2a Flowers in heads or short racemes or rarely solitary:
3a Fruit straight or curved, mostly linear ..... **Trigonella**
3b Fruit mostly spirally coiled, scarcely dehiscent, mostly prickly ..... ***Medicago**
2b Flowers in slender racemes; ovules few; fruit indehiscent or tardily 2-valved ..... ***Melilotus**
1b Petals becoming dry and persistent after flowering; filaments mostly dilated upwards; fruit indehiscent ..... **Trifolium**

Tribe **Vicieae**

Only one genus represented ..... ***Vicia**

Abrus Adans. 3856000

(Papilionoideae—Abreae)
Adanson: 327 (1763); Harvey: 262 (1862); Breteler: 607 (1960); Verdcourt: 235 (1970a).

Shrubs or undershrubs, often twining. **Leaves** abruptly pinnate, with common petiole ending in a bristle; leaflets many-jugate, often small; stipules setaceous. **Flowers** in axillary racemes, or sometimes on short, leafless branches. **Calyx** with short tube and 5 small lobes; 2 upper lobes subconnate, tooth-like. **Petals**: vexillum ovate to round, glabrous, ± adnate to staminal tube below; wings with long claws; keel arcuate, longer and broader than wings, sometimes gibbous, long-clawed. **Stamens** 9, monadelphous; vexillary stamen 0; anthers uniform. **Ovary** subsessile, few- to many-ovuled; style short, incurved, with capitate stigma. **Pod** membranous or woody, oblong or linear, compressed, 2-valved, subseptate, glabrous or sometimes rugose and hairy. **Seeds** subglobose or oblong, shiny, sometimes red, with black base. $x = 11$ (aneuploids, polyploidy).

Species 17, cosmopolitan in tropical and subtropical regions; 2 in sthn Afr.: Namibia, Botswana, Mpumalanga, Swaziland into KwaZulu-Natal and the Eastern Cape near Komga.

Acacia Mill. 3446000

(Mimosoideae—Acacieae)
Miller: [25] (1754); Harvey: 279 (1862); Brenan: 49 (1959); Brenan: 53: (1970); Ross: 24 (1975); Ross: 22 (1979).

Trees or shrubs, sometimes scandent or climbing, rarely undershrubs, unarmed or thorny or spiny. **Leaves** bipinnate, with leaflets often small and many-jugate, or with petiole expanded in some Australian species into phyllodes, with glands often present on petiole; stipules spinescent, inconspicuous, or occasionally membranous. **Flowers** in heads, in axillary or terminal spikes, solitary, fascicled, or on panicled peduncles, often sessile, bisexual or sometimes unisexual with few bisexual. **Calyx** usually present, campanulate, usually (3)4- or 5-toothed or lobed; sepals rarely free. **Petals** (3)4 or 5, usually united, rarely free or 0. **Stamens** many, exserted, free or united at base. **Ovary** sessile or stalked, 2–many-ovuled; style filiform, with small, terminal stigma. **Pod** 2-valved or indehiscent, variable in shape. **Seeds** compressed, with filiform to fleshy funicle. $x = 13$ (aneuploids, high polyploidy).

Species ± 900, mostly tropical or subtropical, mainly in Africa and Australia; 46 indigenous in sthn Afr., widespread; several Australian species have become naturalised.

Adenolobus (Harv. ex Benth.) Torre & Hillc. 3528020

(Caesalpinioideae—Cercideae)
Torre & Hillcoat: 37 (1955); Torre & Hillcoat: 194 (1956); Schreiber: 4 (1967b); Brummitt & Ross: 400 (1976); Coetzer & Ross: 55 (1977).

Erect or prostrate shrubs or small trees, with greyish to white bark, glabrous or sparsely covered with stout, multicellular sessile glands. **Leaves** alternate, simple, small, sometimes borne on abbreviated lateral shoots, emarginate apically or shallowly bilobed, truncate to cordate basally; lobes obliquely obovate to semicircular, light to greyish green, petiolate; stipules narrowly triangular, acuminate. **Inflorescence** a short or elongate raceme or flowers borne on abbreviated lateral shoots. **Flowers** bisexual, irregular, medium to rather small. **Calyx** broadly campanulate, with 5 short teeth or lobes ± equal in size, persistent, covered in some instances with multicellular glands. **Petals** 5, obovate or elliptical to lanceolate, narrowed basally into a claw. **Stamens** 10, free, all functional, some longer than petals. **Ovary** stalked; stalk ± 20 mm long, not fused to calyx tube. **Pod** crescent-shaped to shortly and broadly falcate, rounded, membranous, glandular or eglandular, with several seeds. **Seeds** small. $x = 14$ (1 report).

Species 2, Africa, occurring in S Angola and sthn Afr.: Namibia, N Botswana and Northern Cape.

Adenopodia C.Presl 3468020

(Mimosoideae—Mimoseae)
Presl: 206 (1851); Brenan: 77 (1986).

Entada Adans.: 318 (1763) in part.

Lianes or sometimes erect shrubs or small trees, armed with scattered deflexed or hooked prickles usually present on branchlets, and often on leaf petioles and leaf and pinna rachides and, occasionally on pod sutures. **Leaves** bipinnate; petiole with a conspicuous gland above base; pinnae usually with many pairs of opposite leaflets, rarely leaflets few (1–2 pairs); rachides of pinnae not modified into tendrils. **Flowers** bisexual, sessile or subsessile, in often paniculately aggregated spikes. **Calyx** cupular, shallowly 5-lobed. **Petals** 5, connate, sometimes very shortly so at base, rarely free. **Stamens** 10; anthers glandular at apex, soon deciduous. **Ovary** pubescent, ± stipitate, or subsessile; style-tip narrowing to a small porate stigma. **Pod** straight or curved, flat, splitting transversely into 1-seeded segments but leaving a persistent replum. **Seeds** subcircular to obovate, compound, wingless, with a central aerole variable in shape.

Species ± 10, widespread and mainly tropical; 1 species: *Adenopodia spicata* (E.Mey.) C.Presl, in sthn Afr. from the Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal to the Eastern Cape.

Aeschynomene L. 3793000

(Papilionoideae—Aeschynomeneae—Aeschynomeninae)

Linnaeus: 713 (1753); Harvey: 225 (1862); Verdcourt: 364 (1971a); Verdcourt: 370 (1973).

Annual or perennial herbs, undershrubs, or shrubs. **Leaves** subimparipinnate; leaflets few to many; stipules slender. **Flowers** mostly yellow, often lined with purple, bracteate, usually axillary, solitary or racemose. **Calyx** subequally lobed or 2-lipped. **Petals**: vexillum shortly clawed or sessile, sometimes with 2 pockets at base; wings eared, clawed; keel various. **Stamens** monadelphous; staminal tube sometimes split into 2 groups of 5, rarely diadelphous; anthers uniform. **Ovary** stalked, 2–28-ovuled, sometimes pubescent, sometimes with hairs from papillose base; style incurved or falcate, with terminal stigma. **Pod** linear or elliptic, often constricted into 2–many segments; segments round, elliptic or rectangular, flat or slightly convex, smooth or tuberculate, mostly indehiscent. **Seeds** oblong, reniform or lunate, sometimes slightly beaked. $x = 10$ (polyploidy).

Species over 150, mainly Africa and South America in tropical and subtropical parts; ± 10 in sthn Afr.: Namibia, the four northern provinces to KwaZulu-Natal and the Eastern Cape border.

Afzelia Sm. 3509000

(Caesalpinioideae—Detarieae)

Smith: 221 (1798) name conserved; Brenan: 124 (1967); Ross: 40 (1977).

Unarmed evergreen or deciduous trees. **Leaves** paripinnate or rarely subimparipinnate; leaflets opposite or subopposite, few-jugate; stipules minute, their basal parts connate into a persistent intra-petiolar scale and their upper parts free and deciduous. **Inflorescence** simply racemose or of racemes grouped into panicles. **Flowers** bisexual, irregular, spirally arranged along inflorescence axes; bracteoles large, well developed, concavo-convex, almost completely concealing young flower buds, one bracteole overlapping the other by its margins, both bracteoles deciduous before flower opens. **Calyx** tube ± elongate; sepals 4, slightly unequal (2 outer, 2 inner), imbricate. **Petals** 1, developed, clawed, orbicular or reniform, sometimes 2-lobed; others small or 0. **Stamens** 3–8, free or shortly connate; anthers ovate; staminodes (0)2–4. **Ovary** stalked, with stalk adnate to calyx tube, many-ovuled; style with truncate or subcapitate stigma. **Pod** thick, woody or leathery, obliquely oblong, compressed, 2-valved or subindehiscent, with transverse septa between seeds. **Seeds** ovoid or ellipsoid, large, with a large, basal, brightly coloured, cup-like aril. $x = 12$.

Species ± 14, fairly cosmopolitan in tropical areas; 1 in sthn Afr.: *Afzelia quanzensis* Welw., Northern Province, Mpumalanga to N KwaZulu-Natal.

Albizia Durazz. 3443000

(Mimosoideae—Ingeae)

Durazzini: 11 (1772); Harvey: 284 (1862); Codd: 67 (1958); Brenan: 136 (1959); Brenan: 113 (1970); Ross: 7 (1975).

Shrubs or trees, unarmed. **Leaves** bipinnate, few to many-jugate, main nerve of pinnae usually unilateral; glands on petiole and pinnae somewhat conspicuous; stipules herbaceous, sometimes conspicuous, usually caducous. **Flowers** in pedunculate, globose heads, or cylindric spikes, bisexual or occasionally unisexual, with few bisexual mixed. **Calyx** with campanulate to subcylindric tube and (4)5 short lobes. **Corolla** funnel-shaped with tube as long as or longer than calyx and (4)5-lobed. **Stamens** many, united towards base much exserted, anthers peltate with thecae opening upwards. **Ovary** sessile or shortly stalked, oblong or linear-oblong, narrowed into filiform style, longer than stamens; ovules several. **Pod** flattened, straight, indehiscent or 2-valved, papyraceous to subcoriaceous. **Seeds** few to several, ovoid to orbicular, compressed with filiform funicle. $x = 13$ (high polyploidy).

Species ± 145, from Africa to Asia and Australia; 11 indigenous in sthn Afr.: Namibia, the four northern provinces, Swaziland and KwaZulu-Natal; 2 others naturalised.

*__Alhagi__ Gagnebin 3783000

(Papilionoideae—Galegeae—Astragalinae)

Gagnebin: 59 (1755); Adanson: 328 & 514 (1763); Harvey: 233 (1862); Hutchinson: 469 (1964); Henderson & Anderson: 174 (1966); Ball: 191 (1968).

Rigid, much-branched shrubs armed with sharp, straight, axillary spines. **Leaves** simple, usually small, entire; stipules minute, free. **Flowers** solitary or often few in axillary racemes, pink, red or purple; bracts very small; bracteoles none. **Calyx** campanulate, with 5 short, subequal teeth. **Petals**: vexillum obovate, shortly clawed; wings falcate-oblong, free; keel incurved, obtuse. **Stamens** diadelphous; vexillary stamen free, remainder connate; anthers uniform. **Ovary** subsessile, many-ovuled; style filiform, incurved, glabrous; stigma small, terminal. **Pod** linear, thick or subterete, smooth, indehiscent, strongly contracted between the seeds. **Seeds** 1–5, reniform. $x = 8$.

Species 3, in dry or maritime places from Mediterranean regions to Nepal; 1 in sthn Afr.: *Alhagi maurorum* Medik. (= *A. camelorum* Fisch.), has become naturalised in the Douglas area (Northern Cape) and in parts of the Oudtshoorn District of the Western Cape.

Alistilus N.E.Br. 3910010

(Papilionoideae—Phaseoleae—Phaseolinae)

Brown: 294 (1921); Verdcourt: 387, 409 (1970b).

Perennial herbs, climbing, procumbent or prostrate. **Leaves** pinnately 3-foliolate, long-petiolate, stipulate; leaflets ovate, terminal one 3-lobed, densely ciliate. **Flowers** magenta to pink, in axillary racemes on long peduncles, ebracteate. **Calyx** hairy, with campanulate tube, somewhat 2-lipped; upper lip entire, lower 3-lobed, with lobes shorter than tube. **Petals**: vexillum shortly bilobed, with inflexed auricles and 2 appendages on limb; wings eared, clawed; keel incurved, subsessile. **Stamens** diadelphous, with vexillary stamen adnate to others at middle and kneed at base; anthers uniform. **Ovary** linear, 4–8-ovuled, hairy; style strongly curved near base and apex in same direction, broadening from base upwards, with narrow, membranous margins and lateral, truncate stigma. **Pod** compressed, somewhat falcate. **Seeds** reniform, shiny, reddish brown, slightly mottled with black.

Species 2, S tropical Africa, Madagascar; in sthn Afr.: *Alistilus bechuanicus* N.E.Br., from Botswana into the North-West and the Northern Province.

Alysicarpus Desv. 3810000

(Papilionoideae—Desmodieae—Desmodiinae)

Desvaux: 120 (1813) name conserved; Harvey: 230 (1862); Schrire: 17 (1988).

Perennial or annual herbs, or undershrubs. **Leaves** 1(3)-foliolate; stipules conspicuous, persistent, glumaceous or scarious, free or connate, erect, acuminate and striate.

Flowers small, pink to purple or orange-apricot, pedicellate, in pairs, arranged in slender, elongate, spike-like pseudoracemes, terminal and leaf-opposed, rarely paniculately branched. **Calyx** rigidly glumaceous, with short, campanulate tube; lobes longer than tube, often ciliate, 2 upper often largely connate. **Petals**: vexillum sessile or somewhat clawed; wings adnate to keel; keel slightly incurved, obtuse, with membranous appendage on one or both sides. **Stamens** diadelphous. **Ovary** sessile or shortly stalked, few- to many-ovuled, sometimes glandular-pubescent; style filiform, incurved at apex, with small, capitate stigma. **Pod** linear-oblong, subterete or slightly compressed, constricted between seeds; segments often equal-sided; convex or turgid, sometimes hairy. **Seeds** suborbicular or globose. $x = 8$ (aneuploids).

Species 25–30, Africa to Asia; 4 in sthn Afr.: Namibia, Botswana, the four northern provinces to KwaZulu-Natal and Eastern Cape.

Amblygonocarpus Harms 3458000

(Mimosoideae—Mimoseae)

Harms: 191 (1897); Brenan: 32 (1959); Brenan & Brummitt: 35 (1970); Ross: 132 (1975).

Unarmed trees, glabrous. **Leaves** bipinnate, eglandular; with 2–6 pairs of pinnae, each with several pairs of alternate or sometimes subopposite leaflets. **Inflorescences** of solitary or paired axillary racemes. **Flowers** bisexual, yellowish white, pedicellate. **Calyx** gamosepalous, very small, with 5 (rarely 6) teeth. **Petals** 5 (rarely 6), free. **Stamens** 10 (rarely 12), free, fertile; anthers eglandular apically even in bud. **Ovary** very shortly stipitate. **Pod** straight or nearly so, oblong, woody, indehiscent, bluntly tetragonal or subterete in section, internally septate between seeds. **Seeds** brown, smooth, hard, unwinged.

Species 1, sthn Afr. and tropical Africa: *Amblygonocarpus andongensis* (Welw. ex Oliv.) Exell & Torre, Namibia in the Caprivi Strip and Botswana.

Amphithalea Eckl. & Zeyh. 3644000

(Papilionoideae—Liparieae)

Ecklon & Zeyher: 167 (1836); Harvey: 21 (1862); Granby: 13 (1985).

Lathriogyna Eckl. & Zeyh.: 170 (1836).

Shrubs or shrublets, sometimes ericoid, usually villous. **Leaves** simple, alternate or rarely opposite, sessile or rarely short petiolate, linear, lanceolate or ovate, flat, slightly concave or often with margins ± recurved; stipules 0. **Flowers** small, white, yellow, pink or violet, axillary and sessile or subsessile, often 2-nate, sometimes crowded into a leafy spike, sometimes in bracteate heads; bracts setaceous, linear, lanceolate or triangular; bracteoles 0. **Calyx** usually hairy, with campanulate tube; lobes unequal, the 2 upper broadest or extensively connate. **Petals**: vexillum suborbicular, oblong or obovate and often bilobed, shortly or long-clawed; wings oblong, clawed; keel straight, usually shorter than wings, obtuse, gibbous or saccate at base, clawed. **Stamens** diadelphous; vexillary stamen free, remainder connate high up, alternate anthers longer, basifixed, others versatile. **Ovary** sessile or shortly stalked, usually 1–4-ovuled, sericeous; style slightly curved upwards, glabrous or sericeous below, with minute, terminal, sometimes slightly capitate stigma. **Pod** ovate, oblong falcate or obliquely oblong, often acute, compressed, 2-valved, densely sericeous or more sparsely pubescent. **Seeds** 1–4, appendaged, green or dark.

Species ± 21, Cape, mainly southwestern districts (Western Cape), extending eastwards to near Cathcart (Eastern Cape).

***Arachis** L. 3803000

(Papilionoideae—Aeschynomeneae—Stylosanthinae)

Linnaeus:741 (1753); Hutchinson: 486 (1964); Verdcourt: 440 (1971a).

Annual or perennial herbs, erect or often prostrate. **Leaves** paripinnately 4-foliolate, rarely 3-foliolate; exstipellate; stipules partly adnate to petiole, membranous, apiculate, persistent and veined. **Flowers** yellow, sometimes striped with red, in axillary, short, dense, sessile, 2–7-flowered spikes; bracts membranous; bracteoles 0. **Calyx** membranous, filiform, 5-lobed, the upper 4 lobes joined, the lower ± free. **Petals**: vexillum suborbicular, shortly narrowed at base; wings oblong, free; keel beaked, incurved. **Stamens** all connate into a closed tube; 4 or 5 anthers elongate and subbasifixed, alternating with 4 or 5 short and versatile ones. **Ovary** subsessile, 2–4-ovuled; style filiform, very long, soon deciduous; stigma minute, terminal. **Pod** maturing below soil, oblong or sausage-shaped, 1–6-seeded, constricted between seeds but not articulated, continuous inside, functionally indehiscent, walls thick and reticulate. **Seeds** ovoid or oblong. $x = 10$ (5) (aneuploids, polyploidy).

Species ± 22 in South America, introduced elsewhere in tropics and warm temperate areas; 1 in sthn Afr.: **Arachis hypogaea* L., the Groundnut, has become naturalised as an escape from cultivation.

Argyrolobium Eckl. & Zeyh. 3673000

(Papilionoideae—Genisteae—Genistinae)

Ecklon & Zeyher: 184 (1836) name conserved; Harvey: 67 (1862); Polhill: 1000 (1971a).

Herbs or undershrubs, sometimes dwarf, sometimes with tuberous or strong rootstock, often silky or villous. **Leaves** digitately 3-foliolate; stipules free or united along leaf-opposed margin; stipels 0. **Flowers** yellow, becoming russet later, often with darker veining, sometimes 1- or 2-nate, usually in many-flowered racemes or subumbels, terminal or opposite leaves; bracts usually small. **Calyx** with shortly campanulate tube, 2-lipped; 2 upper lobes free or connate, 3 lower mainly connate. **Petals**: vexillum subsessile or shortly clawed, sometimes with 2 callosities at apex of claw, often hairy; wings oblong or obovate, with short or long claw, often transversely ridged; keel slightly incurved, usually planoconvex, sometimes oblong, clawed. **Stamens** monadelphous; tube closed or split towards base; anthers unequal, alternately long and short. **Ovary** usually shortly stalked, many-ovuled, villous; style incurved, with terminal, sometimes capitate stigma. **Pod** linear-oblong, compressed, 2-valved, with valves continuous or transversely constricted between seeds. **Seeds** mostly oblong-ovate, with a small hilum. $x = (12, 13, 14, 15, 16)$.

Species ± 70, Africa, S Europe to India; ± 50 in sthn Afr.: widespread, mainly in eastern area.

Aspalathus L. 3662000

(Papilionoideae—Crotalarieae)

Linnaeus: 711 (1753); Harvey: 94 (1862); Dahlgren: 7 (1960); Dahlgren: 9 (1961); Dahlgren: 7 (1963a); Dahlgren: 185 (1963b); Dahlgren: 10 (1963c); Dahlgren: 7 (1965a); Dahlgren: 7 (1966); Dahlgren: 512 (1969); Dahlgren: 1 (1988).

Borbonia L.: 494 (1738).

Shrublets or shrubs up to ± 2 m tall, prostrate, ascending or erect, sometimes spiny. **Leaves** usually fascicled, (1)3-foliolate, variable; leaflets varying from flat to canaliculate or terete, obtuse to mucronate or spine-tipped, with entire margin, glabrous or variously pubescent; stipules 0. **Flowers** mostly yellow, often with purplish shades, rarely white, or purple, usually in heads, or ra-

cemes, less often (1)2 or 3, axillary or terminal; bracts and bracteoles often foliaceous. **Calyx** with campanulate tube; lobes usually subequal, sometimes lowest the longest. **Petals**: vexillum usually ovate or rounded, shortly clawed, often pubescent on back; wings oblong, often with transverse ridges, clawed; keel usually planoconvex, gibbous or sometimes saccate, clawed. **Stamens** monadelphous; staminal tube split to base; anthers unequal, 5 short and dorsifixed, 4 long and basifixed and one intermediate. **Ovary** usually shortly stalked, obliquely ovate or lanceolate, glabrous or pubescent, 2–several-ovuled; style incurved, with minute, terminal, capitate stigma. **Pod** usually dehiscent, broadly ovate to lanceolate or rarely linear, turgid or compressed, 1–several-seeded. **Seeds** reniform to obliquely ovate, on filiform funicles. $x = 9$ (7, 8, 10) (high polyploidy).

Species ± 278, the largest genus of flowering plants endemic to sthn Afr.; concentrated in the Western Cape but extending into KwaZulu-Natal.

Astragalus L. 3766000

(Papilionoideae—Galegeae—Astragalinae)
Linnaeus: 755 (1753); Harvey: 224 (1862); Gillett: 413 (1964); Gillett: 1054 (1971a).

Herbs, shrublets, or shrubs, unarmed or petioles spinescent. **Leaves** imparipinnate, rarely digitately (1)3-foliolate; stipulate. **Flowers** in lax axillary racemes, bracteate or rarely ebracteate. **Calyx** with tube; lobes subequal, shorter than tube. **Petals**: vexillum sessile; wings gibbous, with linear claw; keel clawed, sometimes with 2 segments connate. **Stamens** diadelphous; anthers uniform. **Ovary** sessile or stalked, many-ovuled; style straight or incurved, with small, terminal stigma. **Pod** 2-valved, completely or incompletely divided longitudinally into 2 locules by introflexion of carinal suture. **Seeds** often reniform, on filiform funicle. $x = 8$ (10, 11, 13) (B-chromosomes, high polyploidy).

Species 2 000, mainly northern hemisphere, abundant in temperate Asia; 1 in sthn Afr.: *Astragalus atropilosulus* (Hochst.) Burge subsp. *burkeanus* (Harv.) Gillett var. *burkeanus*, the four northern provinces into KwaZulu-Natal.

Baikiaea Benth. 3507000

(Caesalpinioideae—Deterieae)
Bentham: 581 (1865); Hutchinson: 248 (1964); Brenan: 108 (1967); Ross: 35 (1977).

Unarmed evergreen or, in *B. plurijuga*, deciduous trees. **Leaves** paripinnate or imparipinnate; leaflets alternate, sometimes opposite, 1–5 jugate, large and coriaceous; stipules short. **Inflorescences** of terminal or axillary racemes. **Flowers** bisexual, irregular, large, pedicellate; bracts and bracteoles present, caducous. **Sepals** 4, the posticous one larger than the rest, very narrowly imbricate, densely fuscous- or paler brown-tomentellous outside. **Petals** 5, free, subequal, obovate, imbricate, clawed; claw winged or crisped, sometimes with longitudinal rib. **Stamens** 10, diadelphous; upper one free; remainder connate below, with alternate filaments silky-pilose below; anthers versatile, dehiscing longitudinally. **Ovary** stalked or subsessile, with several ovules, densely villous; style stout, arising obliquely from ovary; stigma small, capitate. **Pod** woody, widening from base upwards, obliquely pointed, densely brown-velvety, dehiscing longitudinally into 2 valves. **Seeds** broadly elliptic, compressed, with apex of funicle forming small, white aril. $x = 11$ (aneuploids, polyploidy).

Species 5, Africa; 1 in sthn Afr.: *Baikiaea plurijuga* Harms, Namibia and Botswana.

Baphia Afzel. ex Lodd. 3612000

(Papilionoideae—Sophoreae)
Loddiges: t. 367 (1825); Lester-Garland: 221 (1921); Brummitt: 157 (1965a); Brummitt: 49 (1971); Soladoye: 302 (1985).

Erect or scrambling shrubs, lianes or small to large trees. **Leaves** alternate, unifoliolate, pulvinate, usually large; stipules caducous. **Flowers** in lax, axillary and terminal racemes or pseudoracemes, sometimes panicled or fascicled in leaf axils; bracts smaller below, upper larger, deciduous, sometimes shorter than calyx. **Calyx** splitting into 2 reflexed lobes or down one line, retuse at base; lobes entire or 2-toothed. **Petals** subsessile or clawed; vexillum orbicular; wings oblong or obovate, white with yellow or orange blotch at base, sometimes cream-coloured, purplish pink or pinkish red; keel slightly incurved, obtuse. **Stamens** 10, free; filaments linear; anthers uniform, basifixed. **Ovary** sessile or subsessile, 2–8-ovuled; style incurved with small terminal stigma. **Pod** linear-oblong to oblanceolate, sometimes falcate, usually acuminate, flattened, 2-valved, woody, brown or purplish black. **Seeds** 1–5, lenticular. $x = 11$ (polyploidy).

Species ± 80, Africa and Madagascar; 2 in sthn Afr.: Namibia, Botswana, the four northern provinces and KwaZulu-Natal.

Bauhinia L. 3528000

(Caesalpinioideae—Cercideae)
Linnaeus: 374 (1753); Harvey: 275 (1862); Brenan: 207 (1967); Coetzer & Ross: 47 (1977).

Trees or shrubs, seldom scandent or climbing. **Tendrils** 0 but branches sometimes curling apically and tendril-like. **Leaves** alternate, sometimes simple, entire or conspicuously 2-lobed or sometimes divided to base; stipules caducous. **Inflorescence** a short, usually few-flowered raceme or flowers solitary. **Flowers** bisexual, irregular, often large and showy. **Calyx** spathaceous, with limb split down one side, 5-toothed or -lobed; lobes imbricate in bud. **Petals** 5 (rarely 6), subequal, sometimes, long-clawed. **Stamens** 10, free or connate, sometimes some reduced to staminodes; filaments variable. **Ovary** stalked, with stalk free or adnate to calyx tube, 2–many-ovuled; stigma terminal, small or variously dilated. **Pod** sometimes stalked, woody to membranous, oblong, linear, or ovate, straight to falcate, dehiscent. **Seeds** compressed. $x = 7$ (9, 11, 12, 13) (aneuploids, polyploidy).

Species numbers uncertain, cosmopolitan; 6 in sthn Afr., Namibia, the four northern provinces, Swaziland, KwaZulu-Natal and Eastern Cape; several more cultivated.

Bolusafra Kuntze 3893010

(Papilionoideae—Phaseoleae—Cajaninae)
Kuntze: 162 (1891a); Harvey: 247 (1862); Hutchinson: 422 (1964); Bullock: 200 (1965).

Perennial, twining herbs, or sprawling shrublets, sticky, scented. **Leaves** pinnately 3-foliolate, ± ovate; stipulate. **Flowers** large, bright yellow, in axillary racemes, bracteate. **Calyx** hairy, with bulbous-based hairs, with campanulate tube; lobes much longer than tube, with 2 upper slightly connate. **Petals**: vexillum eared at base, with broad, wedge-shaped claw; wings shorter than keel, eared, clawed; keel obliquely obovate, incurved, gibbous, clawed. **Stamens** diadelphous; anthers uniform. **Ovary** sessile, several-ovuled, villous; style filform, hairy in lower portion, somewhat thickened and glabrous in upper portion, with terminal, capitate stigma. **Pod** obliquely oblong, turgid, 2-valved, hairy. **Seeds** globose, black.

Species 1, sthn Afr.: *Bolusafra bituminosa* (L.) Kuntze, the Western Cape.

Bolusanthus Harms 3607010

(Papilionoideae—Sophoreae)
Harms: 14 (1906); Phillips: t. 23 (1921).

Small trees or shrubs. **Leaves** imparipinnate, 3–6-jugate, pulvinate; leaflets opposite or alternate; usually lanceolate, acuminate. **Flowers** blue or purple, in lax, terminal, pendulous racemes; bracts subulate, caducous. **Calyx** with campanulate tube and 5 lobes; lobes ovate-lanceolate, with 2 upper lobes connate high up. **Petals**: vexillum semiorbicular, slightly lobed at apex, clawed at base; wings oblong, obtuse, clawed, eared at base of limb; keel as long as wings, eared at base of limb. **Stamens** free, subequal; filaments with elliptic, versatile anthers. **Ovary** subsessile, linear-oblong, 4- or 5-ovuled, silky. **Style** terete, curved; stigma small and capitate. **Pod** usually linear, rarely oblong-linear, compressed. **Seeds** 1–4. $x = 8$.

Species 1, sthn Afr.:, *Bolusanthus speciosus* (Bolus) Harms, Northern Province, northern Mpumalanga and Swaziland.

Bolusia Benth. 3732000

(Papilionoideae—Crotalarieae)
Bentham: t. 1163 (1873); Hutchinson: 360 (1964); Polhill: 995 (1971a).

Perennial herbs or undershrubs up to 0.50 m tall. **Leaves** unifoliolate or digitately trifoliolate, glabrous or densely pubescent; stipules various. **Flowers** greenish yellow to pale pink, sometimes with purplish marks, solitary or 2-nate, opposite leaves, bracteate. **Calyx** with shortly campanulate tube; lobes subequal, sometimes with 2 upper and laterals approximate. **Petals**: vexillum sometimes hooded and keeled; with short, sharply reflexed, channelled claw; wings clawed; keel linear, spirally contorted, spurred at base. **Stamens** diadelphous, enclosed and coiled with keel; anthers unequal. **Ovary** sessile, many-ovuled; style enclosed in spiral keel, with terminal stigma. **Pod** oblong, turgid, many-seeded, dehiscent. **Seeds** oblique-cordiform, with a deep hilar sinus.

Species 5 or 6, drier parts of Africa south of the equator; 2 in sthn Afr., Namibia and Northern Cape.

Brachystegia Benth. 3504000

(Caesalpinioideae—Amherstieae)
Bentham: 582 (1865); Brenan: 157 (1967).

Mostly trees, rarely suffrutices. **Leaves** paripinnate, stipulate; leaflets sessile, diverse in number, size and shape, normally opposite, in 2–72 pairs, usually covered with obscure translucent dots. **Inflorescence** a simple or paniculate raceme, usually terminal, rarely lateral on older branchlets. **Flowers** bisexual, ± irregular, completely enclosed in bud by 2 opposite valvate bracteoles, persisting in flower. **Tepals** 0 or 1–10, much shorter than bracteoles, free or with 2 or 3 partly united, imbricate, valvate or open in aestivation. **Stamens** usually 10, all fertile, alternately long and short, free or shortly united; filaments or tube continuous externally with margin of very short cupular or turbinate calyx tube; mouth of calyx tube with or without a disc formed of obvious or obscure internal glandular swellings. **Ovary** oblong or naviculiform, stipitate; style long; stigma small, subcapitate; ovules 5–10. **Pod** flat, woody, soon glabrous, oblong or naviculiform, beaked at apex, dehiscing elastically, valves becoming spirally twisted; adaxial suture with a flange-like wing on each side. **Seeds** compressed, subsessile. $x = 12$ (1 report).

Species ± 30, confined to tropical Africa; 1 in sthn Afr.: *Brachystegia boehmii* Taub., in Botswana.

Burkea Benth. 3474000

(Caesalpinioideae—Caesalpinieae)
Bentham: 593 (1843); Harvey: 271 (1862); Brenan: 221 (1967); Ross: 15 (1977).

Unarmed, trees, rusty-tomentose on young branchlets. **Leaves** petiolate, bipinnate, with (1)2–5(7) pairs of pinnae; leaflets usually somewhat elliptic, leathery, eglandular. **Inflorescences** of elongated spikes, simple or often paniculately aggregated; bracts small, persistent until flowers open. **Flowers** bisexual, irregular, 5-merous, small. **Calyx** shortly campanulate, with oblong lobes longer than tube, valvate. **Petals** subequal, obovate-oblong, imbricate, **Stamens** 10, subequal; anthers with sessile apical gland. **Ovary** subsessile, 1(2)-ovulate, densely rusty-tomentose; style thick; stigma terminal, funnel-shaped, slit down one side. **Pod** stipitate, coriaceous, elliptic, oblong or lanceolate, flattened, indehiscent. **Seeds** compressed with an areole on each face, sometimes aborted.

Species 1: *Burkea africana* Hook., tropical and subtropical Africa; N Namibia, and the four northern provinces.

Caesalpinia L. 3559000

(Caesalpinioideae—Caesalpinieae)
Linnaeus: 380 (1753); Harvey: 269 (1862); Hutchinson: 260 (1964); Brenan: 28 (1967); Schreiber: 7 (1967b); Ross: 122 (1977).

Trees or shrubs, sometimes scandent, usually armed with spines or prickles but sometimes unarmed. **Leaves** bipinnate or rarely with pinnae digitately arranged; leaflets opposite, rarely alternate, few to many, glandular or sometimes eglandular; stipules various. **Inflorescence** of terminal, sometimes falsely lateral, or terminal and axillary racemes or panicles; bracts various, sometimes caducous. **Flowers** bisexual, irregular, often large. **Calyx** with short, campanulate tube, 5 lobes longer than tube, imbricate. **Petals** 5, not all equal, upper one usually somewhat modified and usually with a small lamina and a more pronounced claw. **Stamens** 10, free, declinate; filaments often glandular or villous at base; anthers dorsifixed. **Ovary** subsessile or shortly stipitate, 2–10-ovuled; style with terminal, truncate, concave or hollow stigma. **Pods** very variable, compressed, ovate, oblong, lanceolate, or sometimes falcate, indehiscent or dehiscent and 2-valved, hard and woody or thick and pulpy, sometimes spiny. **Seeds** transverse or nearly so, hard. $x = 12$ (aneuploids, polyploidy).

Species ± 200, cosmopolitan in warm regions; 6 indigenous in sthn Afr., Namibia, Botswana, Mpumalanga, KwaZulu-Natal and Northern Cape; others introduced; **Caesalpinia decapetala* (Roth) Alston, has run wild, especially in eastern areas; see Henderson & Anderson: 176 (1966).

***Cajanus** DC. 3892000

(Papilionoideae—Phaseoleae—Cajaninae)
Candolle: 85 (1813) name conserved; Hutchinson: 421 (1964); Verdcourt: 709 (1971b).

Erect shrubs or shrublets with adpressed or slightly spreading silky pubescence. **Leaves** pinnately 3-foliolate; leaflets elliptic to lanceolate, resinous-glandular on lower surface; stipules small. **Flowers** yellow or lined with purple, in terminal panicles together with several subcapitate axillary racemes; bracts ovate, caducous. **Calyx** 5-lobed; lobes subequal, upper pair joined. **Petals**: vexillum orbicular, reflexed, eared; keel incurved at apex. **Stamens** with uniform anthers. **Ovary** subsessile, elongate, 4–6-ovuled, velvety hairy; style

thickened above, flattened below the small, capitate stigma. **Pod** linear-oblong, inflated, obliquely acute, compressed, 2-valved, obliquely depressed between seeds with transverse grooves. **Seeds** rounded, compressed. $x = 11$ (8) (polyploidy).

Species 2, one native to West Africa. **Cajanus cajan* (L.) Millsp., Dhal or Pigeon-pea, widely cultivated throughout the tropics and partially naturalised in Namibia, the four northern provinces, Swaziland and KwaZulu-Natal.

Calliandra Benth. 3444000

(Mimosoideae—Ingeae)
Bentham: 138 (1840); Thulin *et al.*: 29 (1981).

Much-branched spreading shrubs with spinescent stipules, in pairs, straight or often deflexed. **Leaves** small; petiole short, pubescent, adaxial gland 0; pinnae in 1 pair; leaflets in 2–9 pairs, oblong or elliptic, pubescent or subglabrous and usually with minute, reddish, purplish or whitish glands at point of attachment of leaflets. **Inflorescence** apparently capitate, reduced on axillary peduncles. **Flowers** bisexual, 2–4 per inflorescence, rarely solitary; peduncles conspicuously glandular, pubescent. **Calyx** cupular, with 5 obtuse lobes, pubescent. **Corolla** 5-lobed, pubescent. **Stamens** many, long-exserted; filaments united into a tube basally; anthers dorsifixed, glabrous and eglandular. **Ovary** glabrous or shortly stipitate; style filiform; stigma capitate. **Pod** linear-oblong to oblanceolate, straight, 1–4-seeded, dehiscent acute or acuminate apically. **Seeds** rounded or compressed. $x = 8$ (11) (polyploidy).

Species 2, in tropical Africa; 1 in sthn Afr.: *Calliandra redacta* (J.H.Ross) Thulin & Hunde, restricted to the Northern Cape on granite ridges.

Calpurnia E.Mey. 3607000

(Papilionoideae—Sophoreae)
Meyer: 2 (1836); Harvey: 266 (1862); Phillips: 475 (1917); Brummitt: 12 (1967); Polhill: 46 (1971b).

Shrubs or small trees. **Leaves** imparipinnate with 3–many pairs of leaflets, pulvinate; stipules small; leaflets frequently mucronate, exstipellate. **Flowers** yellow in few- to many-flowered, axillary or terminal racemes, frequently in panicles. **Calyx** with campanulate tube, 5-lobed, with 2 upper lobes smallest and partly connate. **Petals**: vexillum clawed, with claw deeply channelled and limb reflexed and bilobed; wings clawed, oblong, obtuse; keel clawed, obtuse. **Stamens** free or connate at base; anthers small, oblong. **Ovary** stalked, several-ovuled; style arcuate, with small, capitate stigma. **Pod** usually broadly linear, sometimes with a narrow wing on ventral suture, tipped with the remains of style. **Seeds** compressed, ovate-oblong, with small hilum near the narrow end; radicle incurved. $x = 9$.

Species ± 16, Africa; ± 7 in sthn Afr.: the four northern provinces, Swaziland, KwaZulu-Natal and Eastern Cape.

Canavalia DC. 3891000

(Papilionoideae—Phaseoleae—Diocleinae)
Candolle: 325 (1825a) name conserved; Harvey: 238 (1862); Sauer: 106 (1964); Verdcourt: 571 (1971b).

Woody lianes or perennial herbs, prostrate or twining. **Leaves** pinnately 3-foliolate; stipules small, caducous. **Flowers** showy, white to purple, usually clustered along a peduncle in axillary racemes. **Calyx** with campanulate tube, 5-lobed; lobes 2-lipped; upper lip large, truncate or 2-fid; lower smaller, subentire or 3-fid. **Petals**: vexillum large, obovate, reflexed, eared at base, clawed, with 2 callosities or ridges above claw; wings falcate or subtwisted, eared, with callosity on ear, clawed; keel broader than wings, incurved, obtuse or obtusely beaked, with beak usually inflexed or spiral, sometimes eared, gibbous, clawed. **Stamens** monadelphous or imperfectly diadelphous; anthers uniform. **Ovary** subsessile, many-ovuled, often surrounded at base by cupular disc, sometimes hairy, style incurved or folded with keel; stigma terminal, sometimes subcapitate. **Pod** large, oblong, compressed or turgid, dehiscent, 2-valved, often with 2 ridges on sutures, sometimes velvety. **Seeds** black, white or reddish, often elliptic. $x = 11$ (aneuploids, polyploidy).

Species ± 50, cosmopolitan in warm regions; 6 in sthn Afr.: Namibia, North-West, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape near East London.

Cassia L. emend. Gaertn. 3536000

(Caesalpinioideae—Cassieae)
Linnaeus: 376 (1753); Harvey: 271 (1862); Hutchinson: 246 (1964); Brenan: 47 (1967); Gordon-Gray: 69 (1977).

Unarmed trees. **Leaves** simply paripinnate; leaflets frequently 5–12-jugate; stipules various, conspicuous. **Inflorescence** an axillary, many-flowered raceme, sometimes cauliflorous; bracteoles 2, at base of pedicels. **Sepals** obtuse, pubescent to glabrescent. **Petals** 5, imbricate, subisomorphic, vexillar one interior in bud, usually much larger than calyx, sometimes clawed. **Stamens** 10, sometimes unequal, its members strongly accrescent towards abaxial side of flower; filaments twice to many times as long as the dorsifixed anthers, those of 3 long abaxial stamens sigmoidally arcuate, those of the rest straight; anthers dehiscing by terminal or basal pores, or at both ends. **Ovary** sessile or stalked, frequently curved, with several to many ovules; style with terminal, truncate stigma. **Pod** terete, bluntly tetragonal or compressed-tetragonal, sometimes sulcate along sutures, or compressed but turgid, usually much elongate, indehiscent, valves firmly papery, leathery or ligneous, cavity divided by transverse septa into 1 rank or in addition by a longitudinal septum into 2 ranks of 1-seeded locules. **Seeds** transverse, occasionally oblique or longitudinal, ± compressed parallel to septa. $x = 6, 7, 8, 9, 13$ (B-chromosomes, high polyploidy).

Species ± 30, circumtropical (America, Africa, Madagascar, Asia, Malaysia, Australia); 1 in sthn Afr.: *Cassia abbreviata* Oliv. subsp. *beareana* (Holmes) Brenan, N Namibia, Botswana, Northern Province and Mpumalanga; some other species introduced as ornamentals.

***Ceratonia** L. 3529000

(Caesalpinioideae—Cassieae)
Linnaeus: 1020 (1753); Hutchinson: 255 (1964); Brenan: 16 (1967).

Evergreen, unarmed shrubs or trees, often monoecious. **Leaves** simply pinnate; leaflets 2–8, coriaceous; stipules minute, caducous. **Inflorescence** a dense, many-flowered raceme, axillary or often arising from old wood. **Flowers** unisexual or bisexual, irregular, small. **Calyx** caducous. **Petals** 0. **Stamens** 5, free. **Pod** laterally compressed, coriaceous, many-seeded, indehiscent. $x = 12$.

Species 2, Arabian Peninsula and Somalia. **Ceratonia siliqua* L., Carob tree, Mediterranean region, dense ornamental, with nutritious pods, may be found as an escape.

Chamaecrista Moench 3536010

(Caesalpinioideae—Cassieae)
Moench: 272 (1794); Irwin & Barneby: 28 (1976); Irwin & Barneby: 106 (1981).

Trees, shrubs, perennial or annual herbs. **Leaves** paripinnate; extrafloral nectaries often present on peti-

oles and sometimes on axis of racemes, when present patelliform, scutiform or cupular, secretory surface plane or concave. **Inflorescence** a 1–many-flowered raceme, usually axillary; pedicels 2-bracteolate near or above middle. **Flowers** bisexual, irregular. **Petals** yellow, sometimes red-marked near claw, often highly heteromorphic, 2 abaxial ones variously oblique, vexillar one usually interior in bud, sometimes exterior on one or both sides. **Stamens** (2–)5–10, the basifixed anthers longer than their short filament, equal or unequal, but if unequal not accrescent towards abaxial side of flower, lateral sutures incurved puberulent or pilosulous, dehiscence apical by pore or short slit. **Pod** planocompressed, very rarely winged along sutures, elastically dehiscent, valves papery, leathery or subligneous, coiling. **Seeds** either smooth or pitted. $x = 8$.

Species ± 250, primarily neotropical; 9 in sthn Afr., widespread.

*Clitoria L. 3857000

(Papilionoideae—Phaseoleae—Clitoriinae)
Linnaeus: 753 (1753); Hutchinson: 446 (1964); Verdcourt: 515 (1971b).

Climbing or erect herbs or shrubs, rarely trees. **Leaves** pinnately 3–9-foliolate, more rarely 1-foliolate; stipules and stipels present. **Flowers** mostly blue, red or white, in racemes, or solitary or paired, axillary, bracteate; upper pairs of bracts connate. **Calyx** 5-lobed; upper 2 lobes joined at base. **Petals**: vexillum large, rounded, erect, emarginate, without appendages. **Stamens** with vexillary one free or ± joined to the bundle; anthers almost uniform or 5 dorsifixed alternating with 5 subbasifixed. **Ovary** stalked, 2–many-ovuled; style elongated, incurved, bearded inside at slightly dilated apex with small terminal stigma. **Pod** linear-oblong, compressed, sometimes longitudinally ribbed, filled with soft tissue but not septate. **Seeds** subglobose or ellipsoid, compressed. $x = 8$ (6, 7) (aneuploids, polyploidy).

Species ± 70, pantropical, mostly neotropical; 1 in sthn Afr.: **Clitoria ternatea* L., becoming naturalised in parts of N Namibia and Mpumalanga, including the Kruger National Park.

Coelidium Vogel ex Walp. 3646000

(Papilionoideae—Liparieae)
Walpers: 472 (1839); Harvey: 24 (1862); Granby: 12 (1980).

Shrublets ± woody from a woody rootstock, ericoid, usually villous, rarely branchlets ending in spines. **Leaves** simple, sessile, sometimes remote, ovate-lanceolate, concave or flattish, sometimes pungent; stipules 0. **Flowers** white to pinkish purple, seldom bright yellow, frequently with darker keel, usually subsessile and clustered in axils of upper leaves, or in small heads, often paired, pedicels 1-bracteolate. **Calyx** pubescent or villous, with campanulate tube; lobes subequal or with upper 2 extensively connate. **Petals**: vexillum ovate-elliptic or shortly suborbicular, emarginate, shortly and broadly clawed; wings with long claw, sometimes eared at base; keel with pocket on either side, long-clawed. **Stamens** monadelphous; staminal tube sometimes split and short or adnate to lower portion of calyx tube; anthers alternately longer and basifixed, and shorter and versatile. **Ovary** sessile or shortly stalked, narrowly ovate, often slightly compressed, 1-ovuled, villous; style incurved with terminal stigma. **Pod** compressed, obliquely ovate, often beaked, 2-valved, pubescent. **Seeds** ± oblong. $x = 9$ (1 report).

Species ± 20, SW Western Cape as far north as Nieuwoudtville (Northern Cape, Calvinia District) and as far east as the Outeniqua and Kouga Mountains (Eastern Cape).

Colophospermum J.Kirk ex J.Léonard 3490010

(Caesalpinioideae—Detarieae)
Léonard: 390 (1949); Hutchinson: 255 (1964); Ross: 16 (1977).

Unarmed trees, small to medium-sized or shrubs. **Leaves** 2-foliolate; leaflets opposite, obliquely ovate, with 7–12 prominent nerves arising from point of attachment, without midrib, coriaceous, with many pellucid gland-dots; stipules small, caducous. **Flowers** bisexual, irregular, small, in racemes or panicles; bracts minute; bracteoles 0. **Calyx** with 4 sepals. **Corolla** 0. **Stamens** 20–25, free; anthers dorsifixed, dehiscing by longitudinal slits. **Ovary** stalked, compressed, glabrous, with 1 lateral ovule; style lateral. **Pod** compressed, usually reniform, 1-seeded, indehiscent, with many scattered glands. **Seed** large, compressed, reniform, corrugated, with many small reddish resin glands. $x = 9$ (polyploidy).

Species 1: *Colophospermum mopane* (Kirk ex Benth.) Kirk ex J.Léonard (= *Copaifera mopane* Kirk ex Benth.), south-tropical Africa: Namibia to Mpumalanga lowveld.

Cordyla Lour. 3573000

(Papilionoideae—Swartzieae)
Loureiro: 411 (1790); Brenan: 221 (1967); Ross: 133 (1977).

Unarmed deciduous trees, rarely shrubby. **Leaves** imparipinnate; leaflets alternate or rarely subopposite, oblong, shortly stalked, many-jugate, with many pellucid dots or streaks; stipules caducous. **Flowers** bisexual, sometimes male, in short, axillary racemes; bracts persistent. **Calyx** with campanulate tube, 3-lobed. **Petals** 0. **Stamens** many (± 23–126), arising in throat of calyx tube; filaments connate towards base; anthers small, dorsifixed, dehiscing by longitudinal slits; connective glandular apically. **Ovary** on long stalk, ellipsoid, with 2–few ovules; style with terminal, simple stigma. **Fruit** stalked, drupaceous, ellipsoid to subglobose, sometimes as large as a tennis ball, yellow when ripe, 1- or 2-seeded. **Seeds** large, thin-walled, not arillate. $x = 10$ (1 report).

Species 5, Africa and Madagascar; 1 in sthn Afr., *Cordyla africana* Lour.; warm valleys in Mpumalanga, Swaziland and N KwaZulu-Natal.

Craibia Harms & Dunn 3720010

(Papilionoideae—Tephrosieae)
Harms & Dunn: 106 (1911); Gillett: 189 (1960); Hutchinson: 378 (1964); Gillett: 146 (1971b).

Trees or shrubs, usually with golden brown or black indumentum. **Leaves** pulvinate, usually imparipinnate, rarely 1-foliolate; leaflets usually up to 11, alternate or rarely subopposite, acuminate; stipels present or 0. **Flowers** white, usually speckled or streaked with pink or purple, usually fragrant, in terminal, rarely axillary, racemes or panicles; bracts and bracteoles caducous. **Calyx** tubular, with short lobes, upper pairs united for half their length. **Petals**: vexillum shortly clawed, with lamina oblong, not appendaged; wings and keel auriculate. **Stamens** monadelphous or diadelphous; adaxial stamen free, but sometimes adhering in middle; anthers uniform, without appendages. **Ovary** shortly stalked; style with a small, terminal punctate or capitate stigma; ovules 2–6. **Pod** flat, asymmetric, shortly beaked, dehiscing into thin, woody, twisted valves. **Seeds** 1–3, ellipsoid, black or dark brown.

Species 10, tropical Africa; 1 in sthn Afr.: *Craibia zimmermannii* (Harms) Dunn, N KwaZulu-Natal and possibly Swaziland.

Crotalaria L. 3669000

(Papilionoideae—Crotalarieae)

Linnaeus: 714 (1753); Harvey: 39 (1862); Verdoorn: 371 (1928); Polhill: 169 (1968); Polhill: 3 (1982).

Herbs, undershrubs, or shrubs, rarely spinescent. **Leaves** simple, 1-foliolate or digitately 3(–7)-foliolate, usually petiolate; stipules various, occasionally simple, filiform to foliaceous or lacking. **Flowers** usually yellow, less often white or pink, rarely solitary, usually in heads or racemes opposite leaves or terminal; bracts small; bracteoles paired. **Calyx** often with obliquely campanulate tube, usually 2-lipped; lobes variable. **Petals**: vexillum mostly cordate and bicallosed at base within, usually clawed, glabrous or hairy outside; wings shorter than keel; keel angled or rounded near base or ± halfway, generally produced into a beak. **Stamens** monadelphous; tube split; anthers unequal, alternatively long, basifixed, and smaller, dorsifixed. **Ovary** sessile or stalked, 2–many-ovuled; style curved or geniculate, basal portion thick, often laterally pubescent; stigma usually small, rarely bilobed. **Pod** sessile to long-stipitate, globose or cylindric, turgid or inflated, 5-valved, dehiscent. **Seeds** 1–many, oblique-cordiform to oblong-reniform, on filiform funicles. $x = 7, 8$ (aneuploids, polyploidy, B-chromosomes).

Species over 600, fairly cosmopolitan in the tropics and extending into the subtropics particularly to the southern hemisphere; ± 64 in sthn Afr., widespread.

Cullen Medik. 3703010

(Papilionoideae—Psoraleeae)

Medikus: 380 (1787); Stirton: 317 (1981a); Stirton: 342 (1981b).

Shrubs, suffrutices or herbs. **Leaves** 3–1-foliolate or, if digitately 3–5-foliolate, then leaflet margins entire, otherwise either coarsely dentate and conspicuously gland-dotted to undulate and repand-denticulate and black-punctate; leaflets ovate, lanceolate, orbiculate or elliptic, glabrous to densely pubescent; stipules linear-subulate, free and adhering to base of leaf rachis, persistent. **Flowers** purple, purple-blue, rarely pale-coloured, sessile, occasionally subsessile, aggregated in 3–40 triplets into long axillary pedunculate spikes or shortly pedunculate or subsessile axillary clusters, each triplet of flowers subtended by a single ovate bract. **Calyx** either glabrous or strongly glandular-punctate, campanulate with lowest lobe longest, or densely pubescent, sparsely glandular and bilabiate with lowest lobe longest and upper lobes connate high up. **Petals**: vexillum narrowly obovate or obovate with weakly developed claw and auricles without appendages; wing petals longer than keel, oblong with prominent basal lobe; sculpturing well developed; keel broadly obliquely lunate. **Stamens** diadelphous; vexillary stamen usually free or subbasifixed, rest united into a sheath slit adaxially; anthers uniform, alternately basifixed and versatile. **Ovary** substipitate, either glabrous with club-headed glands or pubescent; style upcurved, slender, rarely swollen; stigma either minute or capitate, rarely penicillate. **Pod** erect, indehiscent, conspicuously glandular-warty, glabrous or white pubescent. **Seeds** obliquely reniform.

Species ± 40, a few in drier parts of Africa, but most extending through India and Sri Lanka to Burma, Phillipines, Papua New Guinea and Australia; 4 in sthn Afr., widespread.

Cyamopsis DC. 3700000

(Papilionoideae—Indigofereae)

Candolle: 230 (1825b); Gillett: 6 (1958a); Gillett: 328 (1971b).

Herbs, hairy with biramous hairs. **Leaves** imparipinnately 3-foliolate; leaflets often dentate; stipules small, setaceous. **Flowers** small, in axillary racemes, ebracteate. **Calyx** with obliquely campanulate tube; lower lobes longest. **Petals** similar, glabrous; vexillum sessile, somewhat pointed, markedly veined; wings sessile; keel sessile, incurved, obtuse. **Stamens** monadelphous, with closed tube; anthers uniform, with apiculate connective. **Ovary** sessile, few- to many-ovuled; style incurved at apex, with capitate stigma. **Pod** linear, somewhat 4-angled, beaked, 2-valved, septate within. **Seeds** quadrate, compressed. $x = 7$.

Species ± 4, Africa to India; 2 in sthn Afr.; Namibia, Botswana and Northern Cape, with another species introduced into KwaZulu-Natal.

Cyclopia Vent. 3620000

(Papilionoideae—Podalyrieae)

Ventenat: 8 (1808); Harvey: 6 (1862); Phillips & Hofmeyr: 105 (1922); Kies: 161 (1951).

Erect branched shrubs. **Leaves** sessile, digitately or palmately 3-foliolate; leaflets linear to lanceolate or occasionally ovate, glabrous or pubescent, frequently with revolute margins. **Flowers** yellow, solitary and axillary; bracts 2(3). **Calyx** with shallow tube, truncate and intruse at base and with usually triangular lobes slightly longer than tube. **Petals**: vexillum rounded, plaited at base, with short claw; wings oblong, with transverse fold; keel incurved, obtusely beaked, with small, triangular pocket. **Stamens** 10, free or slightly connate at base; filaments dilated. **Ovary** sessile or shortly stalked, several-ovuled, glabrous. **Pod** oblong, compressed, with coriaceous valves. **Seeds** small, with a strophiole. $x = 9$ (1 report, polyploidy).

Species ± 20, Western Cape, mainly southwestern districts, extending eastwards to near Uitenhage (Eastern Cape).

***Cytisus** Desf. 3682000

(Papilionoideae—Genisteae—Genistinae)

Desfontaines: 139 (1798); Hutchinson: 351 (1964); Frodin & Heywood: 86 (1968); Bisby: 424 (1981).

Sarothamnus Wimm.: 278 (1832).

Unarmed shrubs or small trees, of diverse habit. **Leaves** usually 3-foliolate and petiolate, sometimes 1-foliolate or simple, sometimes crowded on older branches; stipules free, adnate to leaf bases or 0. **Flowers** usually yellow to white, in terminal racemes or in axillary condensed short shoots sometimes aggregated to form pseudoracemes or terminal heads; small bract and 2 bracteoles sometimes present. **Calyx** campanulate, 2-lipped; upper lip 2-toothed, lower lip shortly 3-toothed. **Petals**: vexillum suborbicular or ovate; wing obovate or oblong; keel oblong-falcate to semicircular, always curved on lower side, often slightly beaked, usually glabrous. **Stamens** monadelphous. **Ovary** sessile or rarely shortly stipitate; style usually curved ± in middle, sometimes convolute after anthesis and expanded beneath capitate or introrse stigma. **Pod** chartaceous to slightly coriaceous, usually oblong or linear-oblong, often slightly curved, several- to many-seeded, dehiscent. **Seeds** ovate-oblong or obliquely elliptic. $x = 12, 13, 23, 24, 25$ (polyploidy, B-chromosomes).

Tree Lucerne; several species have been introduced as fodder plants, some have become partly naturalised in the winter-rainfall area of the Cape region.

Dalbergia L.f. 3821000

(Papilionoideae—Dalbergieae)

Linnaeus f.: 52 (1782; '1781') name conserved; Harvey: 264 (1862); Polhill: 95 (1971b).

Trees, sometimes strongly scandent or woody lianes, sometimes with branches modified as spines or climbing

aids. **Leaves** imparipinnate, few- to many-jugate, rarely 1-foliolate; stipules various, small and usually caducous. **Flowers** small, white to yellowish cream-coloured, sometimes fragrant, often many, in axillary or terminal, dichotomous cymes or subcorymbose panicles, bracteate. **Calyx** with campanulate tube, shortly 5-lobed; 2 upper lobes often broader and 3 lower longer and narrower than others. **Petals**: vexillum usually emarginate, clawed; wings shortly clawed; keel often eared, clawed. **Stamens** monadelphous or diadelphous or splitting into 2 bundles, sometimes vexillary stamen 0; anthers uniform, small, erect, didymous, opening at apex or rarely longitudinally. **Ovary** stalked, 1–few-ovuled, sometimes hairy; style short, incurved, with small, terminal stigma. **Pod** oblong or linear, usually compressed, sometimes thickened over seed cavity, indehiscent. **Seeds** 1–4, flattish, subreniform. $x = 10$.

Species ± 100, pantropical in warm regions; 7 in sthn Afr.: Namibia, Botswana, the four northern provinces, Swaziland, KwaZulu-Natal and Eastern Cape.

Decorsea R.Vig. 3910030

(Papilionoideae—Phaseoleae—Phaseolinae)
Viguier: 181 (1952); Verdcourt: 442 (1970b); Verdcourt: 611 (1971b).

Voluble, perennial herbs; rootstock possibly tuberous. **Leaves** pinnately 3-foliolate, bracteate; leaflets ± ovate-lanceolate. **Flowers** in axillary, shortly pedunculate clusters or fascicles, sometimes precocious. **Calyx** appearing 4-lobed, upper 2 united into a low rounded lip. **Petals**: vexillum oblate, reflexed, glabrous, only slightly auriculate; keel incurved through 180–360°. **Ovary** linear, 9–14-ovuled; style of two parts, the upper incrassate, the basal one tenuous; stigma terminal, penicillate, with simple or branched hairs. **Pod** linear, almost straight, not septate. **Seeds** oblong or narrowly oblong, compressed.

Species ± 4, Madagascar and Africa; 3 in sthn Afr.: Namibia, North-West, Northern Province, Mpumalanga, Swaziland, Free State, KwaZulu-Natal and Eastern Cape.

Derris Lour. 3838000

(Papilionoideae—Tephrosieae)
Loureiro: 432 (1790) name conserved; Hutchinson: 384 (1964); Polhill: 73 (1971b).

Woody, climbing shrubs or rarely trees. **Leaves** imparipinnate, sometimes only pinnately 3-foliolate; leaflets opposite; stipels 0. **Flowers** in terminal and axillary racemes or panicles; bracts small, often caducous. **Calyx** often cyathiform, with short or obsolete teeth. **Petals** violet, purple or white; vexillum ovate, obovate or orbicular; wings obliquely oblong, slightly adherent to keel above claw; keel slightly incurved. **Stamens** with vexillary stamen free at base and connate with others from middle in closed tube, rarely altogether free; anthers versatile. **Ovary** sessile or shortly stalked, 2–more-ovuled; style filiform, incurved, with small, terminal stigma. **Pod** obliquely oblong or elongated, flat, indehiscent, with upper suture or both sutures margined with a narrow wing. **Seeds** flat, reniform or orbicular. $x = 11$ (aneuploids).

Species ± 50, tropical regions in the Old World; 1 in sthn Afr.: *Derris trifoliolata* Lour. (= *Derris uliginosa* Benth.), N KwaZulu-Natal.

*__Desmanthus__ Willd. 3450000

(Mimosoideae—Mimoseae)
Willdenow: 1044 (1806) name conserved; Hutchinson: 281 (1964); Ross: 120 (1975).

Trees, shrubs or perennial herbs, unarmed. **Leaves** bipinnate; a gland often present at the junction of the lowest pair of pinnae; pinnae each with several to many pairs of small leaflets; stipules setaceous, persistent. **Inflorescences** capitate, pedunculate, axillary, solitary. **Flowers** in ovate-globose heads, all bisexual or lower neuter and sometimes without petals but with short staminodes. **Calyx** campanulate, shortly 5-dentate. **Petals** 5, free or cohering slightly. **Stamens** 10 or 5, free, exserted; anthers eglandular apically. **Ovary** subsessile; style subulate or thickened above; stigma terminal. **Pods** linear, straight or ± falcate, compressed, dehiscing into 2 valves, continuous within or subseptate between seeds. **Seeds** lying lengthwise or obliquely in the pod, compressed. $x = 7, 11$ (aneuploids).

Species ± 22, mainly in the tropics and subtropics of the New World; 1 species: **Desmanthus virgatus* (L.) Willd., has become naturalised in KwaZulu-Natal near Pietermaritzburg.

Desmodium Desv. 3807000

(Papilionoideae—Desmodieae—Desmodiinae)
Desvaux: 122, t. 5 (1813) name conserved; Harvey: 227 (1862); Schrire: 12 (1988).

Herbs, mainly perennial, undershrubs, or shrubs, erect, ascending or decumbent to scrambling. **Leaves** usually pinnately 3-foliolate, occasionally digitately 3-foliolate, rarely 1- or 5-foliolate; stipules often striate. **Flowers** commonly purple, mauve or pink and hyaline, rarely red, in terminal or occasionally subaxillary racemes or panicles, rarely flowers clustered or solitary or in shortly peduncled, axillary racemes, bracteate. **Calyx** usually broadly campanulate to shortly tubular; lobes longer than tube, 2 upper lobes ± connate, 3 lower acute or subulate-acuminate. **Petals**: vexillum sometimes clawed; wings ± united with keel; keel nearly straight to incurved. **Stamens** mostly diadelphous rarely monadelphous; anthers uniform, basifixed. **Ovary** sessile or stalked, 2–many-ovuled, sometimes hairy; style inflexed or incurved, with terminal stigma. **Pod** exserted from calyx, constricted into membranous or coriaceous, flat or rarely turgid segments which separate on maturity. **Seeds** compressed, often flat, transversely broadly elliptic, ovate or reniform. $x = 11$ (aneuploids).

Species ± 300, cosmopolitan in tropical and subtropical regions, with centres of diversity in E Asia, Mexico and Brazil; 10 in sthn Afr.: Namibia, Botswana, the four northern provinces, Swaziland, KwaZulu-Natal and Eastern Cape.

Dialium L. 3530000

(Caesalpinioideae—Cassieae)
Linnaeus: 3 (1767); Hutchinson: 231 (1964); Brenan: 103 (1967); Ross: 65 (1977).

Unarmed trees or (rarely) large shrubs, not climbing. **Leaves** simply imparipinnate; leaflets 3–21, opposite to alternate; stipules small, usually caducous. **Inflorescences** of terminal and lateral many-flowered panicles; bracts and bracteoles small, soon deciduous. **Flowers** bisexual, irregular or sometimes regular, small. **Calyx** with short or obsolete tube and 5–7 imbricate lobes or segments. **Petals** (0)1–5, shorter than calyx. **Stamens** 2–3(5–10); anthers large, oblong or oblong-ovate. **Disc** sometimes present, wider than ovary. **Ovary** sessile or stalked, 2-ovuled, frequently tomentose; style with small, terminal stigma. **Pod** somewhat ovoid-orbicular, slightly compressed, indehiscent. **Seeds** 1 or 2, ± compressed. $x = 14$ (can also be 7).

Species ± 35, mainly tropical Africa, spreading to Madagascar and Malay Peninsula; 2 in sthn Afr.: Namibia, Botswana and N KwaZulu-Natal.

Dichilus DC. 3664000

(Papilionoideae—Crotalarieae)

Candolle: 136 (1825a); Candolle: 201, t. 35 (1826); Harvey: 77 (1862); Schutte & Van Wyk: 182 (1988).

Undershrubs or herbs, slender. **Leaves** petiolate, digitately 3-foliolate; stipules inconspicuous or 0. **Flowers** 1–3 at ends of branches; bracts minute. **Calyx** distinctly shorter than corolla, with campanulate tube, 2-lipped, glabrous; upper lip 2-toothed or -lobed; lower lip 3-toothed or -lobed. **Petals**: vexillum reflexed, oblong to suborbicular, with a short channelled claw; wings obliquely oblong, eared, clawed; keel slightly shorter than vexillum, much longer than wings, obovate, eared, saccate or gibbous, clawed. **Stamens** monadelphous; staminal tube split along upper side to base; anthers unequal. **Ovary** subsessile, linear, several-ovuled, ciliate on sutures; style incurved, with minutely capitate, terminal stigma. **Pod** narrowly oblong to linear, slightly compressed between seeds. **Seeds** without an aril, on short funicles. $x = 14$ (can also be 7).

Species ± 5, Africa; all in sthn Afr., all countries/provinces except Northern and Western Cape.

Dichrostachys (A.DC.) Wight & Arn. 3452000

(Mimosoideae—Mimoseae)

Wight & Arnott: 271 (1834) name conserved; Harvey: 278 (1862); Brenan: 36 (1959); Brenan & Brummitt: 37 (1970); Ross: 123 (1975).

Shrubs or small trees, with abbreviated lateral shoots often terminating in spines. **Leaves** bipinnate, often with small, many-jugate leaflets; rachis glandular at intersection of some at least of the pinnae. **Flowers** sessile, in cylindric spikes on solitary or clustered, often drooping peduncles, upper bisexual, yellow, lower neuter, rosy or purple. **Calyx** campanulate, shortly 5-toothed or nearly truncate. **Corolla** campanulate; lobes 5, valvate, oblong, shorter than tube. **Stamens** 10, in bisexual flowers, shortly exserted; anthers with stalked glands. **Ovary** subsessile, compressed, villous, several-ovuled; style elongate, with terminal, truncate stigma. **Pod** linear, compressed, contorted, coriaceous, indehiscent or irregularly dehiscent along the sutures. **Seeds** compressed, ovoid to ellipsoid, smooth. $x = 14$ (can also be 7) (polyploidy).

Species ± 20, from Africa to Asia and Australia; 1 from sthn Afr., in warmer parts of Namibia, the four northern provinces, Swaziland and KwaZulu-Natal.

Dipogon Liebm. 3909010

(Papilionoideae—Phaseoleae—Phaseolinae)

Liebmann: 27 (1854); Harvey: 244 (1862); Verdcourt: 406 (1970b).

Voluble, perennial herbs, becoming woody below, thinly pubescent, glabrescent. **Leaves** pinnately 3-foliolate, petiolate, stipulate; leaflets ovate-acuminate, up to 50 mm long. **Flowers** bright purple, in short, dense racemes on peduncles longer than leaves. **Calyx** 5-lobed; lobes short and broad, ciliate. **Corolla** ± 10 mm long. **Style** channelled, bearded along its upper margin, strongly curved near base and apex in same direction, middle part gently curved in opposite direction. **Pod** falcate, ± 50 mm long. **Seeds** 4–6, blackish. $x = 11$.

Species 1: *Dipogon lignosus* (L.) Verdc. (= *Dolichos lignosus* L. and *D. gibbosus* Thunb.) Cape Peninsula (Western Cape) to near East London (Eastern Cape).

Dolichos L. 3910000

(Papilionoideae—Phaseoleae—Phaseolinae)

Linnaeus: 725 (1753); Phillips: 427 (1951); Hutchinson: 441 (1964); Verdcourt: 411 (1970b); Verdcourt: 674 (1971b).

Herbs or undershrubs, climbing, prostrate, or erect, sometimes with large woody rootstocks. **Leaves** pinnately, rarely digitately, 3-foliolate, stipulate. **Flowers** yellow or purple, in axillary or terminal racemes, subumbellate, fascicled, or solitary. **Calyx** with campanulate tube, 2-lipped; upper lip simple or 2-toothed; lower 3-lobed. **Petals**: vexillum often with inflexed auricles at base, subsessile or clawed; wings ± adhering to keel, clawed; keel usually strongly incurved, often beaked, but not twisted. **Stamens** diadelphous; anthers uniform. **Ovary** with basal disc, 2–many-ovuled; style swollen, glabrous or pubescent, with terminal, capitate stigma. **Pod** straight or arcuate, flattened, 2-valved. **Seeds** somewhat flattened, rarely with appendage. $x = 10$, 11 (aneuploids).

Species ± 60, mainly confined to Africa but extending to India and E Asia; ± 12 in sthn Afr., widespread.

Dumasia DC. 3861000

(Papilionoideae—Phaseoleae—Glycininae)

Candolle: 96 (1825c); Harvey: 234 (1862); Verdcourt: 513 (1971b).

Herbs, twining. **Leaves** pinnately 3-foliolate; leaflets ovate; stipules setaceous; stipels present. **Flowers** solitary, clustered, or in axillary racemes; bracts small. **Calyx** with cylindric or narrow tube, gibbous on upper side at base, with mouth obliquely truncate; lobes almost obsolete. **Petals**: vexillum elliptic-oblong, spurred or shortly eared on both sides at base of limb, with channelled claw; wings with long claw; keel somewhat adnate to wings, slightly incurved, with long claw. **Stamens** diadelphous; anthers uniform. **Ovary** subsessile, few- to many-ovuled, sometimes villous; style straight, dilated ± in middle or higher up and incurved above dilated portion, with terminal stigma. **Pod** subsessile, linear, falcate, tortulose, compressed. **Seeds** subglobose. $x = 10, 11$.

Species ± 8, Africa to Asia; 1 in sthn Afr.: *Dumasia villosa* DC. var. *villosa*, Mpumalanga to Swaziland, KwaZulu-Natal and SE Western Cape near Knysna.

Elephantorrhiza Benth. 3467000

(Mimosoideae—Mimoseae)

Bentham: 344 (1842); Harvey: 277 (1862); Phillips: 187 (1922); Burtt Davy: 331 (1932); Brenan: 19 (1959); Brenan & Brummitt: 23 (1970); Ross: 247 (1974); Ross: 138 (1975).

Unarmed small trees, shrubs or suffrutices, often with a greatly enlarged underground rootstock or a number of rootstocks. **Leaves** bipinnate; leaflets small, many-jugate, with midrib usually oblique; petioles eglandular. **Flowers** bisexual, shortly pedicelled in pedunculate racemes or subspikes. **Calyx** campanulate with 5 ovate lobes shorter than tube. **Petals** 5, valvate, free almost to base. **Stamens** 10, free, shortly exserted; anthers with minute, deciduous glands at apex. **Ovary** sessile or shortly stalked, many-ovuled; stigma terminal, small, hollow. **Pod** usually large and straight, flattened, somewhat woody, with sutures remaining closed, but long-persisting, rigid valves separating. **Seeds** compressed-orbicular.

Species ± 9, Africa south of the equator; 8 in sthn Afr., Namibia, the four northern provinces, Swaziland, KwaZulu-Natal.

Entada Adans. 3468000

(Mimosoideae—Mimoseae)

Adanson: 318 (1763) name conserved; Harvey: 276 (1862); Brenan: 9 (1959); Brenan: 13 (1970); Ross: 150 (1975).

Entadopsis Britton: 191 (1928).

Unarmed suffrutices or lianes. **Leaves** bipinnate, uppermost pair of pinnae often modified into tendrils; pinnae in 1–4 pairs, each with one to many pairs of leaflets; petioles eglandular. **Flowers** bisexual, in slender spikes,

sessile or shortly pedicellate. **Calyx** campanulate, shortly 5-toothed or nearly truncate. **Petals** 5, valvate, free, or slightly cohering, or fused to form a campanulate tube. **Stamens** 10, exserted, free or united at base; anthers tipped with deciduous apical gland. **Ovary** sessile or stalked, many-ovuled, glabrous; style terete; stigma terminal, small, hollow. **Pods** often very large (*E. rheedii*), straight or curved, compressed, coriaceous or woody, breaking up into 1-seeded, indehiscent portions. **Seeds** deep brown, smooth, ± compressed, orbicular in outline. $x = 14$ (can also be 7).

Species ± 20, fairly widespread in tropical parts; 3 in sthn Afr., Namibia and KwaZulu-Natal.

Eriosema (DC.) G.Don 3898000

(Papilionoideae—Phaseoleae—Cajaninae)

Don: 237 (1832) name conserved; Harvey: 258 (1862); Grear: 17 (1970); Verdcourt: 761 (1971b).

Perennial herbs suffrutices or shrubs, erect, prostrate, or rarely climbing. **Leaves** pinnately (1)3-foliolate, often exstipellate, resinous-dotted on lower surface, rarely above; stipules triangular or lanceolate, free or connate, leaf-opposed. **Flowers** pale pink, or yellow, or red and yellow, or red, orange and yellow, in axillary racemes, rarely solitary. **Calyx** with campanulate tube oblique at base, hairy, 5-lobed; lobes longer or shorter than tube, subequal, rarely 2 upper shortly connate. **Petals**: vexillum variously oblong or obovate, with deeply channelled claw, usually inflexed-eared; wings usually shorter than keel and partially adnate to it, usually eared and clawed; keel slightly incurved at apex, clawed. **Stamens** diadelphous, with vexillary filament curved or bulbous-kneed at base. **Ovary** sessile or stalked, usually with basal, cupular disc, usually 2-ovuled, villous; style usually slightly thickened above, with capitate stigma. **Pod** compressed, 2-valved, broadly oblong to rhomboidal, obliquely beaked, variously clothed with long hairs. **Seeds** (1)2, compressed, reniform or oblong; funicle attached to one end of hilum. $x = 11$.

Species ± 130, fairly cosmopolitan in tropical and subtropical regions; ± 36 in sthn Afr., widespread.

Erythrina L. 3870000

(Papilionoideae—Phaseoleae—Erythrinae)

Linnaeus: 706 (1753); Harvey: 236 (1862); Collett: 219 (1941); Codd: 507 (1955); Hennessy: 1 (1972); Hennessy: 2 (1991).

Shrubs, or trees, or suffrutices with enlarged subterranean rootstocks; usually armed with prickles; variously hirsute. **Leaves** pinnately 3-foliolate, deciduous; leaflets with a pair of glands at base, stipulate. **Flowers** usually in terminal or sometimes axillary racemes, showy, appearing before or with leaves, bracteate; bracts usually hairy, deciduous. **Calyx** with narrow to campanulate tube, 2-lipped or subtruncate, sometimes with tube cleft nearly to base, sometimes woolly-villous to puberulous. **Petals**: vexillum conduplicate-falcate, shortly clawed, sometimes minutely velvety; wings frequently curved, shortly clawed, sometimes eared at base; keel sometimes eared. **Stamens** monadelphous or diadelphous, but vexillary stamen united to staminal tube for varying lengths; anthers uniform. **Ovary** stalked, linear, many-ovuled, usually densely tomentose; style terete, incurved, sometimes hispid below; stigma small, terminal. **Pod** usually falcate, moniliform, compressed or subterete, constricted, armed with prickles. **Seeds** red or brown, elliptic, smooth. $x = 21$ (aneuploids, high polyploidy).

Species ± 100, fairly cosmopolitan in warm regions; 9 in sthn Afr., widespread, but not extending into central Northern or Western Cape.

Erythrophleum Afzel. ex G.Don 3471000

(Caesalpinioideae—Caesalpinieae)

Don: 424 (1832) name conserved; Hutchinson: 259 (1964); Brenan: 18 (1967); Ross: 10 (1977).

Unarmed trees. **Leaves** bipinnate, with 2–5 pairs of pinnae; leaflets usually large, leathery, often alternate, eglandular; stipules very small, soon deciduous. **Inflorescences** of pedunculate spike-like racemes usually ± aggregated into panicles; bracts very small, falling as or before flowers open. **Flowers** bisexual, irregular, 5-merous, small, shortly pedicelled. **Calyx** narrowly campanulate, with 5 ovate or tooth-like lobes shorter than tube. **Petals** 5, imbricate, arising on calyx tube, free, oblong to oblanceolate-spatulate, pubescent or tomentose. **Stamens** 10, free, equal or unequal, arising with petals; filaments sometimes hairy; anthers dorsifixed, dehiscing by longitudinal slits. **Ovary** stalked, many-ovuled, stipitate, tomentose or densely pubescent; style thick; stigma small, terminal, hollow, minutely ciliolate. **Pod** stipitate, ± oblong, flattened, straight or slightly curved, coriaceous to woody, dehiscing along one or both margins, usually 2–1-seeded. **Seeds** compressed, ovoid; testa pulpy. $x = 12, 14$.

Species ± 10, tropical and subtropical parts of Africa to Asia and N Australia; 2 in sthn Afr., N Namibia, the four northern provinces, Swaziland and KwaZulu-Natal.

Faidherbia A.Chev. 3446010

(Mimosoideae—Acacieae)

Chevalier: 876 (1934); Vassal: 170 (1981).

Acacia Mill. in part; Ross: 44 (1975).

Tall trees with rounded crown and spreading branches; stipules spinescent, in pairs, straight or slightly curved, greenish white with reddish brown tips when young. **Leaves** with adaxial gland 0; rachis subglabrous or puberulous, with a single conspicuous gland at junction of each of 2–10 pairs of pinnae; leaflets grey-green, 6–23 pairs per pinna, linear or linear-oblong to slightly ovate-oblong, apex rounded or subacute or mucronate. **Inflorescence** spicate, usually singly in axil of a leaf. **Flowers** bisexual, yellowish white to pale cream-coloured, sessile or minutely pedicellate. **Calyx** campanulate, 4- or 5-lobed or -toothed, glabrous to pubescent. **Corolla** 4- or 5-lobed, often a delicate pink inside basally, lobes divided almost to base, glabrous to pubescent. **Stamens** many; filaments shortly united into a tube at base; anthers eglandular. **Ovary** shortly stipitate, pilose; style glabrous or subglabrous. **Pod** bright orange to reddish brown, falcate or curled into a circular coil or variously twisted, indehiscent, thick, glabrous or very rarely puberulous. **Seeds** light to dark brown, elliptic-lenticular.

Species 1: *Faidherbia albida* (Del.) A.Chev., widespread in tropical and subtropical Africa; in sthn Afr.: Namibia, Botswana, Northern Province, Mpumalanga and N KwaZulu-Natal.

Flemingia Roxb. ex W.T.Aiton 3899000

(Papilionoideae—Phaseoleae—Cajaninae)

Aiton: 349 (1812) name conserved; Phillips: 425 (1951); Hutchinson: 422 (1964); Verdcourt: 805 (1971b).

Shrubs or herbs, erect, prostrate, or rarely scandent. **Leaves** digitately (1)3-foliolate, exstipellate, gland-dotted on lower surface; stipules striate, often caducous. **Flowers** greenish, yellowish white or pink, densely spicate-racemose or paniculate; bracts foliaceous or dry and narrow, persistent or caducous; bracteoles 0. **Calyx** with campanulate tube, 5-lobed; lobes longer than tube, often linear-acuminate, subequal or lowest the longest. **Petals**: vexillum with inflexed ears at base and channelled claw;

wings often adhering to keel; keel straight or incurved, clawed. **Stamens** diadelphous, with vexillary filament often kneed or broadened; anthers uniform. **Ovary** subsessile, ellipsoid, 2-ovuled, sometimes with basal, cupular disc; style often thickened above, with small, terminal stigma. **Pod** short, oblique, turgid, 2-valved. **Seeds** thick, globose; thick funicle attached to short hilum. $x = 11$ (aneuploids).

Species ± 30, tropical regions of Old World; 1 in sthn Afr.: *Flemingia grahamiana* Wight & Arn., Northern Province, Mpumalanga, Swaziland to KwaZulu-Natal.

Galactia P.Browne 3882000

(Papilionoideae—Phaseoleae—Diocleinae)
Browne: 298 (1756); Harvey: 235 (1862); Verdcourt: 578 (1971b).

Herbs, prostrate or climbing, or shrubs, sometimes villous. **Leaves** pinnately 3-foliolate, rarely 1- or 5- or 7-foliolate; stipules small, often deciduous. **Flowers** fascicled or lower subsolitary, in axillary racemes; bracts small, setaceous. **Calyx** often hairy, with campanulate tube; 2 upper lobes usually fused, lowest often the longest. **Petals**: vexillum ovate or round, shortly clawed; wings narrow, eared, shortly clawed, adnate to keel; keel shortly clawed. **Stamens** diadelphous, or vexillary stamen connate with others at middle; anthers uniform. **Ovary** sessile or shortly stipitate, several- to many-ovuled, often villous; style filiform, with small stigma. **Pod** linear to linear-oblong, straight or incurved, compressed, or rarely convex on both sides, 2-valved. **Seeds** small; hilum small, central, elliptic, not arillate or with a vestigial rim-aril. $x = 10$ (aneuploids).

Species ± 50, mostly New World, tropical and subtropical; 1 in sthn Afr.: *Galactia tenuiflora* (Willd.) Wight & Arn. var. *villosa* (Wight & Arn.) Benth., Mpumalanga, Swaziland and KwaZulu-Natal.

***Gleditsia** L. 3544000

(Caesalpinioideae—Caesalpinieae)
Linnaeus: 1056 (1753); Hutchinson: 266 (1964); Ball: 84 (1968).

Trees or shrubs, usually armed with stout straight or branched thorns. **Leaves** stipellate or not, usually all or partly bipinnate on long shoots, pinnate or bipinnate on short shoots; leaflets often ± serrate. **Flowers** small, greenish, effectively unisexual or plants polygamous with flowers in racemes or small panicles; bracteoles small or 0. **Calyx** campanulate with 3–5 lobes, subequal. **Petals** 3–5, sessile, slightly unequal, imbricate. **Stamens** 6–10; anthers uniform. **Ovary** in male flowers rudimentary, minute or 0, in bisexual flowers subsessile, free; ovules many to 2; style short; stigma terminal. **Pod** ovate or elongated, straight, compressed, coriaceous, indehiscent or tardily dehiscent, often pulpy within. **Seeds** many, transverse, obovate or orbicular, compressed. $x = 14$ (polyploidy).

**Gleditsia triacanthos* L., Honey or Sweet Locust, strongly spiny trees, cultivated and may be found as an escape.

***Glycyrrhiza** L. 3769000

(Papilionoideae—Galegeae—Glycyrrhizinae)
Linnaeus: 741 (1753); Hutchinson: 412 (1964); Yeo: 127 (1968).

Perennial herbs, often glandular or lepidote, some with sweet roots. **Leaves** imparipinnate; leaflets many, rarely 3, entire or glandular-denticulate, without stipels; stipules membranous, caducous. **Flowers** blue, violet, white, or rarely yellowish, in axillary racemes or spikes; bracts narrow, membranous, caducous; bracteoles 0. **Calyx** weakly bilabiate. **Petals**: vexillum narrowly ovate or oblong, erect, shortly contracted at base; wings obliquely oblong, rather acute, free; keel longer than wings, acute or obtuse. **Stamens** diadelphous or monadelphous; vexillary stamen free or connate with the rest into a sheath split above. **Ovary** sessile, 2- or more-ovuled; style filiform or rather thick, incurved at apex; stigma terminal. **Pod** ovate, oblong or shortly linear, straight or arcuate, turgid or compressed, glandular, muricate, bristly or rarely smooth, indehiscent or tardily 2-valved. **Seeds** reniform or subglobose. $x = 8$ (aneuploids).

Species ± 20, mostly in Eurasia but thinly extending to Australia, North America and temperate South America; 1 in sthn Afr.: **Glycyrrhiza glabra* L., has become naturalised in the Montagu District of the Western Cape and in the Middelburg and Graaff-Reinet Districts of the Eastern Cape.

Guibourtia Benn. 3490020

(Caesalpinioideae—Detarieae)
Bennett: 149 (1857); Léonard: 400 (1949) name emended; Léonard: 269 (1950); Hutchinson: 256 (1964); Brenan: 136 (1967); Ross: 19 (1977).

Unarmed evergreen or deciduous trees or shrubs. **Leaves** 2-foliolate; leaflets opposite, sessile, asymmetric, entire, rarely with a terminal leaflet, usually with many pellucid gland dots; stipules small, soon deciduous. **Flowers** bisexual, irregular, sessile or pedicellate, in more than 2 rows on branches, in terminal panicles; branches strobiliform when young; bracts mostly small, bracteoles 2, persistent or falling before flowers open. **Calyx** with 4 subequal sepals, imbricate. **Petals** 0. **Disc** present, ± fleshy. **Stamens** 8–12, free, alternately longer and shorter; anthers ovoid, dorsifixed. **Ovary** stalked or sessile, with 1–4 ovules; style filiform with terminal, capitate stigma. **Pod** ± stalked, suborbicular to obliquely elliptic, flat or dilated, coriaceous or membranous, dehiscent or indehiscent, unilaterally winged. **Seeds** 1 or 2, sometimes arillate. $x = 12$ (polyploidy).

Species 16, tropical Africa and America; 2 in sthn Afr., N Namibia and Northern Province.

Haematoxylum L. 3552000

(Caesalpinioideae—Caesalpinieae)
Linnaeus: 384 (1753); Schreiber: 14 (1967b); Ross: 112 (1977).

Trees or shrubs, unarmed or armed with spine-tipped abbreviated lateral shoots. **Leaves** simply paripinnate or with lower jugae bipinnate; a few leaflet pairs usually obcordate; stipules sometimes spinescent, sometimes caducous. **Inflorescence** an axillary or terminal raceme. **Flowers** bisexual, irregular. **Calyx** eglandular or sometimes covered with many small, stalked glands, with short, sometimes campanulate tube; lobes 5, imbricate slightly unequal, one boat-shaped. **Petals** 5, obovate or oblong, slightly unequal, imbricate. **Stamens** 10, free, sometimes unequal; filaments pilose at base; anthers often elliptic. **Ovary** shortly stalked, 2- or 3-ovuled; style with small, terminal, sometimes hollow stigma. **Pod** compressed, lanceolate or oblong, flattened, membranous, splitting longitudinally almost along middle of each valve. **Seeds** transversely oblong. $x = 12$.

Species 3, Africa, tropical America, India; 1 in sthn Afr.: *Haematoxylum dinteri* (Harms) Harms, Namibia.

Hallia Thunb. 3819000

(Papilionoideae—Psoraleeae)
Thunberg: 38 (1799); Harvey: 231 (1862); Hutchinson: 419 (1964); Stirton: 341 (1981b).

Low ascending or trailing suffrutices. **Leaves** 1-foliolate; exstipellate, simple, entire, often nigro-punctate or pellucid-dotted; stipules striate, adnate to base of petiole. **Flowers** purple, axillary, solitary, slen-

derly pedunculate or subsessile, aggregated in 1 or 5–18 triplets, or rarely doublets, axillary or terminal fascicles, imperfect racemes or lax pseudo-spikes; each flower bracteate and always subtended by a lobed cupulum, itself subtended by 2 bracts; bracteoles 0. **Calyx** campanulate; lobes equal, longer than tube, upper 2 lobes slightly connate, inner face without black stubby hairs (as in *Psoralea*). **Petals**: vexillum ovate, without appendages, auricles weak inflexed but weakly developed; wing oblong, longer than the obtuse keel. **Stamens** monadelphous. **Ovary** weakly substipitate, 1-ovuled. **Pod** compressed, thinly membranous and reticulated, enclosed by the calyx at maturity. **Seeds** unknown.

Species 9, endemic to the Western Cape.

Hoffmannseggia Cav. 3557000

(Caesalpinioideae—Caesalpinieae)
Cavanilles: tt. 392, 393 (1797); Harvey: 269 (1862); Brenan: 198, 202 (1963); Hutchinson: 261 (1964); Brummitt & Ross: 415 (1974); Ross: 117 (1977).

Herbs or undershrubs, often glandular, sometimes shortly spinescent, sometimes with tuberous roots. **Leaves** bipinnate, imparipinnate; leaflets usually small; stipules small, usually deciduous; stipellae, when present, small and setaceous. **Inflorescence** a terminal or leaf-opposed raceme; bracts small, deciduous; bracteoles 0. **Flowers** bisexual, irregular, pedicellate. **Calyx** with shortly campanulate tube and 5 subequal lobes longer than tube, imbricate or valvate, often with black glands. **Petals** 5, subequal, imbricate. **Stamens** 10, free; filaments somewhat declinate, often glandular at base, sometimes villous. **Ovary** subsessile, few- to many-ovuled; style often clavate, with terminal, usually small, concave or hollow stigma. **Pod** subsessile, linear, oblong or ovate, straight or falcate, longitudinally dehiscent, compressed, 2-valved, glandular or setose. **Seeds** compressed, transversely or obliquely ovate. $x = 12$.

Species ± 30, Central America and Africa; 3 in sthn Afr., widespread except in Mpumalanga, Swaziland, Free State, Lesotho and Western Cape.

Hypocalyptus Thunb. 3683000

(Papilionoideae—Liparieae)
Thunberg: 124 (1800a); Harvey: 81 (1862); Dahlgren: 102 (1972).

Shrubs, or rarely trees, up to ± 3(–6) m tall, generally stiff in habit. **Leaves** digitately 3-foliolate, petiolate, stipulate; leaflets oblanceolate to broadly obovate, entire. **Flowers** violet, 2 to more than 50 in terminal racemes or racemose panicles; bracts setaceous, usually caducous. **Calyx** brown, membranous, with campanulate tube, intruse at base; upper 2 lobes ± united to ± 1 mm from apices; lower lobes deltoid to narrowly triangular. **Petals**: vexillum broadly ovate, reflexed, shortly clawed, with callus on inner side of claw; wings oblong-spatulate, eared at base, with short claw bent at right angle to limb; keel incurved, shorter than vexillum, with rather prominent upper ear, shortly clawed. **Stamens** monadelphous; tube closed; anthers unequal, alternately versatile and basifixed. **Ovary** subsessile, curved, with few to many ovules, glabrous; style incurved, with small, capitate stigma. **Pod** linear, flat or sometimes somewhat inflated, 2-valved, with upper suture thickened. **Seeds** 5 or 6, dark, with a whitish, annular, collar-like strophiole. $x = 10$ (B-chromosomes).

Species 3; Western Cape: from Clanwilliam District to Bredasdorp and Riversdale and eastwards to Eastern Cape: Uitenhage and Port Elizabeth Districts.

Indigastrum Jaub. & Spach 3702030

(Papilionoideae—Indigofereae)
Jaubert & Spach: 101, t. 492 (1857); Schrire: 167 (1992); Schrire: 161 (1995).

Annual or perennial herbs, covered with biramous hairs. **Leaves** 1–17-foliolate; leaflets opposite or alternate, entire; stipules adnate to base of petiole, subulate or falcate-lanceolate. **Flowers** pink, in axillary, many-flowered racemes, dense initially, becoming lax later; bracts caducous. **Calyx** usually with shallowly campanulate tube; lobes equal or longer than the tube. **Petals**: vexillum narrow at base, tapering to the claw, glabrous; keel with lateral pouches, apex prolonged rostrate. **Stamens** diadelphous, all fertile; vexillary stamen free; anthers glabrous, hyaline scales at base reduced or 0. **Ovary** usually sessile; stigma oblique or capitate. **Pod** reflexed, 4–20-seeded, terete or laterally compressed, linear, straight or curved. **Seeds** quadrate.

Species ± 9, mostly south tropical Africa and one pantropical; 8 in sthn Afr., widespread.

Indigofera L. 3702000

(Papilionoideae—Indigofereae)
Linnaeus: 487 (1738); Linnaeus: 751 (1753); Harvey: 163 (1862); Phillips: 412 (1951); Gillett: 5 (1958); Hutchinson: 400 (1964).

Perennial or annual herbs, undershrubs, or shrubs, mostly covered by biramous hairs. **Leaves** (1)3(5–9)-foliolate, pinnate, simple or reduced to scales; leaflets opposite or less often alternate, entire; stipules setaceous to foliaceous; stipels often present. **Flowers** in axillary or terminal racemes or spikes, sometimes on long peduncles; bracts persistent or caducous. **Calyx** usually with shallowly campanulate tube; lobes equal or subequal. **Petals**: vexillum usually sessile, mostly hairy on dorsal surface; wings rarely markedly clawed, often eared, sometimes gibbous; keel with short, broad claw, spurred laterally or sometimes saccate, upper margin with a prominent fringe of hairs. **Stamens** diadelphous; vexillary stamen free; anthers uniform, apiculate. **Ovary** usually sessile, usually linear, with 1–many ovules; style usually bent at right angle, with capitate stigma. **Pod** variable, globose to linear, straight to coiled, septate within, variously hairy or glabrous. **Seeds** globose to cylindrical; either truncate, compressed, obloid, ellipsoid or quadrate; with hard, bony testa and a small, oval hilum; a rudimentary rim-aril is present in most taxa. $x = 8$ (7) (aneuploids, polyploidy, B-chromosomes).

Species ± 730, cosmopolitan in tropical and subtropical regions; over 210 in sthn Afr.; widespread.

Julbernardia Pellegr. 3516020

(Caesalpinioideae—Amherstieae)
Pellegrin: 297 (1943); Brenan: 145 (1967); Ross: 43 (1977).

Unarmed evergreen or deciduous trees. **Leaves** paripinnate; leaflets in one to many opposite pairs, ± markedly asymmetric basally, venation prominent on both surfaces, translucent dots often present but sometimes 0; petiolules usually twisted; stipules intrapetiolar, always connate below, bicuspidate above or with 2 relatively large foliaceous lobes simulating free stipules, ± persistent or rapidly deciduous. **Inflorescence** a terminal usually much-branched panicle. **Flowers** bisexual, irregular; bracteoles 2, well developed, valvate, completely enclosing flower buds, persistent, keeled down back. **Sepals** 5, well developed, equal or nearly so in length, ciliate; calyx tube 0. **Petals** 5, equal or nearly so in length, all subequal and well developed, 1 large and 4 small, or all small. **Stamens** 10, fertile; 9 filaments shortly united

below, the tenth free. **Ovary** very shortly stipitate, densely pubescent; stipe free; ovules up to 5; style elongate; stigmas capitate, abruptly enlarged. **Pod** compressed, 1-seeded, elastically dehiscing into 2 woody valves; valves obliquely transversely nerved; upper suture usually with a laterally projecting wing or ridge. **Seed** compressed, exareolate, with a hard testa, borne on short funicles. $x = 12$.

Species ± 8, all in tropical Africa; 1 in sthn Afr.: *Julbernardia globiflora* (Benth.) Troupin, Namibia (Caprivi Strip) and Botswana.

Kotschya Endl. 3796010

(Papilionoideae—Aeschynomeneae—Aeschynomeninae)

Endlicher: 4 (1839); Hutchinson: 475 (1964); Verdcourt: 410 (1971a); Verdcourt: 447 (1973).

Herbs, undershrubs, or shrubs, sometimes villous. **Leaves** impari- or paripinnate; leaflets alternate, asymmetric at base; stipules membranous or scarious, persistent; stipels 0. **Flowers** usually in axillary racemes, rarely solitary, bracteate. **Calyx** scarious, deeply 5-lobed, 2-lipped, upper lip entire or emarginate, lower lip entire to 3-fid. **Petals**: vexillum obovate or rounded, often emarginate, sometimes adnate to staminal tube, usually sessile; wings shortly clawed; keel incurved or straight, sometimes eared, clawed. **Stamens** monadelphous; tube split above, eventually on 2 sides; anthers uniform. **Ovary** sessile or stalked, 2–many-ovuled, usually submoniliform, sometimes with a cupular disc at base; style inflexed, glabrous, with small, terminal stigma. **Pod** within calyx, segmented, with segments at length separating. **Seeds** reniform. $x = 14$ (1 report).

Species ± 31, restricted to tropical Africa and Madagascar; 2 in sthn Afr.: *Kotschya parvifolia* (Burtt Davy) Verdc. and *K. thymodora* (Baker f.) Wild subsp. *thymodora*, the four northern provinces to KwaZulu-Natal and border of the Eastern Cape.

Lablab Adans. 3909000

(Papilionoideae—Phaseoleae—Phaseolinae)

Adanson: 325 (1763); Harvey: 263 (1862); Verdcourt: 409 (1970b); Verdcourt: 696 (1971b).

Herbs, erect or climbing. **Leaves** pinnately 3-foliolate; stipules reflexed, persistent; stipels lanceolate. **Flowers** in axillary racemes longer than leaves; rachis swollen at insertion of pedicels; bracts caducous. **Calyx** with campanulate tube longer than lobes, bilabiate; upper lip entire, emarginate, lower 3-lobed. **Petals**: vexillum usually reflexed, auriculate at base, with 2 callosities on inner face; wings longer than keel; keel beaked, incurved at right angle. **Stamens** 10, vexillary filament free, others connate into sheath; anthers uniform. **Ovary** surrounded by lobed disc; several-ovuled; style incurved at right angle, flattened laterally, with soft hairs towards top of adaxial face; stigma terminal. **Pod** obliquely oblong-falcate, beaked by persistent style, sometimes with upper margin verrucose. **Seeds** slightly compressed, dark brown, with a white aril more than half their length. $x = 11$.

Species 1, variable under world-wide cultivation; *Lablab purpureus* (L.) Sweet subsp. *uncinatus* Verdc., widespread in Africa, throughout sthn Afr.

Lebeckia Thunb. 3660000

(Papilionoideae—Crotalarieae)

Thunberg: 139 (1800b); Harvey: 82 (1862); Dahlgren: 255 (1963d); Dahlgren: 558 (1970).

Shrubs, undershrubs, or sometimes herbaceous, sometimes spinescent and not very leafy. **Leaves** variable, (1)3-foliolate, usually petiolate; leaflets filiform, linear, narrowly spathulate or obovate; stipules sometimes present and then conspicuous. **Flowers** few to many in terminal or unilateral racemes. **Calyx** usually obliquely campanulate; lobes equal or subequal, shorter than tube. **Petals**: vexillum broad, reflexed with bent, channelled claw, glabrous or pubescent on outside; wings oblong or obovate, often eared, sometimes with transverse ridges, clawed; keel usually planoconvex, often gibbous, sometimes saccate, clawed. **Stamens** monadelphous, with tube split to base; anthers unequal. **Ovary** sessile or stalked, usually linear, several- to many-ovuled; style incurved, with minutely capitate stigma. **Pod** dehiscent, many-seeded, sometimes membranous, usually tipped with persistent style. **Seeds** on short funicles. $x = 9$.

Species ± 35, sthn Afr., mainly Cape region, extending into Namibia and 1 in KwaZulu-Natal: *Lebeckia mucronata* Benth.

*__Lespedeza__ Michx. 3820000

(Papilionoideae—Desmodieae—Lespedezinae)

Michaux: 70, t. 39 (1803); Hutchinson: 487 (1964); Hilliard & Burtt: 127 (1970); Schrire: 19 (1988).

Perennial herbs; shrubs or shrublets; woody rhizomes bearing 1–many virgate, aerial stems. **Leaves** pinnately 3-foliolate; leaflets entire, often mucronate, terminal often longer than lateral ones; stipules often small, persistent. **Flowers** borne in pairs, each pair subtended by 2 series of bracts, second series usually paired; bracteoles 2, at base of calyx. **Calyx** campanulate, persistent in fruit, lobes subequal, upper 2 more connate than the others. **Petals**: vexillum clawed; wings falcate-oblong, free or scarcely adherent to keel; keel obtuse or beaked, not laterally appendaged. **Stamens** diadelphous; anthers uniform. **Ovary** 1-ovulate; style filiform, incurved, persistent in fruit; stigma small, terminal. **Pod** ovate or orbicular, reticulate, indehiscent. **Seeds** compressed, suborbicular. $x = 9, 10, 11$ (polyploidy).

Species ± 40, in temperate North America, east and tropical Asia and Australia; 1 in sthn Afr.: **Lespedeza cuneata* (Dum.Cours.) G.Don, has become naturalised in the midlands of KwaZulu-Natal in the Pietermaritzburg, Kokstad and Ixopo Districts.

Lessertia DC. 3756000

(Papilionoideae—Galegeae—Coluteinae)

Candolle: 37 (1802) name conserved; Harvey: 213 (1862); Bolus: 87 (1915).

Herbs, shrublets, or shrubs, rarely spinescent. **Leaves** imparipinnate, stipulate. **Flowers** in pedunculate, axillary racemes, rarely solitary and terminal, bracteate. **Calyx** with campanulate tube; lobes subequal. **Petals**: vexillum sometimes bilobed, sessile or shortly clawed; wings usually eared, clawed; keel straight or incurved, clawed. **Stamens** diadelphous; anthers uniform. **Ovary** sessile or stalked, 2–many-ovuled; style incurved, bearded in front below apex. **Pod** membranous, slightly inflated or compressed, opening at apex. **Seeds** reniform, with filiform funicle. $x = 8$.

Species over 50, Africa; ± 47 in sthn Afr., widespread.

*__Leucaena__ Benth. 3447000

(Mimosoideae—Mimoseae)

Bentham: 416 (1842); Brenan & Brummitt: 53 (1970); Ross: 193 (1973); Ross: 115 (1975).

Unarmed trees or shrubs. **Leaves** bipinnate, a conspicuous gland often present at junction of lowest pair of pinnae, petiole and rachis otherwise eglandular or rarely with glands between other pairs of pinnae; pinnae each with one to many pairs of leaflets. **Inflorescence** capitate, pedunculate, axillary, 1–3 together, often racemo-

sely aggregated. **Flowers** bisexual, sessile. **Calyx** gamosepalous, 5-toothed. **Petals** 5, free, pubescent or glabrous outside. **Stamens** 10, free, fertile; anthers mostly eglandular apically. **Ovary** pubescent or sometimes glabrous. **Pod** oblong or linear-oblong, usually thinly subcoriaceous, compressed, dehiscing into 2 nonrecurving valves. **Seeds** lying ± transversely in pod, compressed, brown, smooth, unwinged. x = 13, 14 (polyploidy, B-chromosomes).

Species ± 50; 1: **Leucaena leucocephala* (Lam.) De Wit, widespread in the tropics and subtropics, has become naturalised in KwaZulu-Natal and Eastern Cape.

Liparia L. 3642000

(Papilionoideae—Liparieae)

Linnaeus: 156 (1771); Harvey: 14 (1862); Bos: 269 (1967); Schutte & Van Wyk: 573 (1994); Schutte: 149 (1995).

Priestleya DC. sect. *Priestleya*.

Woody shrubs or shrublets, variable in habit. **Leaves** simple, variable, linear, lanceolate, elliptic, oblanceolate or cordate to almost round, pungent, palmately-nerved, often drying black; stipules usually present, small, persistent. **Flowers** usually yellow, 4–many, in terminal heads; bracts large, imbricate, clasping flowers; bracts large and conspicuous, sometimes foliaceous or petaloid; bracteoles 0. **Calyx** with shortly campanulate tube intruse at base; lobes longer than tube; 4 upper lobes lanceolate, acute, usually united for some distance; lower lobe longer than others, sometimes as large as vexillum, petaloid. **Petals**: vexillum usually elliptic-oblong, ovate to circular; keel broad with an upward-directed beak or narrow with a forwardly-directed beak, subacute. **Stamens** 10, diadelphous, unequal, vexillar stamen free, the other 9 connate in a dorsally open tube; anthers versatile, linear, ovate, or sometimes subsagittate. **Ovary** sessile or shortly stalked, few-ovuled, villous; style villous below, with small, terminal stigma. **Pod** coriaceous, ovate or oblong, flat, oblique, compressed, 2-valved, hairy, glabrescent. **Seeds** oblong-reniform, appendaged. x = 9.

Species ± 20, SW Western Cape and eastwards to Eastern Cape: Uitenhage and Port Elizabeth Districts.

Lonchocarpus Kunth 3834000

(Papilionoideae—Tephrosieae)

Kunth: 383 (1823) name conserved; Harvey: 263 (1862); Mendonça & Sousa: 831 (1965); Polhill: 65 (1971b).

Trees or rarely strong, woody climbers. **Leaves** imparipinnate, occasionally pinnately 3-foliolate. **Flowers** in racemes or panicles or sometimes fascicled, or 2-nate, bracteate; bracteoles small, usually caducous. **Calyx** sometimes villous, with campanulate tube; lobes 5, shorter than tube with 2 upper lobes connate almost to tips. **Petals**: vexillum ovate, obovate or suborbicular, cuneately clawed, sometimes with 2 appendages above claw, often silky; wings oblique or falcate, clawed, eared, slightly adnate to keel above claw; keel suberect or curved, obtuse, eared, clawed, sometimes gibbous. **Stamens** monadelphous, with vexillary stamen free at base and connate above, rarely entirely free; anthers uniform. **Ovary** ± stalked, 2–many-ovuled, frequently hairy; style incurved, with small, terminal, capitate stigma. **Pod** oblong or linear-oblong, flat, membranous or leathery, indehiscent, with terminal style scar; sutures not winged, sometimes upper laterally dilated. **Seeds** 1 or 2, rarely many, compressed, reniform or suborbicular. x = 11 (polyploidy).

Species ± 100, in tropical America and Africa; 3 in sthn Afr., Namibia, Botswana, the four northern provinces to KwaZulu-Natal.

Lotononis (DC.) Eckl. & Zeyh. 3657000

(Papilionoideae—Crotalarieae)

Ecklon & Zeyher: 176 (1836) name conserved; Harvey: 47 (1862); Dümmer: 275 (1913); Dahlgren: 371 (1964); Van Wyk: 92 (1991).

Buchenroedera Eckl. & Zeyh.: 194 (1836).

Annual, perennial suffrutescent herbs or small shrubs. **Leaves** alternate or rarely opposite, usually petiolate, digitately 3(4–8)-foliolate, rarely simple or 1-foliolate; stipules small or foliaceous, usually single at each node, less commonly paired or 0. **Flowers** usually yellow (often partly orange, pink or white) or blue, rarely pink, pale purple, violet or white, axillary or terminal, usually solitary, sometimes 2- or 3-nate, or in heads, or sometimes head-like racemes, often pedunculate, usually bracteate. **Calyx** with campanulate tube, occasionally somewhat inflated; 4 upper lobes substantially united, lowest narrower than others, rarely lobes subequal. **Petals**: vexillum ovate to oblong with short or long claw, sometimes with 2 cushions at upper end of claw, glabrous or hairy outside; wings sometimes shorter than keel, clawed, eared at base; keel clawed, eared at base, usually gibbous. **Stamens** monadelphous, unequal, usually with tube split to base, open along upper (vexillar) side, rarely much united; anthers usually unequal, 4 oblong to linear and basifixed, 5 ovate and dorsifixed, carinal one intermediate. **Ovary** sessile or shortly stalked, few- to many-ovuled; style curved up and tapering, occasionally hairy towards base, with minutely capitate stigma. **Pod** subsessile or rarely long-stipitate, flat or turgid, linear to oblong or ovate. **Seeds** on long funicle, suborbicular to obliquely cordiform. x = 9, 14 (polyploidy).

Species ± 150, Africa, with few extending to east tropical Africa, the Mediterranean and Pakistan: 144 in sthn Afr., widespread.

Lotus L. 3698000

(Papilionoideae—Loteae)

Linnaeus: 773 (1753); Harvey: 157 (1862); Gillett: 361 (1958b); Gillett: 1042 (1971a).

Annual or perennial herbs, or softly woody undershrubs. **Leaves** 3-foliolate, with 1 or 2 leaflets near stem resembling stipules; stipules minutely tuberculate or 0. **Flowers** in axillary umbels, rarely solitary; bracts 3-bracteolate. **Calyx** variable; lobes equal, or subequal, or rarely calyx 2-lipped. **Petals** free or sometimes adnate to base of calyx tube; vexillum sessile or clawed; wings sometimes eared, clawed and gibbous; keel incurved or inflexed, beaked, gibbous. **Stamens** diadelphous, vexillary stamen free, alternate filaments expanded at apex. **Ovary** sessile or subsessile, many-ovuled; style inflexed above ovary, with terminal or lateral sometimes capitate stigma. **Pod** oblong or linear, straight or curved, terete, turgid, rarely planocompressed, 2-valved, usually septate within. **Seeds** subglobose or lenticular. x = 6, 7 (aneuploids, polyploidy, B-chromosomes).

Species ± 100, fairly cosmopolitan; 1 in sthn Afr.: *Lotus discolor* E.Mey. subsp. *discolor*, the four northern provinces, Swaziland, KwaZulu-Natal and Eastern Cape; several other species introduced and rare as escapes.

***Lupinus** L. 3672000

(Papilionoideae—Genisteae—Lupininae)

Linnaeus: 721 (1753); Hutchinson: 364 (1964); Franco & Da Silva: 105 (1968); Polhill: 995 (1971a); Stirton: 25 (1988).

Annual or perennial herbs, rarely shrubs. **Leaves** usually digitately 5–11(–17)-foliolate; stipules mostly linear-subulate, adnate to base of petiole. **Flowers** variously coloured, usually many in terminal and leaf-opposed racemes, alternate to verticillate; bracteoles often at-

tached to calyx. **Calyx** deeply divided almost to base, bilabiate, 3 lower lobes, at least, largely joined. **Petals**: vexillum with a short claw and broad blade; wings broad, generally enveloping keel, connate at apex; keel beaked. **Stamens** monadelphous; anthers alternately long and short. **Ovary** usually sessile, 2–many-ovulate; style incurved, glabrous except for a ring of hairs beneath terminal stigma. **Pod** dehiscent, compressed, usually constricted between seeds. **Seeds** generally orbicular-rectangular to oblong-elliptic, with a sunken hilum. $x = 8$ (9, 10, 13) (polyploidy).

Species ± 200, most numerous in the western parts of North and South America, with a second centre in Mediterranean Europe with some extensions in the highlands of E Africa. Species of **Lupinus* are extensively used in the Western Cape as a cover crop or green manure and 4 species have become naturalised.

Macrotyloma (Wight & Arn.) Verdc. 3910020

(Papilionoideae—Phaseoleae—Phaseolinae)
Verdcourt: 400 (1970b); Verdcourt: 322 (1970d); Verdcourt: 1 (1982).

Annual or perennial herbs, often with large woody rootstocks; stems erect, scrambling, or prostrate. **Leaves** pinnately 3-foliolate or sometimes unifoliolate; leaflets often with a margin of whitish hairs; stipulate. **Flowers** axillary, fasciculate or in terminal pseudoracemes. **Calyx** 4- or 5-lobed; tube campanulate; 2 uppermost lobes ± united. **Corolla** glabrous, yellow or greenish yellow, often blotched with mauve, rarely reddish; vexillum rounded or elliptic, eared, with 2 small, parallel appendages; wings narrow. **Stamens** biseriate, with uniform anthers. **Ovary** 3–13-ovuled; style ± filiform, with terminal, subcapitate, often penicillate stigma. **Pod** straight or curved, linear or linear-oblong, compressed. **Seeds** compressed, with small or obsolete aril. $x = 11$ (aneuploids).

Species ± 24, Africa and Asia; 6 in sthn Afr., widespread, but not reaching Western Cape.

**Medicago* L. 3688000

(Papilionoideae—Trifolieae)
Linnaeus: 778 (1753); Harvey: 162 (1862); Stirton: 27 (1982).

Herbs, rarely shrubs. **Leaves** pinnately 3-foliolate, veins of leaflets usually extended into teeth on margin; stipules entire, dentate, incised or laciniate. **Flowers** yellow, purple, mauve or pale lilac, in axillary racemes or heads, or sometimes subsolitary; bracts small or 0. **Calyx** with campanulate tube; lobes longer than tube. **Petals**: vexillum sessile; wings oblong, eared, clawed; keel shorter than wings, obtuse, with a linear claw. **Stamens** diadelphous, with vexillary stamen free; filaments with uniform anthers. **Ovary** sessile or subsessile, sometimes twisted, sometimes papillose, (1)- several- to many-ovuled; style variable, with oblique, subcapitate stigma. **Pod** spirally falcate, often spiny, often hooked, or somewhat curved and unarmed. **Seeds** ovoid, slightly reniform, partitioned or nonpartitioned, pale yellow to yellow-brown. $x = 7, 8, 9$ (high polyploidy).

Species ± 50, Europe, except for northernmost part, Africa, and Asia; often naturalised in warm climates; 4 naturalised in sthn Afr., widespread.

Melilotus Mill. 3689000

(Papilionoideae—Trifolieae)
Miller: [876] (1754); Adanson: 322 (1763); Harvey: 161 (1862); Henderson & Anderson: 182 (1966); Gillett: 1039 (1971a).

Herbs annual or biennial, often strongly scented. **Leaves** pinnately 3-foliolate, veins of leaflets usually extended into teeth on margin; stipules adnate to petiole; leaflets toothed. **Flowers** yellow or white, small in slender or abbreviated, axillary racemes; bracts minute or 0. **Calyx** with campanulate tube; lobes variable. **Petals**: vexillum sessile, glabrous; wings oblong, eared at base, clawed; keel ± planoconvex, obtuse, clawed. **Stamens** diadelphous, with vexillary stamen free or partly connate with rest; anthers uniform. **Ovary** sessile or subsessile, 2–few-ovuled; style straight or incurved, with terminal stigma. **Pod** small, subglobose or ovoid, indehiscent or tardily 2-valved, longer than calyx. **Seeds** solitary or few, often ± kidney-shaped. $x = 8, 9$ (high polyploidy).

Species ± 20, temperate and subtropical regions of Europe, Asia and North Africa. 3 species have become naturalised and are widespread near cultivated lands.

Melolobium Eckl. & Zeyh. 3665000

(Papilionoideae—Crotalarieae)
Ecklon & Zeyher: 188 (1836); Harvey: 77 (1862).

Shrubs or undershrubs, often spinescent, glandular-villous or viscid. **Leaves** petiolate, digitately 3-foliolate; stipules often foliaceous, semisagittate or semicordate at base. **Flowers** usually small, in short, terminal spikes or racemes; bracts often foliaceous. **Calyx** with campanulate tube, shortly or deeply 2-lipped; upper lip bipartite; lower lip trifid or 3-toothed, glandular or hairy, rarely glabrous. **Petals**: vexillum with a channelled claw; keel planoconvex, sometimes gibbous, shorter than wings and vexillum, clawed; wings clawed. **Stamens** monadelphous; tube split to base; anthers unequal. **Ovary** sessile or shortly stalked, with 1 to several ovules; sometimes glandular or hairy; style incurved; stigma terminal, capitate. **Pod** linear or oblong, compressed, often torulose, usually glandular or villous, 2-valved. **Seeds** on short funicles. $x = 8, 9$ (polyploidy).

Species ± 20, in sthn Afr., widespread, prominent in arid parts.

Microcharis Benth. 3746000

(Papilionoideae—Indigofereae)
Bentham: 501 (1865); Schrire: 165 (1992); Schrire: 161 (1995).

Annual or perennial herbs covered with biramous hairs, hyaline or yellowish; pearl bodies restricted to leaf bases and between leaflets. **Leaves** 1–9(–13)-foliolate or simple; leaflets opposite, entire; stipules adnate to base of petiole, subulate, deltoid, falcate-lanceolate or broadly cordate. **Flowers** pink, in axillary or terminal, laxly 3–15-flowered racemes; bracts persistent. **Calyx** with campanulate tube, ± half or more as long as staminal sheath; lobes longer than the tube. **Petals**: vexillum narrow at base, tapering to the claw, glabrous; keel with lateral pouches; spurs 0. **Stamens** diadelphous; vexillary stamen free. **Ovary** usually sessile, more than half the horizontal length of the pistil; style short, thick, widened and laterally compressed at base; stigma oblique, discoid. **Pod** linear, laterally compressed, straight or curved, patent to erect, held at right angle to pedicel. **Seeds** 10–30, quadrate.

Species ± 35, Africa, Madagascar and Arabian Peninsula; 3 in sthn Afr., widespread.

Millettia Wight & Arn. 3720000

(Papilionoideae—Tephrosieae)
Wight & Arnott: 263 (1834); Harvey: 211 (1862); Gillett: 122 (1971b).

Trees or shrubs, sometimes scandent. **Leaves** imparipinnate, 2–several-jugate; leaflets entire, usually opposite; stipellae usually present; stipules small, often caducous; a pulvinus usually present at base of rachis. **Flowers** white, pink, blue or violet, in terminal racemes or pani-

cles. **Calyx** campanulate, somewhat 2-lipped or truncate; 2 upper lobes sometimes subconnate. **Petals**: vexillum conspicuous with oblong claw, sometimes with a callus, or eared at base, silky-pubescent or glabrous; wings falcate-ovate, often with broad claw, eared; keel incurved, obtuse, usually clawed, sometimes eared. **Stamens** monadelphous or diadelphous, sometimes free; anthers uniform. **Ovary** sessile or occasionally stalked, pubescent, often linear, few- to many-ovuled; style inflexed, with small, subcapitate stigma. **Pod** linear, lanceolate, oblong or obovate, compressed, coriaceous or woody, 2-valved, but often very tardily dehiscent, glabrous, hairy or velvety. **Seeds** sometimes solitary, orbicular, or reniform. $x = 8, 10, 11, 12$ (polyploidy, B-chromosomes).

Species nearly 100, cosmopolitan in tropical and subtropical regions; 2 in sthn Afr., N KwaZulu-Natal to the Eastern Cape.

Mimosa L. 3449000

(Mimosoideae—Mimoseae)

Linnaeus: 516 (1753); Brenan: 42 (1959); Brenan & Brummitt: 47 (1970); Ross: 117 (1975).

Herbs, shrubs, rarely scandent, or trees, usually armed with prickles. **Leaves** bipinnate, rarely undeveloped or petiole forming a phyllode, often sensitive; glands sometimes present on petiole. **Flowers** bisexual or unisexual with few bisexual, in globose heads or cylindric spikes on axillary, solitary or fascicled peduncles, (3)4–5(6)-merous. **Calyx** usually small, rarely campanulate. **Corolla** tubular, often campanulate, with linear lobes. **Stamens** free, as many as corolla lobes or twice as many or more, exserted; **Ovary** usually sessile, 2–many-ovuled; style filiform, sometimes oblique on ovary, with small, terminal stigma. **Pod** usually compressed, sometimes transversely articulated, margins persisting as an empty frame, densely setose. **Seeds** compressed, ovate or suborbicular. $x = 13$ (aneuploids, high polyploidy).

Species ± 500, widely distributed through the tropics but the vast majority of species found in South America; 1 in sthn Afr.: *Mimosa pigra* L., on northern flood plains of Namibia and N KwaZulu-Natal, and one species: **Mimosa pudica* L. var. *hispida* Brenan has become naturalised.

Mucuna Adans. 3877000

(Papilionoideae—Phaseoleae—Erythrinae)

Adanson: 325 (1763) name conserved; Hutchinson: 433 (1964), Hennessy: 17 (1991).

Stizolobium P.Browne: 290 (1756).

Woody lianes or herbaceous climbers. **Leaves** pinnately 3-foliolate, stipulate. **Flowers** maroon, cardinal red, lilac or green, fairly conspicuous in axillary racemes; bracts small, sometimes caducous. **Calyx** often hairy, with campanulate tube; 2 upper lobes connate, and lowest longer than 2 laterals. **Petals**: vexillum ovate-orbicular, sessile, folded together, shortly clawed, eared at base with ears often upturned; wings incurved, sessile, eared, often adhering to keel; keel sessile, incurved at apex or rostrate, equalling or longer than wings, eared. **Stamens** diadelphous; alternate filaments sometimes swollen at apex; anthers unequal. **Ovary** sessile or stipitate, few-ovuled, surrounded by a cupular disc at base, villous; style filiform, incurved, often hairy with small, terminal stigma. **Pod** thick, ovate, oblong or linear, 2-valved, septate, often covered with stinging hairs. **Seeds** round or transversely oblong. $x = 11$ (polyploidy).

Species ± 100, cosmopolitan in warm regions; 3 in sthn Afr., Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Mundulea (DC.) Benth. 3719000

(Papilionoideae—Tephrosieae)

Bentham: 248 (1852); Harvey: 204 (1862); Burtt Davy: 358 (1932); Gillett: 155 (1971b).

Shrubs or small trees, silky-pubescent; bark corky, smooth or fissured. **Leaves** imparipinnate; leaflets entire, reticulately veined and usually widest below middle; stipules small, subulate. **Flowers** bluish purple, in terminal or axillary racemes; bracts small. **Calyx** with campanulate tube, somewhat 2-lipped, with 2 upper lobes subconnate. **Petals**: vexillum silky outside, with short, curved claw, with callus at base; wings falcate-oblong, slightly adhering to keel, eared, clawed; keel somewhat resembling wings, gibbous, clawed. **Stamens** monadelphous, with vexillary stamen free at base; anthers uniform. **Ovary** subsessile, linear, many-ovuled; style incurved, with small capitate stigma. **Pod** linear, compressed. **Seeds** reniform. $x = 11$.

Species ± 15, all Madagascan except 1 in sthn Afr.: *Mundulea sericea* (Willd.) A.Chev. (= *M. suberosa* in *Flowering Plants of Africa*, 11, t. 406 (1931)), Namibia, Botswana, the four northern provinces, Swaziland, KwaZulu-Natal and Northern Cape.

Neonotonia J.A.Lackey 3864010

(Papilionoideae—Phaseoleae—Glycininae)

Lackey: 210 (1977) .

Glycine Willd.: 1053 (1802).

Perennial climbers or trailers, often woody at base; rootstock often thick and woody. **Leaves** pinnately 3-foliolate; leaflets ovate or elliptic, laterals somewhat oblique, glabrous to densely velvety on both surfaces; stipules ovate or oblong-lanceolate. **Flowers** small, white, in 20–150-flowered, sometimes racemose inflorescences, bracteate. **Calyx** with campanulate tube, sparsely to densely hairy; lobes linear-lanceolate, ± as long as tube; 2 upper lobes ± connate. **Petals**: vexillum oblate, rounded or rhomboid, sessile or shortly clawed, sometimes subauricled at base; wings narrow, slightly adnate to keel, eared, clawed; keel obtuse, broader than wings, clawed, sometimes gibbous. **Stamens** monadelphous or occasionally ± diadelphous; anthers uniform. **Ovary** subsessile few- to many-ovuled, sometimes villous; style slightly incurved; stigma terminal, capitate. **Pod** linear, sometimes falcate, often reflexed, glabrous to densely hairy with adpressed or spreading hairs, compressed or becoming subterete, 2-valved, septate between seeds. **Seeds** oblong, somewhat compressed, reddish or orange-brown; aril white. $x = 11$ (polyploidy).

Species 1, *Neonotonia wightii* (Arn.) Lackey (= *Glycine wightii* (Arn.) Verdc. subsp. *wightii* var. *longicauda* (Schweinf.) Verdc.) from Africa to Asia; in sthn Afr. widespread except in the Free State and the Cape region.

Neorautanenia Schinz 3865000

(Papilionoideae—Phaseoleae—Phaseolinae)

Schinz: 35 (1899); Hutchinson: 441 (1964); Verdcourt: 388 (1970b).

Perennial herbs, erect or prostrate, with subsimple stems, sometimes with tuberous root up to 600 mm in diameter. **Leaves** pinnately 3-foliolate; leaflets sometimes lobed, often apiculate, hairy; stipules lanceolate. **Flowers** in few- to many-flowered racemes, ebracteate. **Calyx** hairy, with campanulate tube, 5-lobed; lobes longer than tube, 2 upper lobes united further than rest, lowest sometimes 2-lobed. **Petals**: vexillum eared at base, with linear, often channelled claw; wings oblong, slightly adnate to keel, eared, clawed; keel planoconvex, with linear claw, sometimes eared. **Stamens** diadelphous or monadelphous; anthers equal. **Ovary** sessile, linear,

with few to several ovules, hairy; style somewhat linear, curved, with a boss or other thickening at base; style with terminal, capitate stigma. **Pod** oblong, septate, sometimes densely tomentose. **Seeds** elliptic, dark brown with white hilum. $x = 11$.

Species 3, Africa; 2 in sthn Afr.: *Neorautanenia amboensis* Schinz and *N. ficifolius* (Benth.) C.A.Sm., widespread except in Swaziland, KwaZulu-Natal and Cape region.

Neptunia Lour. 3451000

(Mimosoideae—Mimoseae)
Loureiro: 653 (1790); Brenan: 40 (1959); Brenan & Brummitt: 45 (1970); Ross: 121 (1975).

Diffuse undershrubs, or perennial herbs, sometimes aquatic. **Leaves** bipinnate, frequently sensitive; leaflets small; stipules membranous, obliquely cordate, persistent or deciduous; petiolar glands rare. **Flowers** in globose heads on solitary, axillary peduncles, with some reduced to male and some neuter. **Calyx** campanulate, shortly 5-dentate. **Petals** 5, coherent to middle or free. **Stamens** (5)10, free; anthers crowned by a stipitate gland. **Ovary** stipitate; ovules many; style filiform with concave stigma. **Pod** oblong, deflexed, plano-compressed, 2-valved, subseptate between seeds within or rarely 1-seeded, dehiscent. **Seeds** transversely ovate, compressed, with filiform funicle. $x = 14$ (aneuploids, polyploidy).

Species 11, fairly cosmopolitan in tropical regions; 1 in sthn Afr.: *Neptunia oleracea* Lour., tropical swamps of Namibia, the northern provinces and N KwaZulu-Natal.

Newtonia Baill. 3460000

(Mimosoideae—Mimoseae)
Baillon: 721 (1888); Brenan: 180 (1955); Brenan: 23 (1959); Brenan & Brummitt: 28 (1970); Ross: 134 (1975).

Unarmed trees. **Leaves** bipinnate; rachis usually with a gland between each pair of opposite pinnae; pinnae each with one to many pairs of leaflets. **Flowers** bisexual, many, sessile or nearly so, small, in slender spike in terminal panicles; bracts minute. **Calyx** gamosepalous, 5-toothed, pubescent or puberulous outside, sometimes on margins only. **Petals** 5, free, separated from gynophore base by a short perigynous zone, pubescent or puberulous outside, sometimes on margins only. **Stamens** 10, alternately longer and shorter; filaments wrinkled in bud; anthers tipped by a small, stipitate, globular, fugaceous gland. **Ovary** many-ovuled, densely pilose outside. **Pod** broadly linear, compressed, straight or somewhat curved, at maturity dehiscing along one of the margins, valves remaining attached along the other, splitting neither transversely nor into layers. **Seeds** flattened, oblong, surrounded by a membranous wing, elongated lengthwise in direction of pod. $x = 13$ (1 report).

Species ± 14, tropical Africa and America; 1 in sthn Afr.: *Newtonia hildebrandtii* (Vatke) Torre; on sandy soils in tropical forests of N KwaZulu-Natal.

Ophrestia H.M.L.Forbes 3718020

(Papilionoideae—Phaseoleae—Ophrestiinae)
Forbes: 1003 (1948a); Verdcourt: 257 (1970a); Verdcourt: 524 (1971b).

Perennial herbs, branched from base, with slightly flexuous, ascending or procumbent stems. **Leaves** subsessile to petiolate, 1–5-jugate; stipules slender, linear to linear-subulate; leaflets ± elliptic-oblong, apex obtuse to acute, sometimes retuse, midrib with 5–7 lateral nerves on each side, nerves prominent below, impressed above, looping back and not forming a marginal nerve. **Flowers** mauve, in axillary racemes, rarely clusters, with peduncles sometimes longer than leaves. **Calyx** usually densely hirsute, somewhat 2-lipped; tube campanulate, slightly oblique at base; lobes ovate to lanceolate, with 2 uppermost connate beyond halfway. **Petals**: vexillum mainly oblong, with channelled claw and 2 ears at junction of claw and limb; wings broadly linear, clawed, sometimes eared; keel ± planoconvex in outline, clawed and sometimes eared. **Stamens** monadelphous; anthers uniform. **Ovary** linear; style short, hooked; stigma capitate. **Pod** ± oblanceolate. **Seeds** oblong-ovoid; hilum short, central; rim-aril developed, cartilaginous. $x = 10$, 11 (1 report).

Species ± 13, Africa and Asia; 1 variable species in sthn Afr.: *Ophrestia oblongifolia* (E.Mey.) H.M.L.Forbes, the four northern provinces, Swaziland, KwaZulu-Natal and Eastern Cape.

Ormocarpum P.Beauv. 3792000

(Papilionoideae—Aeschynomeneae—Ormocarpinae)
Beauvois: 95, t. 59 (1810) name conserved; Hutchinson: 473 (1964); Gillett: 323 (1966); Verdcourt: 361 (1973).

Shrubs or small trees, often glutinous, sometimes harshly setose. **Leaves** imparipinnate, leaflets many; stipulate. **Flowers** solitary or in few-flowered, axillary racemes. **Calyx** with broadly campanulate tube; lobes longer than tube, 2 upper lobes connivent or shortly connate, lowest the longest. **Petals**: vexillum with curved claw; wings clawed; keel incurved, clawed. **Stamens** monadelphous; staminal tube often splitting to give 2 bundles of 5; anthers uniform. **Ovary** sessile, stalked, several- to many-ovuled; style inflexed, with terminal stigma. **Pod** linear, compressed, constricted into 2 or more indehiscent segments. **Seeds** light brown, ± elliptic, compressed. $x = 10$, 12, 13 (1 report each).

Species ± 20, in tropical parts of Old World and Africa; 2 in sthn Afr.: *Ormocarpum kirkii* S.Moore and *O. trichocarpum* (Taub.) Engl., northern parts of Namibia, the four northern provinces to KwaZulu-Natal.

*__Ornithopus__ L. 3773000

(Papilionoideae—Coronilleae)
Linnaeus: 743 (1753); Hutchinson: 464 (1964); Ball: 182 (1968).

Slender annual herbs. **Leaves** imparipinnate; leaflets many, small, exstipellate; stipules lateral, linear, small or membranous. **Flowers** very small, in axillary heads or umbels, subtended or not by a floral leaf; bracts and bracteoles small. **Calyx** tubular or campanulate; lobes subequal or upper 2 connate high up. **Petals**: vexillum obovate or orbicular; wings oblong; keel obtuse, almost straight, shorter than wings or very short. **Stamens** diadelphous; vexillary stamen free, remainder connate, alternate filaments dilated above; anthers uniform. **Ovary** sessile, many-ovuled; style inflexed; stigma capitate. **Pod** linear, compressed or subterete, arcuate, usually constricted between segments. **Seeds** transversely oblong, ovate or subglobose. $x = 7$, 8 (polyploidy).

Species ± 6, in Europe, Mediterranean region, W Asia, Atlantic Islands and South America; 1 in sthn Afr.: *__Ornithopus sativus__ Brot. has become naturalised in the Western Cape.

Otholobium C.H.Stirt. 3703040

(Papilionoideae—Psoraleeae)
Stirton: 341 (1981b); Stirton: 1 (1986).

Shrubs, suffrutices or rarely decumbent herbs. **Leaves** 3-foliolate; petiolate; leaflets oblanceolate, obovate, cuneate, entire, acute or obtuse, recurved mucronate, nigro-punctate or pellucid-dotted; stipules striate, ovate, acute or subulate-acuminate, pubescent, free or adnate to

base of petiole. **Flowers** white, yellow or pale blue, sessile or subsessile, aggregated in 1 or 5–18 triplets, or rarely doublets, axillary or terminal fascicles, imperfect racemes or lax pseudo-spikes; each flower bracteate; triplets subtended by a single, ovate bract; cupulum 0. **Calyx** campanulate, unequally 5-lobed; lowest lobe much longer and broader than the rest; upper lobes variously connate, very rarely stubby black-haired on inside. **Petals**: vexillum ovate-oblong, claw and auricles weakly developed, without appendages; wing petals much longer than keel; sculpturing lamellate; keel long-clawed, purple-tipped, obtuse. **Stamens** diadelphous; vexillary stamen usually free; anthers uniform, alternately basifixed and medifixed. **Ovary** sessile, 1-ovulate, glabrous and glandular, or hairy; style swollen; stigma capitate, penicillate or glabrous. **Pod** swollen, indehiscent, slightly beaked, pubescent, protruding from calyx at maturity. **Seeds** black, longer than broad.

Species over 40, mainly restricted to SE and E Africa, but also extending into the winter-rainfall region of South Africa.

Otoptera DC. 3906000

(Papilionoideae—Phaseoleae—Phaseolinae)
Candolle: 249, t. 42 (1825b); Harvey: 239 (1862); Burtt Davy: 421 (1932); Hutchinson: 430 (1964); Schreiber: 93 (1970).

Shrubs with long, trailing branches. **Leaves** glaucous, pinnately 3-foliolate; leaflets lanceolate, apiculate; stipules lanceolate, produced downwards at base; stipels paired, persistent. **Flowers** blue, paired at top of axillary peduncles; bracts subulate-lanceolate; bracteoles 2, close to calyx. **Calyx** with broadly campanulate tube, 4-lobed; 2 upper lobes fused. **Petals**: vexillum clawed with callosities at base of limb; wings and keel nearly as long as vexillum, auriculate at base of limb. **Stamens** with vexillary filament adnate for basal one-third; anthers uniform, dorsifixed, versatile. **Pod** linear, turgid, dehiscent, valves curling when ripe, with spongy tissue between seeds. **Seeds** several, oblong, kidney-shaped, with small hilum in middle.

Species 2, Africa; 1 in sthn Afr.: *Otoptera burchellii* DC. (= *Vigna burchellii* (DC.) Harv.), Namibia, Botswana, North-West, Northern Province and Northern Cape.

***Paraserianthes** I.C.Nielsen 3443010

(Mimosoideae—Ingeae)
Nielsen *et al.*: 352 (1983).

Unarmed trees or shrubs. **Leaves** bipinnate; rachis and pinnae with a conspicuous gland just below junction of top pinna pair; stipules linear or filiform, caducous. **Inflorescence** of pedunculate spikes or racemes, axillary. **Flowers** bisexual, pedicellate, usually pubescent, subtended by bracts. **Calyx** gamosepalous, 5-valvate. **Corolla** gamopetalous, 5-valvate. **Stamens** many, united into a tube at base; anthers quadrangular, minute, opening by two slits. **Ovary** solitary. **Pod** chartaceous, flat, straight, not segmented, dehiscent along both sutures. **Seeds** subcircular-elliptical to oblong, flat to convex.

**Paraserianthes lophantha* (Willd.) I.C.Nielsen subsp. *lophantha*, introduced from Australia and now naturalised, particularly in the southern Cape region along the coast from the Cape Peninsula to Humansdorp.

Parkinsonia L. 3551000

(Caesalpinioideae—Caesalpinieae)
Linnaeus: 375 (1753); Harvey: 269 (1862); Hutchinson: 264 (1964); Ross: 109 (1977) ; Schreiber: 16 (1967b); Brenan: 43 (1967).

Small trees or shrubs, not climbing, armed with spines or unarmed, eglandular. **Leaves** at first pinnate, later bipinnate, with common petiole sometimes flattened, often ending in a spine; leaflets opposite or partly alternate, small or obsolete; stipules often short, spinescent. **Inflorescences** in axillary racemes which are sometimes corymbose and short. **Flowers** bisexual, irregular. **Calyx** with campanulate or basin-shaped tube and 5 lobes ± imbricate. **Petals** 5, spreading, sometimes unequal, and claw of longest with appendage. **Stamens** 10, rarely fewer, free; filaments alternately longer and shorter, often flattened, villous at least at base; anthers elliptic. **Ovary** free, shortly stalked, many-ovuled; style glabrous or clothed below, with terminal and hollow or slightly oblique stigma. **Pod** linear to ± elliptic, nearly straight or twisted, sub-2-valved, sometimes constricted between seeds. **Seeds** oblong, hard, compressed. $x = 7, 9$.

Species ± 14, restricted mainly to warm parts of America; 1 in sthn Afr.: *Parkinsonia africana* Sond., Namibia and Northern Cape.

Pearsonia Dümmer 3657010

(Papilionoideae—Crotalarieae)
Dümmer: 353 (1912); Polhill: 383 (1974).

Phaenohoffmannia Kuntze: 940 (1891b). *Pleiospora* Harv.: 51, t. 81 (1859).

Perennial herbs or shrublets; usually tawny-silky. **Leaves** sessile, digitately 3-foliolate, sometimes almost sessile; stipules linear to foliaceous or lacking. **Flowers** yellow, white or purplish, in congested or lax, axillary or terminal racemes or spikes, bracteate. **Calyx** hairy, 5-lobed; tube campanulate; 4 upper lobes in pairs, lowest the narrowest. **Petals**: vexillum usually shortly clawed, ± elliptic to oblong-obovate; wings obliquely obovate or oblong, clawed, usually transversely ridged; keel straight with relatively small limb or gibbous, clawed. **Stamens** monadelphous, unequal; tube split to base; anthers subequal. **Ovary** sessile, several- to many-ovuled, hairy; style straight with terminal or suboblique stigma. **Pod** sessile, ovate- or oblong-lanceolate, somewhat laterally compressed, 2-valved, beaked, villous. **Seeds** 1–many, with short funicle.

Species ± 7, Africa; mostly sthn Afr.: the four northern provinces, E Free State, Swaziland and KwaZulu-Natal.

Peltophorum (Vogel) Benth. 3561000

(Caesalpinioideae—Caesalpinieae)
Bentham: 75 (1840) name conserved; Walpers: 811 (1842); Harvey: 270 (1862); Hutchinson: 262 (1964); Verdoorn: t. 1434 (1964); Ross: 130 (1977).

Unarmed trees. **Leaves** bipinnate; up to 21 pairs of pinnae; leaflets small, many, opposite; stipules small, caducous. **Inflorescence** a raceme; racemes often ± aggregated and panicled; bracts usually linear-lanceolate and caducous. **Flowers** bisexual, irregular. **Calyx** with shortly campanulate tube, 5 lobes imbricate, subequal, longer than tube. **Petals** 5, subequal, upper one often shorter than the others, ± spathulate, strongly imbricate. **Stamens** 10, free, declinate; filaments pilose at base, sometimes glandular; anthers versatile. **Ovary** sessile or shortly stalked, 2–many-ovuled; style with broadly peltate stigma. **Pod** narrowly elliptic to oblong, compressed, with a distinct wing along each margin, indehiscent. **Seeds** 1 or 2(3 or 4), compressed, ± winged. $x = 7, 13$ (polyploidy).

Species ± 15, cosmopolitan in tropical regions; 1 in sthn Afr.: *Peltophorum africanum* Sond., Namibia, Botswana, Northern Province, North-West, Mpumalanga, Swaziland and N KwaZulu-Natal.

Piliostigma Hochst. 3528010

(Caesalpinioideae—Cercideae)
Hochstetter: 598 (1846) name conserved; Milne-Redhead: t. 3460 (1947); Brenan: 206 (1967); Coetzer & Ross: 58 (1977).

Deciduous trees, small or shrubby, not climbing, dioecious or rarely monoecious. **Leaves** simple, deeply bi-

lobed, cordate basally. **Inflorescence** a terminal, axillary or leaf-opposed raceme. **Flowers** unisexual, rarely bisexual, irregular. **Calyx** with turbinate tube and 4 or 5 short, acute lobes. **Petals** 5, subequal. **Stamens** 10, fertile in male flowers, reduced to staminodes in female flowers; filaments villous below; anthers dehiscing by longitudinal slits. **Ovary** many-ovuled, stalked; stigma sessile, thick, capitate, flattened-globose; funicle several times as long as ovule. **Pod** linear to oblong, leathery or woody, indehiscent. **Seeds** irregularly arranged, embedded in pulp. $x = 12, 13, 14$ (polyploidy).

Species 3, Africa to Asia and Australia; 1 in sthn Afr.: *Piliostigma thonningii* (Schumach.) Milne-Redh., N Namibia, Northern Province and Mpumalanga.

Podalyria Willd. 3621000

(Papilionoideae—Podalyrieae)

Willdenow: 501 (1799); Lamarck: illustr. t. 327, fig. 3 & 4 (1793) & descr.: 454, 471 (1823); Harvey: 9 (1862).

Shrubs, silky-pubescent or villous. **Leaves** alternate, simple, linear and recurved to suborbicular. **Flowers** 1 or 2(3 or 4)-nate on axillary peduncles. **Calyx** shaggy, with shallow tube intruse at base, sometimes split on one side; lobes unequal, longer than tube. **Petals**: vexillum suborbicular or oblong-obovate, often bilobed, with a deeply concave, linear claw, purple, pink or white; wings elliptic, oblong, obovate, or obovate-oblong, with a curved, linear claw; keel usually convex on one margin and straight on the other, with a straight, flat claw. **Stamens** 10, connate at base; filaments usually flattened at base. **Disc** various. **Ovary** villous or shaggy; ovules 6–18 in 2 rows; style glabrous at base, with small, capitate stigma. **Pod** ovoid or oblong. **Seeds** with fleshy, collar-like aril. $x = 9$.

Species ± 25, mainly SW Western Cape, extending eastwards into KwaZulu-Natal.

Polhillia C.H.Stirt. 3660020

(Papilionoideae—Crotalarieae)

Stirton: 167 (1985); Van Wyk: 42 (1992).

Small, erect, much-branched shrubs up to 1.5 m tall. **Leaves** digitately 3-foliolate, shortly petiolate; stipules involucrate, adnate to petiole, completely sheathing twigs and clasping the stem. **Flowers** pale to deep golden-yellow, 1 or 2(–4), terminal on short shoots; bracts small, linear-lanceolate; ebracteolate. **Calyx** shorter than corolla, 2-lipped; upper lobes separate or somewhat united, triangular; lower lip formed from fusion of lateral and carinal lobes into a lip with 3 short teeth, fusion of lobes higher than vexillar lobes. **Petals**: vexillum broadly ovate, apex rounded or emarginate, claw less than half as long as blade; wing petals and keel petals ± equally long, both slightly pocketed, sculpturing upper basal and upper central or upper basal left central, intercostal, lunulate, becoming diffuse in patches or lunulate-lamellate. **Stamens** monadelphous; staminal tube split adaxially, consisting of 5 linear-oblong, basifixed anthers alternating with 5 ovate dorsifixed anthers. **Ovary** sessile or subsessile, compressed, densely hairy, 7–10-ovuled; style curving gently upwards to a small capitate stigma. **Pod** chartaceous, subsessile, narrowly oblong, sometimes slightly curved, plicate or flattened and impressed between seeds, indehiscent. **Seeds** dull, khaki to dark brown. $x = 8$ (1 report, polyploidy).

Species ± 7, endemic to the Western Cape.

*__Prosopis__ L. 3454000

(Mimosoideae—Mimoseae)

Linnaeus: 10 (1767); Hutchinson: 289 (1964); Burkart: 219 (1976).

Trees or shrubs of varying size, rarely subshrubs, spiny or rarely unarmed. **Leaves** bipinnate, with few pairs of opposite pinnae; petiole with circular, sessile, apical gland and sometimes smaller, similar ones on rachis of pinnae; leaflets small, many, mostly opposite, linear, oblong, fusiform. **Inflorescence** spike-like, axillary, sometimes with globose heads. **Flowers** bisexual, small. **Calyx** campanulate, 5-merous. **Corolla** with 5 linear petals, these fused or ± free, glabrous or pubescent, frequently villous or pilose inside towards tip. **Stamens** 5 + 5, free; anthers elliptic, dorsifixed, introrse, with an apical, pedicellate, globose or ovoid connectival gland. **Pods** linear, straight, falcate, annular to spirally coiled. **Seeds** ovoid, compressed, hard, brown. $x = 13, 14$ (high polyploidy).

Species ± 44, SW Asia, Africa, and predominantly America; **Prosopis chilensis* (Molina) Stuntz (Mesquite) and 3 other species have been introduced and have become naturalised.

Pseudarthria Wight & Arn. 3808000

(Papilionoideae—Desmodieae—Desmodiinae)

Wight & Arnott: 209 (1834); Harvey: 229 (1862); Hutchinson: 399 (1964); Schrire: 17 (1988).

Perennial, erect to suberect, woody herbs or subshrubs, arising from a thick rhizomatous, woody rootstock; tomentose-villous with white or yellow hairs. **Leaves** pinnately 3-foliolate; stipules lanceolate-attenuate. **Flowers** pink, racemose, sometimes panicled, bracteate. **Calyx** with campanulate tube; 2 upper lobes connate. **Petals**: vexillum orbicular, sometimes cuneate; wings free, eared and shortly clawed; keel obtuse, eared, clawed. **Stamens** diadelphous; anthers uniform. **Ovary** subsessile or stalked, many-ovuled, usually hairy; style subulate, inflexed, with terminal stigma. **Pod** linear-oblong or slightly falcate, compressed, with sutures straight or slightly sinuate, imperfectly articulated. **Seeds** compressed, reniform or oblong-ovoid, smooth, brown to khaki. $x = 11, 13, 17$ (1 report each).

Species ± 6, from sthn Afr. into Asia, Madagascar, Mauritius and Réunion; 1 in sthn Afr.: *Pseudarthria hookeri* Wight & Arn. var. *hookeri*, Northern Province, North-West, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Psoralea L. 3703000

(Papilionoideae—Psoraleeae)

Linnaeus: 762 (1753); Harvey: 143 (1862); Forbes: 116 (1930); Salter: 45 (1939a).

Small trees, shrubs or suffrutices, usually glandular with prominent blackish red glands, especially on calyx. **Leaves** digitately (1)3–many-foliolate and 3–5-pinnate, or rarely reduced to scales; leaflets entire; stipules stem-clasping, adnate to petiole. **Flowers** axillary, fasciculate, 1–5, each with or without a bract but always subtended by a lobed cupulum which itself is subtended by 2 free bracts; bracteoles 0. **Calyx** with campanulate tube and sometimes 2-lipped. **Petals**: vexillum orbiculate, clawed, often with inflexed sides, rarely with 2 callosities near base; wings subfalcate, longer than the keel, usually eared, clawed; keel incurved, sometimes eared, clawed, with darker patch at tip. **Stamens** diadelphous or occasionally monadelphous; vexillary stamen usually free, arching over ovary chamber. **Ovary** distinctly stipitate 1-ovulate, glabrous with a few scattered recurved club-headed glands; style glabrous, often filiform, usually thickened above, with terminal, subcapitate stigma. **Pod** usually ovate, indehiscent, included within calyx at maturity. **Seeds** black, on short funicle. $x = 10, 11$ (aneuploids).

Species ± 20, endemic to sthn Afr., mainly restricted to the Western Cape but a few extending as far north as KwaZulu-Natal and Swaziland.

Pterocarpus Jacq. 3828000

(Papilionoideae—Dalbergieae)

Jacquin: 283, t. 183/192 (1763); Harvey: 264 (1862); Polhill: 81 (1971b).

Evergreen or deciduous trees. **Leaves** alternate, imparipinnate, stipulate; leaflets few to many, alternate to subopposite; stipules caducous. **Flowers** usually yellow to orange, often large, in lax, axillary or terminal racemes or panicles, bracteate. **Calyx** with campanulate tube; lobes 5, shorter than tube, 2 upper lobes ± connate. **Petals**: vexillum orbicular or broadly ovate, with broad claw; wings eared, clawed. **Stamens** monadelphous, or staminal tube split into 2 bundles, rarely diadelphous; anthers equal, with longitudinal dehiscence. **Ovary** sessile or stalked, 2–6-ovuled, sometimes hairy; style almost straight to shortly incurved, with small stigma. **Pod** compressed, indehiscent, orbicular or ovate, or sometimes oblong, ± oblique at base, usually with a hardened central seed-bearing part, with membranous wing or sharp ridge, sometimes mainly coriaceous or membranous; style lateral, rarely terminal, glabrous or setose at middle. **Seeds** 1–3, reniform or oblong-reniform, smooth. $x = 8, 9, 10, 11$ (polyploidy).

Species ± 20, pantropical in forests and wooded grassland; 3 in sthn Afr., Namibia, Botswana, Northern Province, North-West, Mpumalanga, Swaziland and KwaZulu-Natal.

Pterolobium R.Br. ex Wight & Arn. 3553000

(Caesalpinioideae—Caesalpinieae)

Wight & Arnott: 283 (1834) name conserved; Salt: 64 (1814) name only; Hutchinson: 261 (1964); Brenan: 40 (1967); Ross: 114 (1977).

Trees or scandent shrubs, armed with recurved prickles on stems and leaves. **Leaves** bipinnate; leaflets opposite, many, small; stipules small or obsolete. **Inflorescences** of terminal and axillary, often paniculately aggregated, racemes; bracts small, soon deciduous. **Flowers** bisexual, irregular. **Calyx** with shallow, basin-shaped tube and 5 imbricate lobes longer than tube. **Petals** 5, imbricate, sometimes slightly unequal. **Stamens** 10, sometimes unequal, longer than petals, usually villous at base; anthers ± quadrate. **Ovary** free, very shortly stipitate, 1-ovuled; style short or elongated and clavate, with truncate or concave, terminal stigma. **Pod** red, sessile, compressed and samaroid, indehiscent, seed-bearing base obliquely ovate or elliptic, upper part produced into an oblique-oblong or falcate, membranous wing. **Seeds** pendulous, compressed, without endosperm.

Species ± 10, cosmopolitan in tropical regions; 1 in sthn Afr.: *Pterolobium stellatum* (Forssk.) Brenan, Northern Province and Mpumalanga.

Ptycholobium Harms 3717010

(Papilionoideae—Tephrosieae)

Harms: 591 (1915); Brummitt: 24 (1965); Schreiber: 98 (1970).

Sylitra E.Mey.: 114 (1836).

Undershrubs, finely canescent, sometimes with deep taproot. **Leaves** 1-foliolate or sometimes digitately 3-foliolate; stipules small. **Flowers** small, usually in pairs, axillary; bracts small or 0. **Calyx** usually with campanulate tube, somewhat 2-lipped. **Petals**: vexillum not markedly clawed; wings adnate to keel, eared, clawed; keel shorter than wings, planoconvex, obtuse, clawed. **Stamens** monadelphous, with vexillary stamen free at base. **Ovary** sessile, many-ovuled; style inflexed, terete, with terminal, capitate stigma. **Pod** oblong, compressed, membranous, sometimes contorted and densely hairy. **Seeds** suborbicular on short, filiform funicle.

Species 3, Africa; all in sthn Afr., widespread except along eastern seaboard.

***Pueraria** DC. 3889000

(Papilionoideae—Phaseoleae—Glycininae)

Candolle: 97 (1825d); Hutchinson: 426 (1964); Van der Maesen: 9 (1985).

Climbers or shrubs with woody, rarely herbaceous stems. **Leaves** pinnately 3-foliolate; leaflets large, ovate or rhomboid, entire, scalloped or palmately lobed; stipules caducous or not. **Flowers** white or mostly purplish or blue, (2)3 or 4–7 per node, in an elongate pseudoraceme; bracts narrow, early caducous; bracteoles small, subpersistent or minute and caducous. **Calyx** campanulate with 5 teeth; upper teeth halfway to entirely connate. **Petals**: vexillum appendaged with inflexed auricles; wings narrowly oblong or obovate-falcate, often adherent to the middle of the keel; keel sometimes beaked, subequal to wings. **Stamens**: vexillary stamen connate, at least in middle with the others, rarely quite free; anthers uniform. **Ovary** elongate, subsessile, many-ovuled, pubescent; style filiform or on a broadened base, glabrous except near ovary; stigma globular, short-papillose, often penicillate. **Pod** hairy or glabrous, elongated, 2-valved, continuous or septate within. **Seeds** compressed, oblong to suborbicular, minutely punctate. $x = 11, 12$ (polyploidy).

Species ± 20, Asia; 1 in sthn Afr., **Pueraria lobata* (Willd.) Ohwi var. *lobata* (Kudzu vine), has become naturalised in Mpumalanga.

Rafnia Thunb. 3654000

(Papilionoideae—Crotalarieae)

Thunberg: 144 (1800b); Harvey: 31(1862).

Shrubs, shrublets, sometimes with single stems from perennial rootstocks, often glaucous. **Leaves** simple, alternate, rarely opposite. **Flowers** yellow, solitary, or in short, axillary or terminal racemes, or sometimes capitate; bracts foliaceous or 0. **Calyx** with campanulate tube, usually with lowest lobe narrowest, rarely lobes subequal. **Petals**: vexillum suborbicular, sometimes bilobed, subsessile or clawed; wings falcate-oblong or oblong, clawed; keel incurved, clawed, sometimes gibbous. **Stamens** monadelphous, unequal; tube usually long; anthers unequal, linear and elliptic. **Ovary** sessile or stalked, 2–many-ovuled, glabrous; style incurved with small, capitate stigma. **Pod** linear or lanceolate, compressed. **Seeds** estrophiolate.

Species ± 22, sthn Afr., mostly Western Cape from Clanwilliam, extending eastwards through Eastern Cape into KwaZulu-Natal.

Requienia DC. 3718010

(Papilionoideae—Tephrosieae)

Candolle: 91 (1825e); Harvey: 230 (1862); Hutchinson: 396 (1964).

Perennial herbs, branching from a woody rootstock; stems moderately branched, tomentose. **Leaves** unifoliolate; leaflet obcordate or narrowly elliptic, tomentose, closely penninerved, mucronate, stipulate. **Flowers** small, pink or purple, axillary, solitary or clustered. **Calyx** 5-fid; tube campanulate; lobes acute, the lowest the longest, persistent. **Petals**: vexillum obovate; carina obtuse; keel obtuse. **Stamens** monadelphous; tube cleft above. **Ovary** sessile, 1-ovulate; style short, incurved. **Pod** oval, compressed, mucronate.

Species ± 3, Africa; 2 in sthn Afr., Namibia, the four northern provinces, Free State, KwaZulu-Natal and Northern Cape.

Rhynchosia Lour. 3897000

(Papilionoideae—Phaseoleae—Cajaninae)

Loureiro: 400 (1790); Harvey: 247 (1862); Baker: 113 (1921); Mcikle: 537 (1972) name resubmitted for conservation.

Chrysoscias E.Mey.: 139 (1836).

Herbs or undershrubs, twining, prostrate or rarely erect, sometimes with woody rootstock. **Leaves** usually pinnately 3-foliolate, sometimes digitately (1)3-foliolate, or pinnate, or bipinnate; leaflets usually with very conspicuous resinous gland-dots beneath, stipulate. **Flowers** frequently yellow, lined with brownish purple, in racemes, axillary umbels, dense subsessile clusters, or solitary; bracts caducous. **Calyx** usually hairy, with short, campanulate tube, 5-lobed; lobes usually longer than tube; 2 upper connate, often more so than others. **Petals**: vexillum usually eared at base, with short channelled claw; wings ± oblong, eared, with straight or curved claw; keel usually gibbous, sometimes saccate, clawed. **Stamens** diadelphous, with vexillary filament often kneed; anthers uniform. **Ovary** subsessile, linear, lanceolate or ovate, frequently with basal, cupular disc, sometimes glandular, usually with (1)2 ovules; style linear, subterete, or filiform, usually hairy on lower portion, curved and thickened in upper portion and with terminal, capitate stigma. **Pod** almost circular to narrowly oblong, compressed, often falcate, frequently glandular and velvety. **Seeds** black or brown, rarely dark blue. $x = 11$ (aneuploids).

Species ± 200, cosmopolitan throughout the tropics and subtropics; ± 70 in sthn Afr., widespread.

***Robinia** L. 3733000

(Papilionoideae—Robinieae)

Linnaeus: 722 (1753); Hutchinson: 370 (1964); Ball: 106 (1968).

Deciduous trees or shrubs. **Leaves** imparipinnate; leaflets entire, reticulate-pinnately nerved; stipels often present; stipules spinescent. **Flowers** white or rose-purple, in pendent, axillary racemes; bracts membranous, early caducous; bracteoles 0. **Calyx** campanulate; teeth short, broad, upper 2 subconnate. **Petals**: vexillum large, reflexed; wings falcate-oblong, free; keel incurved, obtuse. **Stamens** diadelphous; vexillary stamen free at base, connate in middle with the others into a closed tube or at length free; anthers uniform. **Ovary** stipitate, many-ovuled; style inflexed, subulate, hairy at apex; stigma small, terminal. **Pod** linear or oblong, flat and compressed, dehiscent. **Seeds** oblong or kidney-shaped. $x = 10, 11$.

Species 10(–20), with only 4 or 5 basic species, America and Europe; 1 in sthn Afr.: **Robinia pseudoacacia* L., Gauteng, Mpumalanga, E Free State and KwaZulu-Natal.

Rothia Pers. 3659000

(Papilionoideae—Crotalarieae)

Persoon: 638 (1807) name conserved; Hutchinson: 361 (1964); Milne-Redhead: 811 (1971).

Herbs, annual, diffuse, prostrate or spreading, pilose. **Leaves** digitately 3-foliolate; stipules small or foliaceous, solitary or in pairs. **Flowers** solitary or 1–5 in short racemes opposite leaves; bracts and bracteoles setaceous. **Calyx** with campanulate tube; lobes narrow, subequal, upper 2 broader and falcate. **Petals**: vexillum ovate or oblong; wings narrow; keel similar to wings. **Stamens** monadelphous, with somewhat split sheath; anthers small, uniform. **Ovary** sessile, many-ovuled; style straight, glabrous, with terminal stigma. **Pod** oblong, linear or linear-lanceolate, acute, inflated or scarsely so, when mature gaping along adaxial suture. **Seeds** many, on short, filiform funicle. $x = 6, 7$.

Species 2, Africa to India and Australia; 1 in sthn Afr.: *Rothia hirsuta* (Guill. & Perr.) Baker, N Namibia and Northern Province.

Schotia Jacq. 3506000

(Caesalpinioideae—Detarieae)

Jacquin: 93 (1787) name conserved; Harvey: 273 (1862); Codd: 515 (1956); Hutchinson: 240 (1964); Ross: 23 (1977).

Unarmed trees or shrubs. **Leaves** paripinnate; leaflets usually in 3–18 pairs, coriaceous, lower usually smaller than upper; stipules small, deciduous. **Inflorescence** a short lateral or terminal panicle or raceme, sometimes produced from old wood, many-flowered. **Flowers** bisexual, red or pink; bracts caducous. **Calyx** turbinate or subcampanulate, with 4 imbricate lobes longer than tube, persisting in fruit. **Petals** 5, or, in *S. brachypetala*, some or all petals reduced to linear filaments, arising in mouth of calyx tube, somewhat unequal, imbricate. **Stamens** 10, arising with petals, free or connate at base. **Ovary** somewhat unequal-sided, with stalk adnate to calyx tube, many-ovuled; style terete, with terminal, capitate stigma. **Pod** often woody, oblong or broadly linear, often falcate, sometimes beaked, compressed, with a hard margin or wing along upper suture, which persists, often with seeds attached, poorly dehiscent. **Seeds** compressed-orbicular, with funicle small or sometimes expanded into a fleshy, cup-like aril. $x = 12$.

Species ± 5, restricted to Africa south of the Zambesi River; 4 in sthn Afr., Namibia, the four northern provinces, Swaziland, KwaZulu-Natal and through Eastern Cape to Riversdale area in Western Cape.

Senna Mill. 3536020

(Caesalpinioideae—Cassieae)

Miller: [1280] (1754); Irwin & Barneby: 105 (1981).

Trees, shrubs, perennial or annual herbs. **Leaves** paripinnate; extrafloral nectaries often present on leaf stalks or raceme axes or both, verruciform, claviform or phalloid, secretory surface convex. **Inflorescence** a 1–many-flowered raceme, primitively axillary, often becoming corymbose-paniculate towards end of branchlets or rarely cauliflorous; bracteoles 0. **Petals** 5, yellow, exceptionally white, either subiso- or strongly heteromorphic, vexillar one interior in bud. **Stamens** 5–10, straight filaments shorter than or not over twice as long as basifixed anther, when less than 10 stamens fertile then whole set accrescent toward abaxial side of flower, adaxial ones dwindling to staminodes, perfect anthers either truncate, obliquely produced into a pollen cup, or beaked, lateral sutures glabrous, their dehiscence terminal by pore or short slit. **Pod** terete, 4-angulate, turgid, or plano-compressed, sometimes winged lengthwise along either sutures or valves; valves varying from papery to coriaceous or ligneous, cavity often transversely septate, seeds 1- or rarely 2-seriate, oriented either transversely or basipetally; indehiscent or tardily dehiscent along ventral suture, or through both sutures, but valves never coiling. **Seeds** not punctate. $x = 7$ (can also be 14, polyploidy).

Species ± 240, circumtropical, most numerous in the Americas, well represented in Africa and Australia; 5 species indigenous in sthn Afr., others have become naturalised.

Sesbania Scop. 3747000

(Papilionoideae—Robinieae)

Scopoli: 308 (1777) name conserved against *Sesban* Adans.: 326 (1763); Harvey: 212 (1862); Gillett: 91 (1963); Gillett: 330 (1971b).

Herbs, shrubs, or small, slender trees. **Leaves** paripinnate; leaflets usually in more than 10 pairs, oblong, entire, often unequal-sided at base, stipulate. **Flowers** yellow, in racemes or panicles, rarely solitary or 2, bracteate. **Calyx** with widely campanulate tube; lobes often

subequal. **Petals**: vexillum nearly always streaked or spotted with purple, clawed, with 2 free or adnate appendages at base; appendages rarely 0; wings clawed, sometimes eared; keel with claw ± equal to limb. **Stamens** diadelphous; anthers uniform. **Ovary** sessile or stalked, many-ovuled, sometimes pilose with soft spreading hairs; style incurved, with small, capitate stigma. **Pod** linear or sometimes oblong, compressed, 4-angled or -winged, 2-valved or subindehiscent, usually septate within. **Seeds** 8–50, ellipsoid, oblong or subquadrate. $x = 6, 7, 8$ (aneuploids, polyploidy).

Species over 50, cosmopolitan in warm parts, generally in seasonally or permanently wet places; ± 18 in sthn Afr., widespread from Namibia and the four northern provinces into KwaZulu-Natal, Free State and Northern Cape.

Smithia Aiton 3796000

(Papilionoideae—Aeschynomeneae—Aeschynomeninae)

Aiton: 496, t.13 (1789) name conserved; Verdcourt: 15 (1970c); Verdcourt: 408 (1971a); Verdcourt: 445 (1973).

Erect or decumbent herbs or shrublets. **Leaves** pinnate; leaflets in 6–12 pairs, opposite, asymmetric at base, stipulate; stipules conspicuous, appendaged at base, with appendage 2-auricled, one ear rounded and short, the other linear and longer, persistent. **Flowers** in short, dense, axillary, scorpioid cymes; bracts entire, scarious, brownish, caducous, with persistent bracteoles below calyx. **Calyx** 2-lipped. **Petals**: vexillum ± orbicular; keel petals united dorsally, free at apex. **Stamens** 10, alternately long and short, united into a tube for two-thirds, split above. **Ovary** shortly stipitate, with 2–9 ovules; style inflexed, glabrous; stigma terminal. **Pod** enclosed within accrescent calyx, jointed; joints indehiscent. **Seeds** reniform. $x = 19$.

Species ± 30 in Old World tropics, a few in Africa; 1 in sthn Afr.: *Smithia erubescens* (E.Mey.) Baker f., the four northern provinces, Swaziland, KwaZulu-Natal and the N Eastern Cape.

Sophora L. 3602000

(Papilionoideae—Sophoreae)

Linnaeus: 373 (1753); Harvey: 265 (1862); Brummitt & Gillett: 259 (1966); Polhill: 43 (1971b).

Trees, shrubs, or rarely perennial herbs. **Leaves** imparipinnate, pulvinate; leaflets various; stipels setaceous or 0. **Flowers** in terminal racemes or leafy panicles; bracts linear, minute or 0. **Calyx** with narrowly campanulate tube, shortly toothed, sometimes tomentose. **Petals**: vexillum broadly obovate or orbicular, erect or spreading; wings oblong-oblique; keel oblong, suberect, with its petals usually imbricate or cohering along back. **Stamens** free or rarely subconnate at base; anthers versatile, sometimes with small, blunt, apical gland. **Ovary** shortly stalked, several- to many-ovuled, sometimes densely villous; style somewhat incurved; stigma small, terminal. **Pod** moniliform, terete or slightly compressed, fleshy, indehiscent or obscurely 2-valved, often beaked. **Seeds** obovoid or globose. $x = 7, 8, 9, 11, 13$ (polyploidy).

Species ± 50 cosmopolitan in warm regions; 1 in sthn Afr.: *Sophora inhambensis* Klotzsch (= *S. nitens* Benth.), KwaZulu-Natal. **S. japonica* L. and **S. secundiflora* Lag. are grown as street trees or garden ornamentals.

*Spartium L. 3674000

(Papilionoideae—Genisteae—Genistinae)

Linnaeus 708 (1753); Hutchinson: 354 (1964); Heywood: 101 (1968).

Unarmed shrubs, often with leafless branches. **Leaves** rare, 1-foliolate; stipules 0. **Flowers** showy, bright yellow, in terminal, many-flowered racemes; bracts and bracteoles minute, caducous. **Calyx** subspathaceously split at back; teeth 5, short, upper 2 free, lower 3 connate into a lip. **Petals**: vexillum large; wings obovate; keel incurved, acuminate, longer than wings, claw adnate to staminal tube. **Stamens** monadelphous; alternate anthers short and versatile, alternately longer and basifixed. **Ovary** sessile, many-ovuled; style incurved, glabrous; stigma oblong, decurrent on inside. **Pod** linear-oblong, glabrous, flat, dehiscent, 2-valved, subseptate between seeds inside. **Seeds** many, estrophiolate. $x = 6, 8, 9, 13$ (polyploidy).

Species 1: **Spartium junceum* L., Mediterranean region and SW Europe; now naturalised in Gauteng and the S Western and Eastern Cape Provinces.

Sphenostylis E.Mey. 3907000

(Papilionoideae—Phaseoleae—Phaseolinae)

Meyer: 148 (1836); Harvey: 239 (1862); Burtt Davy: 418 (1932); Dyer: t. 1010 (1947); Verdoorn: t. 1521 (1969); Verdcourt: 388 (1970b).

Shrublets or perennial herbs, prostrate, climbing or erect. **Leaves** pinnately 3-foliolate, stipulate. **Flowers** few, conspicuous, in congested heads on long peduncles, with or without bracts; bracteoles 2. **Calyx** glabrous, with campanulate tube; lobes 5, ovate, obtuse, shorter than tube. **Petals**: vexillum rounded, with 2 inflexed auricles, with margins sometimes reflexed, subsessile or with short, deeply channelled claw; wings eared, with linear, sometimes short, claw; keel incurved, ± concave-convex, obtuse, sometimes gibbous, subsessile or with short claw. **Stamens** diadelphous, with vexillary stamen sometimes adnate with others at base. **Ovary** sessile, linear, many-ovuled, surrounded by cupular disc at base; style scarcely thickened above, sometimes articulated on ovary, with flat, oblique, ciliated stigma. **Pod** linear, compressed, 2-valved, septate between seeds; valves convex. **Seeds** black, oblong, thick, minutely papillose. $x = 12$ (aneuploids).

Species 7 or 8, Africa and India; 2 in sthn Afr.: *Sphenostylis angustifolia* Sond. and *S. marginata* E.Mey. subsp. *marginata*, the four northern provinces, Swaziland, Free State and KwaZulu-Natal.

Stirtonanthus B.-E.van Wyk & A.L.Schutte 3621020

(Papilionoideae—Podalyrieae)

Van Wyk & Schutte: 67 (1995).

Stirtonia B.-E.van Wyk & A.L.Schutte: 319 (1994).

Single-stemmed or multi-stemmed shrubs or small trees. **Leaves** simple, flat, obovate to ± orbicular, petiolate, densely tomentose on both surfaces, coriaceous; stipules paired. **Flowers** 2–4(–6), decussate, in axillary, pedunculate inflorescences; bracts sheathing pedicel, sometimes clasping calyx, densely tomentose; bracteoles 0. **Calyx** with base intrusive; upper 2 lobes fused higher up; lateral lobes often coherent with upper lobes or carinal lobe. **Corolla** yellow, longer than calyx, glabrous; standard transversely elliptic, apex emarginate, claw thick, rigid; wing petals oblong to obovate, slightly longer than keel, tips imbricate; keel petals semicircular, rostrate, auriculate, apex obtuse. **Stamens** diadelphous, free almost to the base; anthers slightly dimorphic, 5 + 5, alternately dorsifixed and subbasifixed. **Ovary** 5- or more-ovuled; style slender, slightly upcurved, densely hairy at least on lower half. **Pod** coriaceous, linear to obliquely-oblong, compressed to somewhat inflated, 5–8-seeded, densely sericeous to tomentose. **Seeds** elliptic to obovate in side view, dark green to black or orange-brown to reddish brown.

Species 3, Western Cape: mainly in Montagu, Ladismith, Prince Albert and Oudtshoorn Districts.

Stylosanthes Sw. 3802000

(Papilionoideae—Aeschynomeneae—Stylosanthinae)
Swartz: 108 (1788); Harvey: 227 (1862); Torre: 213 (1966); Verdcourt: 492 (1973).

Erect or spreading perennial herbs or undershrubs, often viscid. **Leaves** pinnately 3-foliolate; leaflets conspicuously paler-veined. **Flowers** yellow, in dense, axillary or terminal heads, each in axil of a leafy bract, or flowers solitary, 2- or 3-bracteolate, or 2 together, one aborting, mainly unisexual, fertile ones often apetalous. **Calyx** with slender tube, 5-lobed; lobes membranous, 4 upper connate, lowest slender. **Petals** arising in throat of calyx tube; vexillum rounded or obovate, emarginate, sessile; wings shortly clawed; keel incurved, subrostrate. **Stamens** monadelphous, arising at mouth of calyx tube; anthers unequal, 5 longer and subbasifixed, 5 shorter and versatile. **Ovary** linear, subsessile, 2- or 3-ovuled; style filiform, articulating towards base; stigma small, terminal. **Pod** oblong, compressed, beaked, with hooked style-base, segmented. **Seeds** ovoid or irregularly oblong, compressed. $x = 10$ (polyploidy).

Species ± 25, in the tropics and subtropics of both hemispheres; 1 in sthn Afr.: *Stylosanthes fruticosa* (Retz.) Alston (= *S. mucronata* Willd.), Namibia, Botswana, the four northern provinces, Swaziland and KwaZulu-Natal.

Sutherlandia R.Br. ex W.T.Aiton 3754000

(Papilionoideae—Galegeae—Coluteinae)
Aiton: 327 (1812) name conserved; Harvey: 212 (1862); Phillips & Dyer: 69 (1934).

Shrublets or halfshrubs with herbaceous branches. **Leaves** imparipinnate, pubescent to albo-tomentose, stipulate. **Flowers** in 2–7-flowered racemes, often ornamental. **Calyx** with campanulate tube; lobes variable. **Petals**: vexillum shorter than keel, slightly narrowed to base; wings clawed, with ear usually shorter than claw; keel clawed, eared, with claws connate except at base. **Stamens** diadelphous; tube ± 3 times longer than free portions; anthers equal. **Ovary** stalked, many-ovuled; style curved, laterally bearded above, with small capitate stigma. **Pod** membranous, bladdery. **Seeds** many, black, flattened, with funicle. $x = 8$ (1 report).

Species 5; Africa, mainly sthn Afr., widespread throughout.

Swartzia Schreb. 3574000

(Papilionoideae—Swartzieae)
Schreber: 518 (1791) name conserved; Brenan: 219 (1967); Schreiber: 19 (1967b); Ross: 136 (1977).

Trees or sometimes shrubs, unarmed. **Leaves** alternate, imparipinnate; leaflets opposite or alternate, without pellucid dots; stipules mostly small. **Flowers** in lateral racemes or sometimes in panicles or fascicles; bracteoles minute or 0. **Calyx** globose or ellipsoid and entire before opening, becoming torn or lobed; disc 0. **Petals** usually 1, rarely with 2 more lateral ones, or entirely absent. **Stamens** more than 30, in several rows around gynophore, free or nearly so; anthers arising near base, dehiscing by longitudinal slits. **Ovary** stalked, several- to many-ovuled; stigma small. **Pod** stalked, coriaceous or woody, cylindric or rarely compressed, indehiscent or dehiscent into 2 valves. **Seeds** 1–several. $x = 8$ (1 report).

Species ± 127, mostly tropical America, 2 in Africa; 1 in sthn Afr.: *Swartzia madagascariensis* Desv., N Namibia and Botswana.

Tamarindus L. 3508000

(Caesalpinioideae—Amherstieae)
Linnaeus: 34 (1753); Brenan: 151 (1967); Ross: 37 (1977).

Unarmed evergreen trees. **Leaves** paripinnate; leaflets opposite, in 10–18(–21) pairs, almost sessile, asymmetric basally; stipules minute, caducous. **Flowers** in lax terminal and lateral racemes; bracteoles 2, completely enclosing young flower bud but soon falling off. **Sepals** 4, imbricate, membranous, calyx tube shortly elongate-turbinate. **Petals** unequal; upper 3 imbricate, ± equal in length; lower 2 minute, setiform, below staminal tube. **Stamens**: filaments united ± halfway into a pubescent tube terminating in 3 upcurved anther-bearing filaments alternating with 5 sterile teeth; filaments short; anthers oblong. **Ovary** ± pubescent, stalked, with stalk adnate to calyx tube; ovules many; style elongated, thickened, with subcapitate, truncate, terminal stigma. **Pod** oblong or linear, incurved, thick, subcompressed, indehiscent, pulpy, septate between seeds. **Seeds** ± compressed, with continuous-margined areole on each face. $x = 12$ (aneuploids).

Species 1: *Tamarindus indica* L., Asia and Africa; isolated specimens are recorded in North-West and N KwaZulu-Natal, indicating chance introductions or relics.

Tephrosia Pers. 3718000

(Papilionoideae—Tephrosieae)
Persoon: 328 (1807) name conserved; Harvey: 203 (1862); Forbes: 951 (1948b); Gillett: 111 (1958c); Brummitt: 219 (1968).

Annual or perennial herbs or undershrubs, rarely shrubs. **Leaves** imparipinnate or digitately (1)3–5-foliolate or pinnately 3-foliolate; leaflets entire, usually narrowed at base and widest above middle; stipules usually setaceous, sometimes broad and striate. **Flowers** in racemes, axillary, opposite leaves, or terminal, sometimes on long peduncles; bracts subulate, ovate, or spatulate. **Calyx** with campanulate tube, somewhat 2-lipped; often 2 upper lobes connate and lowest the longest. **Petals**: vexillum usually with short, broad claw, sometimes with 2 callosities above claw, ± velvety-pubescent on outside; wings obliquely oblong or obovate, slightly adnate to keel, sometimes eared, clawed; keel incurved. **Stamens** monadelphous or diadelphous; anthers uniform. **Ovary** sessile, usually linear, rarely subglobose, (1 or 2)several- to many-ovuled, usually hairy; style incurved or inflexed, often linear, compressed, often bearded, with terminal, capitate stigma. **Pod** linear or rarely ovate, compressed, 2-valved, sometimes septate within. **Seeds** oblong or subreniform, sometimes with a small strophiole; funicle short; aril almost absent, small or well developed. $x = 11$ (8, 12, 13) (polyploidy, B-chromosomes).

Species over 400, mainly in warm regions, abundant in Africa and Australia; ± 53 in sthn Afr., widespread.

Teramnus P.Browne 3866000

(Papilionoideae—Phaseoleae—Glycininae)
Browne: 290 (1756); Harvey: 234 (1862); Verdcourt: 533 (1971b).

Perennial herbs, climbing or trailing. **Leaves** pinnately 3-foliolate, stipulate. **Flowers** small, in axillary racemes, or flowers paired or fascicled in leaf axils; bracts small. **Calyx** sometimes densely hairy, with cylindric-campanulate tube, 4- or 5-lobed; 2 upper lobes somewhat fused. **Petals**: vexillum obovate or rounded, narrowed to base, glabrous or with few hairs near middle; wings clawed, adnate to keel; keel nearly straight, shorter than wings, clawed. **Stamens** monadelphous; alternate anthers small, abortive. **Ovary** sessile, linear,

many-ovuled, sometimes hairy; style short, thick, with capitate stigma. **Pod** linear, 2-valved, septate, tipped with persistent and hooked style. **Seeds** light brown, oblong, almost as thick as long. $x = 14$ (10, 11).

Species ± 8, fairly cosmopolitan in warm regions; 1 in sthn Afr.: *Teramnus labialis* (L.f.) Spreng. subsp. *labialis*, the four northern provinces, Swaziland, KwaZulu-Natal and Eastern Cape near Komga.

Trifolium L. 3690000

(Papilionoideae—Trifolieae)

Linnaeus: 764 (1753); Harvey: 158 (1862); Gillett: 1016 (1971a); Zohary & Heller: 53 (1984).

Annual or perennial herbs, with erect, ascending or procumbent stems. **Leaves** digitately 3(5–9)-foliolate; leaflets dentate or entire; stipules adnate to petioles, entire or sometimes dentate. **Flowers** white, yellow, purple, pink, flesh-coloured, lilac, violet or 2-coloured, pedicellate or sessile, in spikes, heads, or umbels, rarely solitary; bracts small or 0. **Calyx** often with campanulate tube, 5–10(–36)-nerved; lobes variable. **Corolla** persistent; petals all, or lower 4, ± adnate to staminal tube; vexillum sessile; wings oblong, eared, clawed; keel oblong or planoconvex, clawed. **Stamens** diadelphous; vexillary stamen free or partly connate with rest; filaments sometimes all, or alternate ones, broadened; anthers uniform. **Ovary** sessile or subsessile, 1–12-ovuled; style straight and incurved above, with capitate stigma. **Pod** ovate or oblong, compressed or subterete, indehiscent within calyx or opening by sutures. **Seeds** 1 or 2(4), globular to ovoid and oblong, sometimes reniform to lenticular. $x = 7, 8$ (5, 6, 9) (polyploidy, B-chromosomes).

Species ± 250, cosmopolitan in temperate and subtropical regions of the northern and southern hemispheres; 19 in sthn Afr., including some introduced and widespread ones, mainly near cultivation.

Trigonella L. 3687000

(Papilionoideae—Trifolieae)

Linnaeus: 776 (1753); Harvey: 161 (1862); Ivimey-Cook: 150 (1968).

Herbs, often strongly scented. **Leaves** pinnately 3-foliolate; stipules adnate to petioles. **Flowers** solitary and sessile, or peduncled in leaf axils, or in heads, or subumbels or short, dense racemes; bracts minute. **Calyx** with campanulate tube; lobes ovate, acuminate, ± as long as tube. **Petals**: vexillum sessile or clawed; wings oblong, eared, clawed; keel shorter than wings, planoconvex, clawed. **Stamens** diadelphous, with vexillary stamen free or connate with others to middle; anthers uniform. **Ovary** sessile or shortly stalked, few- to many-ovuled; style with terminal stigma. **Pod** a straight or rarely falcate legume, usually dehiscent. **Seeds** usually many. $x = 8$ (6, 7, 11) (polyploidy, B-chromosomes).

Species ± 80, Mediterranean region, central Europe, Africa, Asia to Australia; 2 in sthn Afr., scattered, mainly central, but not extending much into Western Cape.

Tylosema (Schweinf.) Torre & Hillc. 3528030

(Caesalpinioideae—Cercideae)

Torre & Hillcoat: 38 (1955); Torre & Hillcoat: 194 (1956); Brenan: 213 (1967); Schreiber: 19 (1967b); Coetzer & Ross: 61 (1977).

Shrubs with trailing or climbing stems, herbaceous or woody towards base, arising from a large, underground tuber; tendrils usually present, forked, axillary. **Leaves** simple, bilobed at apex or sometimes divided almost to cordate base; lobes oval to obovate or reniform; stipules oblong to squarish, appressed to stem, persistent. **Inflorescence** a lateral short to elongate raceme. **Flowers** bisexual, irregular, medium to rather small, yellow. **Calyx** arising from short receptacle; sepals 5, the two upper usually completely or partly fused, others free. **Petals** 5; upper one bicallose at base and smaller than others. **Stamens** 2 fertile, (7)8 staminodial, unequal, some ± flattened. **Ovary** long-stalked; style elongate, with small stigma. **Pod** woody, dehiscent or indehiscent (1)2-seeded. **Seeds** large, with short U-shaped mark extending from hilum.

Species ± 4, Africa; 2 in sthn Afr., Namibia, the four northern provinces, Swaziland, N KwaZulu-Natal and Northern Cape.

*Ulex L. 3681000

(Papilionoideae—Genisteae—Genistinae)

Linnaeus: 741 (1753); Hutchinson: 352 (1964); Guinea & Webb: 102 (1968).

Shrubs; branchlets very spiny. **Leaves** usually alternate, 3-foliolate on seedlings, but reduced to scale-like or narrow, usually spine-like phyllodes on mature plants; stipules 0. **Flowers** yellow, axillary, solitary or in small clusters, sometimes aggregated into racemes or umbel-like inflorescences; bracteoles 2, immediately below the flower. **Calyx** ± yellow, persistent, divided to base into 2 lips; upper lip 2-toothed, lower lip 3-toothed. **Petals**: vexillum ovate; wings and keel obtuse. **Stamens** monadelphous, connate into a closed tube; anthers alternate, shorter and versatile, longer and basifixed. **Ovary** sessile, many-ovuled; style slightly incurved with terminal, capitate stigma. **Pod** ovate, oblong or shortly linear, compressed or turgid, continuous, 2-valved. **Seeds** 1–6, strophiolate. $x = 8$ (high polyploidy).

**Ulex europaeus* L., Gorse, occurs as an escape in forest areas of the Drakensberg between 2000–2300 m in KwaZulu-Natal and occasionally in similar areas of the Eastern Cape.

Umtiza Sim 3506010

(Caesalpinioideae—Detarieae)

Sim: 205 (1907); Hutchinson: 236 (1964); Germishuizen: t. 1939 (1987).

Evergreen trees or shrubs armed with stout spines which are often branched and bear leaves and inflorescences. **Leaves** paripinnate; leaflets in (3)5–9(12) pairs, subopposite or irregularly alternate, sometime a lateral leaflet appearing terminal; stipules 0. **Flowers** bisexual, irregular, small, white, in a short panicle, usually terminal on lateral shoots. **Calyx** campanulate-tubular, with 5 short, imbricate lobes. **Petals** 5, arising in mouth of calyx tube, free, slightly imbricate. **Stamens** 10, arising with petals; anthers reniform. **Ovary** sessile, 2-ovuled, pubescent; style terete, with truncate-capitate stigma. **Pod** 1-seeded, compressed, elongate, firmly membranous, dehiscent. **Seed** ovoid, somewhat compressed.

Species 1: *Umtiza listeriana* Sim, forests of East London, Kentani and King William's Town Districts of the Eastern Cape.

*Vicia L. 3852000

(Papilionoideae—Vicieae)

Linnaeus: 734 (1753); Harvey: 233 (1862); Hutchinson: 452 (1964); Verdcourt: 1067 (1971c).

Annual or perennial herbs, usually climbing by means of tendrils. **Leaves** mostly paripinnate; petioles of all or upper leaves ending in a simple or branched tendril or a recurved bristle; leaflets entire or toothed; stipules semisagittate, often fimbriate or toothed. **Flowers** often blue, purple or yellow, 1 or few in leaf axils or racemose; bracts usually minute and caducous. **Calyx** tubular, often oblique at base; lobes subequal or 2 upper the shortest. **Petals**: vexillum obovate or oblong, clawed; wings obliquely oblong, adherent to middle of keel; keel

shorter than wings. **Stamens**: vexillary stamen free or ± connate with others. **Ovary** subsessile or shortly stalked; ovules (2–)many; style compressed dorsally, usually pubescent at apex. **Pod** oblong to linear, compressed. **Seeds** globose or rarely compressed. x = 5, 6, 7, 11 (polyploidy, B-chromosomes).

Several introduced species have become naturalised in sthn Afr. near cultivated land.

Vigna Savi 3905000

(Papilionoideae—Phaseoleae—Phaseolinae)
Savi: 113 (1824); Harvey: 239 (1862);Verdcourt: 617 (1971b); Maréchal *et al.*: 164 (1978).

Annual or perennial herbs, climbing or prostrate, rarely short and erect. **Leaves** (1)3-foliolate, stipulate and stipellate; stipules varying from ovate to lanceolate or almost linear to filiform, base varying from spurred below point of attachment to cordate and median attachment with free lateral auricles. **Flowers** shading from white flushed with mauve to cream flushed with green or yellow; or shading from blue, lilac, mauve, purple to magenta, racemose, 1 or 2 together or fasciculate at top of axillary peduncles; bracts small, caducous. **Calyx** with campanulate tube; 2 upper lobes or teeth separate or connate. **Petals**: vexillum reflexed, from reniform to oblate, with basal, inflexed appendages and channelled claw; wings falcate-obovate, eared, clawed; keel incurved, sometimes into a somewhat spiral beak, clawed. **Stamens** diadelphous or monadelphous; filaments often dilated above; anthers uniform. **Ovary** sometimes with basal disc, sessile, with several to many ovules; style often thickened above, bearded along inner margin, with oblique or introrsely lateral stigma. **Pod** subterete, straight or slightly incurved, 2-valved, dehiscing spirally (in wild species). **Seeds** reniform or subquadrate with lateral hilum. x = 10, 11 (9, 12, 17) (polyploidy).

Species ± 160, cosmopolitan in tropical regions of both hemispheres, with more than 50 of these occurring in tropical Africa; ± 18 in sthn Afr., widespread, but absent from the Western Cape.

Virgilia Poir. 3608000

(Papilionoideae—Podalyrieae)
Poiret: 677 (1808) name conserved; Harvey: 266 (1862); Salter: 58 (1939b); Van Wyk: 348 (1986).

Small trees with crown narrow or spreading. **Leaves** very variable, imparipinnate; leaflets with (2–)6–12(–23) pairs of pinnae, subsessile, linear, linear-lanceolate, lanceolate, elliptic or narrowly ovate, with a short, apical mucro; stipules linear, acuminate. **Flowers** pink to rose-violet, violet-purple or rarely white, in axillary and subterminal racemes; bracts small, caducous. **Calyx** 2-lipped, tomentose; tube basin-shaped, somewhat compressed laterally, introrse at base; upper lip 2-toothed; lower lip 3-toothed, both longer than tube. **Petals**: vexillum suborbicular or obovate, strongly reflexed; wings falcate, clawed; keel somewhat shorter than wings, incurved, beaked, with 2 petals clawed. **Stamens** 10, free; filaments linear, narrowing upwards, villous; anthers small, versatile. **Ovary** shortly stalked, 5–8-ovuled, densely villous; style curved, narrowing into small, terminal stigma with a few hairs. **Pod** dehiscent, sometimes only along upper suture, coriaceous or sometimes woody, linear to linear-oblong, 2-valved. **Seeds** elliptic in outline, yellow-brown, dark brown or black. x = 6 or 9 (1 report, polyploidy).

Species 2, limited to moist sites along the Cape coastal region of South Africa, from the Cape Peninsula (Western Cape) to Port Elizabeth (Eastern Cape).

Walpersia Harv. 3647000

Harvey: 26 (1826); Dahlgren: 97 (1965b); Polhill: 392 (1981b).

Walpersia is regarded as a synonym of *Phyllota* DC., a genus known only from Australia. Dahlgren (1965b) is of the opinion that a label with a Cape Peninsula locality was probably mistakenly placed with the specimen on which *Walpersia* was based.

Wiborgia Thunb. 3661000

(Papilionoideae—Crotalarieae)
Thunberg: 137 (1800b) name conserved; Harvey: 90 (1862); Dahlgren: 9 (1975).

Shrubs, rigid, sometimes spinescent. **Leaves** petiolate, digitately 3-foliolate; stipules small or 0. **Flowers** few to many in terminal, often unilateral racemes; bracteoles usually very small. **Calyx** with campanulate tube, somewhat 2-lipped; lobes shorter than tube. **Petals**: vexillum standing apart, ovate to obovate, reflexed, with linear or linear-spatulate claw; wings usually shorter than vexillum and keel, broadest near base, clawed; keel incurved, longer than vexillum, long-clawed. **Stamens** monadelphous; staminal tube split to base; anthers unequal. **Ovary** stalked, elliptic, few-ovuled, glabrous; stigma minutely capitate. **Pod** stipitate, indehiscent, oblong, oblong-elliptic or orbicular in lateral view, winged on upper suture, sharp and thin along the lower; valves sometimes ridged. **Seeds** 1–3, reniform, on filiform funicles. x = 9.

Species ± 10, sthn Afr., from Namaqualand (Northern Cape) to George (Western Cape).

Xanthocercis Baill. 3847000

(Papilionoideae—Sophoreae)
Baillon: 293 (1870); Harms: 162 (1902); Hutchinson: 327 (1964).

Pseudocadia Harms: 162 (1902); Phillips: 399 (1951).

Very tall trees with rounded crowns. **Leaves** pulvinate, imparipinnate; leaflets 3–4-jugate, unpleasant-smelling when bruised; stipules small. **Flowers** white, cream or yellow, in axillary racemes with small, caducous bracts. **Calyx** with campanulate tube, shortly lobed. **Petals** 5, arising at base of calyx tube, unequal, with linear claw, imbricate; vexillum small, gradually broadened from claw, hairy. **Stamens** 10, arising with petals, connate at base, with vexillary stamen free; anthers oblong. **Disc** annular. **Ovary** stipitate, linear, with few to several ovules; style short, with lateral stigma. **Fruit** drupaceous, ellipsoid, indehiscent. **Seeds** solitary, with black testa.

Species 2, Africa and Madagascar; 1 in sthn Afr.: *Xanthocercis zambesiaca* (Baker) Dumaz-le-Grand (= *Pseudocadia zambesiaca* (Baker) Harms), Northern Province.

Xerocladia Harv. 3453000

(Mimosoideae—Mimoseae)
Harvey: 278 (1862); Ross: 130 (1975); Schreiber: 19 (1967b).

Shrublets with many rigid, somewhat zigzag branches, with recurved, spinescent stipules. **Leaves** few, small, bipinnate, with pinnae 1–2-jugate; leaflets. small, few-jugate. **Flowers** bisexual, sessile, in axillary, shortly pedunculate heads. **Calyx** campanulate, with 5 lobes longer than tube. **Petals** 5, valvate, linear, free almost to base. **Stamens** 10, free, 5 opposite petals short, 5 alternating with petals longer but scarcely exceeding petals; anthers with minute, terminal, deciduous gland apically. **Ovary** subsessile, 1(2)-ovuled, villous; style filiform, somewhat thickened above, with truncate stigma. **Pod** broadly falcate-ovate or semiorbicular, plano-compressed, 1-seeded, with lower suture arched and winged. **Seed** compressed-ovoid, smooth.

Species 1, sthn Afr.: *Xerocladia viridiramis* (Burch.) Taub. (= *X. zeyheri* Harv.), Namibia and Namaqualand (Northern Cape).

Xeroderris Roberty 3838010

(Papilionoideae—Tephrosieae)

Roberty: 353 (1954); Mendonça & Sousa: 273 (1968); Polhill: 91 (1971b).

Ostryoderris Dunn: 363 (1911).

Deciduous trees; slash producing blood-red resinous exudate. **Leaves** imparipinnate; stipules present, caducous; stipels almost always 0. **Flowers** white, in lateral, spreading panicles, a number together from young shoots which grow out into leafy branches; bracts and bracteoles small, caducous. **Calyx** campanulate, shortly 5-lobed, the upper 2 obscure. **Petals**: vexillum shortly clawed, scarcely callused, suborbicular to oblate; wings oblong-obovate; keel with elliptic-falcate blades, lightly coherent along lower side. **Stamens** diadelphous, with vexillary stamens free; anthers dorsifixed. **Ovary** sessile, few-ovuled; style curved, attenuate, with a small, incurved stigma. **Pod** indehiscent, compressed, margined with a wing on each side; valves coherent between seeds. **Seeds** oblong-reniform. $x = 12$ (1 report).

Species 1, in the savanna regions of tropical Africa: *Xeroderris stuhlmannii* (Taub.) Mendonça & E.P.Sousa (= *Ostryoderris stuhlmannii* Taub.) Harms, Northern Province.

Xiphotheca Eckl. & Zeyh. 3643010

(Papilionoideae—Liparieae)

Ecklon & Zeyher: 166 (1836); Schutte & Van Wyk: 43 (1993); Schutte: 90 (1997).

Priestleya DC. sect. *Anisotheia* DC.: 91 (1825b).

Woody shrubs or shrublets. **Leaves** alternate, rarely opposite, simple, narrowly elliptic to almost circular, mostly flat, sometimes with recurved margins; petiole very short; stipules inconspicuous, often lacking. **Inflorescence** axillary, 2-flowered, pedunculate and with the two flowers opposite, aggregated into synflorescences of up to 16 flowers; bracts linear to oblanceolate; bracteoles minute, often lacking. **Calyx** usually narrowed to the base; upper 2 lobes fused higher up than lower 3 lobes; carinal lobe sometimes longer than the upper 4. **Corolla** yellow, longer than calyx, glabrous; vexillum suborbicular to elliptic; wings oblong, longer than keel, tips imbricate; keel widely obovate, with distinct pockets, apex obtuse. **Stamens** diadelphous, vexillary filament free; anthers alternately dorsifixed and subbasifixed. **Ovary** 4- or more-ovuled; style slender, slightly upcurved, glabrous. **Pod** somewhat compressed, usually linear, sometimes obliquely oblong, coriaceous, densely sericeous to tomentose. **Seeds** 4 to many, oblong-reniform.

Species ± 9, southern Cape region, endemic to the fynbos, as far eastward as the Outeniqua Mountains.

Xylia Benth. 3462000

(Mimosoideae—Mimoseae)

Bentham: 417 (1842); Brenan: 359 (1957); Brenan: 29 (1959); Brenan & Brummitt: 33 (1970); Ross: 136 (1975).

Trees tall, unarmed, with hard wood. **Leaves** bipinnate, with 1 pair of large pinnae or with more pairs and smaller pinnae; petiolar gland elevated or obscure; stipules small, linear, deciduous. **Flowers** mostly bisexual, small, sessile, in capitate clusters on solitary, axillary peduncles, or subfasciculate, or racemose at the top of branches, pale green. **Calyx** tubular-campanulate, 5-dentate. **Petals** 5, slightly coherent at base, ± pubescent or puberulous outside. **Stamens** 10, free, exserted; anthers ovate, with many pollen grains, glandular at apex. **Ovary** sessile, many-ovuled, pubescent; style filiform, with small, terminal stigma. **Pod** broadly falcate, compressed, thick and woody, 2-valved, with valves elastically recurved from apex, septate within between seeds. **Seeds** transverse, obovate, compressed, with short, fleshy funicle. $x = 12$.

Species ± 12, tropical Asia to Africa; 1 in sthn Afr.: *Xylia torreana* Brenan, rare in the Pafuri region of the Kruger National Park (Northern Province).

Zornia J.F.Gmel. 3804000

(Papilionoideae—Aeschynomeneae—Aeschynomeninae)

Gmelin: 1076, 1096 (1791); Harvey: 225 (1862); Mohlenbrock: 1 (1961); Verdcourt: 497 (1973).

Erect or prostrate herbs, mainly perennial. **Leaves** digitately 2–4-foliolate; leaflets often pellucid-dotted; stipules subfoliaceous. **Flowers** yellow or orange-yellow, solitary or in interrupted spikes; spikes pedunculate, axillary or terminal; bracts enclosing flowers. **Calyx** membranous, 2 upper lobes connate, 2 lateral small, lowest subequal to upper lip. **Petals**: vexillum clawed; wings clawed; keel incurved, subrostrate, clawed. **Stamens** monadelphous, united into a column below, which at maturity is circumscissile and upper part is shed with petals, lower tubular part remaining to protect ovary; anthers unequal, 5 larger subbasifixed, 5 smaller versatile. **Ovary** sessile; several- to many-ovuled; style filiform, with small, terminal stigma. **Pod** sessile, compressed, with upper suture nearly straight, lower deeply sinuate, 2–15-jointed, breaking into smooth or spiny, indehiscent segments. **Seeds** ovoid, mostly black or dark brown, without appendages. $x = 10, 11$.

Species ± 80, mainly Brazil; 4 in sthn Afr., widespread from northern borders to the Northern and Eastern Cape.

*Fagaceae

(Hamamelidae—Fagales)

Compiled by M. Jordaan

Deciduous or evergreen, monoecious, trees or shrubs; buds with imbricate scales. **Leaves** alternate, simple, thin or leathery, entire, dentate, sinuate or pinnately lobed, rarely entire; stipules deciduous and inconspicuous. **Inflorescences** unisexual, in axils of leaves or bud scales, usually clustered at base of new growth; male inflorescences lax, solitary or 1–3 together in pendulous spikes or catkins; female inflorescences solitary, in erect, stiff dichasia, 1–5-flowered, with terminal cupule and sometimes 1–many sessile, lateral cupules. **Male flowers**: perianth tube campanulate; lobes 3–6, subtended by small bracteoles; stamens (2–)6(–12), surrounding tuft of silky hairs (apparently a reduced pistillode). **Female flowers** with smaller calyx, surrounded by an involucre of many imbricate or annular scales; ovary inferior, 3-locular; placentation axile; ovules 2 per locule, anatropous, crassinucellar, bitegmic; styles usually 3, short, recurved; stigmas broad, lining inner faces of styles. **Fruit** a nut (acorn) arising on or partly enclosed

by a cup-shaped or saucer-shaped cupule, involucral scales hardened into teeth or tubercles or annular lamellae. **Seed** 1, without endosperm; embryo straight, as long as seed, cotyledons plano-convex. $x = 12$ (aneuploids, polyploidy).

Genera 9; species 620–800; one of the most important families of woody plants of the temperate and tropical regions, mostly of the northern hemisphere, in SE Asia crossing the equator; no native representatives in tropical South America or in tropical and sthn Afr.; sthn Afr.: genus 1, species at least 5, all exotic.

Dumortier: 11 (1829), as Fagineae; Prantl: 47 (1889); Kubitzki: 301 (1993).

*Quercus L. 1893000

Linnaeus: 994 (1753); Linnaeus: 431 (1754); Jussieu: 410 (1789); Willdenow: 423 (1805); Prantl: 47 (1889); Camus (1936–1954); Schwarz: 61 (1964); Friis: 265 (1989); Kubitzki: 308 (1993); Nixon: 445 (1997).

Description as for family.

Species ± 350–450; in the northern temperate and subtropical regions with extensions into the tropics in W Malesia and NW South America. Several species of **Quercus* (Oaks), have been fairly extensively cultivated and at least 5 occur as escapes, notably **Quercus robur* L. in the Western Cape.

Flacourtiaceae

(Dilleniidae—Violales)

Compiled by C.L. Bredenkamp

Trees or shrubs, armed or unarmed, monoecious or dioecious, occasionally polygamous. **Leaves** alternate, rarely opposite or whorled, simple, entire or toothed, teeth often glandular; stipules present or 0. **Inflorescence** axillary or terminal, racemose, corymbose or paniculate, or flowers fasciculate or solitary. **Flowers** regular, bisexual or unisexual. **Sepals** 3–6 or more, free or connate below into a calyx tube, contorted or imbricate, rarely valvate, often persistent or accrescent. **Petals** as many as sepals, or more, or 0, usually small and inconspicuous, free, contorted or imbricate, with or without a scale on inner face. **Disc** extrastaminal or with free glands between stamens or of staminode-like scales inserted at base of petals, often adnate to receptacle. **Stamens** 5–many, free or rarely connate, sometimes alternating with staminodes; anthers 2-thecous, dehiscing by longitudinal slits, rarely by apical pores. **Ovary** superior or more rarely semi-inferior, 1-locular with 1–many ovules on 2–8 parietal placentas, rarely ovules axile; styles 1–10, free or connate. **Fruit** a capsule or berry, 1–many-seeded. **Seeds** usually small, sometimes arillate; testa woody, leathery or chartaceous; embryo straight; cotyledons usually broad; endosperm fleshy, copious, rarely thin or 0.

Genera 89, species ± 1250, mainly tropical and subtropical, Old and New World; sthn Afr.: genera 13, species 25.

Harvey: 65 (1860) under Bixaceae, Endl.; Wild: 261 (1960); Killick: 53 (1976).

Key to genera

1a Leaves opposite ..... **Pseudoscolopia**
1b Leaves alternate:
2a Petals with a fleshy gland on the inner face or staminodes petaloid with fleshy glands:
3a Stamens numerous; petals spirally arranged ..... **Rawsonia**
3b Stamens 10–12; petals whorled ..... **Kiggelaria**
2b Petals or petaloid staminodes without fleshy glands; petals sometimes 0:
4a Petals present:
5a Petals more than sepals:
6a Branches spiny; fruit globose, indehiscent ..... **Oncoba**
6b Branches without spines; fruit ovoid, beaked, dehiscing into 4–8 valves ..... **Xylotheca**
5b Petals as many as sepals:
7a Stamens numerous, not collected in bundles opposite petals; fruit a berry ..... **Scolopia**
7b Stamens equal in number to petals or in bundles opposite petals; fruit usually a capsule:
8a Leaves with 5–9 nerves from base; flowers unisexual; seeds with a red aril ..... **Trimeria**
8b Leaves penninerved; flowers bisexual; seeds without an aril:
9a Style simple with a capitate or minutely bilobed stigma; flowers in pedunculate cymes; stipules deltoid… ..... **Gerrardina**
9b Styles 2–6 or 2–6-cleft; flowers in racemes or panicles; stipules 0 or large and orbicular or reniform.. **Homalium**
4b Petals 0:
10a Leaves with linear or circular pellucid glands ..... **Casearia**
10b Leaves without pellucid glands:

11a Stamens in bundles of 3–10 alternating with disc glands ..... **Trimeria**
11b Stamens not in bundles:
12a Flowers bisexual; style very short; stigma peltate; leaves narrowly elliptic to oblanceolate ..... **Aphloia**
12b Flowers unisexual or more rarely bisexual; styles 2–8; leaves elliptic to obovate or orbicular:
13a Stamens surrounded by a ring of disc glands; ovary incompletely 4–8-locular with 2 ovules per locule, one above the other ..... **Flacourtia**
13b Stamens intermingled with disc glands and alternating with them; ovules 1–6 per placenta..... **Dovyalis**

Aphloia (DC.) Benn. 5326000

Bennett: 192 (1840); Wild: 279 (1960); Killick: 80 (1976).

Trees or shrubs. **Leaves** alternate, narrowly elliptic or oblanceolate, serrated or sometimes incised, petiolate; stipules minute, caducous. **Flowers** bisexual, axillary, solitary, in few-flowered fascicles or racemes. **Calyx** 4–6-parted; sepals somewhat leathery, orbicular, concave, imbricate. **Petals** 0. **Disc** flat. **Stamens** many, arising outside or towards margin of disc; filaments free, terete, longer than sepals; anthers short, without appendages. **Ovary** superior, 1-locular, with few to several ovules on a single, parietal placenta; style short, stigma peltate. **Fruit** a fleshy berry with ± 6 seeds. **Seeds** obovoid or globose; testa incurved, crustaceous; endosperm thin; embryo incurved; cotyledons ovate. $x = 10$.

Species ± 6, Tanzania to KwaZulu-Natal also Madagascar and Mascarenes; 1 in sthn Afr.: *Aphloia theiformis* (Vahl) Benn., Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal.

Casearia Jacq. 5343000

Jacquin: 4, 21 (1760); Wild: 293 (1960); Killick: 91 (1976); Sleumer: 280 (1980).

Trees or shrubs. **Leaves** alternate, petiolate, entire, serrate or with subspinose teeth; stipules small. **Inflorescence** an umbel or flowers fascicled or rarely solitary. **Flowers** bisexual. **Calyx tube** short or subelongated or 0; sepals 4–6, suborbicular, concave, imbricate. **Petals** 0. **Stamens** 6–15, rarely 20–40, free or connate, hypogynous or arising from calyx tube or at base of calyx; filaments linear, connective of anthers sometimes penicillate at apex; staminodes alternating with stamens, sometimes oblong and hairy at apex. **Ovary** superior, 1-locular with few to many ovules on 3 or 4 parietal placentas; style short; stigma capitate or peltate or stigmas 3. **Fruit** a subfleshy or dry capsule, opening by 3 or 4 valves, few- to many-seeded. **Seeds** sometimes angled, with a fleshy aril; testa chartaceous; embryo straight; cotyledons flat, elliptic or suborbicular; endosperm present. $x = 7$ (11) (polyploidy).

Species ± 160, cosmopolitan in tropics; 1 in sthn Afr.: *Casearia gladiiformis* Mast., KwaZulu-Natal, Eastern Cape near East London; in forest, chiefly along the coast.

Dovyalis E.Mey. ex Arn. 5328000

Arnott: 251 (1841); Harvey: 69 (1860); Sleumer: 64 (1972a); Langenegger: 84 (1976).

Aberia Hochst.: 2 (1844); Sonder: 9 (1850); Harvey: 70 (1860).

Trees or shrubs, evergreen or deciduous, dioecious or rarely polygamous, often armed with spines; branches lenticellate. **Leaves** alternate or sometimes fascicled, petiolate; blade 3–5-veined at or near base, margins entire, crenate or serrate; stipules 0. **Male flowers** pedicellate, in fascicles of 2–10, or 5–10 flowers in groups of 3; pedicels surrounded at base by small hairy scales; calyx 2–6-lobed; corolla 0; stamens 10–many; filaments surrounded at base by sparsely to densely hairy nectaries which form a honeycomb structure; anthers bilocular, dehiscing by means of longitudinal slits. **Female flowers** pedicellate, axillary, solitary or in fascicles of 2 or 3; pedicels surrounded at base by small hairy scale-like bracts; calyx deeply 3–7-lobed; lobes sometimes revolute and sometimes fringed with stipitate glands; corolla 0; disc annular, lobed, glutinous, hairy, sparsely hairy or glabrous; ovary unilocular or sometimes incompletely 2- or 3-locular; placentas 2–7, parietal, each placenta with 1 or 2 ovules; styles channelled, as many as placentas. **Fruit** a subglobose to oblong berry, minutely papillose, glabrous or hairy. **Seeds** embedded in fleshy pulp, elliptic to broadly elliptic, glabrous to densely woolly; testa leathery; embryo straight; cotyledons flat, elliptic, sometimes thin and pinnately veined; endosperm present. $x = 10$.

Species ± 20, widespread in Africa and extending to Sri Lanka and New Guinea; 6 recognised in sthn Afr.: Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal, Western and Eastern Cape.

Flacourtia L'Hér. 5327000

L'Héritier de Brutelle: 59 (1786); Wild: 285 (1960); Killick: 82 (1976).

Trees or shrubs, often spiny, usually dioecious. **Leaves** alternate, petiolate, mostly crenate. **Flowers** unisexual, rarely bisexual, in short axillary racemes or solitary. **Calyx** 4–7-partite or sepals free and imbricate. **Petals** 0. **Male flowers**: stamens many; filaments terete; anthers small, elliptic or somewhat quadrate, sometimes subdidymous. **Female flowers**: stamens 0 or few; ovary surrounded by annular or interrupted disc, usually 4–8-locular with 2 superposed ovules in each locule; styles 4–8, short, thick, ± radiating, persistent; stigma retuse or marginate. **Fruit** a berry, 5–16-locular. **Seeds** obovoid or subcompressed; testa bony, rough; embryo straight; cotyledons flat, ovate; endosperm present. $x = 11$ (9, 10) (polyploidy).

Species ± 15, SE Asia, Malaysia, Polynesia, Madagascar, tropical and sthn Afr.; 1 in sthn Afr.: *Flacourtia indica* (Burm.f.) Merr., in Namibia, Botswana, Northern Province, North-West, Mpumalanga, KwaZulu-Natal and Eastern Cape.

Gerrardina Oliv. 5312000

Oliver: 60, t. 1075 (1870); Wild: 287 (1960); Killick: 72 (1976).

Scrambling or erect shrubs or trees. **Leaves** alternate, petiolate; blades elliptic or ovate, sometimes acuminate, serrulate to serrate or crenate-serrate; stipules present. **Inflorescence** a few-flowered axillary cyme on a long peduncle. **Flowers** bisexual. **Calyx tube** campanulate; lobes 5, imbricate, unequal, 2 outer shorter. **Petals** 5, shorter than calyx and alternating with calyx lobes, inserted on margin of disc, deciduous. **Disc** cup-shaped, lining calyx tube. **Stamens** 5, opposite petals, inserted on margin of disc. **Ovary** superior, 1-locular, with 4 pendulous ovules. **Fruit** a dry capsule. **Seeds** 1–4, ellipsoid or obovoid; testa smooth or reticulate.

Species 2, Africa; 1 occurring in Zimbabwe, Malawi, Mozambique and Tanzania; 1 in sthn Afr.: *Gerrardina foliosa* Oliv., Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape (Pondoland).

Homalium Jacq. 5313000

Jacquin 5, 24 (1760); Harvey: 72 (1860); Wild: 287 (1960); Sleumer: 239 (1973); Killick: 74 (1976).

Blackwellia Comm.: 343 (1789); Harvey: 72 (1860).

Trees or shrubs. **Leaves** alternate, petiolate; blade ovate, elliptic, suborbicular or oblong, sometimes large; stipules 0, minute or large. **Inflorescence** an axillary or terminal raceme or panicle. **Flowers** bisexual. **Calyx**: tube turbinate; sepals 7–9, usually narrow, persistent. **Petals** 7–9, inserted in mouth of calyx tube, alternating with and similar to sepals but broader, persistent. **Stamens** solitary or in fascicles of 2 or 3 or more, alternating with glands which are adnate to base of sepals, terete; anthers small, didymous. **Ovary** semisuperior, 1-locular with 2–5 parietal placentas; styles 2–5; stigmas simple or capitate. **Fruit** a semisuperior, leathery capsule, 1- or few-seeded, opening at apex by 2–5 valves. **Seeds** 1 or few. $x = 9, 10, 11$ (1 report each).

Species ± 180, cosmopolitan, tropical and subtropical; 3 in sthn Afr., Namibia, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape near East London.

Kiggelaria L. 5296000

Linnaeus: 1037 (1753); Harvey: 71 (1860); Wild: 265 (1960); Killick: 60 (1976).

Unarmed, dioecious shrubs or small trees. **Leaves** alternate, petiolate, usually elliptic or ovoid, variously toothed, sometimes discolorous; stipules 0. **Flowers** unisexual. **Male flowers** in axillary cymes, on longish pedicels. **Female flowers** solitary on long pedicels. **Sepals** 5-parted, segments narrowly elliptic, valvate, deciduous, puberulous. **Petals** 5, often very similar to sepals, elliptic, imbricate, each with a fleshy gland adnate at base to petals and free above, puberulous. **Stamens** 8–10, free; filaments short; anthers 2-thecous, opening by terminal pores. **Ovary** sessile, ellipsoid, 1 or 2(–5) parietal placentas, densely pubescent; style short and thick, divided into 5 branches. **Fruit** a globose, woody, several-seeded capsule; valves 2–5, pubescent, sometimes tuberculate. **Seeds** subglobose; testa somewhat woody; embryo straight; cotyledons flat, suborbicular; endosperm fleshy.

Species probably only 1, tropical to sthn Afr.: *Kiggelaria africana* L., in all provinces of sthn Afr. and Swaziland and Lesotho; in forest, open forest, kloofs, along streams, scrub and even mountains of the Karoo. Sometimes placed in Kiggelariaceae.

Oncoba Forssk. 5284000

Forsskål: CXIII, 103 (1775); Harvey: 66 (1860); Wild: 275 (1960); Killick: 56 (1976); Hul & Breteler: 255 (1997).

Trees or shrubs, unarmed or with axillary spines; branches glabrous. **Leaves** alternate, simple, petiolate, elliptic or ovate, margin serrate; stipules present. **Flowers** bisexual, terminal or axillary, often on short side-shoots, usually large and showy. **Sepals** 3 or 4, free or united at base, imbricate. **Petals** 5–10 or more, exceeding the sepals, whorled. **Stamens** numerous, free; anthers linear. **Ovary** superior, 1-locular with 2–10 multiovulate parietal placentas; style simple. **Fruit** large, globose, with woody pericarp, smooth, indehiscent, many-seeded. **Seeds** with a leathery testa; embryo with leafy cotyledons. $x = 11$ (10).

Species 4, Arabian Peninsula, tropical Africa; 1 in sthn Afr.: *Oncoba spinosa* Forssk., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland and KwaZulu-Natal.

Genus *Xylotheca* Hochst. regarded as synonymous to *Oncoba* Forssk. by Hul & Bretelcr (1997).

Pseudoscolopia Gilg 5304010

Gilg: 343 (1917); Killick: 70 (1976).

Pseudoscolopia E.Phillips: 416 (1926) name illegitimate.

Shrubs or small trees. **Leaves** opposite, petiolate; blade elliptic, serrate; stipules 0. **Inflorescence** a lax, axillary cyme. **Flowers** bisexual. **Sepals** 4, valvate in bud, persistent. **Petals** 4, subsimilar to sepals, imbricate in bud, persistent. **Stamens** many; filaments free; anthers arcuate. **Ovary** superior, ovoid-globose, 1-locular with 2 or 3 parietal placentas and 1 ovule on each placenta, pubescent; style terete, 2- or 3-fid at apex. **Fruit** a 2- or 3-valved capsule, ovoid, with persistent style. **Seeds** ellipsoid, covered with stellate hairs; embryo straight; cotyledons flat, somewhat obovate; endosperm sparse.

Monotypic: *Pseudoscolopia polyantha* Gilg, confined to sthn Afr.: N KwaZulu-Natal to Eastern Cape border and isolated in kloof in Piketberg District of Western Cape.

Rawsonia Harv. & Sond. 5275000

Harvey & Sonder: 67 (1860); Sim: 12 (1909); Engler: 559 (1921); Gilg: 394 (1925); Wild: 262 (1960); Bamps: 4 (1968); Killick: 54 (1976).

Evergreen shrubs or small trees. **Leaves** alternate, shortly petioled; blade usually elliptic, coriaceous, margins spinulose-serrate; stipules apparently extant (scar present). **Flowers** bisexual or male, in axillary spike-like racemes. **Sepals** 4 or 5, free, unequal, imbricate, concave. **Petals** similar to sepals but larger, with a petaloid scale opposite each petal with a gland on inner face at base. **Stamens** many, in several rows, inner hypogynous, outer attached to base of scales. **Ovary** superior, 1-locular, with a thick fleshy wall; ovules many on 4 or 5 parietal placentas; style almost 0; stigmas 4 or 5. **Fruit** a globose berry. **Seeds** few, subglobose: testa leathery; embryo straight; cotyledons thin, elliptic; endosperm fleshy, copious.

Species probably only 2, tropical and sthn Afr., only *Rawsonia lucida* Harv. & Sond. in sthn Afr., Botswana, Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape.

Scolopia Schreb. 5304000

Schreber: 335 (1789) name conserved; Sim: 125 (1907); Gilg: 418 (1925); Wild: 276 (1960); Bamps 39 (1968); Sleumer: 26 (1972b); Killick: 63 (1976).

Xylosma G.Forst.: 72 (1786). *Phoberos* Lour.: 317 (1790); Harvey: 67 (1860).

Armed or unarmed shrubs or trees. **Leaves** alternate, petiolate or subsessile; blade elliptic, ovate or subrotund, entire or toothed; stipules minute, caducous. **Flowers** bisexual, in axillary racemes, spikes, fascicles or flowers solitary in axils. **Receptacles** usually funnel-shaped. **Sepals** 4–6. **Petals** 4–6, but not always present, alternating with sepals. **Disc** fleshy, with marginal glands. **Stamens** many, borne on surface of disc, longer than petals at anthesis; anthers 2-thecous, often apiculate. **Ovary** superior, 1-locular, with few ovules on 2–5 parietal placentas; style simple, longish; stigma subcapitate or 2–5-lobed. **Fruit** a fleshy berry with several seeds and remains of sepals, petals and stamens at base and style at apex. **Seeds** suborbicular; testa leathery; embryo straight; cotyledons flat, elliptic-oblong; endosperm fleshy or somewhat horny. $x = 11$ (1 report).

Species ± 37, Africa, Madagascar, Comores, Mascarenes, Malaysia and Australia; 5 in sthn Afr., in all countries and provinces.

Trimeria Harv. 5315000

Harvey: 417 (1838); Harvey: 68 (1860); Sim: 132 (1907); Wild: 296 (1960); Sleumer: 302 (1974); Killick: 77 (1976).

Shrubs or trees, dioecious. **Leaves** alternate, simple, petiolate; blade ovate or orbicular, 3–9-nerved from

base; stipules sometimes foliose, caducous. **Flowers** unisexual, small, in axillary racemes, spikes or panicles. **Male flowers**: sepals 3–5, with marginal disc glands opposite each sepal; stamens 9–16, inserted in 3s or 4s alternating with disc glands; anthers small, subglobose. **Female flowers**: sepals and petals ± as in male; ovary superior, 1-locular, with 1 or 2 ovules on 3 parietal placentas; styles 3, short, persistent. **Fruit** a dry, 3-valved capsule, 1–3-seeded. **Seeds** ellipsoid, testa leathery.

Species 5, Africa; 3 in tropical East Africa and Zimbabwe; 2 in sthn Afr., Northern Province, Mpumalanga, Swaziland, KwaZulu-Natal, Eastern and S Western Cape as far as George.

Xylotheca Hochst. 5284010

Hochstetter: 69 (1843); Gilg: 402 (1925); Wild: 272 (1960); Killick: 58 (1976); Hul & Breteler: 255 (1997).

Oncoba Forssk. in part: 103 (1775); Harvey: 66 (1860).

Shrubs or trees, unarmed. **Leaves** alternate, petiolate; blade elliptic to broadly elliptic or obovate; stipules present. **Flowers** male or bisexual, solitary, cymose or subumbellate in upper leaf axils or terminal on branchlets, large, sweet-scented. **Calyx** of usually 3 sepals, concave, free or almost free, imbricate, glabrous or pubescent. **Petals** 7–14, free or narrowed to base, imbricate. **Stamens** many; filaments free; anthers linear, dehiscing longitudinally from above. **Ovary** rudimentary in male flowers, 1-locular, multiovulate; ovules pendulous from ± 7 parietal placentas; style terminal; stigmas equalling number of placentas, short, spreading. **Fruit** a woody capsule, splitting into ± 8 longitudinal valves; style persists as hard woody point. **Seeds** many, sometimes with a resinous aril.

Species ± 10, Africa, Madagascar; 1 in sthn Afr.: *Xylotheca kraussiana* Hochst., Northern Province, Mpumalanga, KwaZulu-Natal.

Frankeniaceae

(Dilleniidae—Violales)

Compiled by C.L. Bredenkamp

Halophytic, low, spreading, woody shrublets, rarely annuals, often hairy and salt-encrusted. **Leaves** opposite, decussate below, in verticils of 4 above, with leaf clusters (from suppressed branchlets) bearing flowers in their axils, sessile, subsessile or shortly petiolate, connected by an amplexicaul, usually ciliate, stipular ridge or sheath; lamina small, linear to ovate, flat or with margins rolled back, often tightly so and thus terete or sausage-shaped, glabrous or pubescent, punctate. **Flowers** regular, usually bisexual, in forks of branches (determinate), sessile, small, persistent, scattered all over or aggregate in terminal dichasia (leaves subtending flowers in dichasia not differing from ordinary leaves). **Calyx** tubular, induplicate, 4- or 5-fid with prominent ribs, glabrous, puberulous and occasionally with long scattered setae. **Petals** 5, free, imbricate, with an adnate scale or ligule attached to inside of claw, pink, mauvy pink or white. **Stamens** 6 (rarely 4 or 5); filaments connivent and expanded below, filiform above; anthers 2-locular, 2-partite or nearly so, versatile. **Ovary** superior, 1-locular, with parietal placentas bearing 1–many ovules; style terete, with 3 stigmatic lobes. **Capsule** enclosed in calyx, dehiscing longitudinally, ovoid to narrowly ovoid. **Seeds** small, ellipsoid-fusiform, papillate or smooth, albuminous, maturing very early. $x = 5$ (polyploidy).

Genera 2, species 81, cosmopolitan; sthn Afr.: genus 1 (*Frankenia*, the largest and most widespread), species 3.

Harvey: 3 (1860); Roessler & Schreiber: 1 (1968); Obermeyer: 32 (1976).

Frankenia L. 5233000

Linnaeus: 331 (1753); Linnaeus: 154 (1754); Harvey: 114 (1860); Roessler & Schreiber: 1 (1968); Obermeyer: 33 (1976).

Description as for family.

Species ± 80, Mediterranean, along the Atlantic seaboard, western and southern parts of Africa and Australia (± 45 species) to Asia and the Americas; 3 in sthn Afr., two endemic, the third almost cosmopolitan and weed-like in behaviour. Halophytes, usually gregarious, found along the coast and further inland, rarely in nonsaline habitats.

Fumariaceae

(Magnoliidae—Papaverales)

Compiled by M. Jordaan

Annual, ± glabrous herbs with watery sap, often climbing by means of tendrils, often slightly fleshy, arising from a taproot, sometimes with one-celled hairs. **Leaves** alternate, compound, pinnately to ternately divided, often ending in a tendril; petiole sometimes vaginate at base or with membranous appendages; stipules 0. **Inflorescences** terminal racemes on flowering stems, pedunculate; bracteate. **Flowers** bisexual, irregular or disymmetric, small. **Sepals** 2, petaloid or herbaceous, often scale-like, sometimes hyaline, large and ovate, not covering petals in bud, soon deciduous. **Petals** 4, outer and inner whorl very dissimilar, imbricate, ± connivent, 2 outer often saccate or spurred at base, 2 inner narrower and sometimes coherent at apex. **Stamens** 2 or 4, free and opposite petals, or 6 connate into 2 bundles; filaments broad, hyaline or petaloid, nectariferous at base; anthers connivent, adhering to stigma, median anthers 2-thecous, lateral anthers 1-thecous, rounded-elliptic to oblong, dehiscing by slits. **Ovary** superior, of 2 carpels, syncarpous, 1-locular, with parietal placentation; ovules 1–many, pendulous, campylotropous, bitegmic, crassinucellate; style slender; stigma 1, compressed, with 2 lobes or apical horns, and/or 2–8 papillar stigmatic surfaces. **Fruit** various, capsular or a nut, sometimes bladdery or membranous. **Seeds** 1–many, small, usually shiny, with or without a crest.

Genera ± 17; species ± 530; mainly in northern, temperate regions; sthn Afr.: genera 4 (1 exotic), species 9 (2 exotic).

Candolle: 105 (1821); Chamisso & Schlechtendal: 556 (1826), as Fumariaceae; Endlicher: 858 (1839), as Papaveraceae subfamily Fumarioideae; Fedde: 5 (1936), as Papaveraceae; Lidén: 42 (1986), as Fumariaceae; Lidén: 310 (1993), as Fumariaceae.

Key to genera

1a Plants without tendrils; fruit ± globose, 1-seeded ..... ***Fumaria**

1b Plants with tendrils; fruit a many-seeded bladdery capsule or, if 1-seeded, ± discoid or trigonous:

2a Fruit a many-seeded bladdery capsule ..... **Cysticapnos**

2b Fruit a small nut:

3a Pedicels very short; fruit ± discoid with persistent style ..... **Discocapnos**

3b Pedicels long, hair-like; fruit trigonous with caducous style ..... **Trigonocapnos**

Cysticapnos Mill. 2858020

Miller: [427] (1754); Endlicher: 860 (1839); Harvey: 16 (1860) under *Corydalis*; Fedde: 285 (1924); Fedde: 136 (1936); Adamson: 405 (1950); Lidén: 105 (1986); Lidén: 316 (1993).

Phacocapnos Bernh.: 664 (1838).

Soft, annual, glabrous herbs, climbing with tendriliform ultimate leaflets. **Inflorescence**: pedicels short; bracts small, partly scarious. **Flowers** 2-lipped, white or rosy pink. **Sepals** lateral, persistent, much shorter than petals, scale-like. **Petals** free at base, partly connate at tips, posterior one prolonged into a very short, obtuse spur; tube when present shortly campanulate. **Stamens** 6, in 2 groups, filaments of each group variously fused, lateral, 3-fid. **Ovary** sometimes shortly and bluntly stalked, elliptic or oblong, with 2 narrow keels; ovules many; style linear; stigma ± capitate, sometimes deeply cleft or with 2 simple papillae. **Fruit** a membranous capsule (vesicular in *C. vesicaria* (L.) Fedde), thin-walled, inflated, ovoid, up to about 30 mm long, splitting from apex. **Seeds** many, small, lenticular, with a black, shiny testa, without elaiosomes. $x = 7, 8$ (polyploidy).

Species 5, confined to sthn Afr.: S Namibia, Mpumalanga, Free State, KwaZulu-Natal, Lesotho, Northern Cape (Namaqualand, including Richtersveld), Western and Eastern Cape.

Discocapnos Cham. & Schltdl. 2861010

Chamisso & Schlechtendal: 569 (1826); Endlicher: 860 (1839); Harvey: 18 (1860); Fedde: 144 (1936); Adamson: 406 (1950); Lidén: 104 (1986); Lidén: 316 (1993).

Soft, climbing, ± glabrous annual herbs, with tendriliform ultimate leaflets. **Inflorescences** many-flowered racemes, opposite upper leaves, peduncles lengthening as fruit ripens; pedicels very short, equal. **Flowers** small, pink, with short triangular spur. **Petals**: posterior one spurred at base, inner ones with forwardly projecting prominent triangular wings. **Ovary** elliptic; style filiform, curved; stigma with two small erect papillae. **Fruit** (utricle) 1-seeded, orbicular, flattened, membranous, with a central nerve and margin wing-like, indehiscent, tipped with base of persistent style. **Seed** lenticular, beaked, shiny, with thick black testa.

Monotypic; sthn Afr.: *Discocapnos mundtii* Cham. & Schltdl., Western Cape.

*Fumaria L. 2861000

Linnaeus: 699 (1753); Linnaeus: 314 (1754); Chamisso & Schlechtendal: 568 (1826); Endlicher: 861 (1839); Harvey:18 (1860); Fedde: 141 (1936); Exell: 181 (1960); Henderson & Anderson: 148 (1966); Meikle: 88 (1977); Lidén: 42 (1986); Lidén: 310 (1993); Stern: 356 (1997).

Annual herbs, often with slender, flexuose, sprawling or climbing stems from taproots. **Leaves** all cauline, four

times pinnately divided, sometimes with sensitive petiolules; petioles often twining. **Inflorescence** an elongated raceme, terminal on main stem and leaf-opposed branches; pedicels short; bracts usually persistent. **Flowers** bilaterally symmetric, white or pink to purple. **Sepals** peltate with attachment near base, ovate, base rounded, margin ± lacerate, apex acute to acuminate. **Petals**: upper petal spurred, 2 inner petals and a lower petal not spurred. **Stamens** 6, in 2 bundles of 3; filaments of each bundle completely connate, adhering basally to petals. **Ovary** superior, ovoid; ovules 1 or 1 on each placenta; style promptly deciduous after anthesis, elongate; stigma with two big papillae. **Fruit** an indehiscent nutlet, globular, hard-walled, with two apical pits. **Seed** 1, with thin brown testa; endosperm with a hemisperical apical depression; elaiosome 0. $x = 7, 8$ (high polyploidy).

Species ± 50; mostly Mediterranean, also to central Asia and 1 in the Himalayas, Atlantic islands, 1 in tropical Africa; 2 in sthn Afr.: **Fumaria muralis* Sond. ex Koch subsp. *muralis* (most common one) and **F. parviflora* Lam.; widespread weeds, often in lucerne lands.

Trigonocapnos Schltr. 2862000

Schlechter: 131 (1899); Fedde: 140 (1936); Lidén: 105 (1986); Lidén: 316 (1993).

Soft, annual, glabrous, climbing herbs, with tendriliform ultimate leaflets. **Inflorescence** a slender raceme 70–100 mm long, up to 30-flowered, opposite upper leaves; pedicels long and capillary, usually curved near apex with age. **Flowers** small, pink, with short ascending triangular spur. **Calyx** minute, 2-segmented. **Petals**: posterior one spurred at base. **Fruit** small, ± oblong, 3–4 mm long, asymmetrical, trigonous with caducous style. **Seed** 1, oblong with thin brown testa.

Monotypic: *Trigonocapnos lichtensteinii* (Cham. & Schltdl.) Lidén, Northern Cape (Niewoudtville and Sutherland), Western Cape (Vanrhynsdorp to Clanwilliam).

Geissolomataceae

(Rosidae—Celastrales)

Compiled by C.L. Bredenkamp

Xeromorphic, evergreen shrublets or shrubs with somewhat 4-angled branchlets. **Leaves** decussate, simple, subsessile, cordate-ovate, silky when young, glabrescent; stipules petiolar, minute. **Flowers** bisexual, regular, 4-merous, in short, much-branched, bracteate, axillary racemes along upper twigs; bracts 4 or 6, 2 lowest smallest, persistent; axillary bracteoles sometimes present. **Perianth** 4-partite, persistent, rose-coloured; segments imbricate, 2 outer clasping the inner. **Stamens** 8, arising from base of perianth and slightly shorter than it; filaments linear; anthers elliptic, dorsifixed, versatile, 2-thecous, bilobed at base. **Ovary** superior, 4-locular, narrowly 4-winged, with 2 collateral, pendulous ovules in each locule, rarely 1 ovule aborted; styles 4, twisted at base, narrowed and cohering upwards, longer than ovary; stigmas small. **Fruit** a 4-locular capsule, dehiscing by 4 longitudinal sutures on wings of locules. **Seed** single in each locule, whitish, smooth, shiny, with brittle testa.

Genus 1, species 1, Western Cape.

Jussieu: 15 (1846); Stephens: 98 (1915); Dahlgren & Rao: 207 (1969).

Geissoloma Lindl. ex Kunth 5422000

Kunth: 678 (1830); Stephens l.c.; Dahlgren & Rao l.c.

Description as for family.

Species 1: *Geissoloma marginatum* (L.) A.Juss., Western Cape: Swellendam to Riversdale District.

Gentianaceae

(Asteridae—Gentianales)

Compiled by C.L. Bredenkamp & J.E. Victor

Annual, biennial or perennial herbs, erect or straggling, rarely shrublets or trees. **Leaves** mostly opposite, sometimes verticillate, very rarely alternate; stipules 0. **Inflorescence** cymose or rarely racemose, flowers sometimes solitary or crowded into fascicles or globose heads, rarely verticillate (*Enicostema*). **Flowers** bisexual or rarely unisexual, regular or rarely slightly irregular, (3)4- or 5(6–16)-merous, often heterostylous. **Calyx** mostly gamosepalous, usually with a short to well developed tube and imbricate or sometimes valvate or open lobes, sometimes lobes much reduced or suppressed, rarely sepals nearly free. **Corolla** gamopetalous, usually with contorted lobes, usually as many as calyx lobes. **Stamens** arising on corolla tube or in throat, free or rarely connate by anthers, as many as corolla lobes and alternating with them; anthers sometimes twisted, opening by longitudinal slits, rarely by terminal pores (*Exacum*). **Disc** 0, annular or of 5 hypogynous glands. **Ovary** superior, either 1-locular with parietal placentas, or 2-locular by intrusion of locular walls and with axile placentation. **Fruit** a capsule, dehiscing septicidally, rarely berry-like, usually many-seeded. **Seeds** few to many, with fleshy or oily endosperm.

Genera 89, species ± 1200, fairly cosmopolitan and mostly in temperate and subtropical regions; sthn Afr.: genera 9, species 70. *Nymphoides* (6545000) and *Villarsia* (6544000) are dealt with under Menyanthaceae. *Faroa salutaris* Welw. is recorded from sthn Afr. by Marais & Verdoorn (1963) and by Paiva & Nogueira (1990). No specimens of this species from sthn Afr. were seen.

Baker & Brown: 544 (1903); Marais & Verdoorn: 171 (1963); Friedrich-Holzhammer: 1 (1967); Paiva & Nogueira: 3 (1990); Takhtajan: 426 (1996).

Key to genera

1a Trees or shrubs ..... **Anthocleista**
1b Herbs or suffrutices:
2a Ovary 2-locular through intrusion of locular wall, the placentas eventually appearing axile:
3a Flowers mainly blue, rarely pink or white; corolla tube short, broadly cylindrical; anthers coriaceous ..... **Exacum**
3b Flowers mainly yellow, sometimes cream or white; corolla tube cylindrical or funnel-shaped; anthers membranous… ..... **Sebaea**
2b Ovary 1-locular, with parietal or sometimes intrusive placentas:
4a Flowers 3-merous ..... **Pycnosphaera**
4b Flowers 4- or 5-merous:
5a Corolla lobes without nectaries:
6a Flowers sessile or subsessile, solitary or in axillary clusters or heads:
7a Flowers in clusters in axil of each bract ..... **Enicostema**
7b Flowers solitary, rarely 2 together in axil of a floral bract ..... **Neurotheca**
6b Flowers in terminal, simple or compound cymes:
8a Calyx keeled; plants glabrous ..... **Chironia**
8b Calyx without keels; plants pubescent ..... **Orphium**
5b Corolla lobes with fringed nectaries near their base; flowers in lax cymes ..... **Swertia**

Anthocleista Afzel. ex R.Br. 6466000

Brown: 449 (1818); Leeuwenberg: 1 (1961); Verdoorn: 135 (1963) under Loganiaceae; Van Wyk & Van Wyk: 276 (1997) under Loganiaceae.

Trees, tall, deciduous, with straight, clean bole. **Leaves** opposite, usually large, 0.13–1.15 m long, oblong, narrowing towards base in lower half, clustered at ends of branches, glabrous. **Inflorescence** terminal in trichotomously branched, cymose panicles with stout branches. **Flowers** large, white or dull yellow. **Calyx** deeply 4-lobed, coriaceous, imbricate. **Corolla** with tube usually ± cylindric; lobes 8–16, linear, lanceolate, or oblong-linear, imbricate and contorted. **Stamens** as many as corolla lobes; filaments united at base to form a short ring or cup; anther cells parallel. **Ovary** on a fleshy disc, 2-locular or spuriously 4-locular with many ovules in each locule; style long or short; stigma oblong, globose or shortly cylindric. **Fruit** a subglobose or oblong-ellipsoid berry with coriaceous pericarp. **Seeds** many, minute, embedded in fleshy placentas. $x = 6$ (10, 15) (high polyploidy).

Species ± 50 mostly in tropical Africa, Madagascar and Mascarene Islands; 1 in sthn Afr.: *Anthocleista grandiflora* Gilg; subtropical forest of Northern Province, Mpumalanga and Swaziland.

Chironia L. 6503000

Linnaeus: 189 (1753); Hill & Prain: 1096 (1909); Marais & Verdoorn: 212 (1963); Hilliard & Burtt: 303 (1983); Paiva & Nogueira: 32 (1990).

Annuals, suffrutices, rarely shrublets. **Stems** erect to straggling, simple or branched at apex, occasionally much-branched, rarely radicant. **Leaves** cauline and in a basal rosette (sometimes soon deciduous); the cauline ones opposite, usually in distant pairs, linear, linear-lanceolate, ovate-lanceolate to ovate-cordate, sometimes much reduced, sessile, or amplexicaul, rarely cuneate to a petiole-like base. **Flowers** in a lax, few- to many-flowered cyme, sometimes solitary. **Calyx** 5-lobed, lobes with a distinct midrib, sometimes with a keel decurrent on tube as a wing, without basal glands. **Corolla**: tube campanulate or cylindric; lobes 5, contorted in bud, spreading, usually as long as or longer than tube, persistent and enfolding capsule like a cap, rose to magenta-pink, rarely white. **Stamens** 5, arising from throat of corolla; filaments short, usually flattened with a broad base; anthers straight or twisted. **Ovary** 1-locular, globose to cylindric-globose; placentation parietal; ovules many; style simple, terete, usually becoming hooked at apex; stigma subcapitate or 2-lobed. **Capsule** septici-

dally 2-valved, rarely berry-like. **Seeds** many, subglobose; testa foveolate. $x = 17$ (1 report, polyploidy).

Species ± 30 throughout tropical and subtropical Africa and Madagascar; 16 in sthn Afr., Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Lesotho, Northern and Eastern Cape

Enicostema Blume 6484000

Blume: 848 (1826); Hill & Prain: 1117 (1909); Marais & Verdoorn: 237 (1963); Paiva & Nogueira: 49 (1990).

Erect, perennial herbs. **Leaves** opposite. **Flowers** small, many, in axillary clusters. **Calyx** 5-lobed; lobes keeled. **Corolla** 5-lobed to ± midway or deeper, white, drying yellowish. **Stamens** 5, arising from corolla tube below sinuses; filaments with a double-hooded scale at base; anthers erect, not twisted, acute. **Ovary** 1-locular, obtuse; style short, subulate; stigma terminal, capitate. **Capsule** 2-valved, splitting septicidally. **Seeds** many, reticulate. $x = 19$.

Species 3, 1 from America, 1 from Madagascar, 1 from Africa and Asia; 1 in sthn Afr.: *Enicostema hyssopifolium* (Willd.) I.C.Verd., Namibia, Botswana, Northern Province, Mpumalanga, Swaziland and N KwaZulu-Natal.

Exacum L. 6479000

Linnaeus: 112 (1753); Baker & Brown: 545 (1903); Marais & Verdoorn: 211 (1963); Klackenberg: 85 (1985); Paiva & Nogueira: 8 (1990).

Annual herbs, rarely perennial. **Leaves** entire. **Flowers** in dichotomous, terminal and axillary cymes. **Calyx** 4- or 5-lobed; lobes usually broadly winged. **Corolla** 4- or 5-lobed, blue, pink or white; tube short, broadly cylindrical. **Stamens** 4 or 5, arising below sinuses; anthers dehiscing by terminal pores or slits. **Ovary** 2-locular by intrusion of locular walls; style short; stigma capitate. **Capsule** 2-valved, globose; placenta appearing axile. **Seeds** many, minute. $x = 17, 31$ (9, 14, 15) (polyploidy).

Species 65, mainly in Madagascar, Socotra, Sri Lanka and S India, but also SE Asia, New Guinea and Australia, 2 on African continent; 1 in sthn Afr.: *Exacum oldenlandioides* (S.Moore) Klack., Northern Province and Mpumalanga.

Neurotheca Salisb. ex Benth. 6491000

Bentham: 812 (1876); Baker & Brown: 559 (1903); Paiva & Nogueira: 4 (1990).

Herbs, mainly rather wiry annuals. **Leaves** opposite. **Flowers** solitary, rarely 2 in each axil, in long or short racemes or crowded in terminal corymb-like clusters. **Calyx** tubular, 4-lobed, 8–12-ribbed. **Corolla** white, 4-lobed; tube narrowly funnel-shaped or cylindric; lobes ovate, contorted. **Stamens** 4, arising below middle of corolla tube and reaching to its mouth or slightly exserted. **Ovary** 1-locular, oblong; placentas very slightly intruded; ovules many; style filiform; stigma 2-lobed. **Capsule** 2-valved, membranous. **Seeds** minute, reticulate. $x = 15$ (1 report).

Species 3, tropical Africa; 1 in sthn Afr.: *Neurotheca schlechteri* Gilg ex Baker & N.E.Br., KwaZulu-Natal.

Orphium E.Mey. 6504000

Meyer: 181 (1837); Hill & Prain: 1095 (1909); Marais & Verdoorn: 236 (1963).

Suffrutices, erect, virgately branched, ± pubescent; branches leafy to apex. **Leaves** opposite, sessile, rather crowded. **Inflorescence** a lax cyme, terminal or in axils of upper leaves, sometimes flowers solitary. **Calyx** 5-lobed, fitting loosely round corolla base; tube short, campanulate, with annular, crenulate disc at base within; lobes oblong, mucronate, without a dorsal keel. **Corolla** deep pink, rarely white; tube as long as or slightly longer than loosely enveloping calyx; lobes 5, oblong to suborbicular, slightly longer than tube. **Stamens** 5, arising below mouth of tube; anthers erect, slightly spirally twisted. **Ovary** 1-locular, with parietal placentation, oblong-elliptic in outline, shortly narrowing into a long style; stigma terminal, peltate. **Capsule** splitting septicidally.

Species 1: *Orphium frutescens* (L.) E.Mey., Western Cape.

Pycnosphaera Gilg 6486000

Gilg: 333 (1903); Baker & Brown: 565 (1903); Paiva & Nogueira: 47 (1990).

Annual or perennial herbs. **Stems** erect, unbranched or corymbosely branching at apex. **Leaves**: basal leaves oblong-lanceolate or oblong-elliptic; stem leaves from elliptic (lower ones), oblong-lanceolate (middle), to linear or linear-oblong (upper), entire. **Inflorescence** dense bracteate heads, solitary or corymbosely arranged at end of stems and branches. **Calyx** unequally 3-partite; lobes carinate. **Corolla** blue; tube cylindric, with 3 spreading lobes. **Stamens** 3; filaments filiform, arising from sinuses of corolla lobes, dilated into a small hood at their base; anthers cylindric-ovoid. **Ovary** 1-locular, narrowly ellipsoid; ovules many; style filiform; stigmas 2, linear-oblong. **Capsule** 2-valved, oblong-elliptic. $x = 15$ (1 report).

Monotypic, tropical Africa: *Pycnosphaera buchananii* (Baker) N.E.Br., Botswana (Okavango Swamps).

Sebaea Sol. ex R.Br. 6481000

Brown: 451 (1810); Hill & Prain: 1057 (1909); Marais & Verdoorn: 172 (1963); Hilliard & Burtt: 277 (1982); Hilliard & Burtt: 304 (1983); Paiva & Nogueira: 10 (1990).

Lagenias E.Mey.: 186 (1837). *Belmontia* E.Mey.: 183 (1837). *Exochaenium* Griseb.: 55 (1845); Hill & Prain: 1093 (1909).

Annual, biennial, or perennial herbs, erect or procumbent; stems frequently 4-angled or -winged, glabrous, papillose-puberulous, or scabrid along angles. **Leaves** opposite, radical or cauline, well developed or reduced, linear-lanceolate to suborbicular, often sessile and cordate at base. **Flowers** borne in 1–many-flowered cymes; cymes solitary or arranged in corymbs. **Calyx** 4- or 5(6)-segmented or shortly tubular; segments lanceolate to ovate or obovate, frequently with thin, hyaline margin, entire or ± erose, keeled or winged, sometimes papillose, bristly or scabrid along keels or wings. **Corolla** 4- or 5(6)-lobed, yellow, cream or white; tube cylindric or funnel-shaped, long or short; lobes spreading, contorted in aestivation, frequently clawed. **Stamens** 4 or 5; filaments short or long, arising in corolla sinuses or in tube; anthers included in corolla tube or exserted, with 0–3 minute or conspicuous glands. **Ovary** 2-locular with many axile ovules, ovoid, obovoid, or almost globose; style filiform, included or exserted, often with additional stigmatic swellings which are free from or confluent with stigma; stigma capitate, clavate, or long-linear, 2-lobed or entire. **Capsule** septicidally 2-valved, ovoid or obovoid, membranous or coriaceous. **Seeds** ridged or frilled.

Species ± 159, mainly Africa and Madagascar, 1 extending to India and China, 2 in Australia and New Zealand; 53 in sthn Afr., widespread in temperate habitats, Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Lesotho, Northern and Eastern Cape.

Swertia L. 6512000

Linnaeus: 226 (1753); Hill & Prain: 1118 (1909); Marais & Verdoorn: 240 (1963); Paiva & Nogueira: 26 (1990).

Annual or perennial herbs. **Leaves** opposite, sessile, cauline and basal; basal leaves often narrowed at base

into a petiole and often disappearing early or undeveloped; cauline leaves usually distant. **Flowers** in terminal cymes. **Calyx** 4- or 5-lobed, divided almost to base. **Corolla** 4- or 5-lobed, divided almost to base, white, blue, or yellow. **Stamens** 4 or 5, arising in sinuses, shorter than corolla lobes; anthers small. **Ovary** 1-locular, oblong in outline; style short or none; stigma 2-lobed. **Capsule** 2-valved, splitting septicidally. $x = 13$ (7, 8, 9, 10, 11, 12) (polyploidy, B-chromosomes).

Species ± 100, Europe and America; 1 in sthn Afr.: *Swertia welwitschii* Engl. (= *S. stellarioides* (Welw.) Ficalho); Northern Province, Gauteng, Mpumalanga, Swaziland, KwaZulu-Natal and Lesotho.

Geraniaceae

(Dilleniidae—Malvales)

Compiled by L.L. Dreyer & A.M. Makwarela

Herbs, geophytes, subshrubs or shrubs; stems often with jointed nodes; usually with aromatic oils in multicellular, capitate-glandular hairs. **Leaves** opposite or alternate, usually lobed, often palmately or pinnately dissected or compound, rarely simple and ± entire; stipules usually present. **Flowers** bisexual, regular or irregular; on 1- or 2-flowered peduncles or in few- to many-flowered cymose or umbellate inflorescences, rarely solitary and axillary; bracts present or 0. **Sepals** (4)5, free or rarely connate to middle, imbricate, rarely valvate, sometimes (*Pelargonium*) with a tubular, nectariferous spur ± fused with pedicel. **Petals** (2, 4)5 (or 0 by abortion), free, equal or unequal, hypogynous or subperigynous, imbricate, rarely contorted. **Disc** of 5 nectary glands outside stamens alternating with petals often present, but 0 in *Pelargonium* which has a nectariferous tube. **Stamens** usually twice (rarely 3 times) as many as petals, sometimes reduced to 2, all fertile or some sterile; filaments free or ± connate at base, sometimes connate into 5 bundles of 3 each; anthers versatile, 2-thecous, opening by longitudinal slits. **Ovary** superior, consisting of (2)3–5 1-locular carpels with slender styles fused around a central axis (beak, rostrum or carpophore) enlarging in fruit; with 1 or 2 pendulous, axile ovules per locule; styles free at top, with ligulate to clavate, rarely capitate stigmas. **Fruit** a 3–5-lobed, rarely 8-lobed schizocarp, breaking up from base of beak into 1(2)-seeded mericarps, usually with persistent, elastic styles as long awns often twisting spirally. **Seeds**: embryo usually curved; endosperm 0 or sparse.

Genera 11, species ± 800, fairly cosmopolitan in subtropical and temperate regions; sthn Afr.: genera 5, species ± 290.

Harvey: 254 (1860); Knuth: 129 (1912); Müller: 130 (1963); Merxmüller & Schreiber: 64 (1966); Van der Walt: 1 (1977); Van der Walt & Vorster: 1 (1981); Van derWalt &Vorster: 1 (1988).

Key to genera

1a Flowers irregular; stamens 10, usually only 2–7 with anthers ..... **Pelargonium**

1b Flowers regular or very nearly so; stamens 5–15, all perfect, or alternate ones without anthers:

2a Stamens 5 fertile and 5 staminodes ..... **Erodium**

2b Stamens 10–15 fertile:

3a Stamens 10 ..... **Geranium**

3b Stamens 15:

4a Stems herbaceous or slightly woody, rarely subsucculent, without spines ..... **Monsonia**

4b Stems thick and ± succulent; petioles spinescent ..... **Sarcocaulon**

Erodium L'Hér. 3927000

L'Héritier: 414 (1789); Harvey: 258 (1860); Knuth: 221 (1912); Venter & Verhoeven: 79 (1990).

Rosulate or caulescent herbs or shrublets; stems pilose, hirsute or hispid and glandular. **Leaves** alternate, subopposite or opposite, those of a pair unequal, smaller ones with lateral branch and/or inflorescence in axil; petiolate; lamina simple or compound, elliptic, very broadly ovate to oblong-ovate or deltate-ovate; pinnae ovate or obliquely ovate, dentate to serrate; stipules usually paired. **Inflorescence** a cymose pseudo-umbel; bracts ovate or subulate, mostly scarious, whitish to straw-coloured. **Flowers** regular, hypogynous. **Sepals** 5, free, persistent, enlarged around fruit. **Petals** 5, obovate, apex

obtuse; white, pink or violet. **Stamens** 10; 5 fertile, free, hypogynous, antisepalous, alternating with 5 staminodes; anthers introrse, oblong-elliptic. **Disc** of 5 oblong glands, between fertile stamens and sepals. **Ovary** deeply 5-lobed, 5-locular, hispid, with 2 axile ovules per locule, lower ovule abortive; stigmas 5, filiform. **Mericarps** 5, 1-seeded; head obliquely ovoid, tapering towards spinose base, hispid with ascending hairs; awns crested, spirally twisted. **Seeds** brown. $x = 9$, 10 (7, 8) (polyploidy).

Species 60, Europe, Mediterranean to central Asia, temperate Australia and south tropical South America; 6 in sthn Afr., widespread.

Geranium L. 3924000

Linnaeus: 676 (1753); Harvey: 257 (1860); Knuth: 43 (1912); Hilliard & Burtt: 171 (1985).

Annual or perennial herbs or occasionally undershrubs; branches often jointed. **Leaves** opposite or alternate, palmately lobed or dissected, with segments variously lobed to entire; petiolate; stipulate. **Flowers** regular, 1- or 2-nate on axillary peduncles; peduncle rarely aborted. **Sepals** 5, imbricate, usually apiculate, usually pubescent and often with glandular hairs and 3 prominent veins. **Petals** 5, sessile, hypogynous, imbricate, usually obovate and notched on apical margin and with few hairs at base. **Disc** of 5 glands alternating with petals. **Stamens** 10, usually in 2 series, rarely 5 anthers aborted; filaments shortly connate or free. **Ovary** 5-locular, 5-lobed, with 2 ovules per locule, usually with gland at base of each locule, usually villous. **Mericarps** 1-seeded; awns arched, generally glabrous. **Seeds** often oblong in outline, sometimes with 2 depressions; testa with lace-like markings. $x = 7$ (8, 9, 10, 11, 13, 17) (high polyploidy, B-chromosomes).

Species 300, temperate regions, montane tropics; 31 in sthn Afr., widespread.

Monsonia L. 3925000

Linnaeus: 507, 508 (1767); Harvey: 254 (1860); Knuth: 290 (1912); Venter: 1 (1979).

Prostrate, decumbent or erect, suffrutescent or annual, glanduliferous, hairy herbs; stems herbaceous to woody, terete or somewhat compressed. **Leaves** alternate, subopposite or opposite, pairs mostly unequal; lamina simple (rarely compound), palmately or pinnately veined; petiolate; with paired stipules. **Inflorescence** cymose, subumbellate, bracteate, 1–15-flowered. **Flowers** regular. **Sepals** 5, free or connate, imbricate, persistent, margin membranous, apex mucronate, with concealed spurs or pouches when connate. **Petals** 5, free, imbricate or contorted, main veins palmately arranged. **Stamens** 15, mostly all perfect, monadelphous, in 5 basely connate groups or rarely pentadelphous with 5 groups of 3 basely connate filaments, less often all equal; filaments subulate, ciliate; anthers glabrous, dorsifixed. **Ovary** sessile or subsessile, deeply 5-lobed, 5-locular, with 2 ovules per locule; lower ovule abortive; stigmas 5, subterete and linear, inner side with papillose receptive surface. **Mericarps** 1-seeded, awns spirally twisted, crested or crested and plumose. **Seeds** brown, smooth or obscurely reticulate; embryo folded. $x = 9$, 12, 13 (1 report each).

Species ± 40, Africa, Madagascar and SW Asia; 20 in sthn Afr., widespread.

Pelargonium L'Hér. 3928000

L'Héritier: 417 (1789); Harvey: 259 (1860); Knuth: 316 (1912); Van der Walt: 1 (1977); Van der Walt & Vorster: 1 (1981); Van der Walt & Vorster: 1 (1988).

Perennial shrubs, subshrubs, acaulescent geophytes, scramblers, climbers or annual herbs; stems erect or decumbent, mostly herbaceous, sometimes woody, subsucculent or succulent, sometimes viscid, variously hairy, often glandular, sometimes with persistent spine-like stipules or petioles. **Leaves** alternate, entire to much dissected or compound, sometimes heteroblastic, variously hairy, usually petiolate, mostly glandular, often aromatic; stipulate. **Inflorescence**: branches with normal or smaller foliar leaves; pseudo-umbels (1)2–many-flowered; involucral bracts present; peduncles of varying lengths. **Flowers** irregular to almost regular. **Hypanthium** present, including nectariferous tube, ± fused with pedicel, which opens at base of posterior sepal, hypanthium base often thickened. **Sepals** 5, imbricate, connate at base, apices sometimes reflexed. **Petals** usually 5, rarely 4, seldom 2; posterior petals 2; anterior petals 0–3; petals imbricate, unguiculate or sessile, rarely lacerate. **Stamens** 10, connate at base, 2–7 fertile; anthers dorsifixed. **Ovary** 5-lobed, 5-locular, rostrate; ovules 2 per locule; style of varying length; stigmas 5, filiform and reflexed. **Mericarps** 1-seeded, tapering from apex to base, ending in a spirally twisted awn. **Seeds** ± oblong-ovoid; endosperm lacking; embryo curved. $x = 11$ (8, 9, 10) (high polyploidy).

Species ± 270, S, E and NE Africa, Asia, St Helena, Tristan da Cunha, Madagascar, Australia and New Zealand; ± 219 in sthn Afr., widespread but concentrated in Western Cape.

The genus *Pelargonium* has been under revision by the research team of the University of Stellenbosch since 1974. This project, coordinated by J.J.A. van der Walt, has resulted in numerous publications by various authors. Most of these were published either in the *South African Journal of Botany*, *Bothalia* or *Plant Systematics and Evolution*. Not all of these references are cited here, and the reader is referred to Dreyer & Germishuizen (1993) for a more comprehensive bibliography.

Sarcocaulon (DC.) Sweet 3926000

Sweet: 73 (1826); Harvey: 256 (1860); Knuth: 311 (1912); Rehm: 264 (1935); Moffett: 581 (1979).

Rigid, fleshy, perennial shrublets; branches covered with hard, waxy, translucent bark with or without persistent, spiny petioles. **Leaves** dimorphic: long- and short-petiolate; long-petiolate ones occurring singly, remaining as blunt or sharp spines; short-petiolate ones occurring singly or in tufts in axils of spines; lamina generally conduplicate, green or glaucous, cuneate, obcordate, elliptic, obovate or orbicular, toothed, lobed or segmented, deciduous; stipules semipersistent or caducous. **Flowers** regular, hypogynous, pedunculate, solitary, axillary; bracts 2, opposite. **Sepals** 5, free, imbricate, oblong-elliptic, margins membranous, mucronate or mucronulate. **Petals** 5, free, slightly ruffled, sessile, obovate or subtruncate at apex, apical margin undulate to erose, glabrous, sparsely pilose or ciliate; base clawed, hairy. **Stamens** 15, all perfect, monadelphous in 5 groups of 1 long and 2 short filaments each, fused at base; filaments sericeous towards base, tapering towards apex; anthers linear, extrorse, centrifixed. **Ovary** 5-carpellate, narrowly obovate, sericeous, with 2 ovules per locule; style glabrous or tomentose; stigmas 5. **Mericarps** 5, 1-seeded, base oblanceolate, sharp-pointed; awns thin, villous. **Seeds** exalbuminous. $x = 11$ (polyploidy).

Species 14, Africa; 14 in sthn Afr., widespread but concentrated in Namibia and Northern Cape. Albers (1996) places *Sarcocaulon* under *Monsonia*; but see Dreyer *et al.* (1997) and Moffett (1997).

Gesneriaceae

(Asteridae—Scrophulariales)

Compiled by S.J. Smithies

Annual, perennial or monocarpic herbs, usually stemless, or rarely subshrubs, with uneven development of cotyledons. **Leaves** solitary, of cotyledonary origin, growing from meristem at base, or few or rosulate, opposite, rarely alternate; stipules 0. **Flowers** bisexual, irregular, usually in open pedunculate cymes, with flowers of each dichotomy paired and opening serially, sometimes reduced to 1 or 2; peduncles apparently arising from junction of midrib and leaf stalk (hypocotyl) or axillary. **Bracts** small, rarely foliaceous, very rarely 0. **Calyx** tubular and 5-lobed or divided to the base. **Corolla** tubular, 5-lobed, often ± bilabiate; limb oblique or rarely subequal, imbricate, with 2 posterior lobes often inside. **Stamens** 2, anterior, arising from corolla tube, usually included; anthers bithecate with thecae diverging, rarely parallel, usually cohering face to face, dehiscing longitudinally; staminodes 1 or 3. **Nectary/disc** annular or shortly cupular, rarely oblique or 0. **Ovary** superior, unilocular or apparently bilocular, usually slender, terete, rarely ovoid or conical, with 2 parietal placentas ± intruding and bifurcating, sometimes uniting centrally; ovules many; style simple; stigma variable. **Fruit** a capsule, often cylindrical, sometimes conical, spirally twisted, splitting loculicidally into 2, later sometimes 4 spiral valves. **Seeds** many, minute, ± ellipsoid; testa brown, reticulate or verruculose; endosperm ± 0. $x = 16$ (15).

Genera ± 139, species ± 2900, cosmopolitan but mainly Old World, especially China, mostly tropical and subtropical; sthn Afr.: 1 genus, species ± 45 (see Scrophulariaceae for *Charadrophila* Marloth).

Clarke: 437 (1904); Hilliard & Burtt: 43 (1988); Mabberley: 299 (1997).

Streptocarpus Lindl. 7823000

Lindley: t. 1173 (1828); Clarke: 438 (1904); Hilliard & Burtt: 1 (1971); Hilliard & Burtt: 43 (1988); Edwards, Kunhardt & Venter: 192 (1992); Hilliard: 75 (1992); Weigend & Edwards: 168 (1994a); Weigend & Edwards: 365 (1994b); Mabberley: 687 (1997).

Description as for family.

Species ± 125, Madagascar, tropical and sthn Afr., ± 45 in sthn Afr., mainly in eastern half; usually in cool, moist habitats, sometimes epiphytic.

Gisekiaceae

(Caryophyllidae—Caryophyllales)

Compiled by L.L. Dreyer & M. Jordaan

Annual or perennial herbs with annual shoots, prostrate or ascending to erect, with several semisucculent stems often tinged with red, with numerous prominent, linear, whitish raphides especially on leaves, minutely asperous on nodes and inflorescence; containing betalains. **Leaves** opposite, linear to oblanceolate or elliptic, base sometimes attenuate into ill-defined petiole, margin entire; stipules 0. **Inflorescence** axillary or terminal, laxly dichasial-cymose to densely umbellate; peduncle present or absent; bracts minute or obsolete. **Flowers** bisexual or rarely unisexual, regular. **Se-**

pals 5, free. **Petals** (staminodes) 0. **Stamens** 5–15(–20), arising just below gynoecium; filaments free, widening below; anthers 2-thecous, opening by longitudinal slits. **Gynoecium** superior, apocarpous, of (3–)5(6) or 10–15 free carpels, each with solitary ovule and style on inner margin. **Fruit** a cluster of 3–15 ± heterocarpic mericarps: either muricate or almost smooth with thin, ventral sutures. **Seeds** thickly lens-shaped, black, microscopically pitted; embryo ± annular, peripheral; cotyledons oblong, fleshy; endosperm starchy. $x = 8$ or 9 (1 report, high polyploidy).

Genus 1, species 7, tropical and subtropical Africa, Arabia and Asia (S Vietnam), introduced elsewhere as a weed; sthn Afr.: genus 1, species 2.

Nakai: 91 (1942); Gilbert: 343 (1993a); Gilbert: 118 (1993b); Takhtajan: 111 (1997).

This family includes the single, isolated genus *Gisekia*, which has often been placed in either Aizoaceae (Adamson 1961; Jeffrey 1961), Phytolaccaceae (Walter 1909; Rohwer 1993; A.P.G. 1998) or Molluginaceae (Gonçalves 1978). It displays an anomalous set of characters, which complicates positive inclusion in any of these families (Gilbert 1993a).

Gisekia L. 2382000

Linnaeus: 554 (1771); Harvey: 155 (1860); Pax & Hoffman: 192 (1934); Phillips: 285 (1951); Adamson: 131 (1961); Friedrich: 26 (1966); Bogle: 435 (1970); Gonçalves: 304 (1970); Gonçalves: 522 (1978); Gilbert: 345 (1993a); Gilbert: 118 (1993b); Rohwer: 514 (1993).

Description as for family.

Species 7, tropical and subtropical Africa and Asia; 2 in sthn Afr., widespread in Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal and Northern Cape.

Goodeniaceae

(Asteridae—Campanulales)

Compiled by W.G. Welman

Undershrubs, or rarely shrubs. **Leaves** alternate or radical, very rarely irregularly opposite, entire or toothed; stipules 0. **Flowers** bisexual, irregular, on dichotomously branched, axillary peduncles; bracts and bracteoles present. **Calyx** 5-lobed; tube adnate to ovary or rarely free; lobes persistent. **Corolla** 5-lobed, somewhat fleshy; tube split to base, villous within and with processes below sinuses; lobes digitately spreading, with glabrous wings as flower opens. **Stamens** 5, alternating with corolla lobes, free; filaments long, linear; anthers 2-thecous, with thecae parallel and opening longitudinally, with an apical projection. **Disc** present. **Ovary** inferior, 1- or 2-locular, with 1 or 2 erect or ascending, axile ovules in each locule; style simple, thick, semiterete; stigma truncate or 2-lobed, enclosed in a villous, ciliate cup. **Fruit** indehiscent, with a ± succulent or membranous exocarp and a hard endocarp. **Seeds** discoid with parchment-like testa. $x = 8$ (polyploidy).

Genera 16, species ± 430, mostly Australia, also New Zealand, antarctic South America, tropical Asia and Africa; sthn Afr.: genus 1, species 2.

Sonder: 532, 604 (1865); Launert: 85 (1983).

Scaevola L. 8716000

Linnaeus: 145 (1771) name conserved; Jeffrey: 537 (1980).

Description as for family.

Species ± 80, mostly Australia, few in Asia, the Pacific Islands and Africa; 2 in sthn Afr., coastal from KwaZulu-Natal to Western Cape.

Greyiaceae

(Rosidae—Geraniales)

Compiled by R.H. Archer

Shrubs or small trees, with soft wood; ends of branchlets comparatively thick. **Leaves** alternate, crowded apically, petiolate, simple, subrotund, irregularly crenate, lobed; petiole sheathing; venation ± palmate at base; stipules 0.

Flowers bisexual, regular, showy, in terminal, pedunculate racemes; bracts small, lanceolate. **Calyx** 5-partite, persistent; segments oblong, imbricate. **Petals** 5, free, longer than sepals, oblong, glandular-ciliate, imbricate, red, rarely white. **Disc** fleshy, basin-shaped, 10-lobed, with lobes alternating with filaments and with a large gland at apex, or disc of 8 large, oblong structures lobed at apex and without glands. **Stamens** 10, in 2 rows, inserted between disc and ovary, longer than petals; filaments subterete; anthers 2-thecate, with longitudinal dehiscence. **Ovary** superior, 5-locular, oblong, deeply 5-grooved; ovules many, on parietal placentas; style simple. **Fruit** a 5-grooved, septicidal capsule. **Seeds** many, minute, elongated; endosperm copious. $x = 16$.

Genus 1, species 3, sthn Afr. Formerly included in Melianthaceae, but leaves simple and ovules many.

Hutchinson: 205 (1973); Dahlgren & Van Wyk: 29 (1988).

Greyia Hook. & Harv. 4855000

Hooker & Harvey: 138, t. 13 (1859); Harvey: 308 (1862) in Saxifragaceae; Dahlgren & Van Wyk: 29 (1988).

Description as for family.

Species 3, sthn Afr., Northern Province, Mpumalanga, KwaZulu-Natal and Eastern Cape (mainly Drakensberg and Mpumalanga escarpments).

Grubbiaceae

(Dilleniidae—Ericales)

Compiled by M. Jordaan

Evergreen, much-branched woody shrubs or undershrubs, branched from a single stem and with a taproot, or branched from a lignotuber at ground level; branchlets longitudinally ridged, tomentose. **Leaves** opposite-decussate, ericoid or flat, entire, at least ± revolute, linear to lanceolate or obcuneate, acuminate, dull or greyish green, petiolate to nearly sessile; stipules 0. **Inflorescences** axillary, basically dichasial but congested, subtended by 2 or more bracts, with 2–20 flowers. **Flowers** bisexual, regular, very small. **Tepals** 4, small, distinct, calyx-like, externally densely white-hairy, internally glabrous, shiny, suffused pink to dark red, valvate, adnate to ovary. **Stamens** 8, free, in 2 whorls of 4 each, 4 opposite and attached to tepals at base; filaments linear-lanceolate, incurved; anthers basifixed, with 2 adaxial functional thecae and a pair of abaxial vestigial thecae each; thecae dehiscent by means of lateral slits. **Disc** epigynous, papillate to shortly hairy. **Ovary** inferior, 2-carpellate, 1-locular or incompletely 2-locular; ovule solitary in each locule, pendent, anatropous, unitegmic, tenuinucellar, with a long micropyle; placenta free or fused to wall; style erect, straight, unbranched, smooth, with 2 short apical lobes, but appearing simple. **Fruit** indehiscent, drupaceous, often reddish, with a fleshy exocarp and a sclerenchymatous endocarp, each fruit united with adjacent fruits in an inflorescence, forming a syncarp. **Seed** 1, ovoid; testa thin; endosperm abundant, oily.

Genus 1, species 3, Western and Eastern Cape.

Endlicher: 327 (1837); Candolle: 617 (1857); Bentham: 231 (1880), under Santalaceae; Hieronymus: 228 (1889); Hill: 135 (1915); Harms: 46 (1935) as Grubbiaceae; Fagerlind: 315 (1947); Carlquist: 115 (1977); Carlquist: 117 (1978); Dahlgren & Van Wyk: 25 (1988).

Gunneraceae

(Rosidae—Haloragidales)

Compiled by C.L. Bredenkamp

Perennial herbs, nearly stemless, mainly rhizomatous, usually associated with water, monoecious or flowers bisexual. **Leaves** radical, alternate, simple, long-petioled, ovate- to orbicular-cordate, entire, lobed or crenate; stipules adhering to petioles. **Flowers** unisexual or bisexual, small, in compound spikes, sometimes with male flowers above and female below. **Calyx** 2- or 3-lobed, or sometimes 0, or imperfect in male flowers. **Petals** (0)2, small, concave. **Stamens** 1 or 2; anthers oblong, basifixed, longer than filaments. **Ovary** inferior, 1-locular, with a solitary, pendulous ovule; styles 2, papillose. **Fruit** a fleshy or leathery drupe, compressed, 3-angled or subglobose. $x = 17$ (12).

Genus 1, species 40, southern hemisphere; sthn Afr.: 1 genus, 1 species.

Harvey: 571 (1862) (Haloragcae); Mendes: 79 (1978) (Haloragaccae).

Gunnera L. 5836000

Linnaeus: 16, 121 (1767a); Linnaeus: 587, 597 (1767b); Schindler: 104 (1905); Mendes: 70 (1978).

Description as for family.

Central and South America, E and sthn Afr., Madagascar, Malaysia, Tasmania, New Zealand (9 species) and Hawaiian Islands (7 species); 1 in sthn Afr.: *Gunnera perpensa* L., widespread except in Namibia.

Haloragaceae

(Rosidae—Haloragidales)

Compiled by C.L. Bredenkamp

Perennial herbs or undershrubs, rarely annuals, often monoecious, often associated with water. **Leaves** alternate, opposite, or whorled, simple or pectinato-pinnatifid; stipules sometimes present and adhering to petiole. **Flowers** unisexual or bisexual, often minute and imperfect, axillary, solitary, clustered, or sometimes in racemes, spikes, panicles, or corymbs. **Calyx** (0)2–4-lobed. **Petals** (0)2–4, free, concave, deciduous, usually valvate. **Stamens** (1)2–8; anthers 2-thecous, basifixed, ± oblong, often longer than filaments. **Ovary** inferior, 1–4-locular, compressed or 2–8-angled or -ribbed, sometimes 2–4-winged, with 1 or few pendulous ovules in each locule; styles 1–4, usually free, plumose or papillose. **Fruit** usually minute, nut-like or drupaceous, indehiscent, 1–3-locular, or of 2–4 cocci, with a single, pendulous seed in each locule or coccus.

Genera 9, species 120, cosmopolitan, but concentrated in Australia; sthn Afr.: genera 2, species 3.

Family name conserved.

Harvey: 571 (1862) (Halorageae); Obermeyer: 116 (1973); Mendes: 74 (1978).

Key to genera

Plants mainly in marshes, rooted in soil; leaves small, sessile ..... **Laurembergia**

Plants aquatic, floating; leaves in whorls or 3 or 4, with filiform segments ..... **Myriophyllum**

Laurembergia P.J.Bergius 5833000

Bergius 350 (1767); Obermeyer: 116 (1973).

Serpicula L.: 16 (1767); Harvey: 572 (1862).

Herbs, small, creeping and sometimes in marshy places, monoecious. **Leaves** opposite or alternate, entire or toothed. **Flowers** very small, in axillary fascicles. **Male flowers** long-pedicelled; calyx 4-lobed, tube short, lobes longer than tube; petals 4, linear-oblong, concave; stamens 4–8, as long as petals, anthers linear, subsessile; ovary 0; stigmas 4, rudimentary. **Female flowers** sessile or subsessile; calyx 4-lobed, tube short, ovoid, 8-ribbed, lobes ± as long as tube, deciduous; petals as in male flowers; stamens 0; ovary 1-locular with 1–4 pendulous ovules, styles 4, very short, feathery or hairy. **Fruit** a fleshy nut, 8-ribbed. **Seed** 1, cylindric.

Species 4, Africa to East Indies and New Zealand; 1 in sthn Afr.: *Laurembergia repens* P.J.Bergius subsp. *brachypoda* (Hiern) Oberm., Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Swaziland, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

Myriophyllum L. 5834000

Linnaeus: 992 (1753); Harvey: 572 (1862); Mendes: 77 (1978).

Herbs, aquatic, monoecious or flowers sometimes bisexual. **Leaves** alternate, opposite, or whorled, entire to variously dissected and pectinate-pinnate. **Flowers** unisexual or bisexual, axillary, solitary, sessile or shortly pedicelled, or in a terminal spike with male flowers above and female below; bracts leafy; bracteoles 2, concave. **Male flowers**: calyx entire or 2–4-lobed, tube very short; petals 2–4, elliptic, concave; ovary 0; styles 4, rudimentary; stamens 2–8, exserted, filaments thread-like, anthers linear to linear-oblong. **Female flowers**: calyx entire or 4-lobed, tube sometimes furrowed; petals minute or 0; stamens 0 or rudimentary; ovary 2- or 4-locular, with a solitary, pendulous ovule in each locule, styles 4, short, thick and fleshy, often recurved, plumose or glandular-hairy. **Fruit** a nut or drupe or of 4 indehiscent carpels. $x = 7$ (9) (polyploidy).

Species 40, cosmopolitan; represented in Africa south of the Sahara by 2 species only, probably both introduced; sthn Afr., Namibia, Botswana, Northern Province, North-West, Gauteng, Mpumalanga, Free State, KwaZulu-Natal, Northern, Western and Eastern Cape.

Hamamelidaceae

(Hamamelidae—Hamamelidales)

Compiled by M. Jordaan

Evergreen or deciduous trees or shrubs, usually villous or with stellate indumentum. **Leaves** subopposite, opposite or alternate, simple, usually entire but sometimes ± toothed, elliptic or lanceolate, petiolate; stipules 2, small. **Inflorescences** dense, terminal or axillary heads or spikes. **Flowers** bisexual or some female, ± regular, yellow, greenish or white with red base. **Calyx**: tube shallow or campanulate, sometimes adnate to ovary; lobes 5(4), valvate. **Petals** 5(4), free, circinate or straight in bud, ± strap-shaped, with revolute margins, often 0 in female flowers. **Stamens** as many as and alternating with petals; filaments free, usually shorter than anthers; anthers 2-thecous, each theca opening with 1 valve, sometimes beaked; staminodes 0. **Ovary** from inferior to almost superior, of 2 carpels, 2-locular, usually pubescent; ovule solitary in each locule, pendulous, bitegmic, anatropous; placentation axile; styles 2, subulate. **Fruit** a subglobose capsule, 1- or 2-locular, 2-valved, but appearing 4-valved at apex after dehiscence, with ballistic seed ejection by bending, hard endocarp, tomentose. **Seeds** ellipsoid or ovoid-oblong, hilum divided into 2 areas extending from proximal end of seed on each side; embryo large, straight. $x = 12$ (1 report).

Genera ± 30, species ± 100, 12 genera monotypic, scattered and relictic distribution in the temperate and subtropical regions of both hemispheres, with greatest diversity in E Asia; only one genus in continental tropical Africa; sthn Afr.: genus 1, species 3.

Brown: 374 (1818), as Hamamelideae; Candolle: 267 (1830); Endlicher: 803 (1839); Hooker: 664 (1865); Reinsch: 347 (1890); Niedenzu: 115 (1891); Harms: 303 (1930); Endress: 371 (1989); Endress: 322 (1993).

Trichocladus Pers. 3311000

Persoon: 597 (1807); Candolle: 269 (1830); Endlicher: 804 (1840); Sonder: 324 (1862); Reinsch: 383 (1890); Harms: 322 (1930); Hutchinson: 427 (1933); Verdcourt: 1 (1971); Mendes & Vidigal: 71 (1978); Endress: 375 (1989); Endress: 327 (1993).

Description as for family.

Species ± 5; confined to eastern tropical and sthn Afr.; 3 in sthn Afr., Mpumalanga, Swaziland, KwaZulu-Natal and Eastern Cape to Western Cape, near George.

Trichocladus belongs to subfamily Hamamelidoideae Reinsch (1890) tribe Hamamelideae A.DC. (1830) subtribe Dicoryphinae Endress (1989).
